The fact is that the doctrine of evolution has not only made it incumbent on the upholders of miracles to reconsider their arguments; it has also undermined the ordinary arguments of scepticism. The doctrine of evolution implies that the Creator of the Universe is energetically present through all the operations of nature. "For," to quote again the writer of the article in the *Church Quarterly*, "according to evolution, nature has no permanent mechanical constitution, confining it within certain limits. It is rather conceived as a series of progressive events or individuations in time. Now, if we consider that the series of events which make up the succession of nature *in time* is and must be a *history*, that is, a contingent series, the impossibility of throwing back design under evolution is manifest." In other words, if this world were a machine set going for a certain time, the result would be constant and invariable effects following from constant mechanical causes. But evolution has to do with living forms, and these, according to that doctrine, are essentially variable. Granting that protoplasm is chemically the same in the germ-cell of a man and of a fish, this only makes it all the more certain that a presiding mind directs and shapes the very different results. But if we admit that a Supreme Mind is behind the framework of nature directing and controlling its forces, we shall recognize that a miracle is only an instance of the same control charged with a more manifest purpose. The will of God acting on brute matter and compelling its obedience is not different in kind from the will of man energizing through the material organism of the body; and the one is no more than the other a violation or suspension of physical law. If the process by which the loaves were multiplied or Lazarus restored to life were laid bare, a man of science would probably be able to analyse and explain it as easily as he now explains the processes which are daily going on in the laboratory of nature.

We cannot afford space to pursue the argument further. Those who may wish to do so will find matter for fruitful reflection in the article which we have been considering; and meanwhile we trust that the writer of the article will develop his argument, for it supplies premises for a volume.

A MILLIONAIRE FUNERAL.

IN recent years there has been a marked disposition in this country to curtail as far as possible the decorative pomp and ceremony which have become associated with funerals; but in the United States the opposite tendency seems to prevail. The New York papers are full of what are called "the final tributes to the earthly remains of the Great Merchant," and the arrangements of the funeral are of course described in language of becoming magnificence. The Great Merchant, it is needless to say, is Mr. Stewart, late dry-goods warehouseman of New York. He is reputed to have left twenty millions of dollars, and such a dazzling accumulation has naturally attracted abundant worshippers. No doubt most of those who thus bow down before the golden calf are inspired by a more or less conscious hope that somehow or other they may attain to a share of similar greatness; but there is also a sense in which the awe and admiration of the multitude for mere wealth is perfectly disinterested. There is something in the idea of a vast heap of money which excites minds otherwise dull and stagnant. There are potentialities about immense wealth which stimulate the imagination, and in any case it is felt that the general circle of humanity is ennobled by having a tremendously rich man in the family, even though no legacies are expected. There is a reflected enjoyment and elation in thinking that one man at least has this command of money, and in allowing the imagination, as it were, to handle the coin. The school of philosophers who are always preaching about the greatness of common things will now be delighted to find a dry goods business surrounded by a halo of romance.

As far as we can gather, Mr. Stewart seems to have been a very respectable man, who made his money by his steady business habits and devotion to his shop. We can readily believe that, in so far as greatness can be associated with a dry goods store, Mr. Stewart was a great man of his kind. But it is evident that, in the popular view of the matter, his greatness consisted in his fortune rather than in his personal character; and in all probability if he had been less opulent, he would never have been heard of beyond the range of his customers. At the same time, there is no doubt a great deal of the dry goods element up and down the world, and it is only natural that it should make the most of itself. This has been done at New York by giving Mr. Stewart a public funeral, for a touching and picturesque account of which we are indebted to the *New York Herald*. "It is probable," we are told, "that no private citizen of New York ever before had paid him at his funeral such a spontaneous tribute to his memory as was yesterday displayed by the people of the metropolis to the remains of Alexander T. Stewart." Before the funeral the body lay in state in the "marble palace" of which Mr. Stewart had formerly been the proprietor. "The dead merchant," we read, "was attired in a simple walking-dress suit, much like what he was wont to wear in life, consisting of a black frock coat, a vest cut low, with black doe-skin trousers, a white evening tie, the shirt-bosom bearing three plain pearl buttons on its snowy surface." A touch of art was, however, added to the embellishment of the corpse. "The face of the deceased looked very natural, having a slight pink tinge." And so poor Mr. Stewart, with his white tie and dress shirt, and looking all the more ghastly for the dab of rouge, was exposed to public view. The coffin was of course not an ordinary coffin, but one of the new patent "preservers" which have supplemented the ordinary ice coffins. Perhaps, however, we ought to apologize for using such a term as coffin. It appears that this word is considered on the other side of the Atlantic too prosaic and vulgar a term to be used on grand occasions, and a coffin is therefore called a "casket." In the present instance, the casket appears to have been of the most gorgeous description. It was of oak, completely covered with the finest black Lyons velvet, and trimmed with the heaviest gold fringe bullion and gold tassels. The interior was lined with white tufted satin, trimmed with white silk, and the lid was lined with white satin in the form of "gathered sun rays" these rays being richly studded with gold. The pillow was also of satin, and the handles of plated gold; the screws were all gold, and the knobs were of silver washed with gold. Altogether, the arrangements seem to have been such as must have been highly refreshing to the mind of a successful linendraper. The casket was placed on "a massive, oblong mound of flowers three feet high, covered with moss, in which white roses and japonicas were thickly studded"; and the reporter assures us that "those who have not seen the interior of this vast and noble hall can form no idea of its palatial magnificence," but "briefly it may be said that the surroundings were a fit setting for the casket and the banked masses of gorgeous and odorous flowers." At the head of the bier stood a floral cross over six feet in height, surmounted by a crown of violets, and "surrounding the casket were broken columns, harps, and anchors." An immense crowd surrounded the house, and for several hours "there streamed around the casket representatives of every profession and social rank in the metropolis, among whom were notabilities and celebrities of fashion, mercantile life, art, science, and wealth." "Hundreds of ladies who had received invitations came too late, and were forced to remain outside of the mansion." After the friends of the family and those especially invited had taken a last look at the deceased, the clerks of the store, two by two, marched past the casket, followed by five hundred women and girls employed by the firm. Of the hearse we learn only that it was a very handsome one, and of course bran new. The church in which the service was read was also decorated with flowers and foliage, and, when the procession moved into the churchyard, "the casket, held high in the air, with its golden handles and bullion fringes glittering in the open day, formed a focus to which every eye was turned." The widow of the deceased naturally enjoyed a good deal of the reporter's attention. At first, "broken with grief, she sat in an upper *salon*"; then Judge Hilton was seen escorting her "bowed figure" from the house; and it is thought necessary to state that in the churchyard Mrs. Stewart "seemed deeply moved." And so an admiring public paid its tribute of respect to "the greatest business man the country has ever seen."

Mr. Stewart's peculiar position might perhaps account for any exceptional display at his funeral; but it would appear that the system of exhibiting dead bodies to a curious mob tends to encourage a taste for fantastic ceremonial. On the same day that Stewart was buried there was another remarkable funeral in New York, which at any other time would probably have attracted more attention. Mrs. Roxcellanah H. Keyser was the inmate of a fine "brown house" in East Fifty-Seventh Street, and was reported to be worth much money. Tradition said that her husband—for she was a widow—had been buried in his wedding-garments, and attended to his grave by seventy carriages; and Mrs. Keyser had decided to be similarly honoured. Accordingly, she had a hearse and six black horses, "the vehicle of death being as handsome as any in the city, and the horses elegantly caparisoned with velvet and rich trappings"; and behind came four four-horse carriages, and seventy-two two-horse carriages, so that Mrs. Keyser decidedly had an advantage over her husband. The body was laid out in state in the deceased's house, where the religious service was performed. "The casket was of oak, with a gold plate and gold-mounted silver handles," covered with a black velvet pall trimmed with heavy bullion fringe and tassels. The casket and fittings, however, seem to have been quite thrown into the shade by the deceased lady herself, who, we are told, "was robed in a very rich white satin bridal costume, trailed along which were wreaths of fragrant flowers." "The casket itself was lined with white satin, and floral emblems were scattered in profusion about the place where the remains were laid." A cross of flowers seven feet high stood at one end of the coffin, and "there were also anchors and a lyre." It is said that several hundreds of "well-dressed people" availed themselves of the opportunity of amusing themselves with this pretty sight.

When the privileged visitors had passed through the room where the body lay, the mob outside thrust aside the barricades and swarmed into the house. The cost of the display is estimated at 3,000 dollars, the casket alone costing nearly 2,000 dollars, and the flowers being equal to "a fortune for a poor family." On the whole, this affair seems to have gone a little beyond the taste of New York, for the *Herald* remarks that "the scene somehow seemed robbed of solemnity, and appeared more like a marriage than a funeral." As far as we are aware, there are as yet no indications of a similar mania among ourselves; indeed the symptoms are happily rather the other way; but, considering the passion for public display and excitement which has been so strikingly displayed in recent years, it is hard to say how far the gratification of vulgar ostentation may ultimately be carried.

We gather that, though the contemplation of Mr. Stewart's prodigious fortune has excited great enthusiasm among his fellow-citizens, his will has caused some disappointment. In this document, says the *New York Herald*, Mr. Stewart "appears in the light of one who hesitated till the opportunity was gone." "He dreamed over magnificent schemes for the benefit of the city—public charities doubtless of a very practical nature—but he could not decide, and life passed away ere he could determine how to act, or to decide which of the many schemes was most to his satisfaction"; and now "all that grand opportunity, all the luxury of doing good on a scale not often offered, is bequeathed to the millionaire's wife as a holy duty, with his whole fortune as the means to carry out his wishes." We have here, perhaps, the moral of these great fortunes. A vast accumulation of money is cherished for its own sake, as a monument of success and power. The possessor prefers to brood in imagination over the possibilities which are brought within his reach by his command of almost boundless wealth rather than sink it in doubtful experiments. A great fortune is great only when intact; when spent it changes its character, for it is tied down to particular uses. It remains to be seen whether Mrs. Stewart and her trustee, Judge Hilton, will have the courage to disperse the great accumulation which has been left at their disposal.

THE BIBLE-EARTH.

WHEN we spoke casually last week of people who believed the earth to be flat, and the sun to be rather near it, we had remembrances of stories which we had read in the papers and of communications with which we had been once or twice favoured ourselves; but we had no notion that their authors formed an organized sect, or that they could aspire to be represented, like other organized sects, in the periodical press. But so it is. The astronomers, and the unlearned who humbly accept the teaching of the astronomers, have no longer to meet single or scattered adversaries in single combats or skirmishes; they have to meet face to face with the orderly phalanx of the "Bible-Earth League of Christians." As yet indeed we know only the chief and captain; we have not had the privilege of hearing anything of the rank and file. But a league in its own nature implies members; "tres faciunt collegium." We cannot conceive a league of one person only, any more than we can answer the ancient question, "How shall he marry without e'er a wife?" We have indeed heard of a person of unusually careful garb and stately gait being described as "a procession of one"; but there is nothing in the etymology of the word procession which implies plurality, while a league, a binding together, implies more than one thing capable of being so bound. We assume then that the Bible-Earth League of Christians does not consist only of Ferdinand FitzGerald, Esq., for many years editor of the *African Times*, and who now is, or wishes to become, editor of a monthly periodical called the *Bible-Earth*. We remember, indeed, the letters which used to appear in the *Athenæum* with the signature of Hermann Heinfetter, which were addressed "to the Members of the Anglo-Biblical Institute," and began "Dear Brother Members." We believe that the Anglo-Biblical Institute and its members existed only in the imagination of their correspondent. We should be glad to believe that it was otherwise, as we should like to see some genuine Anglo-Biblicals in the flesh; they would, one would think, altogether distance Anglo-Saxons and Anglo-Normans. But Mr. Ferdinand FitzGerald seems to be much more a man of the world—not, of course, of any world that goes round, but of his own flat world—than Mr. Heinfetter. Mr. Heinfetter must have spent a great deal of money on the letters which appeared as advertisements. Mr. FitzGerald is very eager to prove the earth to be flat, and to save immortal souls by so proving it; but he is by no means eager to prove it at his own cost. The fifteen years' editor of the *African Times* has doubtless seen much more of men and things, and has generally better learned what is what, than the solitary dreamer of the Anglo-Biblical Institute. He at least knows that "the work of surveys, and obtaining other incontrovertible proof that the earth is not a rotating revolving globe, will be necessarily expensive, and can only be effected by the liberal contributions of Christians." Moreover there is worldly wisdom in the rule that the six shillings per annum which might entitle us to receive the *Bible-Earth* monthly shall be "payable in advance." And more worldly wisdom still, though not exactly the spirit of a martyr, is shown in this singular stipulation:—"Every contributor to the League and subscriber to the journal will be deemed to be a member of the League, but no name of a subscriber will be published without his or her consent until after the truth of a plane, motionless earth has been so fully established that no ridicule can any longer attach to a belief in it." Mr. FitzGerald, whose soul burns within him, and who is in agony for immortal souls, must deem the flatness of the earth to be a principle as worthy to suffer for or to fight for as any principle set forth by the first preachers of Christianity or of Islam. But if the first preachers of Christianity or of Islam had promised their converts to keep their names hidden till the truth of the new creed was so firmly established that no ridicule could attach to its professors, we hardly think that either faith would have made the way in the world which it did make. But then, though Christianity and Islam were propagated in widely different ways, neither of them was propagated by means of subscriptions and Post-Office orders.

We assume then that the Bible-Earth League of Christians really exists, and does not consist solely of Mr. Ferdinand FitzGerald. We all know that the wildest doctrine is sure to gain some supporters and to draw forth some contributions in money. Otherwise we might be astounded at the news that there is any organized body of people, even the two or three gathered together who are needful to make either a college or a league, who can band themselves together to prove that the earth is flat and that a sun much smaller than the earth goes round it at a distance of about four thousand miles. Save that we have long left off being astounded at anything, we should certainly be astounded at this; but we must do Mr. FitzGerald the justice to say that he is not, like enthusiasts of less worldly experience, at all astounded at people being astounded at him. It is, in truth, exactly what he expects. He expects to meet with ridicule and vituperation, and he is quite prepared to bear them in his own person; it is only his subscribers whom he wishes to shield from them till the expensive surveys made at their cost shall have made the flatness of the earth and the nearness of the sun so certain that nobody would be any longer laughed at for believing in them. Mr. FitzGerald, in his agony for immortal souls, is fearless of ridicule, even the "ridicule which all-confident human science and educational prejudice will direct against him." But he has made up his mind not to return any such treatment in kind. As "abuse is not argument, nor does it strengthen argument," he will take care that the *Bible-Earth* shall not be open to any objections on this score. "Anything having the character of vituperation or abuse will not be allowed in the columns of the *Bible-Earth*." Its "columns will be equally open to the defenders of Newtonian astronomy, to disprove, *if they can*, the supposed facts adduced therein in support of a plane, motionless earth, and the deductions and inferences that may be made from them." But "the controversy must be carried on in its columns with that mutual respect to which all sincere belief is entitled." Mr. FitzGerald, in short, will not do like those sinners the Newtonian astronomers. As yet "Newtonian astronomy so entirely monopolizes the field of daily and weekly journalism and other periodical literature, that supposed proofs and arguments against it and its conclusions appeal in vain for insertion, and meet with ridicule and contempt." The *Bible-Earth* will not be like these unfair specimens of periodical literature. There a fair field will be open; the appeals of an Adams or a Le Verrier for insertion in the *Bible-Earth* will not be in vain, nor will their supposed proofs and arguments be met with ridicule and contempt. There is something charming in this, and something specially charming in the words which we have put in italics. Mr. FitzGerald clearly believes that there will be a controversy. He expects that Newtonian astronomers will take the trouble to write answers to the *Bible-Earth*, and will even send those answers for insertion in the *Bible-Earth* itself. And so many and various are the weaknesses of human nature that it is quite possible that some one knowing enough of astronomy to confute Mr. FitzGerald and the whole Bible-Earth League of Christians, how many soever they be, may be unwise enough to enter into the lists with the league on its own earth. They will be allowed to disprove, "if they can," the arguments of the *Bible-Earth* itself. The condescending qualification was hardly needed. We may be quite certain that no astronomer will be able to confute the arguments of the *Bible-Earth* in its own columns—that is to say, no one will ever be held by the Bible-Earth League of Christians to have confuted them. People of this kind never are confuted; for, if they were capable of being confuted, that is, capable of understanding the force of an argument, they would not be people of this kind. The astronomer who should dispute with Mr. FitzGerald may very likely be treated quite civilly, without any vituperation or abuse; but he will be treated with the lofty condescension which a man who understands anything commonly meets with from those who do not understand it, but fancy that they do. To try to prove the truth of "the conclusions of Newtonian astronomy" in a journal whose "object and aim will be to disprove" them would be like trying to make the Pope doubt of his own infallibility, or to make Mr. Fergusson think differently about the date of Stonehenge.

There is certainly a sense in which, as Mr. FitzGerald says, all sincere belief is entitled to mutual respect, and Mr. FitzGerald clearly has a very sincere belief, not only that the earth is flat, but that the belief that it is otherwise is dangerous to immortal souls. He stands forth like an old prophet (he compares himself to Elijah on Mount Carmel), and asks, "Who is on the Lord's side?" and declares that the "first great effort on the Lord's side" must be to prove that this earth is not a globe. All this is clearly sincere, and therefore, in a sense, entitled to respect. And yet we can neither wonder at nor condemn the contempt and ridicule—we say

nothing of the vituperation and abuse—of which Mr. FitzGerald complains. Contempt and ridicule really are the only ways of meeting attempts to call again in question things which have been settled for some ages by the common consent of all who are qualified to judge. It is no use arguing, because those who start such questions are beyond the reach of argument. It is very hard not to treat them with ridicule, because the extreme grotesqueness of their notions—a grotesqueness which their manifest sincerity only makes more grotesque still—makes it hard indeed not to laugh. But even if we abstain from active ridicule—that is, from laughing—we cannot abstain from contempt—at least, from that silent contempt which is sometimes the hardest of all to bear by the person contemned.

We will therefore not argue against Mr. FitzGerald and his Bible-Earth League. It is really answer enough that many of the most devout and holy men that ever lived have not found a belief in the Newtonian astronomy in any way inconsistent with a belief in those Scriptures which, according to Mr. FitzGerald, the Newtonian theory upsets. We will leave him to the astronomers and divines, if either class should think it worth while to deal with him, either in the columns of his own *Bible-Earth* or elsewhere. We are concerned with him only as a first-rate example of the state of mind of which we spoke casually last week. As Mr. FitzGerald's craze is astronomical, he will most likely make few converts, and will be forgotten after at most a passing laugh from scientific men. But if his craze had been historical or philological, he might have put forth notions quite as absurd as the notion that the earth is flat, and many people would not have been in the least able to see that they were absurd. If any scholar had tried to confute him, we should have heard of "controversies" and "differences of opinion." On one point however historical study may feel some slight sympathy for Mr. FitzGerald. He complains "that in the revised Lectionary of the Church of England the miracle recorded in Joshua of the sun standing upon Gibeon and the moon in the valley of Ajalon was to be excluded in homage to modern science." There is another side to the exclusion, which perhaps neither Mr. FitzGerald nor those who excluded it ever thought of. The same lesson which contained the standing still of the sun and moon contained also the narrative of the taking of city after city, of the five kings taking shelter in a cave, of the triumphant Hebrews setting their feet on their necks. The whole thing read so like the account of a campaign of Ælle or Ceawlin that the hearer was sometimes tempted to remember that he was an Englishman, and to think that Gloucester and Cirencester would sound quite as natural as Makkedah and Libnah. It is just possible that the exclusion may be meant to cut off all chance of wandering thoughts, especially in so ungodly and bloodthirsty a direction. There was the precedent of Ulfilas leaving out the Books of Kings, lest they should make the Goths yet fonder of fighting than they were before. So, while at first sight we might be disposed to join, on a different ground, in Mr. FitzGerald's moan on the First Sunday after Trinity, we are willing to acquiesce in the exclusion as perhaps being well ordered from another point of view.

THE ROYAL ACADEMY.

I.

IT has been prophesied that the present Exhibition would prove to be of exceptional quality. This is at once true and untrue. It is true that there are at least half-a-dozen pictures which, either by their size or by their merit, will render this collection conspicuous in the annals of the Academy. Here and there long-known artists are found to have surpassed themselves; we also discover some comparatively obscure men starting at a bound from a state of promise to an assured success. But such cases are exceptional, almost of necessity; and the exhibitors being, for the most part, year by year the same, the law of averages must bring out pretty much the same results. Therefore it is not true that the present Exhibition is, as a whole, greatly better than its immediate predecessors; yet, at all events, an improvement is seen on last year. But each recurrent season shows a certain ebb and flow in the tide of art; some men rise, others fall, and art itself changes in its currents. For many years the arts have stuck fatally fast on the dry, hard rock of realism; but we shall have the pleasure hereafter of pointing to certain pictures which show that imagination can soar as well as sink, and that, in the words of Lord Bacon, the use of art "hath been and is to give some shadow of satisfaction to the mind of man in those points wherein the nature of things doth deny it."

The number of pictorial works hung this year is 1,345. This is slightly below the average of five years. Last year the number was 110 under the total of this, and in 1870 it sank 300 below. The highest figure—namely, 1,433—was reached in 1874, but the effect was not generally satisfactory. The conclusion is that on the present occasion the happy mean has been struck. The hangers have been Messrs. Hart, Elmore, and Leighton; Mr. Woolner has arranged the sculpture. They have acquitted themselves of their onerous duties fairly well. But the hanging of pictures is often an affair of the carpenter, inasmuch as a picture cannot be placed where it will not fit. Moreover, personal interests must frequently prevail over pictorial considerations. And hence the hanging of the old masters can always be made more artistic than that of the living. On the present occasion little more has been attempted than symmetry as to size, and contrast in light and shade. As for colour, it is often so bad as to look almost equally disagreeable wherever it may be hung.

In this introductory notice we will invite the reader to join us in a leisurely walk through the galleries in order to take a general view of the Exhibition, marking by the way its salient points. Let us begin with Gallery I.—which is not so striking as it is sometimes. The eye is naturally first attracted to the highest light. "An Intruder on the Bedouin's Pasture" (14), is in Mr. Goodall's latest style, wherein he is content to sacrifice form and firmness to sentiment and sunshine. Mr. Small, whose picture was much talked of before it reached the Academy, has been somewhat hardly used as a foil in favour of Mr. Goodall. "The Wreck" (13), is a dark, vigorous composition, vehement in dramatic action. Other excellent pictures in this room belong to a like school of naturalism and realism, such as "A Lancashire Gang" (46), by Mr. R. W. Macbeth, and "Saturday Night" (62), by Mr. Barnard. The latter verges on vulgarity. Gallery II. presents in full view, at the centre of the furthest wall, perhaps the most vigorous and truthful landscape ever painted by Mr. Millais, and that is saying a great deal. "Over the Hills and Far Away" (106) is a foreground study of green rushes growing amid silver waters; beyond rises a russet heath, and further still the blue hills mount into the sky. The exhibition has some remarkably fine studies of nature; but we incline to think that this must be pronounced the landscape of the year. Mr. Hodgson's "Temple of Diana at Zaghouan" (84) is specially unfortunate in the treatment of the greens. Mrs. Ward, in her happiest mood, has hit upon a capital theme, the visit of Mrs. Elizabeth Fry to Newgate (120); and Mr. Crowe, one of the new Associates, after his wont, strikes out a speciality for himself in "Darning Day, Red Maids' School, Bristol" (146).

We next enter the Great Gallery, "the Banqueting Hall," wherein at the annual dinner the President devotes his well-known eloquence to the brick and mortar of Burlington House—in short, to every topic save art, of which it might be supposed he knew something. Things are sadly changed since the time of Sir Charles Eastlake—a President who, in a few apt words, linked the present with the past, and carried the mind back to the great masters in the history of art, whose works form the standards by which each succeeding Academy Exhibition must be tested. Sir Francis Grant does not quite belong to this learned school, as the pictures which he contributes will tell; witness "Winter" (185). No work will be more talked about, chiefly no doubt from the personal interests involved, than Mr. Cope's skilful composition, "Selecting Pictures for the Royal Academy Exhibition" (160). The Council are in conclave, and before them are brought in succession paintings for acceptance or rejection. The artist has caught to the life, not only the faces, but the attitudes and movements, of his fellow-Academicians; specially felicitous are Messrs. Millais, Leighton, Armitage, and Calderon. The technique is better than we might have expected from Mr. Cope; and one is thankful that he has for once forsaken Shakspeare. The picture just described, which on the presentation of Mr. G. Moore becomes the property of the Academy, occupies a centre; the two other centres are equally fortunate. "King Lear Disinheriting Cordelia" (189), by Mr. Herbert, is a replica to the renowned composition in the Houses of Parliament. The fresco having been long in process of destruction, it is well that the artist should with his own hand reproduce the composition in oil. It remains merely to name—for we have not now space to criticize—the great achievement of the year, "The Daphnephoria" (241), by Mr. Leighton. This triumphant procession in honour of Apollo passes beneath the shadow of a grand pine grove, and in the valley below is seen the town of Thebes. The canvas is within a few inches of the same size as that of the "Cimabue Procession." It would be interesting could these two processions be seen side by side; the change in style, as might be expected, is considerable. Other works which should claim attention are Mr. Millais's portrait of "Mrs. Sebastian Schlesinger" (248), Mr. Goodall's "Holy Mother" (182), and Mr. Poole's "Meeting of Oberon and Titania" (175). The oppression of portraits is this year slightly mitigated. "The Right Hon. Lord Lytton" (240), by Mr. Millais, will naturally attract attention. On the whole we have never seen the Great Gallery look better.

After the climax reached in the *salle d'honneur* there is sometimes a sense of anticlimax or decadence as the visitor enters Gallery IV. But the hangers, now as heretofore, have been at pains to hold an even balance all round the Exhibition; the interest never flags. We presume the portrait of "H.R.H. the Prince of Wales" (285), by Herr von Angeli, is hung by command; if so, we pity the Council. From the time of Kneller downwards it has always been cause for regret when our Royal Family have fallen under the pencil of foreigners. On a first visit this room may be passed through hastily; yet it is impossible not to notice so manly an effort as Mr. Hodgson's "Following the Plough" (301); also Mr. P. R. Morris has not injured his good fame by the onslaught of wind and sea at the expense of "The Sailor's Wedding" (280). Gallery V. becomes a little more enlivening. Mr. Millais, who turns up everywhere, occupies a centre with "Getting Better" (387); the opposite centre being held to advantage by Mr. Pettie, in "The Step" of a little girl essaying a dance (433). This artist is always a colourist, though the colour is after his own kind; when once marked it can never be mistaken. The Academy has lost in the death of Earl Stanhope its "Antiquary"; the portrait by Mr. Ouless vividly recalls the presence of a familiar face. "The Hollow

of Leyden" (381), by Mr. A. Gow, deservedly gains a place on the line. By chance or intent, landscapes have gravitated into this room. Take the following, some not to be surpassed even in this age of landscape-painting:—"A Certain Trout Stream" (365), by Mr. Brett; "He Never Came," landscape with figure (388), by Mr. Fahey; "The Gipsies' Pot" (426), by Mr. W. Linnell; "The Life Boat" (455), by Mr. Henry Moore; "Gareloch, on the Clyde" (434), by Mr. J. Macbeth; and "Red Autumn" (440), by Mr. C. N. Hemy. The hanging in this room is rather scattered; at any rate those landscapes are not made the most of.

Nothing very particular occurs in Gallery VI., except that Mr. Fildes, who has hitherto rejoiced in the sunniest of romance, here surrenders himself to the darkest of despair, and it yet remains to be seen in which direction his passion lies. But in the meanwhile much respect is due to his wail—"The Widower" (476). The motive and the manner belong to Mr. Thomas Faed, and yet the pathos is differently intoned, and certain small touches of colour, not in keeping with sombre melancholy, would seem to indicate that the painter is playing a part, and trying an experiment on the public. When may we hope for a surcease of such affected titles as the "Orphans" (515), by Mr. T. S. Cooper? From the Catalogue we look to the picture, and find that the "Orphans" are sheep and that the snow is chalk. We would direct attention to the portrait of Mr. Thomas Carlyle (529), by Mr. Herdman. Gallery VII. has apparently a wall propitious to the display of religious art—such at least as may now exist. Thereon in former years was distended the grand and gigantic composition "Cain and Abel," by Mr. Watts. Now the centre is appropriately occupied by "The Hymn of the Last Supper" (579), by Mr. Armitage, on either side of which range "Judith in the Tent of Holofernes" (578), and "St. Mary Magdalene with the Precious Ointment" (584), severally by Mr. Herbert. These conceptions, though open to criticism, are to be received with respect; but what shall be said of Mr. Thorburn's "Christian Descending the Hill Difficulty"? There evidently is a difficulty, and one scarcely to be got over; the painter has made poor Christian so wooden, has rooted him so immovably, that not a step further can he go. What would a French artist think of our Academy were he to see this picture here on the line? "A Surrey Pastoral" (562), by Mr. Boughton, commends itself by its consonance with nature in her gentler moods.

The Lecture-room has been fittingly made the abode of Academic art. "Phryne" (909), by Mr. Armitage, is the boldest and the best treatment of the nude; the figure is not unworthy of Ingres, as known, for example, in "La Source." A still more arduous effort in the Academic way is "Atalanta's Race" (943), by Mr. Poynter, the newly appointed director of the schools at South Kensington. He proves his qualifications with a vengeance. The work is something more than eclectic; it is no disparagement to say that a figure here and there is borrowed from the Greeks or from Michael Angelo. Mr. Long's "Bethesda" (891) is not quite an unworthy sequel to the Slave Market which gained him his election.

Galleries VIII. and IX. are again devoted to water-colour drawings, architectural designs, engravings, &c. The last room—No. X.—often obtains less attention than it deserves, possibly because the visitor when he reaches it is worn out. On the present occasion it is the chosen abode of the few foreign pictures—ever on the decrease—which find their way to the Academy. Here, for example, is "The Charge of the English Heavy Cavalry at the Battle of Balaclava" (1332), by M. Philippoteaux, whose former battle-piece obtained position and praise in the Academy. Also may be enumerated "Cleopatra" (1282), by Mr. Alma-Tadema, and "A Girl Spinning," with a cow of course added (1297), by Herr O. Weber, and "Sheep Grazing" (1281), by Mme. Peyrol Bonheur, which has exquisite qualities. Of much refinement and delicacy is an interior with figure, "After the Sitting" (1261), by Mr. Rudolph Lehmann.

The changes in the constituent members of the Academy within the last few months have been unusually great, though the effects are as yet scarcely felt in the annual arena. Six new Associates have been brought into the field—Messrs. Alma-Tadema, Long, Storey, Crowe, Oakes, and Pearson—fit and proper men no doubt, but not each and all quite the men who had the right to override all comers. The number of disappointed candidates is of course vastly in excess of the six fortunate elect. We very much doubt the so-called liberal policy of increasing the number of Associates, unless a surrender be made of the monopoly of "the line." The condition of outsiders, who have each year to pass, as it were, through a competitive examination before they can obtain even toleration, is made worse than it was before. The battle for "the line" has become almost the battle for life; and to artists who may be cast out into the cold, a favourite aphorism of the late Earl of Carlisle, that the kingdom of heaven is specially for those who have failed on earth, comes but as a tardy consolation.

THE THEATRES.

THE mysteries, real or supposed, of modern life furnish an unfailing supply of novels by Mr. Wilkie Collins, some of which are capable of adaptation to the stage. Two brothers have quarrelled about a woman, and one of them has killed the other. The children of these three persons are the principal characters in the play called *Miss Gwilt*, and one of them gives her name to it. Mr. Collins appears to hold, for literary purposes, an improved form of the doctrine of original sin. There is usually a son or daughter, or both, in his novels on whom a parent's guilt is visited, and hints are dropped after the manner of a Greek chorus at some ancestral wickedness unexpiated. Confining our view at present to the play, it is difficult to explain to oneself, or anybody else, what it is all about. The ingenious Dr. Downward wishes to bring about a marriage between Miss Gwilt and Allan Armadale; and, as he knows the secret of her previous marriage with Captain Manuel, he might be in a position to levy a tax upon her rich husband's estate. In order to understand how Miss Gwilt came to entangle herself with such a mean scoundrel as Manuel, we must assume, in opposition to Lord Palmerston's opinion, that girls are born bad. She has had thoughts, before the play begins, of suicide; but she consents to live and be a governess for the advancement of Dr. Downward's scheme. An unforeseen difficulty arises from the circumstance that Allan Armadale falls in love with the pupil instead of the governess, while Miss Gwilt declares her purpose of marrying Midwinter, who is Allan Armadale's first cousin, and entitled to bear the same name. Dr. Downward, always equal to the occasion, forms his plan to get Armadale the heir murdered, so that Armadale the cousin may claim the estate, and Miss Gwilt, as his wife, may help Dr. Downward to get a share in it. We cannot help thinking that a man of his knowledge and talent, to say nothing of the valuable quality of unscrupulousness, might have been more profitably engaged than in contriving a murder for such uncertain gain. The letter which he writes to Manuel would be a useful weapon in that worthy person's hands, and as he delivers the letter to Manuel immediately after writing it, he might as well not have written at all, except that Mr. Wilkie Collins always likes to conduct his stories by correspondence. The murder is attempted by the method which has lately become fashionable of scuttling a ship; but as Manuel perishes and his intended victims escape, it requires almost superhuman ingenuity to prevent the story ending happily, and we are bound to say that the author is equal to the occasion. The only ground of quarrel between Midwinter and his wife arose out of the existence of Manuel, and he is dead. Armadale the heir has come back ready to marry Miss Milroy. The creditors of Dr. Downward must be great fools if they do not allow him time to display his remarkable capacity for the management of a Sanatorium; and indeed it would be a reproach to our age if such a man were driven to vulgar murder instead of devoting himself to interesting physiological experiments. However, while it is still believed that the two young men have perished at sea, Dr. Downward has persuaded the widow of Midwinter, who is really Allan Armadale the cousin, to claim the right which would belong to her as the widow of Allan Armadale the heir. When both the young men turn up, the letter written by Dr. Downward in her name would be an awkward fact against the two conspirators, but even a "'prentice hand" in authorship could get its characters out of such a scrape as that. Mr. Wilkie Collins, however, does not want to get them out of it. On the contrary, he makes the lady called originally Miss Gwilt determine, for no visible reason, to murder Armadale the heir, and he conducts the characters to Dr. Downward's Sanatorium, somewhere in the suburbs of London, which is replete with every convenience for scientific murder, including nocturnal supervision of the premises by a policeman.

The charm of Mr. Wilkie Collins's fictions is the subtle suggestions which they convey of the general insecurity of modern life, particularly that part of it which is transacted in suburban villas. It is so nice to feel as we drive home from the theatre that we or our neighbours may be visited in the night by mysterious assassins, and that in the great gloomy house with the high-walled garden, inscrutable wickedness awaits victims who, regardless of their doom, pay back fare to cabs for bringing them to a Sanatorium. If this story is founded either on fact or plausible suspicion, all such establishments ought to be brought under the inspection which Mr. Newdegate would apply to convents. The heroine, persisting in her purpose to murder Armadale the heir, nearly murders Armadale the cousin, who is her husband, and then kills herself. The means of doing this are supplied by Dr. Downward, and consist of an apparatus by which the air of a bedroom may be poisoned. Unfortunately, in order that the dying agonies of Miss Gwilt may be distinctly visible, a large piece has been taken out of the bedroom wall, and so we have "to make believe very much" in order to enjoy the poisoning. And when people rush in and struggle to open the locked door, it is difficult to avoid calling to them to go through the gap. The dramatist might, if he pleased, have followed a great example, by making his wall even more permeable than it is, and he could have made the wall itself explain the nature of the cure-or-kill contrivance which is described in dialogue between Dr. Downward and Miss Gwilt. The lady's dying agonies are suitably represented by Miss Ada Cavendish and people who like this kind of thing should go and see her. We do not. The play shows no adequate reason why she should kill herself or anybody else, and we could wish this clever actress better employment than perpetrating unnecessary murders in a red wig. The character of Dr. Downward is excellently performed by Mr. Arthur Cecil, and he, if any one can, will save the play. Several scenes are highly interesting, and it is only the prolongation of the story that makes us feel that the Doctor's villany is gratuitous. Having got all these people on the stage, it is perhaps as easy to kill a few of them as to do anything else, and the play must be ended somehow. We doubt whether any practical improvement in the art of poisoning is shown in the last act. There must be somewhere

bottle, or the fragments of it, which contained the liquid poured into the machine; and this machine, with its pan for generating gas and pipe for conveying it, although it might be useful, could easily be mischievous. A murder thus committed could scarcely be called a "mystery" even in penny-a-liner's language, and, on the whole, we regard this new invention in homicide as clumsy and disappointing.

The sorrows of wretched wives, however interesting to the sufferers, are apt to pall upon public taste. If, in addition to *Queen Mary* at the Lyceum, an audience can be found for *Medea* at the Haymarket, we can only say that London is very far from abandoning itself to frivolous amusements. Mme. Janauschek, a German actress with remarkable command of English, has chosen ill the time or character of her first appearance. This, as everybody remembers, is one of Miss Bateman's parts, and neither Miss Bateman nor anybody else can make it other than a burden. The parts of Jason and Creon are inconsiderable, and Creusa serves chiefly by her immobility to illustrate the gestures and play of feature of Medea. The new actress has, however, produced a strong impression of her power, and for this purpose her first part was well adapted. Of several foreigners who have of late years undertaken to perform in English, her speech is perhaps the least unpleasant, and it is distinct. Her acting is rather over-laboured, and as the play lasts three hours, and she is almost always on the stage, and nothing of the slightest importance happens in her absence, she produces the impression that one is watching a patent machine for the production of strong theatrical effects, which may go on working, without fatigue or remorse, till midnight. These one-part plays are almost always failures, as, in the interest of art, they deserve to be. They save trouble, however, to managers, especially in small or remote places; and Mme. Janauschek may probably obtain provincial engagements to play Medea, which may be played wherever a couple of children and a little red fire can be forthcoming. The accessories and the company are of the smallest possible importance. It were to be wished, however, that this lady's talent could be employed in London in some other plays less familiar and more interesting than this.

In *Wrinkles*, at the Prince of Wales's Theatre, Mr. Byron has met failure more surprising than the great success he has obtained elsewhere. The characters of Miss Piper and Bob Blewitt are as good as anything he has lately written, and they are capitally acted by Miss Wilton and Mr. Bancroft. The rest of the play is little better than padding, but the same or worse might be said of other plays to which careful acting has given temporary vitality. But the genteel public do not care for this play, and the difficulty of management of such a theatre lies in finding something for which they will care. There have been revivals of Robertson to the limit of possibility, and the company, however well drilled, does not excel in comedies of the last century. Murder and suicide are also rather out of its line, and modern French comedies cannot, as a rule, be satisfactorily translated. The class of persons who see two tragedies within a week is too limited to supply nightly a contented audience for Mr. Byron's comedy; yet, if there be any epicures in theatrical entertainment, we would advise them to see *Queen Mary* or *Medea* one night and *Wrinkles* the next. Any person who tries this bill of fare might then be invited to say honestly which dish he or she would like to have served again. Mr. Bancroft's acting of Bob Blewitt does full justice to one of Mr. Byron's happiest sketches of contemporary life. The reasons against taking the offered appointment in Jamaica are in the author's best style. Bob's friends, thinking probably that geography is not his strong point, explain that Jamaica is an island from which the rum comes. "Not all the rum?" says Bob, having, as an intending colonist, an obvious interest in the question. Whatever comes of the play, the principal actors will gain credit by the performance.

RACING AT NEWMARKET AND EPSOM.

WHAT some people will regard as improvements, and others as innovations, have been plentifully effected at Newmarket since the close of the last racing season. The stand at the end of the Rowley Mile will, when finished, be one of the most commodious in the kingdom, especially when it is remembered that only on two or three days in the year is there anything approaching to a crowd at Newmarket. The price for admission to it and the adjoining enclosure will be very high—no less than ten guineas for a yearly ticket; and when we take into account the numerous other charges, of which the daily toll for driving on the Heath may be taken as an example, and the wonderful sums demanded by hotel and lodging-house keepers for the accommodation of their visitors, it is pretty clear that racing-men must make up their minds to consider a visit to Newmarket as a very expensive luxury. In so far as the increased charge for admission to the enclosure will make the company assembled there more select, and exclude some of the adventurers of the Turf who prey upon the unwary, the sudden rise from two guineas to ten guineas a year may have a beneficial effect; but we must bear in mind that only a minority of the races finish at the end of the Rowley Mile, that one entire meeting is carried on at the other side of the Ditch, and that for all the races that end at the top of the town the new stand will be of no use whatever. Furthermore, a great deal of the betting at Newmarket is carried on, not in the enclosure at all, but in the cords and from the tops of cabs and carts scattered about the Heath; and the ten-guinea fee will not affect in any way the outside betting-men, but, we fancy, will rather tend to increase their numbers. It is quite right that the Stewards of the Jockey Club should keep the Tattersall's enclosure for the use of those only who have a legitimate right to avail themselves of its accommodation; but it would be well if, in addition, they could afford some protection to the general body of visitors to Newmarket. They have ample authority for the purpose. A few years ago they put down *pari-mutuel* betting in the most summary manner; and they could, if they chose, do a great deal to rid the Heath of the scoundrels who infest it in race weeks. If one is to be unblushingly robbed just outside the enclosure, it will be a poor consolation to know that inside it the select possessors of ten-guinea tickets can walk about and make their wagers in serene security.

But while stands and refreshment-rooms are being built at Newmarket on a grand scale, and prices are being raised, the question naturally suggests itself whether a corresponding improvement in the quality of the sport is to be expected. The experience of the last week is hardly calculated to inspire us with any sanguine hopes that the reign of plating and selling races is to be succeeded by an era of more important contests, in accordance with the great preparations that are being made to enable people to witness them. It was indeed a banquet of empty dishes last week. Long programmes were prepared; but though the Stewards racked their brains to invent races, owners and trainers declined to have anything to do with them, and on the last day only four events, one of which was practically a walk over, were decided. The old-established races of the meeting, the Biennial, the Column, and the Claret Stakes, produced wretchedly small fields, and the Newmarket Handicap with 400, and the International Handicap with 300, sovereigns added, and 100 for the second horse, could only attract ten and nine starters respectively. The minor races were just as ill patronized, and, in fact, had it not been for the opportunity of seeing the two Derby cracks, Petrarch and Skylark, and the threatened candidate for the Two Thousand, Great Tom, as well as for one or two exciting incidents, such as the overthrow of Lowlander by Hesper, the Craven week might well have been avoided even by the most steadfast admirers of Newmarket.

The very first race of the meeting produced an interesting contest between Wild Tommy, a great slashing son of King Tom and Wild Agnes, and Great Tom, who, it was reported, had beaten his stable companion Skylark in a trial, and on the strength of that performance had been elevated to the front rank in the Two Thousand favourites. The much-improved Coltness also took part in the race, and having a 4-lb. allowance was expected to show a return to his Ascot form of 1875, especially as neither Great Tom nor Wild Tommy was fully up to the mark. Mr. Houldsworth's usual ill luck stuck to him, and Coltness was beaten a quarter of a mile from the finish. A fine struggle for victory between Great Tom and Wild Tommy then ensued, and resulted in the defeat of the former in the last stride by a head. All sorts of excuses were of course made for the loser; but, in our judgment, either Wild Tommy is entitled to be considered a promising Derby candidate, or else the merits of Great Tom and Skylark have been much overestimated. Later in the day Skylark himself came out, and won the Biennial in fine style. He had little or nothing to beat, however, the speedy but roaring Rosinante being the only one of his four antagonists likely to make him gallop. The Rowley Mile is quite a different thing from the five-furlongs course at Southampton, and Rosinante soon found out the difference. Though on sufferance the son of Rosicrucian led as far as the Abingdon bottom, directly he touched the ascent he began to stop, and Skylark galloped past him at his leisure. But for his curby hocks, it might not be necessary to look for the Derby winner much beyond Skylark, who has won every engagement for which he has started; and the fact of his being now first favourite for the great Epsom race shows that his infirmity is not considered likely to be a bar to his success. Cœruleus and Chaplet, son and daughter of Beadsman, finished first and second for the Bretby plate, and the subsequent victory of Chaplet in the Free Handicap over Carnelion, Picnic, and The Gunner, proves Cœruleus to be a really good horse. On the second day of the meeting there was a more than ordinarily exciting race for a wretched little plate of fifty pounds over the T.Y.C. Hesper, a three-year-old son of Speculum, and Lowlander were the only combatants, and the latter carried 10 lbs. extra to exempt him from sale. Extravagant odds were laid on the son of Dalesman, who, however, never fairly got out of the way of his opponent, and, despite the vigorous efforts of Custance, who, if any man can, is able to get the last ounce out of a horse, was defeated by a neck. On the conqueror of Lowlander being put up to auction it was evident that there would be some brisk competition for him, and the bids speedily rose from 1,000 guineas, the price at which he was entered to be sold, to 2,500. According to the rules, half the excess over the selling price goes to the owner of the second horse, so that, instead of winning fifty pounds by Lowlander's success, Mr. Bird had the gratification of receiving just fifteen times that amount in consequence of his defeat. It is probable that Hesper may be a dear purchase to his new owner, and that Lowlander, who rarely blossoms before Ascot, was not in anything like form last week. But when a great public favourite is overthrown there is a rush to get hold of his conqueror at any cost, no matter what the real merits of the victory may be. For the Column Stakes two of Lord Falmouth's representatives, Farnese and Dandelion, were opposed by Arena. The last named

was manifestly lame, and, Dandelion seeming to be in scarcely better plight, the race looked like a walk over for Farnese. Arena was beaten at the Bushes, and Farnese, whose roaring infirmity increases, as was to be expected, with age, died away the moment he began the ascent of the hill, thus leaving his stable companion, Dandelion, to win at his leisure. This was the first appearance of the winner in public. He had the misfortune to break his leg when a yearling—a contemporary somewhat curiously spoke of him as having had "at one time a broken bone in his leg"—and we should think there are few instances of a horse that has met with such an accident recovering sufficiently to stand training.

The racing of the last two days of the Craven Meeting calls for little remark. Two prominent performers in last year's Middle Park Plate, La Seine and Heurtebise, contested the Free Handicap on the Ditch Mile, and the former won cleverly. A similar race on the Rowley Mile was noticeable on account of the American aged horse Preakness making his first appearance at Newmarket in it. Preakness is nine years old, but perfectly sound in wind and limb; and his fine shape and appearance, strength and quality being equally conspicuous, were the theme of unqualified admiration. As might have been expected when his age is taken into account, Preakness was not very quick on his legs when the flag fell, and the light-weighted English horses, trained to jump off like greyhounds from the slips, got the best of him in the first quarter of a mile. He was just getting into his stride, in fact, when the race was over, and we must wait to see him perform over a long course before we shall be able to form any just estimate of his racing powers. The Claret Stakes ended in a match between Balfe and Tartine; and though the severe course from the Ditch in is not altogether to the liking of the son of Plaudit, he managed to compass it successfully on this occasion. Balfe has thickened very much since last season, and looked as ever a perfect gentleman, while Tartine was by no means in racing trim. Nine ran for the International Free Handicap across the flat, including Grey Palmer, Merry Duchess, Lord Berners, and Advance. The last named had been much talked of as a promising Derby outsider, and was made first favourite for this race; but he never showed prominently in it, and a good finish between Grey Palmer and Bridget resulted in favour of the former. We ought to have mentioned a match over the Ditch Mile between Oxonian and Brigg Boy at even weights, which the latter won after a punishing struggle by a neck. The performance was thought good enough to justify the elevation of Brigg Boy to the position of first favourite for the City and Suburban; but it should have been remembered that Oxonian is very far from being the Oxonian of two years ago, and that, having been trained of late for hurdle-racing, it was not likely that in any case he would have retained his fine speed on the flat. Nor was the severe struggle which Brigg Boy had to make in order to win the best preparation for his encounter a few days later on Epsom Downs.

The field for the City and Suburban was quite up to the average, both in numbers and in quality; and, for once in a way, a big handicap was carried off by a really good horse, carrying almost a hunting weight. The majority of the twenty-three horses were of a good handicap stamp, and the weights ranged from 9 st. 4 lbs., carried by Thunder, to 5 st. 7 lbs., carried by Little Harry. The latter was a stable companion of Grey Palmer, who won the International Free Handicap last week at Newmarket; and the knowledge of the comparative merits of the pair caused Little Harry to be freely supported for the City and Suburban. Certainly, when he was seen in the paddock, he looked by no means the sort of horse to be complimented with the lowest weight in a handicap. Among the other competitors we may mention Brigg Boy, Maud Victoria, Empress, better known as Sister to Musket, Lady Mostyn, and Whitebait, all of whom looked remarkably well, while in point of size the gigantic Ambergris towered above all his rivals. The Americans were also represented by Mate, an aged horse, powerful, like all of Mr. Sandford's team, but apparently deficient in speed, or not at home in short-distance races. We ought to add that Hesper, of whose victory over Lowlander we have already spoken, was also among the runners; but the growing conviction that Lowlander was out of form last week at Newmarket prevented the son of Speculum from being as freely supported at Epsom as otherwise would have been the case. The start was fortunately not long delayed, and with equal good fortune there were none of those casualties at Tattenham Corner which so often mar the fortunes both of the Derby and the City and Suburban. Brigg Boy early overpowered his jockey, an incident which was by no means unexpected, and galloped himself to a standstill, so that, after holding a commanding lead for the greater part of the way, he died away to nothing at the finish. Little Harry came round the turn rather wide, and undoubtedly lost a length or two; but though otherwise he would have made a better fight with the winner, yet the result would not have been altered, for directly Archer gave Thunder his head, the old horse, who had been going quietly along, rushed to the front and had all his field beaten in an instant, and the three lengths by which he won might have been increased to double that distance if his jockey had wished. To win the City and Suburban with 9 st. 4 lbs. is an unprecedented feat, and a first-class horse like Cremorne failed in the attempt. But to win it, in the face of a really good field, under such a weight, with the most consummate ease, stamps Thunder at once as one of the greatest horses of the day. It is easy to see now that in the match that was to have come off last week at Newmarket Lowlander would not have stood a chance with Thunder. The son of Dalesman attempted to give Hesper 30 lbs. and was beaten a neck; but last Tuesday Thunder gave Hesper 40 lbs. and a stone beating into the bargain. According to this running, Lowlander would have been nowhere in the City and Suburban, and, instead of giving weight to Thunder, ought to receive it. Mr. Bird was quite right, therefore, in paying forfeit for his thousand-guinea match, which must have been made up in a very sanguine moment. We need only add that Little Harry justified the opinions entertained of him by disposing cleverly of all his opponents except Thunder, despite the disadvantageous position he occupied at Tattenham Corner, while Merry Duchess and Hesper ran a good race for third honours. We have no great fondness for handicaps, which too often seem specially invented for the benefit of the most worthless horses in training; but we should soon become reconciled to them if a few horses like Thunder could carry their heavy burdens to victory, and dispose with ease of their feather-weighted opponents.

REVIEWS.

GRANT-DUFF'S NOTES OF AN INDIAN JOURNEY.*

WHEN the fall of the Gladstone Ministry released Mr. Grant-Duff from the cares and labours of office, he wisely set himself to make the best use he could of the knowledge he had acquired and see for himself the country which for five years he had helped to govern. The volume before us contains the notes he made while on his travels. In one way they will disappoint the reader. Mr. Grant-Duff has so unusual a capacity for acquiring knowledge, he is so thoroughly interested in everything he takes up, he knew India so well even before he landed there with such knowledge as books and family traditions and long familiarity with all men of Indian eminence and official experience could give him, and his political position offered him so many exceptional advantages as a traveller, that it seemed certain he would have very much more to say than most travellers on the greater matters of Indian politics. This would naturally be the view of the reader, but it was not in the least the view of the writer of these Notes. He determined to set down, not what he heard or what he thought, but what he saw. The book is therefore as far removed from what we should expect an Indian Under-Secretary to write as possible. It was Mr. Grant-Duff's aim to divest himself, as it were, of himself. He put himself in the position of an imaginary ordinary traveller. What, he seems to have asked himself, would A. B. or C. D. really see if he came to India? Supposing him to be a person with no views or theories, utterly averse to word-painting and padding, and only desirous to put down in plain language what came indisputably into his own personal experience, what would be the material he would have for notes? A. B., as Mr. Grant-Duff has reasoned with himself, would see many thousands of dusky human beings, and would soon come to the conclusion that they were for the most part far from nice-looking. He would also see many handsome or interesting buildings, and would be able to compare what he saw with the descriptions given by Mr. Fergusson. Lastly, he would see a vast variety of novel trees and plants. That which this practical person with his eyes open would see is what Mr. Grant-Duff set himself to describe. There is something in his book about the appearance of the people, much about buildings, and very much about botany. Whole pages are filled with strings of botanical names, and short accounts of what the trees and plants with these names are like. And to the plan which he had sketched out for himself from the beginning Mr. Grant-Duff rigidly adhered. We often find him jotting down that he has had most interesting conversations with this or that well-informed person, and that he has been much instructed and much pleased with what he heard; but his readers are not allowed to share in these treats. They are kept to their proper work, which is not to go into views and talks, but to understand that the author observed "the well-named *Oreodoxa regia*, the *Wallichia oblongifolia*, the creeping Calami finding their way up the tall Casuarians," and so forth. *Si quæris librum circumspice* was the motto which Mr. Grant-Duff had imposed upon himself, and which he imposes on the imaginary traveller who is to profit by his example.

Such a book is not entertaining, and is not meant to be entertaining. It has a different aim, and works towards its end by a different method, from that offered in books which profess to please. The style of the day is the style of the Special Correspondent, and a Special Correspondent is a man who, at all hazards, is bound to be entertaining. He goes out at a moment's notice, lands, sees, telegraphs, or reports. With his wonderful nimbleness of mind he can make something out of everything. He is equally ready to count the buttons on the Prince's shooting-coat and to discuss the relations of Buddhism to Christianity. His business is to give views, and to make pictures out of words. To do this is not an easy thing; and the Special Correspondents of the best type do it very well. They know enough not to fall into glaring mistakes. They think enough to seem wiser than most of their readers who go in first-class carriages to business, and to be wiser than most of those who go in second-class carriages. They see

* *Notes of an Indian Journey.* By Mountstuart E. Grant-Duff, M.P. London: Macmillan & Co. 1876.

enough to fill their columns with what they have seen. They entertain; for, being engaged to entertain, they honestly and zealously fulfil their engagement. It is what some would call the defect, and others the merit, of Mr. Grant-Duff's style of composition that it is utterly unlike that of a Special Correspondent. What he does he wants to do really and thoroughly. He has the attraction of following the true unbought bent of his mind. To him knowledge is what a rise in his office is to a Government clerk, or a bath to a dusty tourist. Not to write about things, but to know them, is to him what Gray called "opening Paradise." He singles out a tree, and finds its Latin name, and ascertains its industrial uses, and feels the same elevation and excitement of mind with which men of another cast of thought rise from a successful rubber. To get hold of the facts of nature is better to him than food and raiment. Hence his book is irradiated with an enthusiasm the only weak point of which is that so few can share it. But, dull as all his Latin botanical names must be to the general reader, and overpowering as is the quantity of botany introduced, his enthusiasm carries him on a road that is really worth following. Of all the intercourse with nature attainable without mathematics and expensive instruments, that afforded by botany is the most vivifying and the most satisfying to the traveller. A man who travels to see and not to get praise had better be a botanist than any other one thing. Clouds obscure the skies, but, wet or fine, there are always plants. Even a little travelling makes a difference, and the distance of a few miles changes the habitat of flowers. Five odd minutes on a wayside may give the botanist a pleasure as intense as that which the geologist gets by weary walks over one ridge after another. Then plants have over animals the immense advantage that they need no killing. There is no upturning of dying eyes about them, no dissection, no entrails. There they are, clean, fresh, and sweet, and they perish without repining and without dirt and misery under the hand of the investigator. Botany is a science, or, to speak more accurately, a pleasing labour in the open air, which all can follow who have the sense to wish to follow something; and Mr. Grant-Duff has done well in hinting to his imaginary traveller that, if he wishes to see what is before his eyes when he is not in a town, he had better botanize. What is the good of telling A. B. that, if he wants to enjoy India, he should shoot tigers? A. B. may not be up to tigers. A. B. may not be a grandee who has jungles drawn for him. A. B. might be very unhappy if a real tiger came really at him; but A. B. can go to India, and in a safe, cheap way learn something of the beautiful, odd, prodigal nature of the Indian vegetable world. This will content A. B. if he is the wise, reticent, unpretending man that the confiding author of these Notes good-humouredly assumes him to be.

It would, however, be to convey an incorrect idea of these Notes if it were suggested that they are mere dry pieces of information. They are full of pleasant remarks and illustrations, borrowed from every kind of source. Mr. Grant-Duff has too free a command of miscellaneous literature not to be continually reminded of something for which his readers are much obliged to him, and he even quotes poetry with agreeable liberality for their benefit. Still these Notes are, in the main, jottings of external observation. They were originally published in the *Contemporary Review*, and when they grew towards an end, the editor of that periodical evidently got nervous about them. Were his readers to be exclusively limited to this very wholesome sort of porridge? Had he got hold of the Notes of Mr. Grant-Duff only to find that they were the theoretical production of A. B.? Where was the Under-Secretary of State? Where was the Indian politician? Accordingly he wrote to his contributor a letter, which is set forth in the volume, asking the eleven hardest questions about India that he could think of, and begging Mr. Grant-Duff to be good enough, just by way of supplement, to answer them. With the utmost alacrity, and with the most imperturbable good-humour, Mr. Grant-Duff complied with the request. The editor wanted to draw him, and he was drawn, making no more difficulty about it than the Zoological lions do about being fed at four o'clock. The consequence has been that to the Notes there is an appendix, altogether unlike the rest of the volume, in which external observation and the edification of A. B. are entirely thrown into the shade, and Mr. Grant-Duff states his opinions about India with the utmost frankness. This addition to the volume is most valuable. It is full of thought both true and new. There is no pedantry, no officialism, no optimism about it. What the writer thinks he says, and what he thinks has been clearly and carefully thought out. Is India a gain to England? Are we leavening India? Do we assume too arrogant a superiority over the natives? Is our system of taxation wise? Is Russia dangerous? Is Burmah dangerous? These are only a few of the questions which the editor asks and Mr. Grant-Duff answers. On each head Mr. Grant-Duff has a precise, intelligible answer to give, which is always clear, always suggestive, and often goes far below the surface of ordinary thought.

To enter into the subjects thus briefly but forcibly discussed would take us too far into vexed points of Indian politics. It is sufficient to say that Mr. Grant-Duff thinks that the occupation of Merv by the Russians would not do us any practical harm, but that their advance on Herat must be resisted; not because, even if they got possession of Herat, they would seriously threaten India, but because we have so often said that we would never suffer Herat to be occupied, that to eat our words would be fatal to our reputation. In finance Mr. Grant-Duff especially detests the Salt-tax, and evidently thinks that the Salt-tax ought to be reduced before the [illegible] duties are abolished. In a contest between English manufacturers and the Indian poor his kindness of heart inclines him to favour the latter, while, his party being out of office, he has not to trouble himself about pleasing English constituencies. He also insists strongly on the wisdom of avoiding too favourable estimates of Indian finance, and in connexion with this subject he records a private woe of his own. He on one occasion denounced in the House of Commons what he termed the blandishments of *couleur de rose* financiers. This was too high a flight for the vulgar. The phrase was caught at, but its application lost, and Mr. Grant-Duff found to his horror that he had only invented the term "*couleur de rose* financier" to have it applied to himself, and was supposed to have been describing his own views when he was attacking those of others. He found himself habitually described as an optimist or *couleur de rose* financier. Such are the thorns that vex the souls of public men. If any single specimen of Mr. Grant-Duff's mode of answering the questions put to him is to be selected as specially meritorious, it is, we think, that as to our influence in India. "Be good enough," wrote the editor in his decisive way, "to inform me how far we are leavening India." "We are leavening India," Mr. Grant-Duff promptly replied, "in ten ways." The codes are producing a considerable effect, and in a generation or two their morality will become the morality of India. The native magistrates are learning from us to avoid corruption. The zemindar is learning that property has its duties as well as its rights. Many educated natives are adopting philosophical views of religion. A more accurate conception of the power of England and of its place in the world is being formed. The English language is rapidly becoming the *lingua franca* of the peninsula. The natives are taking to railways, and use them largely even for pilgrimages. The natives are beginning to understand what good rulers can do for them. The very people who think they prefer native to English rule would be wild with horror if they were to be exposed to a year of unchecked native government. We are creating new industries, and extending through schools and universities the idea of scientific method. This is a long list of benefits conferred by Englishmen on India; and it would be difficult to sum up with more brevity and point than Mr. Grant-Duff has done what it is that India gets from England. All this is, as we have said, completely out of the range of A. B.; but at the end of his supplement Mr. Grant-Duff goes back to his favourite traveller, and closes his volume with an assurance that, although to gratify the curiosity of a friend he is quite willing to write for awhile as an Under-Secretary, yet it is A. B. who is next to his heart, and whose interests and capabilities engross his attention when he is free to write as he pleases.

LIFE OF LORD MACAULAY.*

(*Second Notice.*)

AMONG other merits, Mr. Trevelyan's book serves the purpose of a warning against intellectual conceit. If a clever boy, or a man vain of his abilities, regards his own attainments with complacency, he may learn from the Life and Letters that Macaulay knew ten times as much; if he prides himself on memory, on rapidity of acquisition, on the arrangement and command of facts and of literary material, a candid study of the biography will convince him that his accomplishments and faculties are commonplace and second-rate. The epigrammatic and pellucid style, the copious Parliamentary eloquence, and the brilliant conversation may provoke regretful envy, but seldom even imaginary competition. Even in verse, though he belonged to the second or third order of poets, Macaulay fully deserved the wide popularity which he attained. The best of his poems is the "Battle of Marston Moor," which appeared in Knight's *Quarterly Magazine* when he was twenty-three or twenty-four. Campbell himself has not described a battle with greater spirit; and the dramatic fitness of the Puritan sergeant's Scriptural phrases enhances the lyrical effect of Rupert's charge and of Cromwell's victory. One of the chief merits of the *Lays of Ancient Rome* is the choice of a subject. Niebuhr's plausible conjecture that the legendary history of early Rome had first been composed in the form of ballads suggested to Macaulay the experiment of reproduction. The original poems, if they ever existed, were perhaps more curious, and probably much less picturesque. It is a proof of Macaulay's critical sagacity that, notwithstanding his literary obligations to Niebuhr, he escaped the belief in his infallibility which deluded the receptive intellects of Arnold and Hare, and the more powerful understanding of Thirlwall. His remarks on Niebuhr, in a letter to his friend Mr. Thomas Flower Ellis, written from Calcutta in 1835, might have served as a text for the destructive criticism of Sir G. C. Lewis:—

> Having always been a little sceptical about Niebuhr's merits, I am now a confirmed unbeliever. I do not of course mean that he has no merit. He was a man of immense learning, and of great ingenuity. But his mind was utterly wanting in the faculty by which a demonstrated truth is distinguished from a plausible supposition.

Macaulay's soundness of critical judgment was compatible with an omnivorous appetite for reading which in some directions extended far down in the scale of literary merit. While there were perhaps not half-a-dozen scholars in Europe who were so well acquainted with the greatest writers of Greece, of Rome, of Italy, and of England, Macaulay was an insatiable reader of novels, including some

* *The Life and Letters of Lord Macaulay.* By his Nephew, George Otto Trevelyan, M.P. 2 vols. Longmans, Green & Co.

of the humblest pretensions. The first novelists in his affections were Richardson and Miss Austen; but to the end of his life he from time to time read Theodore Hook's clever stories, though he had good reason for disliking the author. He took delight in the voluminous works of a Mrs. Meeke, whose obscure hero always turned out to be the son of a duke. On the last page of a novel by another forgotten favourite, Miss Kitty Cuthbertson, he took the trouble of writing out a list of twenty-seven fainting fits which had occurred to the different characters in the story. Macaulay had not the smallest turn for science; and his antipathy to mathematics placed him at Cambridge in the "Gulf," or immediately below the last Junior Optime. Mr. Trevelyan intimates a belief that he barely missed the chance of competing for the Chancellor's medals; but for that purpose he must have obtained a Senior Optime. In his later years he occasionally regretted his ignorance of mathematics; but he was better employed in more congenial studies. His interest in the distinction which he had failed to share was exhibited in a perfect knowledge of the list of senior wranglers from the first institution of the Mathematical Tripos. He sometimes amused himself by trying to trace their subsequent fortunes, that he might learn whether they had maintained in after life their early pre-eminence. One of many symptoms of Macaulay's simple and healthy nature was a lasting attachment to what he had known and liked in his youth. Contemporary literature could not exercise on his mind a complete and unqualified fascination. There are in his diary and letters several references to Dickens and Thackeray, and he expresses admiration for the first set of the *Idyls of the King*; but Dickens and Thackeray and Tennyson were by half a generation younger than himself; and when they began to write his tastes were finally formed and already satisfied. Of the mischievous communism of some of Dickens's writings he speaks with serious and just disapproval. His imperfect sympathy with the literature of the day was consistent with the retrospective character of his political feelings. Except during his early Parliamentary career, he was never a zealous politician, but it was truly said that he was a strong partisan in the controversies of the days of William III. or of Anne.

Within the wide range of his own studies, Macaulay's taste was almost unerring. He expresses again and again the well-founded opinion that Thucydides was the first of historians, and he furnishes curious illustrations of the sincerity of his conviction. As soon as the first two volumes of his History were published, he read Herodotus through, and then, proceeding to Thucydides, he satisfied himself that he was himself inferior to the great master. The same process was repeated, with the same result, on the publication of the second instalment of the History. It is true that among the historians of all countries it would be difficult to find a more total dissimilarity than that which exists between the transparent fluency of Macaulay and the condensed significance of Thucydides. At an earlier period Macaulay gives a curious explanation of a change in his estimate of the merit of Tacitus. He had been disappointed on a second reading of the Annals, till he remembered that on the first occasion he had been recently reading Xenophon, and on the second occasion he had been recently reading Thucydides. The unconscious change of the standard of comparison explains the difference of judgment. He sometimes amused himself with classifying the poets and great writers of Greece or of all times; and his selections were almost uniformly just. "Plato," he says in a letter to his nephew at Harrow,

> is one of the five first-rate Athenians. The other four are your friends, Æschylus and Thucydides, Sophocles and Demosthenes. I know of no sixth Athenian who can be added to the list. Certainly not Euripides, nor Xenophon, nor Isocrates, nor Æschines. But I forgot Aristophanes. More shame for me. He makes six, and I can certainly add nobody else to the six.

Among poets he placed Dante next after Shakspeare and Homer, and before Æschylus, Sophocles, and Milton. He was inclined to rank Fra Paolo as an historian next to Thucydides. Mr. Trevelyan says that Lord Macaulay was familiar with some of the works of the great metaphysical philosophers, but that he had no sympathy with the subject-matter of their works. He was, in truth, devoid of the metaphysical faculty, which is almost as special a gift as an ear for music, which was also wanting to his organization. He professes to be unable to attach the smallest meaning to a translation of one of Kant's treatises, though the Criticism of the Pure Reason, at least, is not more than ordinarily obscure. It is true that abstruse German sometimes becomes hopelessly unintelligible in a bald English version. Macaulay studied deeply the theological controversies of the eighteenth century, and the Church history of the time of the Reformation. He once said, in answer to a question, that of course any well-informed man could repeat the names of the Archbishops of Canterbury backwards. Similar efforts of memory gave him the same kind of pleasure which an active boy takes in jumping a gate or a ditch. When he became a peer, he learnt the list of the House of Lords by heart, and then proceeded to recreate himself with the second titles. It is odd that he never thoroughly mastered the Popes, always sticking fast, as he said, somewhere among the Innocents. The example of Macaulay proves, if such a demonstration had been required, that memory is compatible with original genius; but in some cases his rapid accumulation of precedents and instances tended both to impair his own judgment and to diminish the effect of his argument. Mr. Trevelyan has printed in a note an extract from Macaulay's speech on Lord Mahon's Copyright Bill of 1842. In the previous year he had unfortunately taken a principal part in defeating Serjeant Talfourd's Bill for extending copyright to a period of sixty years. Lord Mahon proposed that the term should extend to twenty-eight years after the death of the author. Macaulay induced the House of Commons to prefer a capricious project of his own by which copyright was limited to forty-two years. It is surprising that the House can have been misled by a flagrantly sophistical argument consisting in an enumeration of great works composed by celebrated writers in their later years. Unconsciously admitting the principle that the longest term was the most equitable, he informed an audience less familiar than himself with literary history that his plan would have allowed to the best works of Milton, of Dryden, of Johnson, and of several other authors whom he enumerated, a longer term than that proposed by Lord Mahon. There are those who can distinctly recollect the facility with which he poured forth an irrelevant catalogue of names and dates. The chief impression produced on some surviving hearers was that he could with equal ease have furnished a list of youthful productions in support of the opposite conclusion. He spoke without earnestness or the appearance of conviction, and he succeeded in perpetrating a grievous injustice. There are great writers now living, or lately deceased, whose earliest and best works must by this time be almost within the grasp of literary pirates; and they or their families may attribute their expropriation to a paradoxical whim of Macaulay's. The sufferers will derive little consolation from the reflection that his own representatives will in their turn be the victims of injustice.

Macaulay's more serious speeches are of a high order, and some of the earliest are perhaps the best. In maturer life he was less eager than in his contests with Croker during the Reform Bill debates, or in his remonstrance against the political ingratitude of O'Connell. Notwithstanding his genial sweetness of temper, he was not deficient in the indispensable quality of pugnacity. Two of his contemporaries, Croker and Brougham, were objects to him through life of profound antipathy. Having in Macaulay's earliest youth given him the superfluous advice that he should talk on all occasions as much as possible, Brougham soon became jealous of a young rival who might possibly become a better speaker than himself, and who was an incomparably better writer. Of Croker's personal and literary character Macaulay took many opportunities of expressing his opinion; but his great and final triumph over his veteran adversary was accomplished when Croker was unwise enough to make a weak and violent attack on the History in its zenith of popularity. Macaulay's great work is open to much damaging criticism in detail, but it will always hold a high place in historical literature. As Mr. Trevelyan happily says:—"The union of intellectual qualities which formed the real secret of his strength was the combination in one and the same man of literary power, historical learning, and practical familiarity with the conduct of great affairs." Gibbon attributed his own comprehension of military history to his experience as a captain in the Hampshire Militia. Macaulay was the better able to expound the origin of government by Parliamentary majorities because he had taken an active part in the debates on the Reform Bill.

Macaulay described his own character as well as his personal appearance in his comments on Mr. Richmond's portrait of himself:—"It is the face of a man of considerable mental powers, great boldness and frankness, and a quick relish for pleasure. It is not unlike Mr. Fox's in general expression. I am quite content to have such a physiognomy." His estimate of his mental powers will not be disputed, nor was he ever suspected of a want of boldness and frankness. The pleasure for which he had a keen relish can only be appreciated by those who resemble him in mental and moral constitution. As long as his health enabled him to enjoy society he took great pleasure in conversation, of which he was thought sometimes to engross more than his share, especially when he communicated his ample stores of knowledge to hearers who were content to be ignorant of some things. According to Mr. Trevelyan—

> There was no society in London so agreeable that Macaulay would have preferred it at breakfast or at dinner to the company of Sterne, or Fielding, or Horace Walpole, or Boswell. . . . There were certain bad writers whose vanity and folly had a flavour of peculiarity which was irresistibly attractive to Macaulay. In August 1859 he says to Lady Trevelyan, "The books which I had sent to the binder are come"; and Miss Seward's letters are in a condition to bear twenty more experiments." But, amidst the infinite variety of lighter literature with which he beguiled his leisure, *Pride and Prejudice* and the five sister novels remained without a rival in his affections. He never for a moment wavered in his allegiance to Miss Austen.

The love of literature which was inseparable from his conception of pleasure was happily combined with the domestic affections which were the solace and delight of his life. Fortunately for him, his sisters, and afterwards the children of the family, either possessed by nature, or learned from him, a sufficient interest in books to enable them to share his literary and intellectual interests. To both generations

> Macaulay, who at any period of his life could literally spend whole days in playing with children, was master of the innocent revels. When he and his sisters were young, games of hide and seek that lasted for hours, with shouting and the blowing of horns up and down the stairs and through every room, were varied by ballads which, like the Scalds of old, he composed during the act of recitation, while the others struck in with the chorus. He had no notion whatever of music, but an infallible ear for rhythm.

An entry in his diary during his later years records with pleasure his performance during an afternoon's play with his little niece of the parts of Nathaniel Dando, then a notorious petty swindler, and of a dog-stealer who had come to claim the reward, adver-

the recovery of her dog Diamond. His extempore rhymes were always attributed to an author called the Judicious Poet, for whose works the children often searched in vain in the library. One of his letters to his sisters begins with two lines, which are taken almost without alteration from Swift:—

Be you Foxes, be you Pitts,
You must write to silly chits.

Swift, in a letter to Esther Johnson, had written:—

Be you lords, or be you earls,
You must write to naughty girls.

It would be interesting to learn whether Macaulay's Judicious Poet was originally suggested by the similarly imaginary quotations of Swift. In successive Easter vacations he took the family to visit all the English cathedrals; and he felt it as a serious deprivation when his nieces and nephew grew too old to accompany him week after week in visits to the sights of London. It was not without surprise that his nephew first learned from the conversation of his school-fellows that the kindest and most amusing of uncles was a distinguished and celebrated man. Next to his home, he was through life attached to Cambridge; and he sometimes encouraged the fancy that he would like to live there as a Fellow of Trinity. He was not himself inclined to undervalue either his abilities or his writings, though he was wholly exempt from the morbid vanity and susceptibility which are sometimes attributed to famous authors. He criticized plagiarists of his style with remarkable acuteness. "I am," he said, "a very unsafe model. My manner is, I think, and the world thinks, on the whole, a good one; but it is very near to a very bad manner indeed, and those characteristics of my style which are most easily copied are most questionable." It would have been strange if he had not regarded with reasonable complacency works which had attained unparalleled success; but fame and prosperity only enhanced the enjoyment of a singularly happy life. One of the chief advantages of literary tastes and of studious habits is the habitual diversion of the mind from selfish and vulgar interests. The result is not less effectually produced by the abstruse researches which are congenial to another class of intellects. Sir G. C. Lewis, who cared nothing for poetry or fiction, and who knew no amusing book except the *Anti-Jacobin*, was not less simple and cheerful than Macaulay; but an appetite for miscellaneous literature serves the double purpose of healthy excitement and of the exclusion of petty solicitudes. In the last volume of his diary Macaulay mentions that he had turned over Philo and compared his narrative with Josephus. He had also looked into *Soapey Sponge*. "It was a new world to me, so I bore with the hasty writing, and was entertained."

Fortunate in all the circumstances of his life, he may be said to have been *felix etiam opportunitate mortis*, when a separation which would have been fatal to his happiness was impending. Ten days before his death he wrote in his diary, "I am perfectly ready, and shall never be readier. A month more of such days as I have been passing of late would make me impatient to get to my little narrow crib, like a weary factory child." If he had cared for such details he would have approved of the choice of his burial-place, where, "amidst the tombs of Johnson, and Garrick, and Handel, and Goldsmith, and Gray, stands conspicuous the statue of Addison." A still further felicity consists in the admirable record of his life and character by the biographer whom of all others he would have preferred.

ROSS NEIL'S PLAYS.*

IT is unfortunate that in recent years there should have been so complete a divorce between poetry and the stage; but it must be admitted that the experiments which have from time to time been made in the production of poetical dramas have not been altogether of a happy kind. At the present moment attention is directed to a work of this class composed by the most eminent poet of the day, and the respectful sympathy with which it has been received shows that there is at least no lack of appreciation on the part of the public. Yet it would be difficult to imagine a play less calculated to secure popular favour. In the first place, it is, as put upon the stage, not a play at all, but only a loose collection of detached scenes, which it would be scarcely possible to understand if the audience were not already acquainted with the general subject. The most dramatic passages of the original poem have been omitted, and what remains is little more than a monotonous dialogue between two characters who in themselves are anything but prepossessing and agreeable. Mr. Tennyson has begun late as a dramatist; but it is easy to imagine what he might have achieved in this line if he had had any encouragement to devote himself to it at an earlier period. Again, the plays by Lord Byron, Sir Henry Taylor, and Mr. Browning which have been tried upon the stage, have been equally wanting in the qualities which are indispensable to histrionic effect, and the conclusion has been drawn that nowadays it is hopeless to expect a revival of poetical drama. The answer, however, is that it is hopeless only as long as the writers of poetical dramas neglect to study the essential conditions of dramatic success. Sir Henry Taylor's plays, for example, are full of fine poetry, but they are deficient in concentration, unity, and incident. There is no want of character, only the characters do not act; they are like figures in a picture, and do not step out of the canvas. It is no doubt true that the faculty of producing dramatic animation and vividness in its highest degree is a rare form of genius; but there is no reason why it should not be cultivated to a certain extent by attention to the obvious rules and necessities of theatrical representation; and it is because there has been a tendency to disregard these conditions that the poetical drama has been more or less discredited. If, however, more support were given to this branch of literature by managers, authors would no doubt be led to take more pains to adapt their pieces to the exigencies of the stage. A Shakspeare is the product of a particular era, and cannot be expected periodically. But the general development of art depends upon the spirit in which it is cultivated, and there can be no doubt that, if the fashion of giving a nobler and more poetical form to the drama were once set, it would tend to propagate itself, and that not only the theatre but literature would thereby be strengthened.

It is not to be expected that all at once any great intellectual revival will overtake the drama; but it is not too much to hope that, as public taste improves, and opportunities are allowed to a higher class of dramatists, there will be a gradual process of elevation. Much might indeed be looked for from the theatre, if, instead of the vulgar melodrama and the artificial comedy of manners which have of late years almost monopolized the stage, plays of the class of which Mr. Ross Neil's may be taken as the type were to come into fashion. It is a great mistake to suppose that intellectual interest cannot be combined with patient and necessary attention to the practical requirements of the stage. For the groundlings there must of course be such entertainments as they are capable of understanding; but it can hardly be believed that in a city like London there does not exist a sufficiently educated and intelligent audience to appreciate a higher and more thoughtful style of drama than that which is ordinarily presented. Mr. Ross Neil is already known by two volumes of plays which have secured him a literary reputation, and it appears that *Elfinella*, one of the pieces in the present publication, has been successfully produced on the stage. *Elfinella* is a fairy piece, somewhat similar to those which Mr. Gilbert has popularized, but of deeper significance and more thoroughly poetical. There is, it seems, a law in fairyland by which each tribe of elves is allowed to adopt a human being as one of its members,

if born in the midnight hour,
And 'neath a certain blending of the stars
As gracious as 'tis rare.

And Elfinella finds herself in this position. She was snatched away at the moment of birth, and has ever since been brought up among the fairies, and has become as one of themselves. It appears that in fairyland humanity bears but an indifferent reputation. The earth is supposed to be peopled with a miserable set of creatures who have to drudge and toil, are subject to all sorts of suffering and privation, and are also animated by such malignant tempers that they spend the most of their brief life in quarrelling and fighting with each other till death—and the thought of death is above all appalling to the fairy mind—annihilates them for ever. The elves are filled with a sense of terror and pity when they think of men condemned to live

the life that leads to death,
Through age and sorrow, sickness, fear, and toil.

Elfinella has had the secret of her birth disclosed to her, and naturally feels much ashamed of her kinship, but consoles herself with the assurance that the fairies have made her in all things one of themselves, and that she shares their immunity from

The dreary pain of dull mortality,
Its tears, its shames, its sins—and then its end.

There is, however, one thing which has been concealed from her—that the adoption of a mortal into the fairy community is not finally accomplished without the fulfilment of another condition, which is:—

That whoso'er of mortal race is ta'en
To be the comrade of a fairy band
At end of thrice seven years must be again
Giv'n to the world and to mortality,
In midst of men to abide for thrice seven days,
A day with them for every year with us,
And, by this time of trial taught, make choice
(To be unmade no more) 'twixt life with them,
And cares and fears, and death to end it all—
And life etern with us, and smiles and mirth.

Poor Elfinella is at first dreadfully shocked at the idea of being even for a few days parted from her friends, but feels sure that she will never choose to remain on earth. Indeed she would make her choice at once without revisiting her place of birth, but the rule is imperative. Before she goes, however, the Fairy Queen tells her, by way of warning, of a former case of a mortal who, after being enrolled among the fairies, made her choice to live with men:—

ELF. Was she mad?
F. QUEEN. It chanced to her to be what you have heard
That mortals in their jargon call in love,
And this they say is madness while it lasts.
Then, being warned, be wise.
ELF. O fear me not.
F. QUEEN. And of all else avoid the thing called love.
Think that for you it means a heritage
Of care and death, and long companionship
Of mouldy-breathed decay, with bootless rue
When reason shall return, for as they say
The frenzy quickly passes.
ELF. Love means death;
I will remember that, and so be safe.

* *Elfinella; or, Home from Fairyland. Lord and Lady Russell.* By [illegible] Neil, Author of "Lady Jane Grey," "Inez," "The Cid," &c.

This gives the key to the story. Elfinella on her first descent among mortals finds confirmation of the bad accounts of them prevalent among the fairies. Her sister Lisa henpecks her husband, who shows a sad want of spirit. She also finds that earthly flowers wither quickly, and that the wicked passions of men are immediately to be exhibited in a war; the peasantry of the district—the scene is laid in Switzerland in the autumn of 1315—having resolved to resist their Austrian tyrants. It gradually dawns on her, however, that, after all, men are not quite so wretched and despicable as she supposed; for Lisa really loves Hans; Hans is a brave fellow who is quite ready to defend his country, though rather afraid of his wife; and she is also very much struck with Waldmar, the gallant young leader of the peasants, who happens to save her life. Indeed she begins to think that, with but a little change, the state of men might become almost enviable—as, for instance, if anger, strife, and death were done away with, and all men were like Waldmar. But, she asks herself, where would then be room for heroism and self-sacrifice?—

> If death were not, no man could ever say,
> "For you I'd give my life," and if 'twere said
> 'Twould have no meaning.

She vainly endeavours to persuade Waldmar not to risk his life in the war, but when he returns, stricken almost to death, she sees that "death lends nobleness and hope to life," and that "love is all." This bare outline, however, gives a very insufficient idea of the graceful mingling of humour and tenderness with which the joyous but idle sportiveness of fairyland is contrasted with the deep and serious experiences of human life. Nothing can be more touching than the delicate simplicity with which the dawning of love in Elfinella, and her vague terror of it as the madness against which she had been specially warned, are brought out. While the whole piece is of course by its nature fanciful, the writer keeps his fancy within control, and the result is a natural and suggestive study of character in which even the fairies are felt to be at home.

The other play in this volume, *Lord and Lady Russell*, is of a more solid and important character, and some readers may perhaps think that it ought to have come first, and that the fairy legend should follow, according to theatrical routine, to alleviate the sadness of the tragedy. On the other hand, however, whether the arrangement is intentional or not, it can hardly be doubted that it is a wise one for the author, as the tone of emotion thus rises steadily through the volume; whereas, if *Elfinella* had come last, there might have been something like a reaction. The general style of *Lord and Lady Russell* resembles that of the author's former historical play, *Lady Jane Grey*. There is the same natural eloquence and deep, but restrained, feeling, while the nature of the subject affords scope for broader treatment and for more varied and animated dialogue. The light, melodious cadence of *Elfinella* changes, as the transition requires, into a fuller and more stately key; and we have seldom read any blank verse which is so steadily and continuously satisfactory to the ear, without becoming in the least monotonous. The strength of the drama lies in the remarkable ease, naturalness, and simplicity, not only of the language, but of the way in which the incidents are treated. There is a close, but not a dry, adherence to the facts of history, with a sufficient degree of poetical suggestion to stimulate the imagination and feeling of the reader. There is frequent temptation throughout the piece—as, for instance, in the scenes between Lord Russell and his wife and those in which their little girl takes part—for sentimental developments, but these are, we will not say sternly, but firmly repressed. The author strikes the right note of feeling, confident of response from the reader, without having recourse to any artificial amplification or reiteration. There is no strain of language, no affectation, no forced working up of incident. Everything is natural, simple, and spontaneous, and is the more impressive from being so. These are qualities which are rare in literature, and still more rare on the stage. It does not appear whether *Lord and Lady Russell* was distinctly intended for the stage, and the length at which it at present stands would preclude that use of it; but it might, we fancy, be easily adapted to the purpose. The contrast between the cynical levity and corruption of the Court and the sweet serenity and highmindedness of the Russells in their affectionate domestic intercourse is the main feature of the play, though not didactically insisted on. Charles II., with his ready sense of humour, selfish good-nature, and weak dislike of serious subjects, is happily hit off, not in an elaborate portrait, but in the light touches of a master-hand; and so is the Duke of York, though the portrait is perhaps somewhat conventional. The various conspirators are also drawn with a graphic, discriminating touch. But, above all, the characters of Lord and Lady Russell stand out grandly in their grave and unaffected simplicity. We must quote one passage between the mother and her little daughter:—

> RACH. History makes me sad: in history
> Good men are always dying—ay, are killed
> For nought but being good.
> LADY R. Yet must you think
> The best least need our pity.
> RACH. Mother.
> LADY R. Well?
> RACH. How say you? will these times we live in now
> Ever be history?
> LADY R. Ay, surely, child,
> If the world last long enough to let men write.
> RACH. And when they write will't be of things so sad
> As what they wrote before—of wars, and lies,
> And murders in the dark, and wicked kings,
> 'And good men brought to die?
> LADY R. Pray Heaven no—
> But 'tis as Heaven shall please.
> RACH. I cannot think
> That aught so ill shall ever be again
> Here in this pleasant world that the blue sky
> Clasps round with brightness. Where so much is good,
> Sure evil cannot conquer.
> LADY R. Yet the world
> Hath oft looked fair ere this, and villany
> Been done in golden sunshine—as the sea
> Where men lie drowned may yet be jewelled o'er
> With diamonds of light. But this one thing
> I'll tell you, child: that since the world was made
> Did evil never truly conquer good,
> But only seemed to conquer.

And here is another from the final interview between Russell and his wife:—

> LADY R. Something there is of glorious in the cause
> Of my greatest sorrow that upholds me now,
> And may uphold me then.
> RUS. O this is well!
> So have I all I would for the time that rests,
> And am so rich in what hath gone before
> That, but in having had, I stand more high
> Than the highest that now have.
>
> * * * * * * *
>
> LADY R. Why, even some such triumph feel I too,
> And would not change with the happiest wife alive.
> That God hath giv'n me such a friend to lose
> Is very much, I know.
> RUS. All things look small
> When death takes measure of them, all but love;
> And love hath grown so huge, and so hath poured
> Its strength upon my soul, that I am willing
> To leave my life, made full of all save years,
> Ay, even for a while to leave thy self.
> Wilt thou not say as much?
> LADY R. I'll try to say,
> Lord, though thou kill me, I will trust in thee.

It must occur to every one who appreciates the peculiar influence of the stage on all classes of society, that plays of this kind, dealing with subjects of national interest, and in a tone which excites sympathy with the noblest emotions, might do much in making public opinion, not only more refined and intellectual, but more robust.

VIOLLET-LE-DUC'S HABITATIONS OF MAN.*

M. VIOLLET-LE-DUC has here adopted the same general form which he adopted in his *History of a Fortress*, that of a fictitious narrative, bringing out the different varieties of the arts of building or defence at the different times through which he traces them. But the fiction which runs through the present volume takes a much bolder flight than that which ran through the *History of a Fortress*. In that work the particular fortress and its endless changes were imaginary, and perhaps no one fortress may ever have gone through all of them in such regular order. But it was perfectly possible that it might have been so, and, if no one fortress went through all the adventures which M. Viollet-le-Duc described, most fortresses had gone through some of them. The fiction at most consisted in rolling several true histories into one. But M. Viollet-le-Duc's present subject could not be treated with so small a departure from literal truth. He could tell the history of a particular building through a long series of ages, because, however much the building was changed, it at least did not move from its place. But here he has to tell the history, not of a particular building, but of the art of building, and that not in one country only, but in the world in general. If then he was to give his work the shape of a continuous fictitious narrative, it must take quite another form. So M. Viollet-le-Duc's work contains the observations of two mysterious and seemingly immortal beings, Epergos and Doxios, who have gone through the world in all ages, giving special attention to the building of human dwellings at each stage. Epergos may be said to represent the spirit of progress; he is always encouraging invention; indeed the first hut of all is said to have been made at his suggestion, and he preaches the doctrine of always going forwards in a discourse which he is made to deliver to a select company in Paris seemingly quite lately. Doxios, on the other hand, represents the spirit of standing still. He checks all change; he remonstrates with Epergos from the beginning, for the making of the primitive hut; and at every stage his sympathies lie with those nations who stand still. The Egyptians, for instance, are his delight. Then they are supplanted by the Assyrians; then the Romans have a turn in his affections; and in this last stage he becomes a bitter hater of Christianity, as something new, and a defender of the doings of its persecutors. Somewhat later he comes across the Buddhists, and is charmed with the doctrine of Nirvana. He now becomes a zealous missionary of this faith of repose and of all that is opposite to progress; but, some centuries before the story is done, Doxios has become an equally zealous Christian. The form of the book is thus a very strange one, but the very strangeness of the fiction gives it a certain kind of interest, and, granting the impossible premiss, there is something decidedly effective in the notion of a being—for we must hardly say a man—who has seen all the various stages of art with his own eyes and has actually himself suggested some of them. What we really have is of course M. Viollet-le-Duc's notions as to the progress of domestic architecture,

* *The Habitations of Man in all Ages.* By Eugene Viollet-le-Duc. Translated by Benjamin Bucknall. London: Sampson Low & Co. 1876.

which the thread of his fictitious narrative allows him to set forth with a kind of life which he could hardly have given to a mere technical treatise. Now and then his immortal companions have reminded us of Lord Lytton's Zanoni. But what is characteristic of M. Viollet-le-Duc's story is the application of this fanciful machinery to a special and technical subject. We are not inclined to say anything against it as long as it stands by itself. A bold and fantastic idea is carried out ingeniously, and, we may add, successfully. But the idea is one which may very easily be worked threadbare. The present attempt must stand by itself. M. Viollet-le-Duc must never use the same machinery again, and he must, as far as in him lies, hinder anybody else from using it.

The form of M. Viollet-le-Duc's book almost necessarily involves a good deal of what elsewhere we should call ethnological speculation; but which, when dealing with beings like Epergos and Doxios, we must rather call ethnological observation. These immortal personages, in their long and constant travels, are able to follow various stages of the Aryan migration, besides paying many visits to men of other races, which of course are all set forth according to the ethnological views of M. Viollet-le-Duc himself. And M. Viollet-le-Duc has clearly thought much about these matters, and about many others. He has a perfect right, if he chooses, to adopt the theory of Ernst Curtius, and to plant primitive Ionians in Asia before what is commonly called the Ionian migration. We look on that theory with a good deal of doubt, and we hold that Professor Hadley made some very strong points against it. But beings like Epergos and Doxios cannot doubt, neither can the chronicler of their adventures. If M. Viollet-le-Duc is fully convinced of this theory, he has a perfect right to make use of it in his quasi-romance; and he at least brings out, what there is no reason to doubt, that the Ionic capital had an Asiatic origin of its own, quite distinct from the true Doric of Hellas. Contrary to the general belief, M. Viollet-le-Duc gives the Doric a stone, instead of a wooden, origin; and he sees in Egyptian architecture, not a style derived from buildings hewn in the rock, but a style derived from buildings of wooden construction. Whether we accept his conclusions or not, the illustrations by which he tries to confirm them are, in any case, curious and instructive. Here and there we must think that he draws a little on his imagination. We have suffered too much at the hands of Pelasgians, or at least at the hands of those who have talked about them, to accept all at once M. Viollet-le-Duc's picture of the house of a Pelasgian noble. We must remember that his subject is the habitations of man, so that his business is throughout with domestic architecture, not with religious or municipal architecture, or even with fortresses, except so far that they happen also to be habitations. Still, with a little exercise of the imagination, he contrives to illustrate the chief forms of architecture from domestic buildings only. But we are rather inclined to complain that one or two important forms of domestic architecture are left out. M. Viollet-le-Duc is far from leaping over the transitional ages of European history. Epergos and Doxios wander about in the later days of the undivided Empire as well as in the Augustan age itself. But it does seem rather strange that he has not taken them to Spalato, to that domestic building which forms a greater era in architectural history than any temple or fortress. Nor are we satisfied when he leaps from a feudal castle of the thirteenth century to a *Renaissance* house in Paris in the sixteenth. Both England and France had a good deal to show in the way of strictly domestic architecture in the intermediate time. Epergos and Doxios, who visited so many people in so many distant ages and countries, would certainly have found it worth their while to make a call either on Jacques Cœur at Bourges or on Sir Anthony Browne at Cowdray.

On the whole we are inclined to wonder at the success with which M. Viollet-le-Duc's rather startling machinery has been worked. It certainly brings many things home to us in a more living way than could be done in any regular treatise on domestic architecture. We follow the two mysterious beings through their wanderings of ages, we hear their discourse with men of such distant times and places, and we feel ourselves taken behind the scenes. Not only the mere style of architecture and arrangement, but the origin and use of each feature, and the manner of those who dwelled in the successive buildings, are all brought out with a life which could hardly have been given them in a formal treatise. One of the most striking parts is where Epergos and Doxios visit Assyria in the days of its glory, and where Epergos has a talk with the architect of the Assyrian King, which strongly brings out the utter carelessness of human labour and suffering with which the great works of despots were reared. Then when, ages afterwards, in the days of Augustus, they are entertained by the patrician Mummius—were there any patrician Mummii?—Epergos holds forth, as he could hardly have found a more appropriate place to hold forth, on the higher value of works of art, each one in its own place, than when they are carried off, as they so largely were in those days, to form collections or to adorn places for which they were not meant. But some of the most interesting parts, though of course the most imaginative parts, are those which trace the earliest efforts of all—not so much perhaps the very first hut of the savage, as the first Aryan dwelling, destroyed by the elements and rebuilt with improvements suggested by Epergos, and the further changes made as the Aryans press southward and become lords of subject races. Their progress, slow and sure, is well contrasted with the early and unprogressive civilization of the Chinese, typified in the "fat Fan," whom our travellers visit at a very early stage of the progress of our own branch of mankind.

At the very end of the book Epergos makes a set discourse which is of course to be taken as setting forth the views of M. Viollet-le-Duc himself. Its key-note may be said to be "progress," but "progress within the old lines." He shows how the style of each nation has sprung from a certain constructive origin arising out of practical need, how its details have been modified by other practical needs, but how the marks of its real origin still hang about it. Strictly to go back is strictly impossible. The architects of the classical *Renaissance* tried to build Roman houses; but they could not; all that they could do was to build French houses with a Roman mask. M. Viollet-le-Duc evidently holds that, in such a case, reaction is the only means of again taking up the thread of progress. Each nation must fall back on the genuine principles of its own style, and so work out something for itself:—

> Those enthusiasts for Greek and Roman forms—for in their naïve admiration they were accustomed to confound them, utterly different though they are in their principle and in its expression—have succeeded in misleading Europe for two or three centuries,—a mere moment, however, compared with the life of humanity; and we have been inundated with neo-Greek and neo-Roman,—such indeed as would make Greeks and Romans laugh,—without the slightest regard for origins, natural aptitudes, climate, materials, or the novel conditions of social life. In Paris and in Rome, in Madrid and in St. Petersburg, in Vienna and in Stockholm, so-called Greek and Roman palaces have been erected.
>
> Nevertheless, a generation of inquirers has arisen who have had no difficulty in demonstrating that humanity is not thus homogeneously constituted; that because a Pompeian house was charming under a Neapolitan sky, and admirably suited to the requirements of people who lived two thousand years ago, it by no means follows that such a house suits our time and climate. A decided tendency towards a reaction is therefore manifest. Every civilised nation has begun to inquire—and the inquiry will be prosecuted with increasing ardour—whence it comes, and what are its elements; and it is consequently endeavouring to adopt those original forms in art which are adapted to the genius and requirements of the race to which it belongs. This movement is already very apparent in England, in Germany, in Sweden, and in Russia, and it is becoming daily more marked.

It is quite certain that, if a mediæval house would not suit modern requirements, a Greek or Roman house would be still further from suiting them. And it is equally certain that, in England, just when the classical fancy set in, houses had begun to be built which, with very little change, would meet modern requirements. If we need not go back to old Greece or Rome, neither need we go away to Venice or Verona. But how hard to persuade a modern architect, brought up in due Ruskinesque scorn for the "savage" and "detestable" works of his own land, that, by such a humdrum process as going into Gloucestershire and Sussex and studying Thornbury and Cowdray, he might have learned far more for practical use than anything that he can find on the other side of the Alps.

The illustrations are throughout singularly effective, bringing out the main points in the several styles with great clearness. And Mr. Bucknall's translation, as a rule, reads easily enough, though now and then he forgets that the duty of a translator is to turn things into the language into which he translates, not to leave them in that in which they were first written. M. Viollet-le-Duc, writing in French, naturally wrote about "souvenir" and "mélange." Mr. Bucknall, translating into English, should have found English words, and not have transcribed the French. "A pyre of souvenirs" is specially grotesque, and goes some way towards spoiling a striking passage at the end of the chapter on the Asiatic Ionians.

BIBLIOGRAPHY.*

IT is well for reading people that any one can be found to perform the necessary literary drudgery of making book-lists. It is true that we hardly thank them. Bibliographers are the butts of other literary men. They are, no doubt, estimable and industrious labourers in a difficult field; but we generally fail to understand how any intelligent being can be found to do their work. Those who only care for what a book contains of pleasure or information cannot bring themselves to see how an educated and thinking man can interest himself only with the exterior, or, at most, with so much of the interior as will enable him to record of a book that it is in so many sheets of so many leaves, and that the signatures run from A or B to Gg in sixes. Yet, without the labour of such folk, we should be without any knowledge of much old literature. The very existence of vast masses of early literature is unknown except through them. But for the care of bibliographers we should, for example, have less information about Shakspeare than we have now, if that is possible. The few hard facts as to the plays, upon which such mountainous theories have been built, are chiefly of a bibliographical kind. And it is the same with the works of a few other authors. Yet, allowing for this, and allowing, too, for the fascination which any record of human folly must exercise on certain minds, it remains a standing mystery that there should be men among us who, from preference and with no hope of anything like adequate reward, will give attention, learning, and often also talent, or something very like it, to the production of such a list as this now before us.

It is just possible, however, in an idle half-hour to extract some amusement from reading a list of the titles of books. A comparative study of title-pages might even have in it an element of historical and psychological importance. Every possible re-

* *Collections and Notes*, 1867–1876. By W. Carew Hazlitt. London: Reeves & Turner. 1876

source that conceit, ignorance, and falsehood could employ has been dragged into the service of giving books attractive names, and of persuading people to buy them. And, merely glancing at a few of the curious title-pages in Mr. Hazlitt's volume, we may see that, where attraction has been found impossible, the opposite course has been pursued; books by the score exist to which their authors have evidently endeavoured to give the most repulsive names possible. And again there is a third class—that of books which have no particular name. For the most part, scientific works are of this character. Books on the beginnings of knowledge are often sent into the world with a sort of summary of their contents on the first leaf, and the reader may choose for himself from a page of words the biggest for a title. Booksellers have a way of distinguishing one new book from another by the mere use of the author's name and the first word of the title. An order will be given at a publisher's for so many dozen of Green's "Shorts" or Huxley's "Lays." But a few authors are to be found who are so wholly incapable of understanding the objects and uses of titles that they neither display nor conceal the subject of their productions, and neither attract nor repel the reader. They simply put a name on the title-page because, since Wynkyn de Worde's time, titles have been usual. We cannot but look upon this course as foolish. An unfortunate author wonders he cannot get the public to see the worth of his performance. He expected, and perhaps he was right to expect, that everybody would talk of it, and yet nobody mentions its name. But he never reflects that he has given it a name that people cannot mention if they would. A cheap volume came out some years ago with the name of "Melibœus." It was an account of modern London, and was, we believe, intended for the working classes, but they never asked for it. How could they? Many of Mr. Ruskin's titles are of this character; yet he intends them, he says, for people who do not know Latin and Greek. There are English names, however, which are just as hard to say as if they were in Latin, aye, or Hebrew. Mr. Cockayne, when he wrote a history of certain forms of superstition for the Rolls Series, gave it the very distinctive but utterly unserviceable name of "Leechdoms, Wortcunning, and Starcraft." This, though very good English, is just as hard to pronounce as "Burnt Njal," or the "Hydrologia Philosophica," noticed by Mr. Hazlitt, which is really an account of the mineral waters at Ilmington, or the "Chryso-thriambos," noticed in his former book, which is a cantata for the inauguration of a Lord Mayor, or the "Eropaideia," a book on education, published in 1607. Against such perversions on one side may be set the long descriptions usual a hundred years ago, and now, we regret to see, coming in again. A title, so as it serves to distinguish one book from others, can hardly be too short or tell too little. Novels require nothing but a bare name. Yet novelists have sinned on their title-pages more than even theological and philosophical writers. It is a stock question in the schools to ask a man if he can repeat the full account of his treatise given by Bishop Butler on the first page of the *Analogy*; but very few readers, we take it, could correctly repeat Richardson's abridgment of *Clarissa Harlowe* as it may be found on the title-page:—"Clarissa; or, the History of a Young Lady: comprehending the most Important Concerns of Private Life. And particularly shewing the distresses that may attend the Misconduct, both of Parents and Children, in Relation to Marriage." But this is nothing to some of the titles copied out so carefully by Mr. Hazlitt. Thus, Mary Cary published in 1651 the "Little Horn's Doom and Downfall; Or a Scripture-Prophesie of King James and King Charles, and of this present Parliament, unfolded. Wherein it appeares that the late Tragedies that have bin acted upon the Scene of these three Nations: and particularly the late King's doom and death, was so long ago, as by Daniel predeclared. And what the issue of all will be is also discovered: which followes in the Second Part. By M. Cary, a servant of Jesus Christ. . . . 1651." Nor is this all, for a second title-page follows, lest the first should not have been full enough:—"A new and more exact mappe or Description of new Ierusalems Glory," and so on for about the same space as the first. These Puritan titles are famous, like Puritan prayers, for their length; but it must be allowed that the other side made up in extravagance for anything that the names of their books may have wanted in length. Who would have supposed, without such evidence as Mr. Hazlitt gives, that even Court poets could pretend to mourn for James I.? But here we have an account of William Hodgson's "Plvrisie of Sorrow, Let Blood in the Eye Veine: Or, The Muses teares for the death of our late Soueraigne, Iames, King of England," a work of such rarity that even the Museum copy is imperfect.

The use of alliteration's artful aid appears to be one of the most important of the title-maker's objects. Thackeray, who avoided it for his own books, made the most of it in his *Prize Novelists*, but other authors have used it for themselves. Mr. Hazlitt gives many instances. Thomas Churchyard published in 1575 "Churchyardes Chippes," and in 1593 "Churchyards Challenge." Thomas Coryat published in 1611 "Coryat's Crudities" and "Coryat's Crambe." The assonance is more complicated in "Batt upon Batt, a Poem upon the Parts, Patience and Pains of Barth. Kempster, Clerk, Poet, Cutler, of Holy-Rood-Parish in Southampton; by a Person of Quality"; and sometimes we have a jingle or half-rhyme like Carlyle's "Britaines Glorie, Or An Allegoricall Dreame: with the Exposition thereof Containing the Heathens infidelitie the Turkes blasphemie the Popes Hypocrisie Amsterdams varietie The Church of Englands verity in Religion. And in our Church of England The Kings excellencie. His Issues integritie. The Nobles and Gentries constancie. The Councell and Judges fidelities. The Preachers puritie. The Bishops sinceritie." It is refreshing, after wading through pages of such enormities, to come upon a title of the older style. Hawes's poem, printed by Wynkyn de Worde in or about 1512, has a woodcut on the title-page, and over it, "Here begynneth the booke called the example of vertu." A later edition is not so good an example of this particular kind of virtue:—"Here foloweth a compendyous story and it is called the example of vertu in the whiche ye shall fynde many goodly storys and naturall dysputacyons betwene foure ladyes named Hardynes Sapyence Fortune and Nature."

The books noticed by Mr. Hazlitt in this volume are all rare. In his former work on the "Popular, Poetic, and Dramatic Literature" from the introduction of printing to the restoration of the Stuarts, he had occasion to mention many books already described by Lowndes or some other bibliographer. But in these *Collections and Notes* there is very little that has ever been recorded before, and perhaps it would be safe to say that three-fourths of the books named in it are unique. For this reason, if for no other, they are of value to collectors and to men of the same tastes as Mr. Hazlitt; but English literature would not have suffered any irreparable loss if these three-fourths had perished altogether. There are very few that are worth reading, still fewer that will improve the reader's mind, and an immense number which, whether on account of their party violence or their obscenity, are absolutely unfit for reading. Fortunately it is not often one can meet with them; their profanity or ribaldry have ensured their destruction, and we may very well look on the mania for collecting them as a harmless form of the prevalent insanity. To such collectors Mr. Hazlitt's book is simply indispensable; nor will it be absolutely useless to the student of the history of English literature. The books which are the most popular for a time are often, perhaps in consequence, the rarest afterwards. Famous as is now the "Martin Marprelate" controversy, no one has been able to find a copy of the original tract which started it; yet such a discovery would be of great interest. Only a single specimen remains of the first edition of Bunyan's *Pilgrim's Progress*. No fragment of Tyndale's first publication of the Gospels is known to exist; of his first complete Testament there is only a single copy, and that imperfect. Of other very popular books, again, copies are common. *Gulliver's Travels* is by no means scarce in the first edition. It is the same with *Paradise Lost*. But Cocker's *Arithmetic* is very rare in its first edition, and so is Joe Miller, for it would almost seem as if people who had learnt the jokes off burnt the book, that they might the more easily make its contents their own.

Mr. Hazlitt has the same advantage over his readers as a traveller who has traversed some region previously unknown. No one who has not seen the books of which he tells us can correct his description of them. He has things all his own way. He may almost say, like the Irishman, "The man's dead now, and I defy him to contradict me." He has had access to a large number of private libraries. He has an unrivalled knowledge of his subject. And, above all, he has spent many years in which he has never lost an opportunity, in auction-rooms and other places where rare books may be seen, of noting down examples; and even, as he tells us, of going over collections of a kind which we would gladly believe no one ever makes now—namely, of title-pages alone, cut out of books. In one or two places we wish he had given a little more information. A few biographical notes would have been of great value. To take a single case. In Lowndes's *Bibliographer's Manual* there is the following entry:—

> Plantagenet (Beauchamp). Description of the province of New Albion, and a direction for adventurers with small stock to get two for one and good land freely. 1650. 4to.

Lowndes goes on to say that a copy of this edition fetched 17*l.* 17*s.* in a sale in 1861, and that there was a previous edition in 1648, of which apparently he could get no account. In Mr. Hazlitt's former work there is nothing about Mr. Plantagenet. But in the present *Collections and Notes* we have something about the edition of 1648, for which we must refer to the book. But our purpose is not bibliographical. We should like to know whether this was an assumed name, who the assumer was, whether he founded a family in Virginia, where New Albion, it seems, was situated, and, in short, some historical particulars of a man who, if he was not remarkable himself, certainly bore a very remarkable name. But perhaps Mr. Hazlitt is right in sticking to bibliography in a bibliographical book, and we can only end, as we began, by congratulating the world that there are people willing to do the necessary work which he has performed here with so much ability and industry.

ELSA AND HER VULTURE.*

THE charm of "local" novels is one that must increase as the life of capital cities is more and more crushed into uniformity. A capital may produce a thousand professions and commerce may branch into innumerable special lines, but in the main the dwellers in a capital are better known to each other than the peasantry are to any of them. And not only is one Londoner like another, but a London merchant or workman is more like a merchant or workman of Berlin, Amsterdam, Vienna, than he is to a Westmoreland peasant. It is not true to say, as has been said more than once,

* *Elsa and her Vulture: a German Peasant Romance.* By Mme. von Hillern. Translated by Lady Wallace. London: Longmans & Co. 1876.

that humanity becomes interesting only when it has begun to live in cities, and that all peasants are alike. They seem alike to the jaded senses of the town-bred critic, because he has come to believe that naturalness must imply uniformity. As a matter of fact it is their very naturalness, the fact that they are the product of the soil they live upon, that gives them their distinctness, as the colours of the tree give their difference of shade to the moths that feed on it. The peasantry of Berry differ as much from the peasantry of Westmoreland as do the flora of the two districts from one another; you might as well expect to find the Edelweiss on Headington Hill as to find an Elsa in Oxfordshire. Artists have seen all this long ago, and the enthusiasm with which Scott's Northern novels were received at their appearance is only one piece of evidence among many that the artists are right. It is a curious fact that the foremost novelists now living in most European countries are full of local knowledge, and are at their best when they are displaying it. George Sand in the Vallée Noire, George Eliot in Leamshire, Auerbach in the Black Forest, Trueba among the Biscayan valleys, are following a right instinct, as their success proves. And now Mme. von Hillern comes forward with a Tyrolese novel, of which we may say that from the first page of it to the last we are in Tyrol, breathing the air of the mountains, and thinking the thoughts of those who live among them. Elsa, or "Vulture Elly," as she is commonly called, is the daughter of old Stromminger, the "Höchst Bauer" or head peasant of Sonnen-Platte, near Solden in the Oetz Thal. She got her name from an adventure in which, at fourteen years of age, she stole a young vulture, or Lammergeier, from its nest, and, as she hung by a rope in air, fought off the parent bird, and brought the young one home. This adventure is an index to her character, and the memory of it never leaves her; for Hansel, the stolen vulture, is her constant companion, the partner of her sorrows and her joys. She is, as the hero of the story says, "the handsomest and strongest girl in all Tyrol, and immensely rich," for her father, the head peasant, owns fields and flocks innumerable. After a poetical bit of introduction, where Elsa is revealed to us standing beaten by the winds upon a giddy precipice, the story begins with her confirmation-day at Solden. Elsa is sixteen years old, and very tall; she is a little ashamed of herself for it, lest people should laugh at her. But no one takes any notice of her, for all are too much excited by the news which has just come that Joseph Hagenbach, the brave young chamois-hunter, has killed the bear that was seen up in Vintschgau. Hardly is the confirmation over—a service that has been lost upon poor Elsa, whose thoughts have been away with Joseph and the bear—when the victorious hunter appears, escorted by a crowd of youths, tall men all, but he taller and stronger than any. "He seemed almost to shine from a distance. He looked like St. George in the church." At the first glance Elsa's heart is irretrievably gone, and her case becomes more hopeless still as she listens, from the fir-tree into which she has climbed, to the story of the battle which Joseph tells. The whole village is wild about Joseph; the Bishop publicly blesses him; only one person stands sullenly aloof, and that is Elsa's father. The old Stromminger, who for thirty years had been the most athletic man in the district, could not bear to feel that he must yield to the younger generation; and his sullenness breaks out into open fury when one of the bystanders, not content with praising Joseph, must needs cry out that Joseph's prowess was inherited from his father, who had also been the best shot and the best wrestler in the whole country. This is more than the Stromminger can bear; to hold his own he insults the memory of Joseph's father, and threatens Joseph himself. In the struggle that follows Joseph overcomes him, and then offers him his hand. But the Stromminger never forgives, and the scene ends with his cursing Joseph and the whole village, and dragging his daughter home.

This chapter introduces us then to the motive of the story. Elsa loves Joseph, who is hardly conscious of her existence; her father hates him, and swears that he shall never have his daughter. With her the savage old man tries the violent means that come most natural to him—he beats her, he disgraces her, he orders her to marry another, and when she refuses, he first half-murders her, and then, exerting the patriarchal authority that still survives in pastoral societies, tries the *ultima ratio* of banishment:—

> Stromminger allowed a couple of minutes of deep thought to elapse, and then said, in a hoarse voice, "I cannot take your life, but as you love the Similaun and the Murzoll as much as your father, you shall henceforth live with them. Your place is there; never again shall you sit at my table. You shall go to the Hoch Joch to herd cattle, and shall stay there till you have found out that it would be better in a warm nest with Vincenz than surrounded by the snow heaps of the Murzoll. Make up your bundle, for I will not see you again. To-morrow, early, you are to set out. I will let the Schnalsers know my intentions, and send a farm lad next week with the cattle. Take bread and cheese with you, that you may have food till the cattle arrive. Klettenmaier shall guide you up the mountain,—and now be off with you. This is my final resolve, and I shall not change it."
>
> "Good," said Elsa, in a low tone, and, bending her head, left her father's room.

Nothing could be more awfully solitary than the Hoch Joch, the uncultivated levels amid the peaks, where the sheep can in the summer months find a scanty living, and where the only human beings are the Schnalser herdsmen, "half-wild fellows, clothed in skins," who live miles apart in little stone huts. Here it is that Elsa is condemned to live, her only companions being her vulture and her flock, her only intercourse with the world being through the herd-boy, who, as the weeks go by, brings her a pittance of food. Her father sends to know if she will obey him now; her only answer is that she would sooner be torn to pieces by her vulture. In manifold ways the silence and remoteness of the place are influencing her. Sometimes "a nameless longing seized the girl for the familiar meadows of her home, which were gradually veiled from her sight by the peaceful shades of evening." Sometimes, in the moonlight,

> The mountain tops stared at her in hostility, because she dared to watch their nocturnal doings. It appeared as if it were only since her arrival that they had become so still and peaceful, like a company discussing some secret plot, who suddenly become silent when a stranger comes among them.

Sometimes the freedom of the place is what inspires her; she feels like a queen on her solitary throne, a ruler in the silent, boundless kingdom which her eye overlooks; "so that at length she gazed with compassionate contempt from the heights above at the ignoble race below, who gained their daily bread by bargaining and calculating, and a secret aversion replaced her former longing for home." Sometimes she sees visions and dreams dreams; dreams that she literally becomes the child of the mountain, and is adopted as a sister by the "Seligen Fräulein," the awful beings with which the imagination of the simple peasantry has peopled the hollows of the hills. Sometimes, however, and most often, she dwells in thought upon the strong and brilliant creature for whom, without his knowledge, she is suffering this exile—Bear-Joseph, "the St. George of her dreams," whose equal is no girl in the Tyrol but herself.

We will not follow Elsa through all her after troubles, for the story is so short that no reader can have any excuse for skipping, or can want another hand to fill in for him the details of the plot. Elsa descends to find all changed at home; her old nurse Luckard dismissed and dead, her father disabled by lameness, and Vincent, her hated suitor, all-powerful with him, and directing the whole establishment. The new servants insult her, and she is driven by the sight of a piece of brutality on Vincent's part to an outburst of violence so frantic that she has to flee her father's house and wander about the country, she and her vulture seeking for a home. Naturally, folk look askance at her for her companion's sake, and for the fierceness which adversity and others' cruelty have stamped upon her beautiful face. The priest of Heilig Kreuz himself, fair example of the noble type that has charmed poets and novelists from the days of the "pouré persoun of a toun," dares not shelter her; and she finds no rest until she falls half-dead at the door of the Klötze's house in the Rofen Hof, "the highest inhabited spot in all Tyrol." The pathetic little love-story that follows is most delicately sketched, and we will not spoil it by telling it again. It is enough that Elsa is faithful to her one passion, and escapes from the wooing of the honest Benedict Klötz, whom she respects and likes as a brother, to the hut on the Hoch Joch, when the spring has come again. Here she remains the summer through, and in the winter finds some shelter in service in the further valley, far from the home that she has learnt to hate.

It is while she is in her mountain hut that the plot thickens. With great art the author contrives a meeting between her and Joseph, just before her father's death frees and enriches her. But, not to mention a violent incident of the meeting which is best read in the story itself, an element of strife is introduced in the person of another girl, Afra, the maidservant at the "Lamb" inn, whom Joseph is escorting over the mountain. It is with the relations of these three that the rest of the book is occupied. Vulture Elly, now that she has become Höchstbauerin, rich, courted, and important, is almost maddened with the thought of her Joseph, about whose new exploits all the world is talking, throwing himself away on a maidservant. She vents her anger on all around her; if she cannot be loved, she will be feared and hated; she rejects with scorn all her suitors—nay, she conquers them in fair fight, for she has openly given notice that he who can force a kiss from her shall marry her, but none are strong enough to do it. She wanders among the hills the whole night long, and returns to deck herself out in finery which no other peasant can rival. She is inflexibly severe upon the peasant vices of her servants; she has dismissal or chastisement in store for any that is guilty of drunkenness, dishonesty, cruelty, or light conduct. And all the while she broods over her disappointment till, at the procession on Corpus Christi Day, she publicly insults Afra, her rival, and forces Joseph to plan a revenge.

The revenge and its consequences occupy the last chapters of the book. How a trap is laid for Elsa, how she falls into it smiling, how she is affronted as publicly as she had affronted Afra; her wild outburst of passion, her vehement repentance, her thrilling rescue of Joseph from the death to which she has devoted him, the clearing-up of the Afra mystery, and the romantic end of all, we will not spoil our readers' appetite by telling. Here is one piece only, which, while it does not tell too much of the story, is a good example of the author's power. Joseph has asked Elsa to go with him to a dance—an act equivalent in the Tyrol to an offer of marriage—and in order to avenge Afra he has vowed to gain the kiss that none of her suitors has gained before. He has asked her for the kiss in the presence of all the people; she struggles for a moment between love and modest embarrassment. At last:—

> She raised her fair face to him, and his eyes rested for a second on the fresh quivering lips offered to him; then he pushed her back gently, and said, in a low voice, "No, not so; no good hunter shoots his prey except on foot or in the air. I said that to you once before. I will win it from you in fair fight, I won't take it as a gift; and if I were a girl like you, I would

not hold myself so cheap. Defend yourself, Elsa, and don't let me off more easily than you did the others, or there would be no honour for me."

A scarlet flush of shame was diffused over Elsa's face: she would gladly have sunk into the earth. Had she so entirely forgotten what was due to herself that her suitor must remind her of it? A glare seemed to dazzle her eyes. Suddenly, drawing herself up to her full height, she measured Joseph with blazing eyes. "All right," cried she, "let it be so. You shall also learn what Vulture Elly is. Now, try whether you can win a kiss from her!"

She felt choking; she tore off her neck-handkerchief, and stood there in her silver-laced velvet bodice and white cambric sleeves, while Joseph's eyes were fixed with admiration on her beauty. "You are beautiful—as beautiful as you are vindictive," muttered he, as he sprang on her like a hunter on his prey, whom he intends to stab with his *couteau de chasse*, seizing her round the neck; but he little knew Vulture Elly. With one powerful effort she was free, and a malicious burst of laughter ensued from all those who had formerly fared no better that made Joseph frantic. He seized the girl round the waist with an iron grasp, but she gave him so well aimed a blow that he involuntarily drew back; fresh peals of laughter! By this blow, the effects of which she knew, she had always defended herself against every hostile attack. Joseph, however, dissembled his pain, and with redoubled fury seized the girl's arms with both his hands to try to approach her lips, but in an instant she bent to one side, while a breathless struggle ensued amid an ominous silence, only interrupted by a curse from Joseph. The girl twisted like a snake, so that he could not reach her mouth. Three times he bore her to the ground, and three times she sprang up again. He lifted her in his arms, but her movements were so rapid he could not touch her lips. Elsa's fine cambric sleeves were torn, and her silver necklace was broken to bits. It no longer looked like a love struggle, but rather a struggle for life or death. Suddenly she got free, but he pursued and once more seized her in his arms in a passionate embrace. Then, when she felt his heart beating against hers, and his breath on her cheek, all power of resistance left her, and sinking on her knees before him, overpowered by shame and love, she said, "I am yours!"

It must not of course be expected that all the scenes in the story are as exciting as this; but they are all as full of life and swing. This "German peasant romance" is a delightful story, well written and well translated. Throughout it is racy of the soil; it is full of the spirit of the mountains and of those remote valleys into which we wander in the summer-time, but into whose real life so few of us can enter. If the story fails of reaching quite the first rank, if it is not to be reckoned side by side with *La Petite Fadette* and *Silas Marner*, it still ought to be put high among tales of peasant life. Mme. von Hillern has not the subtlety or the supreme style of the greatest novelists, but she has seized a genuine character and brought it to us fresh from the mountains, simple, passionate, violent, childlike in its waywardness, and yet desperate in its intensity, and has presented it with success.

THE EARLS OF MIDDLETON.*

AS will be observed from its title, the author of this volume has set herself a double task. Besides writing the Lives of the two Earls of Middleton, she has undertaken to give a brief account of the Middleton family in general. Neither Principal Alexander Middleton himself, however, whose reverend academical figure flits in a ghostlike way through the volume at large, nor any of his descendants, unless it be Lord Barham, who was First Lord of the Admiralty under Mr. Pitt, to any appreciable degree influenced the destinies of Great Britain. To Lord Barham Miss Biscoe assigns a share, in a roundabout sort of way, in the laurels of Trafalgar. He provided Nelson "with more vessels than he had demanded as necessary. To the reliance of the latter," (the comma confuses us, but we think we see what is meant) "on receiving the succours promised, the glorious battle of Trafalgar may, indeed, in a great measure be attributed." Be this as it may, any student specially interested in the Middleton pedigree before and after Alexander, the brother of the first Earl, will find in this book what he requires. But tracing pedigrees is one thing, and writing biography is another. Not every subject lends itself to a biography, and not every method of treatment ensures success in a biographer. In neither of the Earls of Middleton personally was there anything great or attractive, or distinctively interesting. The one was a coarse soldier, fond of gain, and in his latter days fond of drink, in whose services there was nothing extraordinarily brilliant, and in whose character there was nothing manifestly noble, though his political change or changes may admit of very easy explanation. The other was a man of education, and of a certain amount of political sagacity, who served a fallen cause unselfishly (for we disregard the scandal to which we shall refer below), but was of no really important use to that or to any other cause. In the case of the latter we have abundant materials by which to gauge the measure of his capacity; but of his personal character we hardly know enough to enable us to understand him as a man. In the case of the former we have hardly any materials of a personal kind, except such as a stray letter or a passing notice by Mr. Pepys supply. The Earls of Middleton are therefore chiefly interesting on account of the transactions in which they played more or less conspicuous parts. But to compress an account of these transactions into a biographical framework is a task of great difficulty, and in the present instance was perhaps hardly worth attempting. In endeavouring to perform it Miss Biscoe has shown a good deal of industry. She has read a good many historical works and collections, which she freely cites, without inquiring into their general character or special adequacy; Hume, Smollett, or Oldmixon seem to serve any turn, though many other works have been consulted. Macaulay is hardly at all referred to, though his character of the second Earl of Middleton really sums up most that can be said of him. Sometimes a "search in the Records" appears to have been instituted. Of footnotes Miss Biscoe is the reverse of chary; indeed we could have spared a few of these, such as the elucidation of the term Covenanters, or the not very exhaustive extract from "Beeton" about "Prior the poet." In general, however, we give all credit to the author for the trouble she has taken; and only regret that she should have been at such pains to make a book out of what, unless under very exceptional treatment, was better suited for a contribution to a dictionary of British biography.

It may be worth while, in illustration of this opinion, to run more rapidly than Miss Biscoe through the lives of the two Earls of Middleton. The elder, John, began his military life, which was the basis of his fortunes, as a pikeman in Hepburn's regiment, which was, says Miss Biscoe, "sent to France." This is a rather vague notice of the regiment in the French service composed of old Scottish companies, of which Hepburn had assumed the command in 1633, and of which some account is given (with a reference to Middleton) in Mr. James Grant's well-known Memoirs of that renowned adventurer. Hepburn, like Leslie, was a soldier of the Thirty Years' War, and the days of soldiers of fortune were not yet at an end. But Middleton's campaigns were to be fought on his native soil; and already in 1638, when a lad of eighteen, he found himself back in Scotland, whither all Scottish officers serving abroad had been recalled by the Covenanters. Montrose was at the head of their forces, his device at this time being "For Religion, the Covenant, and the Countrie," while his soldiers wore "ane blue ribbin . . . which they called the *Covenanters' Ribbin*" in "despyte and derision" of "the *Royall Ribbin*, of ane reid flesh culler," worn by some of the loyalists. But the treaty of Berwick soon intervened; Montrose disbanded his forces and went over to the side of King Charles; and Middleton for a time withdrew into private life and married a wife, whose Christian name, Grizel, Miss Biscoe justly remarks, should be pronounced with the accent on the second syllable. In 1642, however, Middleton entered the service of the English Parliament and took an active part in the campaign of the following year. When deprived of his commission by the Self-Denying Ordinance, he (1645) obtained a command in the Scotch army operating against the now Royalist Montrose. This appears to have been the most brilliant part of his military career; Montrose was obliged to quit the country, and after the King's surrender Middleton, or rather one of his officers, succeeded in effecting the capture of Huntly. It is clear that as a commander Middleton fell short in nothing of the ferocity of the worst types of his age, burning castles, and in particular never sparing the life of an Irishman. Times were destined to change before 1654, when we find Hyde writing to Nicholas:—"Ask Middleton if he will have two or three Irish priests with him to carry on correspondence with Ireland."

The difficulties of Middleton's biography begin with the perplexed and perplexing period of Scotch politics which ensued after the surrender of King Charles, and during the final struggles of the Presbyterians in England to recover power out of the hands of the Independents. Miss Biscoe distinguishes three Scotch parties at this time—the Royalists pure and simple, the rigid Covenanters, and the Moderates, who sought to reconcile the interests of the King with those of the Covenant. Among the last-named she classes Middleton, and seems to defend him against Whitelocke's charge of double inconsistency or tergiversation accordingly. That Middleton acted with considerable canniness, more especially at the time of Montrose's landing, is clear; but we are afraid that there can be no doubt as to one of the motives which, to all intents and purposes, made him a supporter of what Mr. Carlyle, speaking of the situation of parties at a later date (1650), calls the "Malignant or Royalist extreme." The royal charter of June 29, 1648, which conferred upon Middleton the barony of Fettercairn (p. 42) might have helped to clear Miss Biscoe's doubts (p. 44) as to Middleton's "exact reasons for turning Royalist." Charles II., it is known, came to Scotland as a covenanted King, so that Middleton's principles (if any) were exposed to no trial in the services he devoted to the new sovereign. He was taken prisoner at Worcester, but, fortunately for himself, contrived to escape from his imprisonment in the Tower. For Cromwell is said to have "thirsted" for his blood: and it must be allowed that (like Cromwell himself) Middleton had interpreted the Self-denying Ordinance in no very self-denying spirit.

The expedition which Middleton, after many difficulties, the chief of which was the peace between the United Provinces and England, contrived to carry over to Scotland in 1654 was defeated by Monk. It was hopeless from the first; and an amusing letter from Captain M., conjectured to be Charles Middleton, afterwards the second Earl, illustrates some of the causes of the failure. "Mr. Presbyter" failed to show all the enthusiasm to which it was hoped to move him; the nobility and gentry, "descended of no bastard aery," who had joined the army, fell to quarrelling and duelling, and among the soldiery there was desertion, which Middleton is stated to have suppressed by the horrible punishment of decimation. Though Monk had set a price on his head, he escaped to the Continent, and his military career was now at an end. Miss Biscoe at this point draws a broad line of demarcation between the two parts of Middleton's career, the latter half of which was overshadowed by a vice "of which we have as yet heard no complaints"—namely, that of excessive drinking. The Earl (he had been raised to this dignity in 1656 by the exiled

* *The Earls of Middleton, Lords of Clermont and of Fettercairn, and the Middleton Family.* By A. C. Biscoe. London: Henry S. King & Co. 1876.

King) in vain attempted in the (probably congenial) locality of Danzig to raise men and money for a new Scottish expedition, but it came to nothing, and he remained abroad till the Restoration.

The account of Middleton's proceedings as High Commissioner in Scotland is the least satisfactory part of this biographical sketch. "He was throughout the greater part of his time intoxicated," and it is therefore "no marvel that many of his acts were arbitrary, and often outrageously absurd." We agree that hardly any terms of condemnation can be too strong for the intolerance and impolicy of the system of government pursued by the High Commissioner and his Council; but it should be remembered that the Scottish Parliament was, if anything, more Royalist than the representatives of the Crown; and Miss Biscoe herself, in her rather perfunctory account of the Rescissory Act, has shown that Clarendon, who was very sober, insisted upon maintaining a measure devised by Middleton when he and his friends were, according to tradition, very drunk. When Middleton was finally overthrown by Lauderdale, he had the support to the last of Clarendon, and of his old adversary Albemarle. The whole of this part of his life, if carefully examined, would have formed a most interesting passage of history; Miss Biscoe has, however, treated it with exceeding slightness.

After this we catch glimpses of Middleton chiefly through Pepys, who thought him "a shrewd man, but a drinking man," and who states, in his own inimitable way:—

> It pleased me to observe how some men may by age come to know much, and yet through their drinking and other pleasures render themselves not very considerable.

The fallen statesman was in some measure restored to the Royal favour, receiving the command at Rochester, and thus perhaps being in part responsible for the most notorious national disgrace of King Charles II.'s reign, and being finally appointed to the governorship of Tangiers. After much vexing the soul of Mr. Pepys in respect to this post, he repaired to it at last. But he did not long enjoy its sweets, such as they were: for, in 1673, he fell down a staircase in a drunken fit, and after that drank no more. "Lord Middleton's career," moralizes his biographer, "is but one out of many examples of opportunities lost and talents wasted through habits of intemperance."

Charles, second Earl of Middleton (there seems no doubt as to his Christian name, though, oddly enough, he was outlawed under the name of John), is, upon the whole, indisputably a more attractive personage than his father. He was worthy of him, like the King his master, whom he is said to have likewise resembled in his "gay and lively manners, embellished with wit." Of this latter quality Miss Biscoe is, however, unable to give any specimen besides the stock story about the priest, which she quotes from Oldmixon, and which Macaulay quotes from Burnet. Elsewhere we are informed, on the authority of Macpherson, that Middleton "was a man of humour and some learning, and he sometimes threw a mixture of both into his letters on the most serious subjects." But in the numerous letters extracted by Miss Biscoe from Macpherson's collection, which, in fact, form the staple of this second biography, there is hardly anything really characteristic in these directions. Lord Middleton's manner in some of his despatches as Secretary of State to the exiled King resembles that of diplomatists who have probably always abounded at the minor Courts of Europe, and have sometimes found their way to positions in the greater. His arguments evidently strike him as extremely clever, and he thence concludes that they will have effect with others. It is true that the Ministers of King James II. and his successor at St. Germains had little but words on which to fall back, whether their aim was to move their friends in England or their friend at Versailles. But one seems to understand the weakness of their position when one reads such a letter as that of Middleton to Renaudot (January 24, 1695), in which he insists upon the fact that the loyal addresses presented by the Parliament to William offer a very strong and a very useful proof of the existence of a party opposed to him.

In this biography, as in the companion sketch, the author has not always seized with sufficient force upon its chief points of interest. It was unnecessary to give so many letters at length, while it would have been useful to illustrate with greater fulness the chief phases of Middleton's personal activity as a politician. His career before the final flight of King James II. from England was creditable to himself; for, though he loyally adhered to his sovereign in good and in evil fortune, his voice was always for moderate counsels, and he did not condescend to the surest means of securing the fulness of the Royal favour. When the crisis came, he did his best to persuade James to weather it, although, as we read in the King's own statement, cited by Clarke, he in the end owned there could be no safety for him to stay. When he afterwards followed the King to France, it was as the representative of that party among the Jacobites to meet whose views James issued a declaration calculated to conciliate his Protestant supporters at home. But, as Macaulay has shown at great length, this laudable effort proved an utter failure; and though King William himself had been sorely troubled with fears as to the influence of so capable a man as Middleton upon the counsels of King James, his endeavours proved as futile as those of his rival Molfort. After James II.'s death, Middleton became a Roman Catholic, a step which it is simply absurd to attribute to unworthy motives, though the Whig historian Oldmixon charitably suggests a desire for the recovery of a pension from the French Crown, and St. Simon a hope to regain the confidence of Queen Mary Beatrice. Converts have at all times been the victims of calumny; but it is hard that Middleton, who had never yielded to the wishes of King James during the life of the latter, should have been maligned, even if he professed to have been moved to his conversion by the appearance of King James after death in a vision. After his conversion he withdrew from the Court for a year, partly to study Catholic theology in a convent, partly because he justly thought that "his continuing in office would give offence to Protestants," *i.e.* Protestant Jacobites "in England." After his return he resumed his activity, apparently still adhering to a moderate course of policy. In the attempt of 1708 his two sons were taken prisoners, and there was nothing in the course of public affairs to console him for this great private misfortune. The advent of the Tories to power once more raised the spirits of the Court of St. Germains, whose hopefulness had never deserted it altogether, and which continued to view things through the glasses of self-delusion. Marlborough had always seemed a possible Monk, and so in truth he was, only that "the Hamburg merchant" would at no time have engaged in any speculation without better securities than "Mr. Smith" was able to offer. Now, a Government from which even more might be expected appeared to be in power, but they likewise preferred a dilatory policy to that which Middleton recommended in a passage which we may quote as an example, if not of his epistolary wit, at all events of his fair political foresight:—

> The greatest should take examples by Crœsus to make use of their time; the star of the most fortunate is not fixed, and just now the cracked bully of the age has been severely banged for his presumption.

The crisis of Queen Anne's death came and took the Tories by surprise, as Middleton had feared. Shortly before, with a view probably of being no obstacle in the way of the adherence of Protestant Jacobites to the cause of the Pretender, he had again withdrawn from office. When he returned to St. Germains, it was merely in the position of the Queen's Great Chamberlain. He died, not long after Queen Mary Beatrice herself, in the year 1719. His two sons died some time after without issue; his daughters—at least, two of them, one being the Countess de la Roche, celebrated as *la belle* Middleton—survived to a later period of the century.

As we recently took occasion to observe, a history of Jacobitism in which a connected view should be taken of its military expeditions, its intrigues at home, and its diplomacy abroad, still remains to be written. In such a history the name of the second Earl of Middleton will hold a conspicuous place as that of one of the most devoted, as he was indisputably one of the most intelligent, servants of the Stuarts. Miss Biscoe's sketch helps to show the nature of some of the materials at hand; and if she has made no very striking use of them, her biography of the second Earl of Middleton may prove of service in the eventual execution of such a project.

TWO NEW NOVELS.*

MRS. CADELL has everything to learn in the technical manipulation of a story; yet, paradoxical as it may seem, *Ida Craven* is by no means a failure. It is not a failure, because, written with a definite psychological intention well preserved and clearly displayed, it is evidently a book of personal experience, and therefore true to nature in the main facts and the central conduct of the story, with personages neither fanciful nor exaggerated. If the character of the heroine herself is too composite, too subtle, for any but a master-hand to be able to draw it with perfect satisfactoriness, if the details at times escape us because of the uncertain touch of a novice, we know all through at what the author is aiming; and so far we feel grateful that, unlike many of the novel-writing tribe, she aims at anything at all beyond filling her allotted space with the requisite number of words. Again, if there is nothing very new in the plot—being simply the history of a young wife's struggle between love and duty—it is one which is as everlasting as human life itself, and which may be made interesting or repulsive according to the manner in which it is treated. In the hands of some it has been a peg on which to hang scenes of more or less suggestive immorality; but we must acquit the author of anything approaching to licentiousness, even in the scene on the house-top wherein the action culminates, and the heroine has to decide whether she will listen to love and Hugh Linwood or keep to her husband and her honour. Whatever risk there may be in the subject, it has been avoided by the tact of a delicate imagination rather than with the craft of artistic proficiency; and as we think that truthfulness in drawing and a delicate imagination go far towards making a good novelist, we believe that, if Mrs. Cadell will study her art as an art, and learn how to handle her materials with technical skill, she will make a very good writer of novels as times go, and novels of a kind which, judging from the specimen before us, we should expect would be always pure in treatment and healthy in tone. Naturally, her prominent failure is in a want of dramatic continuity. A novel may be likened to a growth where each preceding part is of vital importance to that which follows; or to a mosaic where everything fits so perfectly one with the other, that nothing could be taken away without destroying the harmony and completeness of the whole. Scenes which lead to nothing, and chapters which might be cut out bodily without the slightest damage to the sense of the story, are among the most usual mistakes

---

Miss Molly. By Beatrice May Butt. Edinburgh and London: William Blackwood & Sons. 1876.

of novices. We may add to these the habit of telling the story rather than letting it transact itself; and the kind of shaky grammar which is represented by the persistent absence of relative pronouns and the determination to make some things "different to" others. But if, underneath all these roughnesses and weaknesses of immaturity, we can discern marks of latent power, we are justified in dealing gently with a first attempt and in hoping better things for a second.

There is a keen sense of humour in the beginning of this book, in that part where the Bygrave family are spoken of; and we only regret that "the boys" slip out of the story so soon and so entirely. Good fun might have been made of them, more especially of Jack, the eldest, whose "rather mongrel education" seemed to have every quality but the one of definiteness. We will give his portrait in Mrs. Cadell's own words:—

He had a scientific turn, was clever and absent, much given to books, and wild about birds, beasts, and fishes. His knowledge of French and German stood him in good stead. He could read up his subjects in other languages than his own, and better still, was able to make acquaintance with foreign savans. He was becoming known in the college as a boy who would do something, no one quite knew what, and was well thought of by the professors, who were glad of such a recruit for science, though they would have been better pleased with a little more definiteness of aim. He had at first lived with an old aunt of his mother's; but that was given up, as he worried her almost equally with his work and his play. His specimens and his musty books were only a degree less trying than his tobacco and his very miscellaneous acquaintance. Old Aunt Bridget was not a little thankful when at last he went into lodgings, though she did all in her power to prevent the step.

"How that boy is ever to make his living I cannot see," she would say. "This is what comes of bringing up children in outlandish foreign places. If he had been sent to Winchester, like his father, he would have been at Oxford by now, and in a fair way to make a worthy clergyman in the course of time."

But Jack would certainly not make a worthy clergyman, and was likely to be a trouble to his friends for some time to come; and when his mother, on her arrival in London in the April of this year, had seen him for the first time, she felt her heart sink. He had left her a smart, bright schoolboy, with a half formed intention of becoming a doctor; she found him no longer smart, but tall and weedy; still bright enough, but woefully conceited. He seemed to have passed from her hand, never to return; and when the mother thought she was going to put him out into the world with a very vague notion as to how it was to be done, she found that he had already entered into a world of his own, where she was nothing.

Further on we read that Mrs. Bygrave "had a floating dread that, sooner or later, her eldest son would be found keeping a menagerie." Herbert, the second son, who is to cram for the army, is found to "require some months of English life, before he would have sufficiently unlearnt his foreign manners and foreign ways to mix pleasantly with boys of his own standing"; while the third boy "was to go to Rugby, and become, if possible, an English boy again." "After spending all these years making foreigners of her sons," says Mrs. Cadell, speaking of the mother. Mrs. Bygrave, "she began to doubt if she had not better have left that undone. Jack's mind had become German, Herbert was very French, she was determined her youngest boy should be English." All this is very good and graphic, and we wish that we had more of it; but this is all that we see of the younger two, and almost all that we see of the eldest; and the little that is presented to us of this last is not much to the purpose, nor in any way helpful to the book. The description of Ida too, if a little vague, has one good expression—the "puppy clumsiness of her age;" but we are rather in a fog between her inner childishness and outer manner of womanliness, and do not see exactly the personality sought to be presented to us. Though so little is said of Mrs. Bygrave, Ida's mother, she is a more vivid personation than the heroine herself; and matters do not mend in this respect as the story goes on. Is not the husband too, Arthur Craven, a little too cold? As the adoring husband of a very young and very childish wife, he strikes us as being both dull and chilly. We know that it is not in the nature of things for husbands to continue lovers; and life at fever-heat would soon put an end to itself; still there is the golden mean which is by no means a despicable thing, and we wish that the author had hit it more exactly in her character of Colonel Craven. In the end, however, he atones for his former flatness, and proves the sterling quality of the metal of which he is made; while Ida, in her turn, atones for her perilous weakness by the honesty with which she confesses herself to her husband, and the loyalty with which she sets her young face once more to her duty. We are glad that the story ends well for all concerned; save indeed the Mussulman friend of Colonel Craven, Saadut Khan. We suppose there always must be a sacrifice, even in the least morbid book, by which the rest are made happy; but we do not see why poor Saadut should have been killed, and we should have liked to see more of him. The slight indication given of his character in his Oriental distrust of Ida and his patriotic (?) disinclination to side with his British friend are good so far as they go; but they do not go far enough. In her next book Mrs. Cadell might utilize the Eastern knowledge which she manifestly possesses, and so give both freshness and piquancy to her pages. We trust, however, that she will not publish another novel until she has studied the construction and method of narration of some of our best models, and developed more perfectly her own possibilities of smartness and character-drawing.

The author of *Miss Molly* has odd ideas on some matters. "A long low room, a fire blazing on the hearth, which cast a comfortable red glare on all around, more comfortable than ever after one glance at the grey, wintry sky outside," may be pretty as the corner of a picture, but can scarcely be called any one's "surroundings"; and when we find, in the very first page, a sentence in which a nominative case figures without a verb, we expect to see slipshod writing matched by slipshod thinking. A writer who speaks of a lake nearly a mile long, with little islands at intervals, but nowhere "deep enough to be dangerous," has certainly not studied that part of her subject which deals with nature and natural phenomena; and things are still worse when we come to "different to," "as to who should go with who," "either of you were," "it was us," and the like. We do not think that we are too exacting when we ask for accuracy of description and correctness of grammar from the ladies and gentlemen who undertake to amuse and instruct us by means of fictitious sorrows and imaginary joys.

The story of *Miss Molly* is very slight. It is merely the love affair of the heroine, who gives her name to the book, and a certain Rex or Reginald Burnaby, the first man who has known how to fix her roving fancy or subdue her high spirit. Hitherto she has been notorious chiefly as an incorrigible flirt, who subjects herself to passionate kisses and despairing wailings from the men whom she has cajoled and rejected; but when she saw Captain Burnaby she owns her master, and in so doing acts only as many of her sex had done before her:—

A big, broad-shouldered man, too broad-shouldered almost, some people said, for the small, beautiful-shaped head that he carried so proudly—that beautiful-shaped head being one of his few good points, for he was not at all a handsome man, at least not in the ordinary acceptation of the term, as he had not a single good feature in his face, excepting the dark eyes that were so like his sister's. But there was something about him that went further with women than mere looks—at least so may be supposed, as it was not often that he set himself down to any siege but, however it might be prolonged, in the end he rose up victorious. Not that he was at all conceited, or in any way given to boasting of his conquests, only that such was the fact; though, perhaps, it does not say much for the sense of his victims that it was so. Perhaps it was his strength, for women like to feel themselves conquered physically as well as morally.

The course of the true love, however, which springs up between these two people is destined to run in a very mournful kind of way for some time, for Captain Burnaby has a quarrel and a stand-up fight with a brother officer, who is somehow killed in the scuffle, and he is sentenced to five years' imprisonment for manslaughter. After one or two heartrending scenes between the lovers in prison—where they are allowed to meet and kiss each other as in the good old-fashioned times, all to themselves quite comfortably in the cell, with no thought of that uncomfortable division between the grated compartments where a warder stands to see that no tricks are played—Rex goes off to fulfil his term, and Miss Molly goes home to be ill and miserable. Nothing happens during the five years, save the marriage of Miss Molly's twin-sister Genie, and the death in the Crimean war of a former victim, one Mr. Winwick, a man who kisses Miss Molly with very inconvenient passion when he has helped her down from the third step of the library ladder on the top of which she was perched when he comes into the room to bid her good-bye after her rejection of his offer. And after the term of imprisonment the action is as simple as it was before, comprised as it is in these three facts, that Rex takes refuge in his brother's house—the brother being the penultimate cause of the fatal squabble which ended in Captain White's death and Captain Burnaby's ruin; that Miss Molly, hearing of this, goes to the house with her mother and again offers him herself and her love; and that, after the proper hesitation and chivalrous coquetting with his happiness due from the gentleman, the lady's devotion and persistence win the day, and Miss Molly's love conquers Reginald Burnaby's reluctance.

We have no moral objection to urge against *Miss Molly*. It is a silly little story, but an innocent one; if we except the heroine's adventures into the domain of reckless flirting and unauthorized kissing, which we confess we do not like. But, if harmless, it is a book without life-likeness or the ring of truth in it anywhere; a phantasmal kind of thing throughout, drawn from fancy models and fancy circumstances, not from real life in any way, and thus falling into the category of those feeble absurdities which have no abiding place in literature because their roots are not in fact or truth.

AMERICAN LITERATURE.

MORE than one memoir of "Stonewall" Jackson * has been published during the thirteen years that have elapsed since his death; but we do not think that any of them has been better executed, gives a truer picture of the great Confederate hero, or shows a clearer insight into his extraordinary character, which was partly displayed and partly concealed by certain outward eccentricities, than the one now published by Mr. J. E. Cooke, a member of General Stuart's Staff, and therefore brought into frequent contact and personal relations with Stuart's first commander and most intimate friend among the Confederate leaders. During the earlier period of the war, no character on either side made so deep an impression, either upon his own countrymen, upon the enemy, or upon European observers, as that of Stonewall Jackson. Less distinguished in the field by first-rate victories or consummate strategy than either of the two great Virginian commanders-in-chief, a man of far less elevated genius and much more

* *Stonewall Jackson: a Military Biography.* By John Esten Cooke, formerly of General Stuart's Staff. With an Appendix, containing Personal Reminiscences, and a Full Account of the Ceremonies attending the unveiling of Foley's Statue. New York: Appleton & Co. London: Sampson Low & Co. 1876.

limited mind than General Lee, he was undoubtedly, in the eyes of the Confederates, until his death at Chancellorsville, the hero of the war, the idol of the troops, the trust of the people, the one figure on which all eyes were fixed, and in whose powers and almost unvaried success they seemed to discern a guarantee of final victory. To the Northern armies he was the object of peculiar dread, to the Northern people an object of mingled admiration and fear; but alone among the leaders of the South, military and civil, he never seems to have been the object of personal animosity. In England he was naturally regarded with especial admiration as representing a type of soldier character peculiarly English, a Puritan of the Elizabethan stamp, a military Christian in whom Havelock or Lawrence would have recognized a brother. An orphan who had worked during boyhood on a farm, and received such education only as he could pick up at a Virginian common school between the intervals of labour, he bore so high a character that he was appointed at sixteen constable of the township; he had so much moral courage and intellectual self-confidence as to press for a nomination to West Point among competitors all of whom had had a far better education than himself; and beginning at the very bottom of his class of seventy, he worked so hard as to graduate seventeenth in that same class after four years of study. Immediately appointed to a battery of artillery serving in Mexico, he won his way in a single year to the rank of brevet-major in the regular army. When his health, broken down by service in Florida, compelled him to accept a professorship in the Military Training College of Virginia, at Lexington, his brilliant services were so far forgotten, and his personal oddities so prominent, that he was ridiculed as foolish or mad by the young cadets, though he contrived to maintain his authority, and set an example of punctilious obedience to orders which, if sometimes laughed at, was not without its wholesome effect. When the war of secession broke out he was selected for the command of a brigade by the Governor of Virginia, who of course knew better than the cadets of Lexington, how Jackson had distinguished himself in Mexico. He was for some time in command at Harper's Ferry, and, when superseded by Johnstone at the head of a larger force, he had brought the first brigade of the army of the Shenandoah to such proficiency in drill and discipline as won the confidence and respect of his superiors, and gave it at once that pre-eminence which it never lost. This was the brigade which, standing like a "stone wall" at Manassas when the rest of the Confederate troops around it were retiring in confusion before overwhelming numbers, checked the Federal advance until reinforcements could be brought up, turned the fortune of the battle by a desperate bayonet charge and by hand-to-hand fighting—a hard trial for troops not three months embodied—and won for itself and for its chief a nickname which will be remembered until the history of the United States is forgotten. Those who have lost sight, as many English readers have done, of Jackson's next exploits, his campaigns in the Valley of Virginia, are apt to render imperfect justice to his powers of independent command. In those campaigns he showed himself as fully capable to act with skill and energy on his own account as any general engaged in the war, and achieved as much in proportion to his strength as any, save Lee himself in his last struggle. From the moment when, beating and baffling in succession three Federal armies, each superior to his own, he disappeared from their front to fall suddenly, in pursuance of General Lee's scheme, on the flank of Maclellan, and strike the first blow in that seven days' battle which hurled the Federal army, confounded, shattered, and utterly cowed, from the bank of the Chickahominy to that of the James—from that moment he was known, and was content to be known, only as the right arm of the Commander-in-Chief. Lee trusted him in very truth as his own right hand; and when Jackson fell by the fire of his own men at Chancellorsville, his chief and his country felt that not only Lee, but the army of Virginia, was half crippled. After Jackson's death there were splendid actions, victories gained against overwhelming odds, a defence amongst the most glorious that history records, but there was never again for that heroic army a brilliant and successful offensive.

A new edition of Mr. Samuel Hopkins's quaint book, originally published in 1859, entitled *The Puritans and Queen Elizabeth**, will probably find, if not more readers than it deserves, at least many more than can safely give themselves up to the influence of the author. Mr. Hopkins thought proper to treat his subject in what he is pleased to call a dramatic manner; that is to say, he mixes up with real history and actual State documents, with facts obtained from contemporary writers, or more commonly at second-hand from the pages of later authors, and with anecdotes vouched either by history or tradition, a quantity of purely imaginary incident and conversation. He puts into the mouths, not of invented characters, who might be supposed, like a Greek chorus, merely to represent the popular ideas of the time, but into those of historic personages, not merely opinions and comments such as he chooses to suppose they might have uttered, but discussions which, if they really took place, would have an important bearing on our judgment of the men or on our understanding of the history, and interlards with fragments of what may be called an historic novel a book which, if these were cut out, would be regular history. We cannot think that this practice is at all legitimate, or even excusable. Mr. Hopkins imitates, more or less successfully, what we know to have been the language of the time, and what he infers, more or less reasonably, to have been the sentiments of the speakers whom he introduces. But, inasmuch as he affords us no means of distinguishing the thoughts which he ascribes to them as in his view the necessary consequence of their known opinions from those opinions themselves, the effect of this treatment is to put the cautious reader on his guard, and make him mistrust every impression he derives from the book; while the incautious reader—and most readers of such books are incautious—is led to form a multitude of impressions, both as to men and facts, of which he can give no reasonable account, and which may be utterly misleading, but which will inevitably colour all his views regarding the personages and events of the Elizabethan age. And the more successful the dramatic treatment is, the more complete and incurable is the mischief. On certain points, and those of no trivial importance, Mr. Hopkins is undoubtedly wrong; wrong, because sympathizing warmly with the Puritans, and at the same time holding the views of their modern descendants, he represents the former in a manner agreeable to the latter, and puts into the mouth of the most illiberal faction in English history the Liberal ideas of the latter half of the nineteenth century. Mrs. Hemans, a woman and a poet, might be excused for representing the Pilgrim Fathers of Plymouth Bay as having

> left unstained what there they found,
> Freedom to worship God;

but no citizen of Massachusetts is to be excused for repeating as history a poetic fiction to which every line in the records of his State gives the lie direct. The Puritans of fancy may have been Liberals; and the Puritans who migrated to New England may have sought freedom to worship God for themselves; but even they strenuously denied that freedom to others; and the Puritans of England contended in Parliament as much for the liberty of persecuting Papists and slandering their Sovereign, his wife, and his friends in language such as could not now find a decent publisher, as for the liberty of preaching without a gown and praying on their feet. When they drew the sword, it certainly was not for religious freedom; and when they got the upper hand, their persecution was more inquisitorial, and, but for the political sense of Oliver Cromwell, would have been more merciless than that of Laud himself. It is probable that the Puritans of Elizabeth's day, especially before she had begun to persecute them severely, and even afterwards while she stood between them and the terrors of a restored Popery, were less fierce and less violent than they subsequently became. But they were never gentle, and they were never tolerant; they regarded toleration as a sinful compromise with the priests of Baal, and gentleness as treason to the cause; and the language which Mr. Hopkins puts into their mouths would have been quite as much in place in that of Bonner, and much more congenial to Cardinal Pole. His dramatic conversations, therefore, so far as they produce any idea at all in the reader's mind, produce a false one.

The memoirs of Mr. George Ticknor†, written partly by a friend named Hillard and partly by Mr Ticknor's wife and daughter, have little political or biographical interest, but contain a great deal of curious incidental information regarding the men and events of the last fifty years. Mr. Ticknor belonged to one of the best families in Boston. His father was one of that small, highly cultivated, intellectual society which has always existed in what is called the American Athens, tracing its descent back to the least bigoted and most intelligent of the original Puritan settlers, and through the colonial times down to the Revolution, in which many of its members bore a distinguished part. The circle in which the elder Adams was most prominent could see that in a mere colony, governed as our colonies then were, there could be little room for a high ambition, and for the employment of great talents; while of a new nation they might hope to be among the principal founders and chief rulers. However their personal aspirations may have been gratified, the hopes they naturally entertained for their descendants have, as we know, been utterly disappointed. Scarcely one of them, born in the present century, has filled a high place in the political world, the American democracy being almost as jealous of hereditary culture as of hereditary wealth. By the time that George Ticknor was old enough to choose a career in life, it had become evident that the influence of the society to which he belonged was rapidly waning, and that of the men who had given to Boston her high intellectual reputation, and her weight in the councils of the Union, few could hope to attain such political rank and influence as would make politics an attractive occupation. Having no taste for the stormy life and degrading condescensions of a demagogue, and being exempt from the necessity of earning a livelihood, Mr. Ticknor, after going through the formal education then required of American, as of English, lawyers, resolved to devote himself to what he called, and perhaps meant to be, a literary career, but what proved to be in reality a life of intellectual indulgence and literary dissipation. He spent several years in Europe; and, having introductions to the leading men of letters in England and on the Continent, being favourably regarded as a member of the intellectual aristocracy of his country, and well acquainted, despite his youth, with many of her chief statesmen, he enjoyed such opportunities of mixing in the choicest society of Europe as render his letters and journals a

* *The Puritans and Queen Elizabeth; or, the Church, Court, and Parliament of England, from the Reign of Edward VI. to the Death of the Queen.* By Samuel Hopkins. With an Introductory Note by Mark Hopkins, D.D. 2 vols. New York: Randolph & Co. London: Sampson Low & Co.

† *Life, Letters, and Journals of George Ticknor.* Boston: Osgood & Co. London: Trübner & Co.

rich repertory of personal and historical anecdote. Having also considerable insight into character, he has left on record many interesting portraits of the most eminent personages of the first half of this century on both sides of the Atlantic. This constitutes the whole value of the two volumes before us; for Mr. Ticknor's remarks on the politics of America, though he lived through the most critical period of her history, and was a moderate partisan and a careful observer, are neither original nor important.

The records of the cholera epidemic of 1873 *, consisting of historical and critical papers communicated by the leading physicians of America, statistics collected by public authorities, and an account of the manner in which the disease was introduced, or was supposed to have been introduced, by the merchant ships which carried on communication between the ports of the Union and the infected parts of Europe and Asia, are full of interesting and important information. The volume before us is in the form of a State Paper submitted by the President to Congress; but, like most other documents of a similar character, it is written with much greater freedom, and is composed to a much greater extent of essays embodying individual opinions and observations, than is the case with English Blue-Books. It is a work which epidemiologists will do well to study with care, whether they may agree or differ with its principal conclusions—namely, that the first symptoms of an outbreak of epidemic cholera in Europe and America may be discerned in a temporary aggravation of the perennial cholera prevalent in parts of India; and that quarantine precautions can hardly be effective, inasmuch as the infection is conveyed by vessels sailing from European ports before it is known that these have actually received it.

An essay on "Shelley as a Philosopher and Reformer"† may naturally excite hopes that we shall find therein some new and original views concerning the character and temper of a very extraordinary mind, and the tendency of opinions which—universally and mercilessly condemned when first put forward—are less antipathetic to the present tone of public feeling, and less anti-religious in their essential spirit, than those of many of the leading authorities in science or philosophy who influence the creed of the existing generation. But to those who remember the name of Charles Sotheran, now perhaps generally forgotten in this country, the title-page will be sufficient to moderate any such expectations, and we are bound to say that not even a study of Shelley's works—of all others the most likely to temper the passions, purify the ideas, and improve the style of a materialist and a demagogue—seems to have exercised any wholesome influence on the mind of Mr. Sotheran. His sympathies go entirely with the superficial evil and absurdity of Shelley's writings, with their false morality and their formal atheism, not with their essential purity of sentiment and the deep religious feeling, devoid though it be of a legitimate object, which pervades every line. From no other writer should we have had a repetition of that senseless abuse of Lord Eldon which was natural enough in the aggrieved father and persecuted Liberal, but which is inexcusable in any man not maddened, like Shelley, by the grievous wound to his personal affections, and aware, as every one must now be, that, while Shelley was leading a life distinctly immoral according to the views of English law and English society, it was the simple duty of the Chancellor, when appealed to, not to hand over children to such guardianship. The doctrine on which Lord Eldon acted may have been right or wrong, but it was unquestionably the doctrine of the law which it was his duty to administer. Mr. Sotheran's views of Shelley's philosophy and politics are such as might be expected from one who thus revives the animosities of half a century past. The philosophy was that of a poetic, pantheistic dreamer; the politics were those of an utterly unpractical, philanthropic sentimentalist. Mr. Sotheran would turn the one into hard materialism, and the other into vulgar demagogy; and his book is a mere translation of the poetry of Shelley into the prose of Bradlaugh.

There has been considerable discussion in the American press during the past month respecting the alleged attractions of the "Black Hills," a portion of the great Rocky Mountain range on the borders of the Wyoming and Dakotah territories. Certain persons had put forth glowing descriptions of the country and of the amount of gold to be found there, and contrived to create what in Australia and California is called "a rush" towards a region barren of food and difficult of access, especially for trains of supplies and provisions. Reports came back from many of the adventurers, showing that the gold was hard to get and scanty in quantity, the chances of wealth very small, the chances of starvation considerable; and some respectable and careful American journals are disposed to regard the whole thing as an imposture. Under these circumstances this little volume of Colonel Dodge ‡ will be read with considerable interest. It shows that at a future time the Black Hills may be a seat of prosperous graziers and thriving farmers, that they contain quartz reefs which may give a paying return to companies working with adequate machinery, if they can command labour and carriage at moderate cost, but that placer-mining—the resource of the individual adventurer and the attraction which alone inspired the rush to the Black Hills—will never pay there.

Mr. Hallock has compiled a handbook under the title of *Camp Life in Florida* * from the pages of a sporting journal which sent correspondents to explore the south and south-west of that State. The book contains a good deal of information serviceable to the sportsman and to the tourist, and not a few valuable facts concerning the agricultural resources of that almost tropical peninsula. Florida may be able at no distant date to grow fruit for half the world, if only she can obtain a sufficiency of capital and labour; and the planting of orange and other orchards promises an abundant return to the white capitalist, and high wages to the negro labourer, if the latter can be persuaded to work there steadily and in good faith. In fact her resources, though less varied than those of California, are even less developed, and offer a still more remunerative field to the intelligent cultivator.

Under the title of *A Domestic Problem* † Mrs. Diaz puts forth a new volume on "woman's rights," insisting, with an even unusual disregard of consistency, that women should be specially educated for the work of wives and mothers, but that they are not to be regarded as dependent on or subordinate to men, or to be guided as regards their education and training by the idea of winning the regard and approval of the other sex. How they can be wives and mothers unless they win the approval of men, or how they can educate their children to any purpose except in subordination to the head of the family, Mrs. Diaz, like most of the strong-minded, is too femininely illogical to inquire.

Mr. Noyes's *Home Talks* ‡, chiefly delivered to the Oneida Community, contain much less than might have been expected of his peculiar views, with much more than might have been hoped for of sensible, if not very original, religious and moral teaching. Mr. Collens's *Eden of Labour* § is, on the other hand, rank nonsense of the worst socialist kind, based, first on a belief in "natural value"—that is to say, on the idea that every article has a rightful price from which it is immoral to depart—and, secondly, on the absurd fiction that all labour has the same natural value, and fixes by its amount the value of all its products. Many of the wildest Communists have not contradicted so completely the plainest teachings of political economy and of common sense.

Mr. Quackenbos has given to schools an Illustrated History of the World ‖ in some four hundred octavo pages, and in broken paragraphs; a History which no adult would read so long as there was at hand a dictionary with which he might amuse himself by preference; a History which children may indeed be forced to read, but of which they will remember nothing.

A work entitled *Analytical Processes* ¶ is one of the dullest and most unreadable of those metaphysical treatises to which the famous definition of metaphysics may be applied without any paradox whatsoever.

The *True Order of Studies* **, by Dr. Hill, formerly President of Harvard University, in so far as it attempts to arrange all the departments of human knowledge in logical order of study, seems to us deficient alike in logical soundness and in practical method. When it comes to deal with the actual teaching of particular subjects it contains many suggestions which appear to us eminently valuable, and calculated especially to improve the very defective mode of instruction pursued in most second-class schools and in nearly all homes. It is not too much to say that half the time and two-thirds of the labour which children are obliged to give to their studies up to the age of fourteen are simply wasted through bad teaching, and that any system whatever, especially such a system as might be gathered from Dr. Hill's work, might double the amount learned in a year by an intelligent child, with an infinite saving of time, trouble, and tears.

We have two poems, or rather two volumes of poetry, rather above the dead level of mediocrity. Mr. Moffat's "Romance of Study" †† celebrates in several cantos the intellectual progress of an aspiring youth; and Mr. Watson's *Legend of the Roses* and *Ravlan* ‡‡, though wild and extravagant, contain some passages

ADVERTISEMENTS.

PHILHARMONIC SOCIETY.—*Conductor,* Mr. W. G. CUSINS. THIRD CONCERT, Monday, May 1. First Appearance of Herr Anton Rubinstein who will play his New Concerto, No. 5, in E Flat, and some Pianoforte Solos. Stalls 10s. 6d., 7s. Admission 2s. 6d. and 5s.

THE SOCIETY of PAINTERS in WATER COLOURS.—The EIGHTY-SIXTH EXHIBITION is now OPEN. 5 Pall Mall East. From 9 till 7. Admission 1s. Catalogue 6d.
ALFRED D. FRIPP, *Secretary.*

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRETORIUM," with "Dream of Pilate's Wife," "The Night of the Crucifixion," "Le Vigne," "Soldiers of the Cross," "Christian Martyrs," "Passing Tables," &c.—DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1s.

CHRISTIAN WEHRER'S WATER-COLOUR DRAWINGS and PAINTINGS in OIL, on Exciting subjects, including "A View in Venice," the property of Her Majesty the Queen. EXHIBITION now OPEN at PUBLINGTON GALLERY, 191 Piccadilly. Ten to Six. Admission, including Catalogue, 1s.

BRITISH MUSEUM.—The BRITISH MUSEUM will be CLOSED on the 1st and REOPENED on the 8th of May, 1876. Visitors cannot be admitted to see the Collections between the 1st and 8th of May, inclusive.
By order of the Trustees,
British Museum, April 20, 1876. J. WINTER JONES, *Principal Librarian.*

ROYAL LITERARY FUND.—The EIGHTY-SEVENTH ANNIVERSARY DINNER of the Corporation will take place at Willis's Rooms, on Wednesday, May 3.

The Earl of CARNARVON, on behalf of the Earl of DERBY, in the Chair.

Stewards.

Dr. John Anderson, M.D., F.R.S.E.
Rev. Charles T. Arnold, M.A.
James Lloyd Ashbury, Esq., M.P.
The Lord Bishop of Bangor.
Captain H. W. Bax, R.N.
H. E. Count Beust, Austro-Hungarian Ambassador.
Henry G. Bohn, Esq., F.R.G.S.
The Earl of Bradford.
Mr. Sinclair Bruff.
Colin Minton Campbell, Esq., M.P.
H. E. Marquis Casa Laigleziana, Spanish Minister.
Right Hon. the Chancellor of the Exchequer.
The Earl of Crawford and Balcarres.
George Dalziel, Esq.
Rev. Prebendary Davies, M.A.
Sir George Elliot, Bart., M.P.
Sir Barrow Herbert Ellis, K.C.S.I.
The Marquis of Exeter.
Rev. James Fleming, R.D.
John T. Freeman, Esq., M.A.
Sir Bazalgette S. Gifford, Q.C., Solicitor-General.
George Godwin, Esq., F.R.S.
John Murray Graham, Esq.
Charles Lewis Grantham, Esq., F.R.G.S.
H. E. The Marquis d'Harcourt, French Ambassador.
Charles Heneage, Esq., F.R.G.S.
Professor E.C. Jebb, M.A.
H. E. Baron Rochsbild, Swedish and Norwegian Minister.
Alderman and Sheriff Knight.
The Lord Bishop of Lincoln.
Rev. Dr. Littledale, LL.D.
The Lord Bishop of London.
Thomas Norton Longman, Esq.
David Mac Iver, Esq., M.P.
Rev. Donald Macleod, B.A.
Right Hon. the Lord Mayor, M.P.
H. E. Mirza Malcolm Khan, Persian Minister.
Herbert Minshton, Esq.
Kenneth Muirdurchan, Esq., F.R.G.S.
J. G. Parkinson, Esq.
H. E. Musurus Bashá, Turkish Ambassador.
Frederic Ouvry, Esq., President S.A.
H. E. Baron de Penedo, Brazilian Minister.
Rev. George R. F. Prothero, M.A.
The Lord Bishop of St. David's.
The Marquis of Salisbury.
Sir Albert Sassoon, C.S.I.
Charles Shaw, Esq.
William Smith, Esq., F.S.A.
H. E. Baron Solvyns, Belgian Minister.
Rev. Canon Swainson, D.D.
John Symonds, Esq.
Rev. J. Edward Vaux, M.A.

10 John Street, Adelphi, W.C. OCTAVIAN BLEWITT, *Secretary.*

ARTISTS' GENERAL BENEVOLENT INSTITUTION, for the Relief of Distressed Artists, their Widows and Orphans.

The ANNIVERSARY DINNER will take place in Willis's Rooms, on Saturday, May 13, at Six o'clock.

His Grace the Archbishop of YORK in the Chair.

Donations will be received and thankfully acknowledged by:
JOHN EVERETT MILLAIS, R.A., *Honorary Secretary.*
FREDERIC W. MAYNARD, *Secretary,* 24 Old Bond Street, W.

Dinner Tickets, including Wines, One Guinea.

THE ANNUAL BALL in AID of the FUNDS of the UNIVERSITY COLLEGE HOSPITAL will be held at Willis's Rooms, St. James's, on Thursday, May 18, under the distinguished patronage of
Her Royal Highness the PRINCESS LOUISE, MARCHIONESS of LORNE.

Vouchers may be obtained from the Ladies Patronesses or the Stewards, and should be exchanged for tickets as soon as possible by application to any of the Stewards, or to the Resident Medical Officer at the Hospital.

Tickets (not transferable) £1 1s. Refreshments, with wine and supper, included.

Further information may be obtained by application to the Resident Medical Officer at the Hospital.

BRITISH AND FOREIGN SCHOOL SOCIETY.

THE SEVENTY-FIRST GENERAL MEETING OF THIS SOCIETY will be held on Monday, May 8, 1876, at the College, Stock well Road, S.W.

The Chair will be taken by the Right Honourable the Earl RUSSELL, K.G., or the Right Hon. W. E. FORSTER, M.P., at 12.30 o'clock.

There will be an Exhibition of Kindergarten occupations at 10 A.M. The Mixed and Infant Schools may be inspected from 10 A.M. to noon. The New Premises will be opened by the Right Hon. the LORD MAYOR at 11 A.M. The College may be viewed after 2.30 P.M.

Tickets may be obtained by application at the Society's House, Borough Road, S.E.
ALFRED BOURNE, *Secretary.*

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.

The SUMMER SESSION will begin on Monday, May 1.

The Clinical Practice of the Hospital comprises a Service of 710 Beds, inclusive of 36 Beds for Convalescents at Highgate.

Students can reside within the Hospital walls, subject to the College regulations.

For all particulars concerning either the Hospital or College, application may be made personally or by letter, to the RESIDENT WARDEN, of the College, or at the Museum or Library. A Handbook will be forwarded on application.

GUY'S HOSPITAL MEDICAL SCHOOL.—The SUMMER SESSION will Commence on Monday, May 1. The Hospital contains 650 Beds, with separate Wards for special Diseases. The Museums of Physiology, Anatomy, and Comparative Anatomy contain numerous Specimens and Drawings, as Models of Skin Diseases, and an unique Collection of Anatomical Models. Special Classes are given in the subjects required for the London University Degrees.

For particulars apply to the Dean, Dr. F. TAYLOR, or the Secretary, Mr. STOCKER.
Guy's Hospital, S.E., April 1876.

POWIS EXHIBITIONS.—ONE EXHIBITION, of the value of £60 a year, tenable at any College or Hall at either of the Universities of Oxford or Cambridge, is intended to be filled up after an examination of the Candidates, which will take place at King Edward's School, Birmingham, on Tuesday, September 26, and the following days, before JOHN RHYS, Esq., M.A., late Fellow of Merton College, Oxford, and the Rev. CHARLES EDWARD GRAVES, M.A., Lecturer of St. John's College, Cambridge.

Candidates are requested to send their Names, Addresses, and Certificates of Baptism, with Testimonials of Conduct and Character, on or before August 1, to CHARLES SHAW, Esq., 2 Essex Court Temple, London, E.C. Candidates must be Members of the Church of England, Natives of Wales, or of one of the four Welsh Dioceses, under Twenty years of age upon October 10 next, acquainted with the Welsh Language, and intending to become Candidates for Holy Orders.

The Candidates will be examined in Welsh Reading, Composition, and Speaking, the Gospel according to St. Luke and the Acts of the Apostles in Greek; the Fifth and Sixth Books of the Iliad; the First Book of Thucydides; the Tenth Book of the Æneid; Xenophon's Anabasis; Cicero de Officiis; and Latin Prose Composition. Those who fail in Welsh will not be further examined.

The Exhibition will be tenable (during Residence) for Four years, by an Exhibitioner who at the time of his Election is not legally a Member of either University, and will in his case date from Matriculation; and by an Exhibitioner who at the time of his Election is legally a Member of either University, till the close of the Term in which the Degree of Bachelor of Arts is due to the Holder.

April 1876.

CHELTENHAM COLLEGE.—TWELVE SCHOLARSHIPS. Eight £30; Four £20. Election Second Week in May.—Apply to the SECRETARY, the College, Cheltenham.

CLIFTON COLLEGE SCHOLARSHIPS.—EIGHT or more will be open to COMPETITION at Midsummer, 1876, value from £25 to £50 a year, which may be increased from a special fund to £80 a year in cases of merit where the requirements. Further particulars may be obtained of the SECRETARY, the College, Clifton, Bristol.

CLIFTON COLLEGE.—BOARDERS will REASSEMBLE On Tuesday, May 9. The Entrance Examination for new Boys will take place the same day at 1 P.M.

LADIES' COLLEGE, POLYGON HOUSE, SOUTHAMPTON.

Patrons.
The Right Rev. the Lord Bishop of WINCHESTER.
The Right Hon. Viscount EVERSLEY.
The Right Hon. Lord FORTESCUE.

President.—The Right Hon. COWPER-TEMPLE, M.P.

The SUMMER TERM commences May 4 for Boarders, and May 5 for Day Students. Instruction is given by Professors in Literature, Science, and Art. English and Foreign Governesses reside in the College. The Senior Classes are open to Occasional Students, who may be desirous of taking up any given subject.

Children are received from Five years of age.

For particulars, application should be made to the Lady Principal (Miss DARNELL), Polygon House, Southampton.

W. C. MACLEAN, M.D., C.B., *Hon. Secretary.*

MISS MARY TEED'S MORNING SCHOOL for YOUNG LADIES will RE-OPEN Tuesday, May 2, at 10 Radnor Place, Hyde Park, W.

THE MISSES A. and E. LEGGE'S [illegible] Kensington Gardens Square, Bayswater, W.

No. 1,071, Vol. 41. May 6, 1876. [Registered for Transmission abroad.] Price 6d.

THE ROYAL PROCLAMATION.

THE terms of the Royal Proclamation took the world by surprise. Although the Act enabled the QUEEN to make any addition to her titles that she pleased, and she might under its provisions have assumed the title of Empress of India without any reservation, yet it had been stated that the advice of her Ministers, under which the QUEEN would act, was that this title should be purely local, and should be confined to India. On some occasions, such as when treaties are made with foreign Powers, and generally in diplomatic intercourse, it would be necessary that the full title should be used; but for every ordinary purpose of government outside India the QUEEN's titles would remain precisely as before. In order to make this undertaking absolutely binding, it was proposed by the leaders of the Opposition that the Act should itself contain the necessary limitations. But the Ministry wished to avoid the long delay and severe verbal criticism to which this alteration of the measure would have given rise, and asserted that it was wholly unnecessary to insert any limitations in the Bill, because they would be inserted in the Proclamation by which the Bill, when it became law, would be made operative. The Proclamation was therefore to be the instrument by which the title of Empress was to be localized in India. How this was to be done was a matter of reasonable curiosity, but the CHANCELLOR was clear on the point that it could and would be done. When the terms of the Proclamation became known it seemed as if the Government must have forgotten all about the limitations it had promised. There was no reference to India, no shadow of an intimation that the title was an Indian title, the use of which was to be restricted to India. The new title, Empress and all, is to be used on all occasions when it can be conveniently used, and the only exception is as regards instruments the operation of which is confined to the United Kingdom. This seems to be exactly the reverse operation from that which the Ministry had undertaken to perform. What they had promised to do was to restrict the use of the title to India. What they have done is to make the use of the title general, and to take out of its range one specified class of documents. The new title is, it seems, meant to prevail to the utmost limits where this one special exception does not operate. So far as the Act and the Proclamation affect the Colonies, they are exactly in the same position as India, and the QUEEN is Empress there as much as in Bengal. In all instruments "extending in their operation beyond the United "Kingdom," the title of Empress is to be used. This language is open to many interpretations. What are the instruments which do or do not extend in their operation beyond the United Kingdom? Nice and difficult points are sure to arise under this head. Already the opinion of a VICE-CHANCELLOR has been taken as to whether a writ of the Court of Chancery intended to be served in Germany should be passed with the old or the new title. The VICE-CHANCELLOR prudently said that this was too high a matter for him, and the parties must ask the LORD CHANCELLOR, who alone was qualified to interpret his own Proclamations. It is a document that will need, and no doubt will receive, a large amount of interpretation. But for the moment the important point is one of a larger and rougher sort, and is whether the Government has fulfilled in the Proclamation the engagements it entered into while the Bill was under discussion.

The pledges of the Government were chiefly given in the House of Commons, and by no one in a more definite shape than by Mr. DISRAELI himself. The issue will be raised more distinctly in the Lower House than it could be in the Lords. As the Opposition, with a very fair show of reason, contend that the pledges of the Government have not been redeemed, it has been impossible to frame a motion expressing this opinion without conveying a censure on the Government; and Mr. DISRAELI at once, on hearing the notice of the motion which Sir HENRY JAMES proposes to make, fixed a day next week for its discussion. The vote which will follow the motion is altogether immaterial. The majority of the Ministry is assured. The Conservatives are not going to let their chiefs be turned out of office, whatever may have been the terms of a Proclamation. But the victory will lie really with the side that shows a superiority in argument, and the case against the Ministry is undoubtedly a strong one. It must be owned that it ought to be a strong one to justify the re-opening of a subject at once painful and wearisome. But the importance of holding a Ministry to its engagements is so paramount that the Opposition, having a strong case, cannot fairly be blamed for wishing to state it once for all effectively and fully. It is not probable, however, that the opponents of the Ministry will have much to add to the statement of Lord SELBORNE, or that the defenders of the Ministry will have much to add to the counter-statement of the CHANCELLOR. No pledge given by any of his colleagues could be more full, precise, and intelligible than that given by Mr. DISRAELI himself. "The assumption of "the title of Empress," the PREMIER said, "is to be limited "to India and to be a local title." In some formal documents in which it was necessary that the full title of the Sovereign should be set out, the words Empress of India would, the Ministry owned, have to be used; but the ordinary and general use of the title was to be confined to India. The simple question is, has it been so confined by the terms of the Proclamation? Lord SELBORNE, wishing to be very precise, stated that he held that the Government had, as he understood the matter, entered into two engagements—the negative engagement that the title of Empress should not, when it could possibly be avoided, be used in the United Kingdom of Great Britain and Ireland, and the positive engagement that it should be, as far as possible, limited in its use to and localized in India. The first or negative engagement has, as Lord SELBORNE contends, been broken by not providing against the use of the title in the United Kingdom, except in a limited class of documents. The second or positive engagement has, in Lord SELBORNE's opinion, been altogether ignored. There is nothing in the Proclamation to localize the title at all. It is in general operation throughout India, the Colonies—so far as the Colonies are bound by an English Act and a Proclamation made under its provisions—and in the United Kingdom itself outside of the range of the excepted documents.

The CHANCELLOR failed to shake the case of his opponent, but he inspired a belief that the Ministry had wished to fulfil its pledges, and had only failed to do so because it could not find any way of carrying them out. It had offered to do more than it could do. It could not make up its mind as to what were the documents operating beyond India in which the full title was to be used. The other alternative seemed to offer a readier means of getting out of the difficulty. Instead of saying where the title was to be used, it was simpler to say where it was not to be used. If a document operates only in the United Kingdom, then the ancient title alone is to be used; and in all other cases the new title is to be used. It is true that there is extreme difficulty in deciding what are the instruments which ope-

rate only in the United Kingdom; but then the burden of solving the problem will now rest, not on the Government, but on individuals. As the VICE-CHANCELLOR said, with reference to the writ to be served in Germany, the parties, unless they choose to act under the directions of the CHANCELLOR, must take their chance of having the proceedings set aside. This is a curious effect of a title which was said to be meant to be localized in India. The failure to localize the title is still more evident when the case of the colonies and dependencies of the Crown is taken into consideration. Colonies with a local Legislature are not bound by an English Act in which they are not named, but many of the dependencies of the Crown are exactly in the position of India. Whatever can be said of India can be said of Malta, and the QUEEN is just as much Empress of India at Valetta as she is at Calcutta. How can it be said that this is localizing the title in India? Even the Channel Islands are beyond the restrictions of the Proclamation, and a Royal Warrant to operate in Jersey must run in the new form. The Proclamation, it must also be repeated, makes the new title general unless where the restrictions operate. The Corporation of Dublin wish to present an address to the QUEEN, and have consulted Sir BERNARD BURKE, as Ulster King-at-Arms, as to the proper form. Sir BERNARD BURKE has replied that, according to the terms of the Proclamation, the title of Empress of India ought to be inserted. The ATTORNEY-GENERAL, when questioned on Thursday in the House of Commons, stated, on the other hand, that there is nothing, in his opinion, in the Proclamation which can warrant the use of the new title in an address presented to the QUEEN by her subjects in this country. But the opinion of the ATTORNEY-GENERAL seems to differ from that of the CHANCELLOR, who said that Corporations were at perfect liberty under the Proclamation to use the new title or not as they might think proper. This is an excellent instance of the mischief which, if their words were to be taken in any literal or intelligible sense, the Ministry engaged to avert by the terms of the Proclamation. If it is open to Corporations to call the QUEEN Empress, the Corporations that call her Empress will be thought the more loyal, and those that still call the QUEEN by her old title will be thought the less loyal, bodies. If the Ministry were to advise the QUEEN to refuse to receive any address from residents in the United Kingdom in which she was styled Empress, a very salutary effect would be produced. But this would be to put an interpretation on the Proclamation which its terms do not suggest. As it stands, it does not localize the title and confine it to India, whereas the Ministry promised that it should do so. That their failure to carry out their undertaking proceeds from the difficulties of the task they rashly imposed on themselves, and not from any want of good faith or desire to introduce Imperialism by a side wind, may be freely admitted, but it is still unfortunately true that they have not succeeded in doing what they undertook to do.

MR. LOWE.

AFTER Mr. LOWE'S ample apology it would be ungenerous to reproach him with his mistake, except as far as it illustrates his intellectual character. He seems destined to serve as an example of the comparative inutility of great powers when they are accompanied by want of tact and by deficient knowledge of human nature. On several occasions during the present Session he has wantonly damaged himself and his party by the use of arguments which, even if they tended to support his conclusion, were offensive to the House and the country. Of all the numerous and convincing objections to the Royal Titles Bill, the most obnoxious, not excepting Mr. GLADSTONE'S protest on behalf of the native princes, was the suggestion that at some future time England might be compelled to abandon her Indian Empire. The consideration might legitimately affect the judgment of a statesman, but it was unfit to be expressed in words. Disaffected natives will probably hereafter quote the admission of an eminent member of the House of Commons that the foreign dominion in India is precarious and transitory. When Mr. LOWE afterwards learned with surprise the irritation which had been provoked by his indiscreet phrase, he seems to have been unable to understand the cause and nature of the offence which he had given. He afterwards expressed regret for having said what appeared to be disagreeable to the House, but he added a repetition of the opinion which had been justly censured. About the same time his first speech on the Suez Canal purchase did the Government important service. The Ministerial measure was at that time popular because it was regarded as an instance of bold and active policy; and Mr. LOWE did his own cause injustice by an irrelevant contention that the Government had not made a profitable investment. As if to illustrate in the most effective manner his misconception of the issue, Mr. LOWE took the opportunity of boasting that his own arrangements for paying the *Alabama* damages had been more economical than the provision for paying the Canal purchase-money. It had evidently not occurred to him that the *Alabama* payment was the most mortifying transaction of modern times; and that, when he spoke, the Egyptian bargain was approved as a gratifying result of patriotic spirit. Submission to America in the past, and possible Indian disaster in the future, were topics not acceptable to the House of Commons.

The severe rebuke which Mr. LOWE received on Tuesday last was, as he admits, the result of a graver blunder. At the East Retford Liberal dinner he had evidently determined to inflict a heavy blow on an adversary who has perhaps earned his hostility. On former occasions impartial spectators have watched with amused sympathy, if not with unqualified respect, Mr. LOWE'S attempts to damage Mr. DISRAELI. It would be unjust to attribute his persistent attacks to merely personal animosity. Mr. LOWE evidently feels an intellectual antipathy or antagonism to a mental constitution which seems to him incomplete and objectionable. He has often called attention to Mr. DISRAELI'S habitual inaccuracy in details, as if the brilliant victim of his criticism had not survived the exposure of a thousand loose and questionable statements. COLERIDGE propounded the aphorism that, till you understand a man's ignorance, you ought to presume yourself ignorant of his understanding. Mr. LOWE has never understood that Mr. DISRAELI'S ignorance of statistics, of law, and of many branches of public business, has somehow been found compatible with almost unprecedented success. A thousand errors have fallen to his share, but the House of Commons and the country have looked at his career and have forgotten them all. It is true that of late Mr. DISRAELI has made some mistakes which might rather have been expected from Mr. LOWE, as in the wonderful speech which began with a schoolgirl and ended with a defiance of the Emperor of RUSSIA. Mr. LOWE knows books and figures and other important matters incomparably better than Mr. DISRAELI; but Mr. DISRAELI understands the temper of the House of Commons; and in personal encounters of wit with Mr. LOWE he has almost always come off the conqueror. At the last general election Mr. LOWE'S ingenious vituperation and bitter ridicule were stifled in the burst of amusement which welcomed Mr. DISRAELI'S account of his reasons for erecting the University of London into a constituency. The pink fly of Abyssinia is inseparably associated with Mr. LOWE, though there is reason to believe that it was really invented by Mr. DISRAELI.

The serious charge which Mr. LOWE preferred at Retford ought not to have been lightly made, even if it had not involved a higher personage than Mr. DISRAELI. The responsibility of introducing the Royal Titles Bill would have been greatly aggravated if it had been true that two Prime Ministers had, at the risk of incurring disfavour at Court, withstood solicitations to propose a similar measure. Mr. LOWE accused Mr. DISRAELI of being a courtier, if not a sycophant; and there can be no doubt that his statement produced the intended effect of subjecting the Minister to general disapproval. Mr. LOWE indeed declared that he was violating no confidence, because he had received none; but his position and former official rank justified the impression that he spoke on evidence which could not be impugned. In the pleasure of inflicting an injury on a political opponent Mr. LOWE seems to have forgotten for the moment that Mr. DISRAELI and his predecessors were not the only actors in the story. If Lord DERBY, or Lord PALMERSTON, or Mr. GLADSTONE, had declined an indiscreet request, it followed that an indiscreet request had been made by one whose name and station ought to have made her sacred from attack. His language also involved the statement that the demand which had been condemned by two Ministers as injudicious had been a third time advanced with greater success when a more pliable states-

man was in office. Of the most objectionable part of the transaction Mr. LOWE was probably altogether unconscious. It was his object to do the utmost possible harm to an opponent, and the collateral results of his attack were never contemplated. It is not known whether he was even awakened to the nature of his declaration when Mr. GLADSTONE, who had been naturally supposed to be one of the personages of the story, publicly repudiated any share in the reported transaction. After the appearance of Mr. GLADSTONE'S letter, it was supposed that Lord PALMERSTON and Lord DERBY had refused their consent to the assumption of an Imperial title; and at first it seemed difficult or impossible to prove a negative.

Mr. LOWE'S answer to Mr. LEWIS would have been justifiable if the indiscretion committed at Retford had been less serious. When he refused to explain language which had not been used in the House of Commons, he implied that he still believed in the truth of the charge which he might have taken the opportunity of retracting. He was probably not prepared for Mr. DISRAELI'S crushing confutation. By his own fault Mr. LOWE was delivered into the hands of an adversary from whom he had not deserved mercy. Mr. DISRAELI made good use of the advantageous position of incidentally refuting the accusation against himself while he was discharging the duty of defending the QUEEN. In the peculiar circumstances the SPEAKER and the House could not refuse, under pretext of a Parliamentary rule, to listen to an authorized contradiction of a slanderous rumour. Mr. LOWE had not only committed the error of including the QUEEN in his charge against the PRIME MINISTER. He is exclusively responsible for compelling the QUEEN to defend herself against the imputation which had been repeated by a former Cabinet Minister. It is now certain that no Minister before Mr. DISRAELI has either refused to propose an addition to the Royal Titles, or received from HER MAJESTY any overture of the kind. The answer is complete; but the QUEEN ought not to have had occasion to answer. It is true that a Royal suggestion to a Minister is, whatever may be its nature, perfectly compatible with constitutional propriety; but a perfectly regular proceeding may be injudicious; and the renewal of a proposal already declined by two Prime Ministers might have been thought to indicate unbecoming obstinacy. It is at least certain that Mr. LOWE unintentionally blamed the supposed overture when he condemned Mr. DISRAELI for adopting it. Mr. LOWE'S mistake proceeded from no more blameable cause than a natural bluntness of perception. If the gossip which he reproduced had happened to be true, his accusation of Ministerial servility might have been sustained; but his violation of the respect due to the Crown would have been equally inexcusable. Mr. REED'S well-meant attempt to cover Mr. LOWE'S retreat must have reminded him painfully that his former colleagues could not devise an apology to extenuate his error. It was only by strange mismanagement that the numerous episodes of controversy on the Royal Titles Bill could have ended with an undisputed triumph achieved by Mr. DISRAELI.

GERMANY AND ITALY.

ALL modern societies in Europe, unless they are on a very small scale, have the same difficulties to encounter. The same questions in different forms agitate one country after another. There are the questions of the province of the State with regard to society and industry, of the relations of Church and State, and of disaffected minorities. In some States Socialism causes greater embarrassment than in others, but in all it causes some; and although each State may have its own special points of foreign policy, questions arise like that of the Turkish insurrection which affect all at once. In Germany and Italy more particularly the same questions are constantly arising. One of the causes of dispute which proved fatal to the MINGHETTI Ministry was the proposed purchase of the Lombard, Roman, and Southern Railways. The new Ministry is evidently much puzzled what to do with the Railway Bill bequeathed to it by its predecessors, and to gain time it has induced the Chamber to take one system at a time and to begin with the Lombard. It is probable that Signor DEPRETIS would like to have nothing to do with the purchase of any railway; but he finds it difficult to escape from the treaty with Austria for the Lombard purchase, and as in Italy the Companies wish to sell, there is naturally a strong pressure put on the Government by those who wish to see the bargain concluded. In Germany it is just the other way. There it is Prince BISMARCK who wishes to buy, and the owners of the railways who do not wish to sell. That which is the objection to the purchase in Italy, the increased power of centralized machinery and of officialism generally, is the attraction to Prince BISMARCK. The absorption of all German railways into one vast system, belonging to the Empire and under its exclusive control, is said to be the object at which he aims. No sufficient commercial motives can be urged to justify the scheme. The merits it possesses are almost exclusively political, as is the opposition to it. It is really a scheme for placing all the lines of communication throughout Germany under the direction of Berlin. Very naturally the small States object to this. While their railways belong to them they have still something of their own which they can see. Their separate armies are, they know, under the direction of Berlin, and their little Legislatures fall in with the humours of Berlin, or are made to feel the consequences of disobedience. But they are proud of their railways as local triumphs, and are pleased to think that the porters and guards are still indisputably their own. It is a small sign of independence, but it is one felt and realized in daily life. So strong has been the opposition that Prince BISMARCK has cut down his actual proposal to very modest figures. His proposal does not proceed from the Imperial Government at all. It only concerns Prussia, and all that Prussia has done at his bidding is to signify to the Federal Council that, if the Empire likes to buy the Prussian State Railways and the authority of the Prussian Government over the private railways in Prussia, a fair price would be accepted. By this no one is committed to anything. But the upholders of such independence as still remains to the small States are probably quite right in feeling uneasy. They say to themselves that Prince BISMARCK, when he has invented a big policy, is very apt to persist in it, although it has always been his way to draw back for a time when he thinks it prudent to do so. It is not to be supposed that he has taken up his railway scheme without having a distinct and serious aim, to attain which would compensate him for the great trouble which must precede success. Nor is it difficult to see what this aim is. The unity of Germany owed its existence in a great measure to the enthusiasm excited by the French war, and enthusiasm is apt to die away. It is natural that Prince BISMARCK should wish to consolidate his great work, and to bind up the idea of the Empire with all the sentiments and the habits of the people. One way to effect this would have been to lead Germany through new military triumphs; but the circumstances of the times are not propitious to a policy so hazardous, and the readiest method of attaining the desired end may easily appear to be to increase in a large degree the machinery of Imperial administration.

Germany and Italy are both apparently going through a period of comparative repose in ecclesiastical matters; and advantage has been taken of the lull for a conference to be held at Rome between some special representatives of the Papacy and what are vaguely termed representatives of some of the Great Powers. It is highly improbable that Germany or Italy took any part in the proceedings, but those who did take a part in them must have had Germany and Italy in their eye. As might have been expected, the Cardinals were not authorized to make any concessions. They said that Concordats were the only instruments of peace, and there can be no doubt that from their point of view they are right. A Concordat is a piece of bargaining in which the Vatican always gets the advantage; and necessarily so, for a Concordat is merely a statement of the terms on which, in a particular case, Rome will consent not to put the doctrines of the Syllabus in force. If the State has got down to the point at which it merely asks that the Syllabus may be slightly watered for its benefit, civil independence is gone; and this is a position which neither Germany nor Italy can possibly accept. But if the Italian Ministry has not got ecclesiastical troubles to vex it, the crop of difficulties that surround it grows rapidly enough to engage its attention. It finds itself obliged to tread with unpretending humility in the paths of its predecessors. Not only has it to retain the Grist-tax, the obnoxiousness of which was the main engine which it used to subvert its opponents, but it has to use force in a very peremptory manner to put down those who

object to it. The Grist-tax is to the Italian Left very much what Irish Coercion Acts used to be to English Whigs—a monstrosity to be fervently attacked when in opposition, and a necessity to be urgently demanded when in office. Signor NICOTERA, whose appointment to the Ministry of the Interior was represented as highly dangerous on the ground that he was a Garibaldian democrat, has been almost exclusively occupied since he gained the prize of office in suppressing popular tumults and manifestations. One of the very best parts of Parliamentary government is that it gives a Liberal Opposition the opportunity of occasionally learning the instructive lesson that government is a business, and has to be carried on in a very different way from what they led the world to suppose would suffice, while they had nothing to do but to go on rolling out irresponsible talk.

A Conference is to be held at Berlin between the representatives of the three Empires for the discussion or settlement of the Turkish insurrection; and it is highly proper that Germany, which invented the league, should come forward as the arbitrator or peacemaker between the conflicting aims and views of her allies. The importance of the questions raised by the insurrection, and of the issues which may grow out of it, has been duly appreciated by the Italian Government, which has transferred Signor NIGRA, the most eminent of its diplomatists, from Paris to St. Petersburg. A French Correspondent of the *Times* has written a very curious letter in which he bewails the hard lot of Signor NIGRA. He proves by the most elaborate arguments that Signor NIGRA deserves to stay in Paris, and that to take away from Paris a man who has well earned the supreme felicity of staying there is an instance of the most wanton tyranny or the blackest ingratitude on the part of the Italian Government. He recounts all the great services of Signor NIGRA—how he managed to get Venice by a Prussian alliance without offending France; how he was the devoted friend of the EMPEROR, and perfectly charming in his deferential regard for the EMPRESS; how, after the war, he won the heart of M. THIERS; and how, after the fall of M. THIERS, he gained the confidence of Duke DECAZES. It is quite terrible that such a man, having been fifteen years at Paris, should now be sent somewhere else. The explanation of the change would be almost beyond the comprehension of a patriotic and enthusiastic Frenchman. While Italy was being made a European Power, Paris was for Italians the centre of hopes, fears, interests, and ambition. Now that Italy has been made a European Power, it has to look where is the real centre of the foreign policy with which for the time Europe is busying itself. Delightful as Paris is, and eminent as are the services by which Signor NIGRA has earned his right to stay there, it is unfortunately the fact that Russia has very much and France very little to do with the solution of the question which is now agitating Europe. Italy wants its ablest diplomatist where he can be most useful, and Signor NIGRA can serve his country in exile by the Neva much better than in his happy home by the Seine. His transfer marks the great change which a few years have wrought in the political situation of Europe.

THE IRISH PEERAGE.

THE House of Lords ought to receive with favour Lord INCHIQUIN'S Bill for diminishing the anomalies which are inseparable from the existence of Irish peerages. It is not for the interest of hereditary legislators that their social and political privileges should be shown in living instances to be practically separable. The Irish peerage has, like many eccentric institutions, an historical origin and explanation; but it serves no practical purpose. Before the Union it had for ages been thought necessary to reproduce in Ireland the English Constitution, if not substantially, at least in form. It followed that there was a House of Lords of different ranks, possessing every attribute of its prototype except political power. The Crown, which generally objected to a profuse creation of English peers, was less scrupulous in Ireland. The heads of the families which managed the Government business were ennobled one after the other; and in later times the roll of the peerage was filled up with Englishmen who were thought not sufficiently important in property or interest to be admitted to the English House of Lords. GEORGE III. more than once complained of the profuse employment by his successive Ministers of Irish peerages as rewards to their adherents; but Lord NORTH persisted in the practice, and PITT was still more liberal of honours which cost him nothing. At one time he adopted the odd practice of making an Irish peerage a step towards a peerage of Great Britain, which might be earned by other services. When the Act of Union was passed there were more than two hundred Irish peers, including many who would never have thought of taking their seats in the House of Lords. To obviate opposition, and in accordance with the Scotch precedent of a century before, the lay Irish peers were allowed to elect representatives, and the bishops took their seats in the House by rotation. Parliament perhaps foresaw and regarded with complacency the certainty that the representative peers would belong exclusively to the majority, and the probability that they would not be insensible to the influence of the Tory Government of the day. In practice the independent choice of the constituency has been a transparent fiction. The Duke of WELLINGTON, and after him the late Lord DERBY, had for many years the patronage of the representative peerage.

Lord STANHOPE, who, though he was not an orator nor a statesman, possessed a happy knack of discerning the absurdity of obsolete practices, had the merit of carrying an Address to the QUEEN requesting her to suspend the creation of Irish peerages. It was unlucky that in this respect the precedent of the Scotch Union had not been followed. But for the frequent limitation of the succession to Scotch peerages to heirs general, the order, which has not been recruited for a hundred and seventy years, would by this time have been extinct or have been merged in the peerage of Great Britain. Either the Irish peers feared that as their numbers declined they might not be thought a sufficiently numerous constituency, or the Minister was not willing to relinquish the distribution of one of the minor streams which flowed from the fountain of honour. It was accordingly provided that the Crown might create one Irish peer for every three peerages which became extinct; and until recent times the power was commonly exercised. Some difficulties were raised as to alleged interference with the rights of the Crown, but eventually Lord STANHOPE'S judicious proposal was adopted. Lord INCHIQUIN meets with no opposition when he proposes to render the new system permanent; and the House of Lords unanimously affirms the proposition that "it is expedient that peerages should no longer be created "which do not confer the right to sit and vote in the "House of Lords." The preamble might have been better expressed, and it has the fault of being argumentative; but on the substance of the proposal there is no difference of opinion. Lord INCHIQUIN'S second clause has no necessary connexion with his first. The reason for increasing the number of representative peers from twenty-eight to thirty-two is fanciful and unsound. The bishops who represented the spiritual estate naturally lost their seats when the State no longer recognized a Church in Ireland. It was not intended to transfer any advantage which the clergy formerly possessed to the lay peerage.

The discussion in the House of Lords turned less on the provisions of the Bill than on an amendment of Lord O'HAGAN'S which was intended to give the minority a share of representation. It was proposed that no future election should take place until there were three vacancies, unless indeed Lord INCHIQUIN'S provision for the immediate increase of the representation were adopted. Each peer was only to vote for two candidates, or, according to an alternative scheme of Lord GREY'S, which was adopted by Lord O'HAGAN, all three votes might be concentrated on a single nominee. The LORD CHANCELLOR made the odd objection that the device would be ineffectual, inasmuch as the Liberal minority was not strong enough, even with cumulative voting, to return a single candidate. The modern theory of representation of minorities is not yet generally accepted, but the experiment could not be tried with less risk of harm than in the case of the Irish representative peerage. There is at present only one Liberal member of the body; and if he were to vacate his post, his successor would be chosen by the majority. It is desirable to cultivate and keep alive the decaying stock of aristocratic Liberals. No class of the community has deserved better of the country; but the younger generation includes many deserters from the creed or party of their forefathers. Innovations in modern times are not of the kind which can be palatable to a rich and privileged class. There were probably not half a dozen members of the House of Lords who really approved of the Irish Land Bill with the precedent which it might possibly establish.

The acquiescence of the peers in the obnoxious measure was an act of patriotic prudence; but the effect has been to render Liberal landowners suspicious of some of their allies. If a few Whig peers can be found in Ireland and sent to the House of Lords, they will reinforce a valuable body which threatens to become extinct. Time would show whether Lord CAIRNS was justified in believing that no possible contrivance would enable the minority to elect a representative.

The law which prevents an Irish peer from sitting in the House of Commons for a county or borough in his own country was strictly consistent with principle and precedent, but it is in practice either useless or mischievous. The Scotch peers are subjected to a more painful disability, inasmuch as since the Union they are absolutely prohibited from sitting in the House of Commons. If Tiverton had been less loyal to Lord PALMERSTON, it might have been an inconvenience that he could not sit as member for Sligo. Unfortunately in modern times the class to which Irish peers belong is not in the greater part of Ireland acceptable to those who control elections. It was, as Lord INCHIQUIN acknowledged, properly suggested that the proposal ought to be introduced in the House of Commons, which is supposed to be the judge of its own constitution. It will be difficult or impossible for a private member to carry the Bill through the House in the present Session. Some members will not desire to remove any anomaly which may be supposed to diminish the credit of the House of Lords; nor will it be possible to prevent Irish patriots from profiting by the opportunity for declamation. Lord INCHIQUIN has unluckily drawn his first clause in an awkward form, by proposing to repeal the Acts for the Union of Great Britain and Ireland as far as they relate to the creation of Irish peers. Some ingenious Home Rule member may perhaps move by way of amendment to omit the words which specify the purpose of the Bill. A proposal to repeal the Act of Union sounds strange; and probably it will hereafter be quoted as a precedent. Mr. BUTT has never abandoned his ostensible project of restoring to Ireland a Parliament consisting both of Lords and Commons. It is true that no Irish peer is prepared to take a seat in the revived House of Lords; but the restraint of the power of the Crown to create Irish peers may easily be converted into an insult to Ireland. If the Government would take charge of the Bill, the only important clause which prevents the creation of Irish peers might probably pass into a law. If the House of Commons cares little for the anomalies of the Irish peerage, it can scarcely insist on maintaining an abuse which has been denounced by the Assembly to which the subject-matter belongs. The Irish members can, if they think fit, oppose the insidious suggestion that Irish peers should be capable of representing Irish constituencies in the House of Commons.

FRANCE.

THE French prefects who have been dismissed by the MINISTER of the INTERIOR are behaving themselves after a fashion which is not uncommon with domestic servants after receiving notice to go at the end of the month. They are exceedingly anxious to convince M. RICARD that they would not have stayed in his service however much he might have wished it. The place did not suit them any better than they suited the place. If they had not been sent away because they were not sound Republicans, they would have taken themselves away because M. RICARD is not a sound Conservative. Occasionally they hint that the day will come when their unfortunate country will again have need of their devotion, and they magnanimously pledge their word that no recollection of the injuries they have sustained shall be suffered to stand in the way of their return. Whenever the Government of France is once more conducted on right principles, these noble souls will again sacrifice themselves on the altar of public duty. Till then they will amuse themselves with watching the useless struggles of the Republic against the anarchy which must follow their departure. The Republican journals—at least those of them that were foremost in urging the Government to dismiss any official who was so unfortunate as to be appointed by M. BUFFET or the Duke of BROGLIE—draw, as it seems to us, a wrong moral from these impertinent letters. They treat them as so much evidence of M. RICARD's weakness in not sending his whole staff about their business the moment that he came into office. Now you see, they say, the class of men you had to deal with. You thought that you might temporise with them, that you might be content with moving some to new departments, and only dismissing those of whose enmity to the Republic you had positive proof. The result of this weakness is that you and the Government in your person have been grossly insulted. You have had your dismissals thrown in your face. If these officials had been sent away as soon as you accepted a seat in the Cabinet, they would never have dared to write these impudent letters. That they have written them now is the natural result of the reputation for timidity which you have wilfully made for yourself. This denunciation of the Minister is founded on a wrong estimate of the motives which lead dismissed officials to say rude things to their late chief. A prefect who has been deprived of his place and his salary on political grounds has nothing to lose by incivility to the Government. His income is already gone; his reputation, so far as it depends on Ministerial approval, is already gone; and all that remains to him is such reputation as he may make with the enemies of the Administration. These ex-prefects who tell M. RICARD that they would not have served under him, even if he had been willing to retain them, will earn some cheap credit with the adversaries of the Government; whereas, if they had remained silent, even this small consolation would have been denied to them. But it must be noted that, though M. RICARD was not at all in a hurry to dismiss his subordinates, none of them were beforehand with him in sending in their resignations. Yet, if their antagonism towards the Republic had been as pronounced as it is now their interest to make it out, they would hardly have allowed M. RICARD to get the start of them. M. BUFFET'S resignation would have told them all that they needed to know about the character of the newly elected Chamber and of the Government in which it would place confidence. The truth probably is that these dismissed officials would have been willing in most cases to make the best of the change, and to serve the new Government as they had served the old. Here and there there might have been instances of a more robust determination not to go with the tide, but these would have been only the exceptions. With the rest M. RICARD would have been able to do pretty much what he liked, and thus the Republic, instead of adding to its enemies, would only have added to its converts. If any of those who had been continued in their offices had shown a disposition to play the enemy in the camp, it would have been easy to dismiss them with ignominy. A dangerous precedent would thus have been avoided, and the monarchical faction would have lost an opportunity of presenting themselves in the character of martyrs.

An undesigned tribute has lately been paid to the stability of the Republic by one of the ablest and most reasonable of its adversaries. Ever since the close of the war M. HERVÉ has advocated the cause of Constitutional Monarchy in the *Journal de Paris*. Neither the eclipse of the Orleanist section of the Royalists which was brought about by the visit of the Count of PARIS to Frohsdorf, nor the overthrow of all the carefully-nursed hopes of a restoration which was brought about by the obstinacy of the Count of CHAMBORD, could avail to discourage him. Even the adoption of the Constitution of February was not too great a trial to his faith. Either he thought that under M. BUFFET the idea of revision would be kept so constantly before the public mind, that an Orleanist journalist would never lack materials for drawing useful lessons from events, or he disbelieved that the Republic, committed to such hostile hands, had any chance of living out even the shortest term assigned it by the organic laws. But the constitution of a genuinely Republican Administration has been too much for his endurance. M. HERVÉ is not one of those Conservatives who do not care what Government they live under provided only that it is not a Republic. His detestation of the Empire, of which, while it lasted, he was one of the severest critics, has not lessened with time; and it would be no satisfaction to him to feel that he had hastened the death of the present Government if the Empire succeeded as its natural heir. Consequently he prefers to abandon the contest. The country has shown unmistakably that it desires a Constitutional Republic and not a Constitutional Monarchy. Politicians who in their zeal for Monarchy make it a wholly secondary consideration whether it is constitutional or despotic are not disturbed by this discovery. Constitutional Monarchy may be out

of the question, but Bonapartism is still active, and every inch of ground that the Republic loses improves the prospects of the Empire. Men who can comfort themselves in this fashion are under no temptation to retire from politics. If they cannot further the cause they most love, they may at all events have opportunities of damaging the cause they most hate; and as by this time they have probably grown indifferent to the precise form of Government which may succeed the present, the destructive element in the conflict has become more interesting to them than the constructive. These are not the doctrines that have been maintained in the *Journal de Paris*. It has never professed that all kinds of Monarchy were alike dear to it, or that so long as the rule of one man could be secured it was a matter of secondary moment whether that rule were absolute or limited. The step that M. HERVÉ has taken will bring the impossibility of a Bourbon restoration home to many people who, so long as an avowedly Orleanist newspaper continued to appear, might not have realized that the most eminent Orleanist politicians are no longer Orleanist in any personal sense. M. HERVÉ does not pretend to be converted from his old ways. He still thinks Constitutional Monarchy the best Government in itself and the best Government for France. But he no longer sees any hope of bringing his countrymen to share his convictions, and he retires for the time from the field. That M. HERVÉ and his colleagues will cease to be journalists is not probable. Their views will not preclude them from supporting the Government of the Republic whenever they think its policy satisfactory; but they will naturally prefer to support it in a journal which begins by taking the Republic for granted rather than in one which has steadily opposed it whenever an opportunity has presented itself.

THE RAILWAY COMMISSION.

THE Second Annual Report of the Railway Commissioners extends only to last October. More than half a legal year has since elapsed; and the cases which are brought before the Commission tend to increase in number. As the experiment of appointing a special Court for the trial of one kind of issues has been commenced, it ought not to be hastily discontinued. There is no reason to doubt the personal competence of the Commissioners, and they are constantly accumulating experience; but the existence, at a cost of some thousands a year, of a tribunal which in one twelvemonth decided eleven cases of alleged undue preference is not a little anomalous. By the Regulation of Railways Act, 1873, it was provided that the Commission should consist of three members, one of whom was to be a lawyer, and one a person experienced in the administration of railways; and it was implied that the Chairman should be selected on grounds of general ability and eminence. No objection can be taken to the appointments which were consequently made by the late Government. Sir FREDERICK PEEL had acquired a respectable reputation in Parliament and in office; Mr. MACNAMARA was well known as a sound lawyer; and Mr. PRICE had been for many years either Director or Chairman of the Midland Railway, and had also sat in the House of Commons. The appointment of laymen to judicial offices is at least a novelty; nor would it be easy to show that railway disputes are so peculiar or so complex in character as to require the intervention of experts acting as judges. When the Traffic Act of 1853 was under discussion, Lord CAMPBELL objected to the powers which it was proposed to confer on the judges of enforcing equal treatment of freighters by Railway Companies. In a speech full of fallacies which have often been quoted and never sufficiently exposed, he declared that, though he had spent his life in the study of the law, he knew nothing of the management of railways. Lord CAMPBELL might have remembered that he was every day administering justice in relation to matters of which he was in the first instance equally ignorant. He decided patent cases with little or no knowledge of mechanics or chemistry, as he tried horse causes without professing to appreciate the points of a horse. If the theory which he assumed were consistently applied, there need be neither lawyers nor judges; for it was implied that special and professional knowledge of the subject-matter of litigation is the sole and indispensable qualification of a competent tribunal. Courts of law and equity deal every day with questions which are new to them except so far as they may have previously occurred in the course of their judicial experience. It is their business to be guided by evidence, and not by any knowledge which they may have previously possessed. The Railway Commissioners have properly regulated their proceedings in accordance with the ordinary practice of the Courts, and the evidence and arguments which have been produced before them differ in no perceptible degree from the grounds of judgments given in Westminster Hall. An Irish Railway Company allowed to certain carriers employed by themselves *2d.* a parcel, and refused any similar allowance to independent carriers. The Commissioners, as might be expected, directed the Company to discontinue an obvious preference of one customer to another. If the case could have been brought before a police magistrate or two justices at petty sessions, it would have been decided in the same way and still more expeditiously. It is difficult to understand why jurisdiction over so simple a matter of dispute might not be entrusted to a Division of the Court of Judicature, or even to a County Court.

It is not the fault of the Commissioners that they have to deal with trivial matters as well as with questions which are sometimes of serious importance. The first case in the Report illustrates the large results which may sometimes ensue from the application of the plausible principle of equality of treatment. In an application by certain Scotch coal-owners against the Caledonian Railway Company the Commissioners decided that equal rates for coal must be charged from two different coal fields. It was alleged by the Caledonian Company that the coal which had been allowed a lower rate was inferior in quality; but the Commissioners held, and, it must be supposed, rightly held, that the difference of quality was not such as to justify a difference of rate. A court of law might probably have arrived on the evidence at the same conclusion; but it is doubtful whether such an adjustment of rates ought to be referred to judicial interpreters of an Act of Parliament rather than to the discretion of traffic managers. Popular prejudice indeed welcomes any measure which may be supposed to be injurious to a Railway Company; but there are in all cases of the kind third parties who in their litigation with the Companies are really appealing to a judicial tribunal against one another. The interests of the coal-owner are much larger than those of the carrier, and it may be doubted whether Parliament deliberately intended that the competition among coal-owners in different districts should be controlled by the operation of the Act of 1853. It might well happen that comparative equality of rates would have the effect of shutting an entire coal-field out of the market, except in prosperous times when there is a margin of profit to spare. In many cases, though not universally, the interest of the railway in attracting the largest possible traffic coincides with the interest both of consumers and producers. The regulation or readjustment of several millions of different rates would be but roughly and unsatisfactorily effected by external interference. As there are undoubtedly cases in which it is proper to enforce uniformity of treatment, it would be premature to attempt a complete definition of the conditions under which control is expedient. When the Commissioners have exercised their jurisdiction for six or seven years, it may perhaps be found desirable to limit their authority in certain directions. The Companies ought to confine their efforts to vigilant observation of the tendency of the decisions in railway cases. It is not their interest for the time to irritate popular prejudices which may probably hereafter disappear. If the free action of independent traders is impaired, their grievances will attract attention.

One of the most useful functions of the Commission consists in its taking the place in many instances of the arbitrators to whom differences were referred under the provisions of numerous Acts. It is greatly to the benefit of Companies that arbitrators should be paid from the Consolidated Fund, and not out of the pockets of the litigants. The Commissioners also, sitting continuously till a case is finished, conduct the arbitration both more satisfactorily and at less expense. Their jurisdiction is in this department advantageously substituted, not for that of the courts of law, but for that of tribunals constituted for the occasion. It generally happens that arbitrators are busy in their various professions, and that they can give only intermittent attention to questions which are sometimes of grave importance. It is highly probable that the majority of disputes will be referred to

the Commissioners, especially as they can assume jurisdiction on the application of either party. In some instances they have promoted the public interest by giving a narrow construction to railway treaties which provide, not only for the avoidance of competition between the Companies themselves, but as far as possible against extension of railway accommodation within their joint districts. Courts of law would perhaps deal still more peremptorily with contracts which are intended principally to prevent the increase of railway accommodation. The power of fixing through rates on the application of a Company which owns any portion of a complete route has been in some instances beneficially exercised. The weakest point in railway administration has been the jealousy with which Companies have habitually regarded their immediate neighbours. The inconvenience which has consequently been suffered by travellers and freighters is not to be attributed to gratuitous malignity or caprice. Large adjacent Companies have commonly a number of questions pending between them; and the diplomatic ability of chairmen and managers is often exercised in adjusting a demand for accommodation in one part of the system against a counter claim in another. In every bargain all the circumstances of both parties are taken into consideration, and even a harmless concession is not readily given, when by a judicious delay it may become possible to sell it for a price. It is not undesirable that a body such as the Railway Commission should sometimes derange the strategy of rival managers; and it is probable that their intervention will gradually tend to make trains fit better, and to give freighters in some instances a choice of alternative routes. Perhaps the most anomalous duty imposed on the Commission is the determination of the mode in which railway property should be rated for the relief of the poor. It was wholly unnecessary to refer one application of the general law of rating to a Court which has no jurisdiction over the rating of ordinary property.

THE MERCHANT SHIPPING BILL.

THE Merchant Shipping Bill has improved so greatly since the Government have begun to pay attention to it, that it is impossible not to regret that more of their spare time in the autumn was not spent in considering what they meant to propose during the Session. There would then have been a fair chance of seeing a really final Bill passed in the present year; whereas in its present form, improved as that is, it can be little but the beginning of strife. It must not be forgotten that none of the amendments which are being introduced into the Bill as it goes through Committee, nor of those other amendments which are promised upon the Report, touch the radical fault of the early clauses. The Bristol Chamber of Commerce declared the other day that the machinery of detention provided in these clauses would either prove altogether inoperative, or would make the position of a shipowner unendurable. Out of this pleasing dilemma there is, so far as appears, no escape. The lives of seamen depend on the activity of the detaining officer. The ability of the shipowners to carry on their business with reasonable immunity from interruption depends on the sapiencess of the detaining officer. If the detaining officer is a man of Mr. PLIMSOLL'S stamp, scarcely a ship will be allowed to go to sea without being subjected to examination just at the most inconvenient time. If the detaining officer is a man of the stamp which Mr. PLIMSOLL imagines the officials of the Board of Trade to be, the fact that the examination cannot be instituted except at great inconvenience will be held to be a reason for omiting it. In the former case, who would be a shipowner? In the latter case, who would be President of the Board of Trade? The public interest in the question has for the present grown weaker; but there is no saying when it may not revive, and the moment that it does revive the first instance of neglect on the part of a detaining officer will be the signal for a fresh agitation. If the clauses relating to the detention of ships had come later in the Bill, they would probably have been withdrawn on the understanding that clauses based on a wholly different principle would be substituted for them on the Report. Unfortunately they came at a stage when Sir STAFFORD NORTHCOTE had not yet discovered that the Bill as originally framed must be abandoned. It would be unsafe, however, to say positively that this error will not be redeemed. To recast the earlier part of the Bill on the Report would give an historical symmetry to its progress which will otherwise be wanting. Clauses which have remained the same from first to last will look out of place in a measure which is for the most part so completely changed that Sir CHARLES ADDERLEY himself will have to think twice before he can feel assured that he is the titular author of it.

On Monday the Government brought up their new provisions for dealing with deck cargoes. They had satisfied themselves, not quite soon enough for their reputation as legislators, that it was impossible to approach this question without a definite idea of the position in which British ships were to be placed as regards foreign ships. If foreign ships arriving at British ports were to be excepted from the Bill, it must be on the principle that the more thoroughly the seaworthiness of British ships is secured the more highly they will be esteemed as carriers. Lord ESLINGTON subsequently said that, if our regulations are successful, we shall ensure a preference being shown for British vessels all over the world. The natural inference from this is, that British shipowners can have no special interest in seeing foreign ships subjected to similar regulations. The more entirely these regulations are confined to British ships, the more valuable will be the reputation which British ships will derive from the observance of them. This is not the view which the Government take of the question; and, to judge from Lord ESLINGTON'S argument, it is not the view that the shipowners take of the question. They are too unselfish to wish to profit by any such superiority as an exclusive system of regulations might confer upon them. They are anxious that foreign shipowners should have a share in their blessings, whether they wish for it or not. By placing foreign vessels in our ports under British regulations we shall be doing, said Lord ESLINGTON, the best thing we can for them, because we shall be placing them on an equality with our own ships. It is conceivable that foreign shipowners might have liked to have had a voice in the controversy, and that they may even suspect that this desire to have all ships subjected to the same treatment may be prompted rather by a fear that the regulations will prove annoying than by any strong belief that they will prove beneficial. It seems clear, however, that the shipowners would have strongly opposed any proposal to legislate for British vessels only, and when this had been ascertained the course of the Government became clearer. The inconvenience of coming into conflict with foreign Governments was less, or, at all events, less immediate, than the inconvenience of coming into conflict with a powerful interest in the House of Commons. The penalty on deck cargoes was consequently made applicable to foreign as well as British ships, and the unmeaning restriction to ships sailing from North American ports was done away with. Whether the penalty has been made effectual as well as universal is more doubtful. The clause as ultimately passed only applies to deck cargoes of timber, and even these are not interfered with if they do not rise more than three feet above the deck. The Government seem on this point to have been strangely blind to the feeling of the House. An amendment moved by Mr. PLIMSOLL to make the penalty apply to all timber carried on deck was only lost by eight votes. With the Government majority what it is, this is a fact of great significance, and the composition of the minority which supported the amendment is as remarkable as its numbers. One shipowner after another rose to say that, if deck cargoes are to be dealt with effectively, they must be prohibited altogether. The motive of the Government in permitting deck-loading to the height of three feet is to assimilate British and Canadian legislation; but the evidence of the President of the Quebec Chamber of Commerce, quoted by Mr. BRASSEY, makes it exceedingly doubtful whether the Canadians are much in love with their own laws on this point. This witness says that the concession of three-feet loads made by the Minister of Marine, in deference to certain shipowners, has not worked well, and that a large proportion of the cargoes so carried have had to be thrown overboard during the last season.

When the principle of legislating for foreign ships arriving in British ports had once been accepted, there was no reason for making difficulties about its application to foreign ships loading in British ports. In its original form the new clause providing for the detention of foreign ships proposed that, as soon as the provisional order for detention has been made, notice is to be given to the Consul of the nation to which the ship belongs; and if the order is disputed, the Consul is to name a surveyor, who shall decide between the master and the Board of Trade. The

objection to this plan lay in the absence of any security that the Consul would not favour the ship of the nation he represents; and in the interval between Monday and Thursday, or rather in the course of Thursday evening, the Government changed their mind. Sir STAFFORD NORTHCOTE stated very frankly the dislike which he entertained to the possible subjection of British ships in foreign ports to retaliatory legislation. But the difficulty of making a foreign Consul the virtual court of appeal from the decision of the Board of Trade had evidently made itself felt, and he suggested that on the Report a court of appeal for foreign vessels should be constituted, in which an assessor named by the Consul should take the place of an assessor named by the local Marine Board. With the prospect thus held out of incurring misunderstandings with foreign Powers in reference to the treatment of foreign vessels in British ports, it is satisfactory to learn from Sir CHARLES ADDERLEY that the Government are every day receiving intimations from foreign Governments that they heartily approve the steps which Parliament is taking to prevent the loss of life at sea. It seems, therefore, that the CHANCELLOR of the EXCHEQUER has overrated the danger to be apprehended from the legislation forced upon the Government. It must be remembered that Governments have to think of seamen as well as of shipowners; and, as a foreigner is probably not more careless of his life than an Englishman, the feeling of foreign sailors will usually be on the side of the English officials who detain their ship in order to save their lives. If the parts were reversed, and it was the foreign shipowner who might be expected to sympathize with the British Government, and the foreign sailor who might be expected to take offence at these new regulations, the chances of inconvenient consequences would probably be greater. In every country there is a feeling that the rich can take care of themselves wherever they are, and that it is the business of Governments to see that their poor subjects come to no harm abroad. If the principle of protecting life at sea is universally recognized, the danger of interested retaliation will disappear, and Englishmen may claim the merit of having led the way in a genuine improvement in mercantile legislation.

LITERATURE AND ART.

LITERATURE and art are apparently the subjects of the day, or perhaps we should say of the week. "The interests of Literature" was one of the toasts at the Royal Academy dinner last Saturday; in the middle of the week the supporters of the Literary Fund held their annual festival; and to-night the LORD MAYOR entertains a miscellaneous company under the general title of "Representatives of Literature." As for art, at this season it blooms on every side, and the Exhibitions open as regularly as the chestnut-buds. The public would thus seem to be specially invited to contemplate the results of human genius in these forms, and to say what it thinks of them. The first thing that must strike any one is, we fancy, that nowadays there is at any rate a great deal of literature and art. Each has come to be a vast business, giving wide employment not merely to those who produce the books or pictures, but to those through whose hands they pass in the course of trade. Moreover, it is obvious that there is a bewildering variety of classes and degrees, and that the general term "literature" or "art" includes many things which have little in common with each other. Still, as to the things themselves, there is some possibility of arriving at a sufficiently intelligible, if not very precise, definition of what is really literature and what is really art. But when we come to the producers a difficulty arises, at least in the case of men of letters. Art requires such special qualities and close devotion that those who work at it at all may be fairly called artists; but men of letters are not a class thus set apart. As Mr. FROUDE asked the other night, what is literature, and who are men of letters? One answer is, of course, that literature does not include all writing, and that a clerk is not a man of letters. On the other hand, there is a small class of professional persons who write for publication who may be distinctively termed men of letters; but, as far as the great bulk of literature is concerned, it is not the work of any special class, but is made up of the efforts of almost everybody of decent education. Literary capacity is, in fact, usually only one side of a character, and is, in a certain degree, very widely distributed. There are not very many persons who spend their lives in writing books or articles, but there is an immense number who occasionally do so, it may be only once or twice in a life, or more frequently.

On the whole, it may be said that literature is not produced by men of letters expressly devoted to such work, but by people who find time to write when engaged in other occupations. Literature, in fact, is only a means of expressing ideas like speech, and consequently a great deal of prose is written as well as spoken. All sorts of people, without being literary men or journalists, contribute a great deal of information to the newspapers; and books are written in a similar way. At the Literary Fund dinner the Norwegian and Swedish Ambassador put in a claim to have a high place in literature assigned to diplomatic despatches; and no doubt there are many specimens of this kind of writing which well deserve that honour. Again, Lord HOUGHTON started a theory that the literary instinct is closely allied with military courage, and that the soldier class supplies a large number of the best writers. This is a theory which will hardly bear analysis; but there can be no doubt that, as a matter of fact, military men often make valuable contributions to literature, both on their own and on other subjects; and the same might be said of sailors, lawyers, clergymen, and, in fact, of every professional group. Lord HOUGHTON remarked that the man of letters, as such, was the creation of a late civilization, and had come into existence only in comparatively recent days. This is no doubt true, but one reason for it is that in other days authors got little pay; and therefore to set up as solely a man of letters was much the same as giving up a livelihood. It was not till after DRYDEN'S time that copyright in England began to have a commercial value. Lord HOUGHTON also suggested a doubt whether the man of letters pure and simple was a happy creation; and there can be no question that literature, if produced exclusively by dreamers or bookworms, would lose its healthy and elastic force, as well as its influence on the public, which demands practical ideas. What is wanted in literature is the embodiment of every kind of thought, knowledge, and experience. It is, we fancy, not uncommon with men of letters, even when successful, to grow weary of mere writing, and to be seized with a desire to do something. We have heard that this was so with M. PRÉVOST-PARADOL. He had achieved a great reputation by his attacks on the Empire, but after all it seemed like whipping the wind. Could he not, he thought, get a hold upon the machine of government himself, and turn it, in however small a way, to good ends? And so he fell into NAPOLEON'S snare. There must of course be professional men of letters to carry on the systematic work of literature; but nothing could be more unfortunate than that literature should fall wholly or in great part into their hands. At the present moment, however, it does not appear that there is much chance of this.

Lord CARNARVON, in his speech on Wednesday, remarked that the general tone of modern English literature was, in the main, sound and healthy; and we are glad to believe that this is the case. At the same time there are symptoms of deterioration in certain directions. The mere fact that such a quantity of matter is published carries a danger with it. Literature is now manufactured with so much haste and in such large quantities that it is scarcely possible to keep up the quality at a high point. Again, the best market is apparently found among the most numerous class of the community, which does not happen to be the most intelligent or best educated; and in the midst of a vast mass of third or fourth-rate literature even the higher kinds are apt to catch the taint of looseness and vulgarity. The House of Commons, which is in more ways than one a representative body, is, as Mr. GOSCHEN has pointed out, declining, if not in intelligence, in culture and literary taste. By and by, when the mental range is widened among all classes of the population, there will no doubt be an enormous productive power available for literary creation; but in the meantime the tendency seems to be that the new body of readers, who have hitherto known literature only in its lower shapes, are by their encouragement diverting literary industry into the devious paths which lead to popular favour. Mr. DISRAELI observed at the Academy dinner that the conditions of life in England were not very favourable to the cultivation of high art, because "the "creation of the beautiful in a community required the "concentrated sentiment of a limited population." And the same remark may be in a certain degree applied

to letters. The influences which kept up a standard of taste are gradually being weakened by the pressure of the multitude. Not only does the critical faculty in the more refined and intellectual core of society fail to produce much impression on those outside, but it is even itself impaired and corroded by the surrounding passion for what is within the range of limited minds and rudimentary tastes. At the same time, that national spirit which comes from the strain of anxieties and difficulties, and which gives vitality to literature, is in danger of being diminished by the smoothness and ease of modern life. Still there is no reason that we can see for taking a desponding view either of the present position or prospects of literature. It must be expected to reflect the circumstances of the time; and this is undoubtedly a transition period. As education spreads there must, after a time, be a steady rise in the literary taste of the country.

In art the immediate effect of what was formerly the special possession of a select class being thrown open to the general public is perhaps more conspicuously observable than in literature. No one can visit the present exhibition at Burlington House—though it is perhaps in some respects better than usual—and compare it with the pictures of the older masters which have lately been displayed, and say that the standard of art has been raised in England. The practice and enjoyment of art have undoubtedly been widened, and it may be that the great body of the people have sounder views about art, and derive more refreshment from it than formerly; but this, though good in itself, does not compensate for a certain lowering of the aims of art which is only too obvious. At the Academy this year there is a great variety of pictures, and it is evident that proficiency in technical skill is extending. But the want of soul, of mind, of anything in the shape of idea, is depressingly apparent. The range of subjects is, with some important exceptions, painfully commonplace and uninteresting. Indeed a large proportion of the pictures are merely an improved reproduction of the men and women of the fashion-books. There are not less than three pictures in the Academy which rise to the height of excitement represented by the amazingly heroic feat of a young man helping a young woman over a puddle. Others are the sort of paragraph-pictures of events with which we are familiar in the illustrated papers, and which are rather a style of reporting than real art. It is perhaps not without significance that the members of the Academy, though they drank to the general interests of literature, passed over the interests of art, and contented themselves with "The Health of Sir FRANCIS GRANT and Prosperity to the Royal Academy." It does not follow, however, that the prosperity of the Academy implies the general prosperity of art; and, besides, prosperity has different meanings. That Academicians and Associates are prosperous in the sense that they get good prices for their works may be believed; but it cannot be said that art is prospering when such a very low standard of invention and beauty is exhibited on the walls. Sir FRANCIS GRANT expressed regret that so many pictures had this year to be rejected; but it might have been more reasonable if he had deplored the large proportion of bad and worthless art which has been admitted, and which must certainly discourage high aspirations, seeing that it is thus officially announced that almost anything may be passed off as art on an ignorant public, and that the Academy is willing to countenance the imposture. What art wants more than anything else is the exercise of authority in favour of a higher style of art.

MODERN MANNERS.

THERE are some things which everybody sees, but which there is a general reluctance to speak about until some kind of explosion occurs and compels attention. For some years past, for instance, there has been visible in English society a tendency to increasing freedom of manners, and a relaxation of those prudent restraints on giddiness or forwardness which used to be supposed to be an indispensable protection to all modest women. We have ourselves repeatedly called attention to it, and urged that the spread of habits of dangerous familiarity ought to be closely watched, and some check placed by social influence on the introduction of novelties of this kind, all tending in one direction. It would appear, however, that the departure from old-fashioned traditions of propriety is growing still more marked, and that a system of social intercourse is being gradually established under which all the once recognised rules of decent behaviour are completely set at nought. Indeed, it is becoming increasingly difficult in some fashionable circles to form any estimate of the personal respectability of a well-dressed woman from her bearing and conduct. It is to be hoped that the remarks which a judge has just felt himself bound to make in the course of his duty will suggest profitable reflections on this subject. In a divorce suit which has been tried this week, and into the nature of which it is unnecessary to enter in detail, Sir J. Hannen, in summing up the case to the jury, made the following remarks:—"Generally speaking, when a young woman made a secret appointment with a young man, only one inference could be drawn from it; but it should be remembered that the respondent had been leading a life of frivolous gaiety, passing her time in frivolous amusements, flirting with a variety of men, and conducting herself in such a way as to lead to her husband's remonstrances. It was also only fair to remind them that there had of late years been a very marked change in the habits and manners of society, and that formerly women would have shrunk from being seen with persons and at places in circumstances which were now thought nothing of. He spoke of the change with loathing, but it was a fact that there had been such a change as that to which he referred in fashion and in the habit of young persons. Therefore, in these days, the same conclusion ought not to be drawn from conduct which would have been drawn from it in former times."

It is evident that things must have reached a pretty pass when a judge, sitting on the bench could feel himself justified in drawing such a picture of fashionable life; and it can hardly fail to open the eyes of those who have either shut their eyes or winked at the continual loosening of social restraints. What Sir J. Hannen has said would seem to come to this—that nowadays it is impossible to say from a lady's manner and behaviour whether she is or is not a respectable person, seeing that a part at least of society has agreed to dispense with the old rules on the subject. No matter what may be the levity and freedom of a woman's ways, no matter what breaches of decorum she may commit, it is not to be concluded that she is not a most respectable lady, for that is the way in which many respectable ladies now conduct themselves. Once upon a time there was a difference between the manners of good and those of bad society, and a man could judge from the way in which a lady received him on what terms he stood with regard to her. But the test of propriety is now gradually being given up. A woman may be quite respectable, though not at all proper. Everybody knows that Prince's is a most select and respectable place. All disreputable people who apply for admission are strictly blackballed. Yet it seems that the society which congregates there, and which may, we suppose, be taken as a fair sample of the fashionable world from which it is extracted, is not absolutely immaculate. It is stated that all the parties in the suit which led to Mr. Justice Hannen's observations were members of Prince's Club, and that it was there that the co-respondent was introduced to the respondent, and that they appear to have passed a good deal of their time. The respondent, who is described as "well connected and moving in good society," and who was also young and had only lately been married, appears to have gone about as if perfectly free and unattached. She took a husband only as a matter of form. She "flirted with a variety of men" on the strength of meeting them in such company as that to be found at Prince's, and she even went so far as to pass an evening with one of them in his lodgings. But nobody is to be allowed to suppose that, because a lady "moving in good society" chooses to run about, to rink, dance, and have *tête-à-tête* dinners with any man she takes a fancy to, she is therefore likely to be unfaithful to her husband. It appears that, in this instance, the husband did not relish the treatment to which he was subjected, and no doubt his wife and the men whose society she preferred thought it very unreasonable. We cannot say that it strikes us in that light. It must surely be the duty not only of a wife, but of every virtuous woman, to avoid placing herself in situations where she is certain to be suspected, and in which it is probable that she will fall. A woman who had due respect for the marriage tie or for the character of her sex would certainly not behave in such a way. It must be remembered that general character is always an important element when a question arises as to the truth of any suspicions which may have been roused. The proof of actual guilt may depend on some accidental disclosure, but no woman can expect to be trusted who flagrantly adopts a freedom and looseness of manner similar to that of her abandoned sisters. People who make a point of carrying jemmies and skeleton-keys about with them have no right to complain if strange things are believed of them; and so with ladies who defy their husbands, and roam about with other men. Suspicion must necessarily be part of the penal system of society, and it is exercised in rightful defence. It might be difficult or impossible to procure conclusive evidence of a particular offence, such as would be necessary for judicial purposes; but society has a right to judge from appearances, and to place under a ban those who try to break down the barriers of propriety.

There is a sufficient accumulation of human experience since the world began to explain the necessity of those social rules which are now falling into contempt, and the danger of disregarding them. The conduct of people mainly depends upon their habits, and if those habits tend in a certain direction, and present constant temptation to and opportunities for evil-doing, the decline is usually found slippery enough by those who try how far they can slide, in the hope that they will still be able to pull themselves up again on the verge of sudden peril. It is not merely that the prevalence of free and easy manners affords a convenient cover-

ing to vicious courses, but that it also serves as an encouragement to innocent people to trust themselves on treacherous ground. Nothing is so fatal as the curiosity which leads women into experiments of this kind, and it is inevitable that out of a number of cases there should be some disasters. It is no excuse to say that some women are quite able to take care of themselves under such circumstances; for, in the first place, this is seldom true, and, in the next, mischief is done by the bad example which is set to those of warmer feelings or weaker resolution. Cases occur from time to time which supply illustrations of the way in which habits of ready and unreserved familiarity operate on a certain kind of men, if not on women. Womanly modesty has been likened to an onion which is composed of successive folds, and, these being stripped off one by one, there is found to be nothing left. The suppression of any of the precautions which are required to keep libertines at arm's length not only weakens the general line of defence, but fosters the audacity and unscrupulousness of the enemy. It is impossible for any one who really looks about him and sees what is going on under his nose to be blind to the injurious effects of those habits of gregarious fastness which are constantly becoming more daring and reckless. It would appear as if it were the object of a class of women to associate with men on the footing of male friends, to join in their sports, and even to share their dissipations. Under prudent arrangements, the association of the sexes is wholesome and beneficial; but the attempt to discard old-fashioned notions of prudence and propriety cannot fail to be unsettling and disastrous. At the rinks there appear to be great facilities for striking up promiscuous acquaintanceships, and carrying on familiarities under cover of the nature of the amusement. In other days mothers assumed that it was their duty to exercise some kind of supervision over their daughters' daily life, to see what sort of books they read, what companions they had, and what kind of talk and ideas was brought to bear on their young and unsophisticated minds. But modest timidity is now regarded as childish affectation, and girls are left to learn everything, and to do almost anything they choose on their own responsibility. We should be sorry to make too much of the sad consequences which occasionally ensue, but these are not the only evils to be guarded against. The mere approach to such things in fancy, the familiarity of the mind with subjects of scandal, exercises a deteriorating influence on the moral fibre, and plants dangerous seeds which may find congenial nourishment. Maidenly reserve is too delicate and precious a thing to be exposed to ruffling and jostling. Girls nowadays go about too much into places where they are likely to encounter equivocal people, and to hear of, if not to see, equivocal scenes. Nobody would wish to see English girls shut up like the pupils of a convent, but it can hardly be doubted that just at present the opposite tendency is being carried too far. After the judicial rebuke which has now been given, it cannot be said that the unfavourable reports of modern manners are a mere invention of malicious gossip. The disorder may not yet have spread so far or so deeply as some suppose, but that it is lurking in the system and requires stringent remedies has now been proved beyond the power of contradiction. However painful it may be, it is necessary to realize what society is coming to, if it goes on as it is doing, and as this case reveals—marriage without maternity, nominal husbands, and constant flirtation with other men pushed to the brink of guilt.

CHRISTIANITY AMONG THE NEGROES.

MR. GLADSTONE is not peculiar in maintaining that, while the dogma of Christianity is always the same, its outward form and clothing may, and indeed must, vary according to national, local, and personal differences. There is nothing in such a statement, rightly understood, to shock the most orthodox convictions, while the too common failure of missionary enterprise, and especially of Protestant missions, may be partly explained by a practical oblivion of it. A Bampton Lecturer some years ago observed on the absurdity of assuming that the same cut-and-dried system of religious usage and worship which had become stereotyped in an English country parish would therefore be the most suitable for transferring bodily to the Iroquois; and Jesuit missionaries in China, if some of their proceedings have been open to very grave censure, at least showed their good sense in not refusing to dress like Mandarins. It is a sad but significant fact that preachers like Dean Church, and historians like Dean Merivale, have felt obliged, in tracing the influences of Christianity on national character, to confine themselves almost exclusively to the various branches of the great Aryan stock. Few comparatively among the Semitic, Mongolian, or Negro families have embraced the religion of the Gospel; and it can hardly be doubted that the fault lies in great measure at the door of its professors, if not through their neglecting their duty altogether, through their erroneous method of discharging it. It is to the case of the negroes that we desire especially to call attention here in connexion with an interesting paper "by a Negro," which appears in the current number of *Fraser's Magazine*. The writer has naturally drawn his illustrations mainly from the Western world, as containing the greatest number of negroes who have come under Christian teaching, and especially from the United States.

We are met of course on the threshold by one great drawback which has necessarily prejudiced the efforts of Christian missionaries for centuries—the institution of slavery. It is painful to be obliged to acknowledge that the system owed its origin to a Christian priest, Bartolomé Las Casas, whose sympathy for the delicate Caribs led him to suggest that the hard work to which they were unequal should be laid on the shoulders of robust Africans. It is fair indeed to remember that Las Casas repented heartily before his death of the injustice he had committed, though his motive had been a good one. But his repentance, as in such cases usually happens, came too late to benefit any one but himself. The transportation of negroes from Africa which he had first suggested became a matter of national policy, and was continued for three centuries. The curious thing is that what had originated in a scheme of terribly one-sided benevolence, and was perpetuated from motives of interest sufficiently intelligible, however discreditable, came to be accepted and vindicated by Christian teachers of various creeds and of unimpeachable integrity, as a kind of Divine dispensation. That Aristotle should defend on philosophical grounds the principle of *φύσει δοῦλοι*, which was universally accepted among his countrymen, is explicable enough; but it is strange to find the descendants of a Huguenot or Puritan ancestry claiming a natural right to the absolute obedience of their dark-skinned serfs, and instructing such of them as embraced Christianity that acquiescence in serfdom was the most urgent of their Christian obligations. Yet we hear of one Southern Bishop elaborately embodying this doctrine in a volume of *Sermons, Tracts, and Dialogues for Masters and Slaves*, and another inditing a catechism which teaches that for a slave to disobey his master is to yield to the Devil; while a minister of another Christian denomination compiled a catechism deducing the same lesson from the story of Onesimus. General Hammond went further when he maintained that "slavery is not only not a sin, but especially commanded by God Himself through Moses, and approved by Christ through His Apostles." He adds, with [illegible] but quite unconscious irony, that "slavery is truly the corner-stone of every well-designed and durable Republican edifice"; and that it is unsafe for slaves to read the Bible, because there is an "abolitionist key" to it which "would convert the reader, not into a Christian, but [illegible] a demon." When the "peculiar institution" was unanimously upheld by men of the highest character and position of the dominant race and creed—governors, magistrates, legislators, [illegible] landed gentry, as well as clergy of all denominations—it is hardly wonderful that Christianity either failed to attract the negroes over the[m] at all or could only exert a partial and distorted influence on them. That, even so, it did more or less influence them for good is grievous much for the divinity of a religion which suffered so If, as a[t] at the hands of those who claimed to be its interpreters. saints of Ariter in the *Westminster Review* has intimated, the it must be [illegible]rica were chiefly to be found among its bondsmen, Christian instruc[tion] that their sanctity was rather in spite of their the saints were the exceptio[n] consequence of it. And, after all, vivals of heathenism, such as the horrible Obeah[ism] and strange superstitions described by Mr. Kingsley in his *Christmas in the West Indies*, continued to prevail among nominal converts to the Gospel. Yet even so late as 1864 the General Assembly of the Southern Presbyterian Church declared it to be the mission of that body "to conserve the system of African slavery."

It is perhaps more interesting to inquire into the effects of Christianity on the negro race since the period of emancipation; only it must of course be remembered that the evil effects of the false teaching and misgovernment of centuries cannot be removed in a day. It is not therefore surprising to meet with a very general complaint of the want of moral fibre, so to speak, even among the best of these coloured Christians. In the official Report of the Superintendent of Public Schools for Virginia in 1874 they are described as "polite, amiable, quiet, orderly, and religious," but "without moral character." The *American Missionary* quotes the sermon of a preacher who had entirely failed to distinguish between the Bible and the *Pilgrim's Progress*, and whose hearers were quite unable to correct him. The Episcopal *Spirit of Missions* deplores "the absence of the ethical element" from negro religion. This is however only the natural consequence of a long course of slavery, and unfortunately the change in the actual relations of whites and blacks does not seem yet to have effected a corresponding change in their relative estimates of each other. Slavery is still upheld as a doctrine by many Christians in the South, while the contempt for the subject race which it inevitably engendered is hardly less active in the North now than formerly. Thus a distinguished Professor of Straight University and Moderator of the Presbytery is excluded from hotel accommodation, when travelling on the business of his Church, simply because he is a negro. The Bishops of the African Methodist Church have addressed a pathetic appeal "to the American people," craving protection against the impositions and oppressions to which they, pastors of "the oldest and most numerous organization of coloured persons in the country," and their flocks are subjected. Under such a social condition—and our illustrations of it might easily be multiplied—it is not wonderful that the ethical element should be wanting. Education has done something, but it could not in any case do everything, and under existing social and ecclesiastical arrangements it can do comparatively little.

We have seen that negro slavery took its origin from the well-meant, though terribly misdirected, philanthropy of a Roman Catholic priest. It has since found champions among every class of American Protestants. The journals of the [illegible] were

have lately been employed in discussing the relative claims of the Catholic and Protestant Churches on the allegiance and respect of negroes. A negro Bishop of the Methodist community warned his fellows in the *Independent* newspaper against the "aggressions" of the Roman Catholics. This called forth a vigorous reply from a coloured gentleman, a friend of the late Senator Sumner, who insists that, while the Protestant Church proclaims the doctrine of the brotherhood of man, the Catholic alone acts upon it. "The cruel spirit of caste finds sympathy and protection under a Protestant Republic," but the Catholic Church freely opens its schools to the little ones who are excluded from the Protestant schools, on terms of equality, and educates coloured youths at Rome for missionary work. This view of the case is endorsed by the coloured writer in *Fraser*—apparently a Protestant—who thinks no reader of history can question the deep debt of gratitude owed by his class to the Roman Catholic Church. "The only Christian negroes who have had the power successfully to throw off oppression, and maintain their position as free men, were Roman Catholics. In the ecclesiastical system of modern, as in the military systems of ancient, Rome there seems to be a place for all races and colours"; the names of canonized negroes are to be found in the Catholic hagiology, and the negroes have risen to high positions in Catholic countries. On the other hand, he considers that under Protestant rule the negro is kept in a state of tutelage and irresponsibility fatal to the development of manliness and independence. The American Episcopal Church has, however, lately consecrated a negro Bishop for Hayti, the only dissentient voice in the Episcopal Convention being that of the English Bishop of Jamaica, who insisted that in that diocese no negro priest would be able to command respect. This certainly appears a strange account of the negroes after two hundred years of residence in the island and forty years of freedom, and a writer in the *Quarterly Review* of last July is probably right in attributing it to the strength of English prejudice. It is a trite saying that extremes meet, and our author holds that, next to Roman Catholics, they are the heterodox rather than the Evangelicals who have proved themselves friends of his race. Their ablest American champions belong to the ranks of Unitarian preachers and poets like Channing, Emerson, and Longfellow, and in England the *Westminster Review* has been readier to do them justice than the respectable organs of orthodoxy. It must not of course be forgotten that Evangelical heroes like Wilberforce and Zachary Macaulay took the lead in the Emancipation movement in England, but they do not seem to have inspired the main body of their theological adherents with the same generous and Christian enthusiasm. Negro Christianity, however, where it is not Roman Catholic, almost always takes the form of orthodox Protestantism. It must be hoped that in the future Catholics and Protestants will learn to vie with each other in impressing on their coloured brethren by word and example alike the spirit as well as the bare letter of their creed.

THE WORKS AT ST. DAVID'S.

THE traveller who visits the most remote cathedral church of South Britain after an absence of a quarter of a century finds that even there change has wrought a good deal. We assume that by this time a class of people have arisen who at least know where St. David's is, who do not look on it as the same place as St. Asaph, nor yet invent curious etymologies to prove it to be the same place as Llandaff. But even within the diocese itself there are difficulties to be striven against. One sect, with a kind of holy simplicity, believes that the Bishop lives at the real St. David's. Another sect, because the Bishop lives on a more practical site in Caermarthenshire, believes that St. David's must be in Caermarthenshire also. A third sect often leads the unwary astray by a more wanton geographical confusion. Men who have been brought up at St. David's College, Lampeter, are apt to speak of their own place of education as "St. David's," and so either to win for the ancient city an undeserved reputation as a modern seat of learning, or else to transfer it in imagination from its own place to quite new quarters at Lampeter. But we will hope that there are some who have found the way to steer clear of all these errors, and who know in what corner of Britain to look for the mother church of the diocese which stretches further to the west than any save one in Southern Britain, and which once reached almost within sight of the inland city of Hereford.

The church of St. David has certainly seen a good deal of change during the last twenty-five years; but at first sight the church seems to have changed less than the village city, especially in those parts of it which immediately look down on the church. We say "look down," because every one who has either been at St. David's, or has studied its picture with any care, knows that the Welsh fashion of planting episcopal churches at the bottom of a hill rather than on its top is carried to its extreme at St. David's, where church and palace lie in a basin surrounded by higher ground on every side. The town stands on the eastern height, the top of the cathedral tower hardly ranging with its buildings. But those buildings have certainly not been improved by a phase of architectural zeal which seems to have come over the place. Contending religious denominations, contending theories of education, have crowned the heights with school-house and tabernacles, each uglier than its fellow, each less in harmony with the venerable buildings on which they look down. But, as we go down the hill, the change in the church itself seems less than might have been looked for when it is remembered that a great work of restoration has been going on there for many years. The eye at once takes in that, though the eastern chapels still lie roofless, yet the aisles of the presbytery, which once lay no less roofless, are now covered in and restored to their natural use as an essential portion of the church. Here is an improvement which cannot be spoken against. But it is rather a pity that the one thing in the restoration which may be spoken against is one of the first things to thrust itself on the eye. He who goes down the hill sees at once that the east end is no longer as it was in past times. The eastern limb at St. David's had a singular history. The original east end was a composition of lancets in two rows—perhaps, when perfect, of three—after the type of those at Ely and Southwell. But this design was very early hidden, and afterwards blocked, by the addition of eastern chapels. At the end of the fifteenth century, when the beautiful chapel of Bishop Vaughan was built immediately to the east of the presbytery, the presbytery itself was remodelled according to the taste of those times. The walls were raised, the roof was lowered, the lower range of lancets was blocked, the upper range was supplanted by a single wide Perpendicular window. This last, as so often happens, had decayed more rapidly than the earlier work; it needed a renewal of some kind, and the skill of Sir G. G. Scott was able to make out exactly from surviving fragments and indications what the upper range of lancets had been. Here was a case in which, as it seems to us, two courses were open, for either of which a great deal might be said. One course would have been to respect the history of the building in all its changes; to respect the work of the fifteenth century no less than the work of the thirteenth, and to give to both that amount of conservative restoration which was physically needed. On the other hand, as some repair of the window was unavoidable, and as the earlier window could be restored with certainty, there was a great temptation to restore the design of the thirteenth century in its fulness; to lower the walls, to raise the roof, to restore the upper range of lancets, and to design a gable in harmony with them. Either of these courses, either the bolder or the more timid, would, we think, have been better than the intermediate one which was actually chosen. The upper range of lancets was restored; but the roof was not raised, nor the walls lowered. Inside there is less to be said against the change; the more daring plan would have involved the destruction of a really good wooden roof. But outside, in the first glimpse which the visitor has of the restored east end, the effect is not pleasing. The range of lancets had its place and its beauty when it formed part of one greater design, with something in harmony with itself both above it and below it. It does not look in place with the low gable above it and the flat chapels below it. The visitor who remembers the church in its former state is perhaps tempted to wish the old window back again, which at least suited its place; if of a less conservative turn, he is sorry that he does not see a high gable with a further composition of the same kind rising above the restored lancets.

With this single exception, the traveller who revisits St. David's has the great comfort of looking on a building which has been made safe and sound, but which has not been made to look new. The roofless aisles have been covered, the blocked windows of the nave clerestory have been opened, but St. David's is still St. David's. It has not, like some of our restored churches, put on new forms which almost hinder us from knowing them again. The church itself, the gateway tower above it, the ruined college by its side, the ruined palace beyond it, are all essentially as they were. In looking down on them we turn our backs on the ugly buildings which have sprung up above them, and we feel that ancient Menevia is still herself. We enter the church, and we soon see, that without ceasing to be herself, she has learned how to improve upon her former self. Through the greater part of the building, through the whole part which is still in practical use, all signs of neglect and decay have passed away. The building has been made secure, its arrangements have been made decent and in order, a large amount of ornament has been introduced in many parts, and yet the whole has been so skilfully done that there is no feeling of newness. The old familiar building has been strengthened, cleansed, and adorned, but no one can take it for a new building. The traces of the history of the building, in which St. David's is so especially rich, the marks of the repeated changes which have been carried out, and the still more characteristic marks of the many complicated changes which were never carried out, the spaces traced out for so many vaults which have never been added, all have been respected—all are there to be seen and studied as fully and clearly as before any hand had been laid upon the building. Several things which were before hidden have been brought to light to form new subjects for study and for perplexity, but none of the old signs have been done away. It is hardly possible to give higher general praise to any work of restoration than this; every practical object is satisfied, while there is hardly a single change which can offend the historical sense.

But the works which have been done at St. David's suggest the works which are still to be done there. Unhappily the best work of all cannot be done. That would have been for the great prelate whom St. David's has lately lost to have been buried in a fitting tomb in the still roofless part of his own church, and for the roof which has perished to have been renewed as the noblest of canopies over his tomb. That unhappily cannot be; but the next best thing under the circumstances both can be and will be done. A vigorous effort has been made for the purpose of providing the church

with a more fitting west front as a memorial of Bishop Thirlwall. We gave our reasons some time back for thinking that, under the very peculiar circumstances of the case, this was the best course to follow, and it is the one which has been actually chosen. But exactly to settle what change should be made is a matter which calls for some thought. The present west front, though its great window, its doorway, and the finish of its turrets and gables are all hideous enough, is solid and not without a certain kind of dignity. On the other hand, the original form of the front, though it cannot be recovered with the same minute exactness as the four lancets at the east end, can be recovered in its main outlines from old drawings. Over the doorway there was again a composition of lancets, while there were round windows at the end of the aisles. The present gable is low, the whole outer roof of the nave having been lowered when the splendid wooden ceiling was added at the beginning of the sixteenth century. The question now arises whether in such a case, especially when the building is to have a special purpose and significance, the architect is at all bound to reproduce the lines of a front which is altogether gone, and of which all that is known is the general design, and not the detail. Here again there is something to be said on both sides. But it must not be forgotten that the special object of the work is to form a memorial of Bishop Thirlwall, and it is important that the design should be one in which a figure of him may form a prominent object. For this purpose hardly anything could be better than one of those large doorways set in a gable which would give a space in that gable for a statue in a niche. But as this would give the doorway a greater height than is usual in English churches, it would hardly be consistent with a window of the usual form. Would it not be lawful, in such a special case, to cast aside both the present ugly window and the lancets which went before it, and to carry out the idea suggested by the small round windows at the end of the aisles in a greater round window at the end of the nave? This would give more room for the tall gabled doorway and the statue. And anyhow we should be strongly inclined to restore the high gable. The front, above all if it is to consist of lancets, can hardly have a satisfactory outline without it. Yet there is the fact that the roof of the nave has been for ages low, and that not long ago it was newly leaded. But why not make the gable, not as a sham, but as a beginning, with a small part of the roof raised? This was done with the eastern gable of Dorchester, and the long line of roof gradually rose to meet it. The high roof outside would in no way interfere with the rich flat ceiling within, while it is the very thing that is needed for the external effect of the nave. We do not presume to dictate to Bishop, Chapter, or architect; but we at least throw out these thoughts for their consideration.

RECTORIES AND RECTORIES.

IN novels, and not unfrequently in reality, the English rectory is the embodiment of everything most attractive in English rural scenery. It would often seem as if the reformed clergy had inherited the good fortune of their Roman Catholic predecessors in the pleasant places where their lines have fallen to them. Making your way along woodland lanes between tangled hedgerows, or across breezy commons scented with furze and broom, you have been catching glimpses of the grey church tower, withdrawing itself modestly behind sheltering trees. As you come nearer, the homely thatch and quaint gables of the village cottages show irregularly through gaps in the timber, and at last a turn of the road brings you into the village street. There is the tavern sign swinging from the boughs of the elm over the gravelled space before the door of the Somebody's Arms; the horse-pond under the flowering chestnuts, where the waggoner is watering his thirsty team; and the little green pastured by its flock of geese, where the boys are getting up their game at cricket. The place is clearly well to do; the people look as if they had long been the pets of lords of the manor as liberal as the Hazledeans of Hazledean in *My Novel*. There is no lack of paint and whitewash, although the one and the other have generally been mellowed by time. Indeed for the most part the cottage walls disappear behind masses of climbers and creepers, while there is a blaze of simple old-fashioned flowers in the little borders that divide the dwellings from the roadway. The church you have been admiring from a distance naturally tempts you to a closer inspection, and there you distinguish the same signs of easy munificence. The lych gate in sculptured oak, with its pious inscription, is a graceful specimen of the very modern antique; so is the new chancel with the stained memorial windows that blend so happily with the ivy-covered Norman church. The grass in the churchyard is as carefully kept as the gravel; the crosses and wreaths enamelled by affectionate hands in bouquets of brilliant bloom on the new-made mounds relieve the shadows that fall from venerable yews on the moss-grown tombstones of long-forgotten generations. There is a sense of peace and beauty in the languid atmosphere which cannot but make its impression on the least susceptible. The man of the busy world most wedded to cities and the excitement to be found in them feels for the moment as if his own life were perhaps a mistake after all, and as if real happiness were more likely to be found here than either in Lombard Street counting-houses or Pall Mall clubs.

We may take for granted that he would be ready enough to change places with the squire. The oak park-palings and the snug lodges, the broad gravel approaches innocent of weeds, the herds of deer in the glades among the well-kept timber, the rambling *façade* of the Elizabethan mansion with its stacks of chimneys thrown back between the trees of the rookery above the lake and the terraced flower-gardens, tell no story of mortgages or other latent disagreeables. You can imagine the fortunate proprietor to be the happier in his ancestral halls, inasmuch as he can leave them in the London season, or at any other time, without unpleasant explanations with his banker. But even more congenial to the frame of mind into which the cheerful aspect of the village and the calm of the churchyard have for the moment thrown the visitor is the modest residence which he suddenly notices while still loitering musingly in the precincts of "God's Acre." A little gate opens in the low wall into a dense laurel thicket. A glimpse of a broad-eaved gable suggests the vicinity of the rectory or vicarage, though, from that side at least, it seems almost as carefully hidden out of view as any wren's nest in the roots of the neighbouring bushes. If the inmates care to meditate among the tombs, they must turn out for the purpose; the suggestive spectacle is effectually screened from them by masses of foliage. On the other side all is light and brightness, as you see when you go round by the road. The front is broken by great bow windows; the verandah, covered with clematis, is festooned with variegated sun-blinds, which seem dull by comparison with the gay arrangement of colours in the flower-beds that fringe the velvet lawn. The happy inmates may regard the park of the neighbouring Hall as their own, without being weighted with the burdens of wealth and position. They look across the stretches of grass and bracken to the timbered knolls, vocal with clouds of rooks; the deer come feeding up to the sunk fence that marks the limits of the little pastoral domain; there is a concert of soft rural melody in the sunny air, made up of the song of birds and the hum of bees, with the cooing of the ring-doves from the recesses of the coppices. Not inharmoniously, the subdued notes of a richtoned piano come murmuring out of the open windows of the drawing-room. You may make your passing observations without being obtrusive, for the little church path which has existed from time immemorial is carried along under the ha-ha. You can see that the clergyman does not live altogether out of the world, though he may be three long miles from the nearest railway-station and twice as far from the county town. The other open window is evidently that of the library; the massive bookcases contain good store of tomes in respectable calf, while the tables are heaped with lighter literature in periodicals. The soft-cushioned armchair in the bay, with all a landscape without and such surroundings within, seems like a deserved seat in a terrestrial paradise for a *dilettante* of refined taste. There is not too much of the sensuous about it for severe intellectual labour, although everything conspires to assure you that the master of the establishment can work easily. The comfortable old servant sunning himself on the steps of the door suggests a well-spread table and a well-stocked cellar. You feel sure that through all the fluctuations of fashion in wines the bins of orthodox port have been steadily replenished; that the circulars of cheap advertising Companies are altogether thrown away on such a household; and that it can still produce a bottle of venerable Madeira, notwithstanding the failure of the vines. And in fact the rector, although he may have his skeleton in the cupboard like the rest of mankind, has everything about him that can smooth existence. He is in that state of life between poverty and riches so lauded by the sacred sage whom he is fond of quoting in his sermons. It is a family living, and a very good one; but the incumbent had means of his own, and so had his wife. His fortune is safely invested in securities that make him indifferent to rumours of war abroad and disturbances in the stock market at home. He is ready enough to open his purse, but has very rarely occasion to do so, for the liberality of his kinsman at the Hall anticipates the calls of the parish. Being in such easy circumstances, of course he has only children enough to make his nursery lively, just half as many as his curate. There is not a Dissenter within his bounds; his loyal churchwardens have no opinions but his; and his parishioners to a man are tenants on the property, or labourers dependent on the landlord and the farmers. The brougham, the pony carriage, and the light waggonette, encourage him in the social dispositions that make him courted by his neighbours for a dozen miles round; and if we can suspect him of cherishing any special secret sorrow, it is that in all human probability he will be left to live and die in his Eden. For affluent indolence eats away active ambition; the springs that shoot a man towards high Church dignities have in his case lost most of their elasticity; and his dearest friends would be the last to dream of tempting him to a change of condition by the offer of some piece of wealthier preferment.

This is one picture of an English beneficed clergyman—rosily coloured perhaps, but by no means extravagantly so. The most that can be said by way of drawback is that our happy parson has drawn one of the prizes in the clerical lottery and can hardly be called a representative man. Let us take, by way of counterpart, the case of one of his old College comrades, who once congratulated himself on a fortunate start, but is now to all appearance hopelessly stranded. This time we are in one of the Northern counties, and the rectory, which is set upon a hill, is conspicuous from very far off. It is substantially built, as it had need to be, considering the bitterness of the prevailing blasts. Wood only thrives

under shelter, and the few trees about the parsonage are stunted and weather-beaten. The solid stone wall that surrounds the garden is decidedly useful, if not ornamental, for without it the less hardy vegetables would have even rougher times than they have. The architecture is as bald as that of the neighbouring church, whose builders seem to have borrowed a leaf from the book of ecclesiastical architects over the Scottish border. Though it is the beginning of summer, the small window-sashes are scrupulously closed, for a keen East wind brings up a touch of raw sea fog from the leaden-coloured ocean. The view is extensive enough, in all conscience; but there is nothing for the eye to rest upon better than the chilly sea on the horizon on one side and the barren hills on the other. Not a gentleman's seat is to be seen, for this and half-a-dozen of the adjacent parishes are inscribed on the rent-roll of a single great landowner. The sparsely scattered farmhouses indicate farms of portentous size, with a vast extent of moor and grazing land. Here, too, there is a village hard by, and a tolerably populous one, as it is the habit of the poorer classes to huddle together. But, though it shows no signs of positive poverty, the long single street is the very abomination of repulsive desolation. There is not a bit of green beyond an occasional kale-yard, enlivened with a struggling currant-bush or two. No one thinks of attending to appearances or undertaking superfluous repairs; the fetid gutters meander uncovered along the roadway; the pigsties are generally in front of the doors; the refuse is left to rot where it is shot down; and, in spite of excessive ventilation from every quarter of the heavens, the prevailing stenches are as horrible as they are miscellaneous. If the parson tried to play the reformer, he would only take the surest way to perpetuate abuses. By far the greater part of his parishioners are Presbyterians, while two-thirds of the rest belong to minor Dissenting bodies. He is regarded generally with suspicion, if not aversion. When he takes his walks abroad, people meet him with the slightest and rudest of greetings, if they do not go by with a sneer or a scowl. He preaches, as a rule, to half-empty pews, occupied by stolid listeners who have yawned over his most stirring appeals till his preaching has naturally lost all animation. He has a good deal of trouble about tithes, which create much bad feeling; but he cannot afford to make concessions. He is in the enjoyment of some 300*l.* a year, and thought himself the most fortunate of men when the bishop presented him as a youthful curate. But since then he has married, and his wife had as little as he in the way of private fortune. In compensation she has presented him with a dozen children, who have all survived the perils of infancy, since the climate is healthy, though disagreeable. Everything is dear except coal. He can only economize by dispensing with things which he used to regard as necessaries, and there is a steady professional drain on his scanty resources, as there are no resident gentlemen to lay under contribution. He is ten miles from a station, and it is long ago that he was compelled to put down his pony carriage. The parishes around are as big as his own, and it is a good forenoon's march to the nearest of his brother clergymen, who perhaps chances to hold diametrically opposite views to his own. His wife has to fall back on the society of the farmers' wives, or to go without. He cannot afford to buy books, and is far beyond reach of any decent lending library. He has even given up taking in a newspaper, since he began to find that his personal embarrassments gave him enough to think of, to the exclusion of all concern in public affairs. Poverty has proved at least as great a snare to him as affluence and elegant leisure to his brother parson in the South. His talents have rusted for want of exercise, and his ideas have become hopelessly cramped in their grooves, as the shadows of indifference and ignorance have settled down on him. The bishop who placed him, failing to make allowance for untoward circumstances, is half inclined to regret his choice, and certainly has no idea of helping him to further preferment. With everybody else he is out of sight and out of mind; in fact, the unfortunate divine is effectually shelved, and if he turns into a misanthrope, who can wonder?

It would be altogether impossible to make a misanthrope of a third class of incumbent, although he has seen far more than most clergymen of the least agreeable side of human nature. As a curate he was thrown over head and ears into hard work in a parish among the collieries, where the beershop is the grand institution and dog-fighting the favourite pastime. There he was so successful in winning his way, and crowding the hard benches of his schoolshed of a Sunday evening, that he was translated by a gentle pressure of episcopal authority to the charge of a district church in a "rising and flourishing industrial centre"—rising and flourishing, that is, in an industrial sense, though, so far as vegetation goes, the surrounding country is blackened with chemical deposits for a radius of a score of miles over a blighted flat broken up by slag heaps. The worthy pastor's rectory-house is a semi-detached villa in a brand-new suburban thoroughfare, founded on unstable deposit beds of oyster shells, broken crockery, and miscellaneous rubbish. Yet already the stucco begins to take the tint of lampblack; and the decomposing paint falls in flakes from the area railings. Possibly he might be hipped and unhappy had he any spare time to think; but he has far too much on his hands to indulge in melancholy reveries. He is continually up and about, saying a casual word in season here, looking in upon a sick-bed there, ventilating the oppressive atmosphere with the healthy sympathy of his cheery nature, while he has a worthy helpmate in his devoted wife. His parishioners consist of one or two wealthy employers, and a busy multitude of hard-working men doomed to what strikes one as most depressing drudgery. Yet it was only the other day that they sunk long-standing differences, ignored the memories of strikes and locks-out, and presented him harmoniously with a tea-service of silver plate, a Bible and Prayer-book, and a purse of sovereigns to boot. The plate and books he accepted cordially; the sovereigns he passed on to a struggling hospital, which he has been doing his best to establish and endow. In the enjoyment of some fruit of his arduous labours he is marvellously happy and contented, considering his surroundings. The other day he was well nigh tempted away by the offer of an episcopal see in the Fiji Islands, which held out the attraction of work seasoned by danger, with a fair prospect of martyrdom in reversion. But when it came to a decision he could not resolve to move. To all appearance he is likely to live and die in the sphere of usefulness which he fills so admirably; and who shall say that he is not to be envied, although few of us would have the courage to change places with him?

A NORTH-COUNTRY ELECTION.

THE East Cumberland election of last week has, apart from its political significance, an interest of its own which deserves to be recognized. It is refreshing in these dull, languid days to find so much public feeling and spirit as appears to have been shown by both parties in the contest. A notion has been spreading in recent years that there is no great difference between one party and another, and that it matters very little which candidate is returned, as long as he is respectable and not too crotchety. It is evident, however, that the Cumberland people still cling to the idea that there is a real difference in principle between Liberalism and Conservatism, and that a good deal depends upon which side a constituency throws its influence in choosing a representative. We are not now going to discuss which side had the best of the argument on this occasion. What gives this contest a distinctive character is the thoroughness with which the electors seem to have interested themselves in it, as if they felt that there was a vital question at issue, which it was worth while to take some trouble about. There has been, says the *Carlisle Journal*, an amount of speech-making on both sides quite unprecedented in the history of the constituency; scarcely a day passed without meetings being held by one side or the other. On the day of election the constituency was polled in a most exhaustive manner. About half of the whole body of voters had given their votes before noon, and by three o'clock the polling was virtually over. Altogether, of 7,323 electors on the register, 5,722 exercised their franchise, which, allowing for dead men and duplicate entries, is a very creditable proportion. Forty-five votes were lost because the voters had either not marked their papers at all, or not marked them properly. In one case the intelligent elector had simply written "yallow" on the back of his ballot-paper. Some alarm, which was shared by both sides, was caused by a decision of the High Sheriff that the whole of the votes in one of the polling divisions must be struck off, as the papers had been improperly marked by the Returning Officer's agent with the elector's number on the register as well as with the progressive number corresponding to that on the counterfoil. One hundred and eighty votes were thus affected, and neither party knew on which side the loss would fall. Happily, it turned out that they were equally divided between both, so that the cancelled votes had thus conveniently paired off. It would certainly have been very hard if so large a number of voters had been excluded from no fault of their own, but in consequence of a blunder on the part of one of the Returning Officer's subordinates. The Conservatives seem to have had the advantage over the Liberals in vehicles, for the latter had only 150 against the other side's 200. Each party issued a circular among its friends asking them to give notice at the nearest Committee-room of their having polled; but the Conservative card appears to have been drawn up in a disingenuous manner, so as to convey the idea that, if any other name than that of Sir R. Musgrave (the Conservative candidate) were marked, "the vote would not be counted." What should, of course, have been stated was that such a vote would not be counted to Sir R. Musgrave, but to the other candidate. It is satisfactory to observe that, though party feeling ran high and intense interest was taken in the contest, the polling was everywhere conducted in a very quiet and orderly manner. Formerly the throwing of bags of flour was a regular part of the entertainment, but this time the practice was given up, and there was, we are assured, "a marked absence of any attempt to disturb the peace and good humour of the people." There can be no doubt that the secrecy with which votes are given under the ballot tends, for the moment at least, to allay excitement, because there is nothing to be excited about. The race is going on, but out of sight, and the sense of a neck and neck competition is therefore lost. On the other hand, what is to be feared in such a case is an outbreak of violent disappointment when the figures are announced.

One feature of this election was the large display of party colours among the ladies of the district, which the haberdashers seem to have found very profitable. A return of the local sale of blue and yellow silk respectively while the contest was going on might be very instructive in its bearing on the question of woman's suffrage. At one place there was "a contingent of young ladies from Netherby, gaily decked in yellow ribbons and daffodils," and no doubt many "blue-eyed maids of Cumberland" were equally demonstrative on the other side. Indeed, we are sorry to hear that at Alston "enthu-

siastic female Blues pulled down all the yellow placards." However it was not only the shopkeepers who profited by the general enthusiasm; for it must, we imagine, have been advantageous to the community at large. Life in the country is apt to be so dull and monotonous that some occasional stimulus of this kind is required to prevent stagnation. The meetings which were being constantly held must have been a source of much interest and amusement to the people who attended them. It would be ridiculous to pretend that there was any great power of eloquence, in its higher sense, displayed on either side; but still the speeches were of a rattling spirited kind which could hardly fail to act as a useful tonic. Indeed, as the chairman of one of the Liberal meetings graphically remarked, "they were all as lively as a cow's tail in fly time." One of the chief promoters of this liveliness appears to have been Sir Wilfrid Lawson. When he at first came forward to support the Liberal candidate his intervention was regarded on that side with alarm, if not dismay: while the Conservatives could scarcely disguise the hopes which they based on the discredit which would thus be fastened on their opponents. It was soon perceived, however, that in Sir Wilfrid's case a want of logic on one point was more than counterbalanced by genial manliness and sense of humour. It is an old controversy both among philosophers and lawyers whether a man who is mad on one point must necessarily be regarded as mad all round; but Sir W. Lawson's case seems to support the theory that a casual eccentricity may be overlooked in one who is in other respects sound and sensible. Sir Wilfrid is of course, like other people in a free country, entitled to his own opinion as to the evil of intemperance, and the proper way of dealing with it; but when he proposes to solve a difficult problem by allowing every little borough or parish to make its own laws, regardless, or it may be in open defiance, of the general sentiment of the nation, he is flying in the face, not only of common sense, but of his own views on other subjects. For instance, he is apparently opposed to a standing army—or at least to an efficient one—to the Established Church, and to other institutions as to the advantages of which his countrymen are tolerably unanimous. But he does not venture to ask that the question of tolerating the existence of the Church or of contributing to the cost of the army and navy should be left to every borough and parish to settle for itself according to its own limited lights. If Sir Wilfrid were consistent, he would feel that his support of the Permissive Bill committed him to the absurd principle that Great Britain should cease to be a nation under common laws and a supreme constitution, and should become a mere fortuitous combination of obscure and insignificant atoms, left at the mercy of local ignorance and caprice. A man who really held such an opinion as a fundamental and essential part of his political creed would certainly be out of place in the midst of a party calling itself Liberal. It has been the good fortune of this country to have its affairs regulated by the general balance of public opinion throughout the land, and not by the crotchets of local cliques and sects; yet Sir W. Lawson and his friends wish to insert the wedge which would make ruin of the system that has made England not only great, but stable. A charitable view of Sir Wilfrid would, however, lean to the conclusion that, after all, his delusion is due only to his want of logic. Pope once described a complex character as—

> A very heathen in the carnal part,
> And yet a sad, good Christian at the heart.

And a similar distinction may perhaps be drawn between Sir W. Lawson's extravagance on one particular question and his general acuteness and common sense.

One of Sir W. Lawson's hits would seem to have derived its force from the position taken up by the orators on the other side. When answering the argument that Sir R. Musgrave must be the best man because he was born a Tory, he remarked that, if mankind had always remained as they were born, we should still be naked savages. There must be some progress in the world, and the weakness of the Conservative cause in this instance is that people like Sir R. Musgrave and Mr. Cavendish Bentinck pride themselves on being as ignorant and blind as to the actual condition and wants of society at the present day as their grandfathers. An important speaker on this side asserted that the child of an agricultural labourer received as good an education in being set to work in the fields as if sent to school. On the whole, it will be seen that the Conservative party was unfortunately represented, so that it showed its weakest instead of its strongest side. It is needless to say that the talk was not always kept up to a high level. One of the questions which obtained a large share of attention at this election was whether Mr. Stafford Howard, the Liberal candidate, was old enough for the House of Commons. It appears that he is twenty-five years old, while Sir R. Musgrave is thirty-eight. One of Mr. Howard's relatives and chief supporters appealed to what he called his "scholastic career," and another friend laid down the rule, on the authority of Professor Christison, that the brain-power of a man, if he had any, manifested itself before twenty-five. Mr. Howard and his friends also indulged in the use of the Cumbrian dialect, which was apparently foreign to their opponents, who therefore denounced it as vulgar. Still, the main question as to whether the administration of the country is at present being conducted in a proper spirit was not neglected. Whatever conclusion may be come to on that point, it must at least be admitted that it is a good thing that constituencies should apply themselves seriously to consider such questions, and should feel that the issue is of great importance. The loss which the Conservatives have sustained in East Cumberland may be a small matter in itself; but then there are other constituencies which may possibly catch the same earnest and searching spirit. The value of a popular election lies not merely in its result as far as one candidate or another is concerned, but in the enlightening effects of free and outspoken discussion.

THE "YANKEE EMPEROR."

THE Special Correspondents who have attended the Prince of Wales in India have not presented to the world an edifying spectacle, and if we comment on the absurdities of the American press in reference to the "Yankee Emperor," as they call him, Dom Pedro, we may be justly told that our own newspapers are equally extravagant. The real authors, whoever they may be, of the Royal Titles Act will be gratified to learn that the title of "Emperor" is so popular in America that the *New York Herald* declares that the United States are "an imperial soil where all are emperors." It is odd, if this be so, that so much fuss should be made about one particular specimen of the class; but if the readers of the *Herald* like to be told that Dom Pedro said they belong to an energetic people who may be allowed to be a little rough, it would be unkind to grudge them such a cheap and harmless gratification. We should ourselves think a visit to Chicago not particularly exhilarating, and the perusal of a description of an Emperor's visit to Chicago would have seemed to us one of the mildest forms of literary excitement. It was remarked in an unenlightened age that kings could do little to cause or cure the sorrows of humanity. But our age has discovered that emperors can be made the source of a whole nation's pleasure. In travelling to Chicago Dom Pedro was astonished to find the land so level. Owing to heavy rain, much of the low-lying fields was under water, and the aspect of the country was cold and cheerless, more especially to the Imperial party "arriving from the tropics," where we should think they might advantageously have stayed. It is perhaps the penalty of greatness that Chicago must be visited in April, and there is some compensation in a pressure of engagements which limited the stay there to two hours. Although the country was flat, wet, and dreary, the Emperor was favourably impressed by the comfort and well-being that met him on every side. Approaching the "Garden City," the general feeling, which we must confess we should have shared, was that its chief interest lay in the fact of its having been burned down and rebuilt. Along the line the frequent occurrence of splendid public buildings, in situations where they could scarcely have been expected, excited the visitors' admiration.

We cannot help thinking that the Emperor of Brazil in the United States, like the Seyyid of Zanzibar among ourselves, is an instrument on which clever people play their own tune. That potentate was replete with sentiments suitable for the annual meeting of a Missionary Society; and Dom Pedro says, or is said to say, the very things which an "enterprising people" like to hear. The splendid school-houses were especially admired, and "the Visconde de Bom Retiro declared they were educational palaces," which will be, no doubt, a great satisfaction to those who paid for them. Perhaps we might, if we tried, get an illustrious visitor to say as much for those School Board schools which adorn London, and afflict its ratepayers. To call Chicago, or any other newly-built town, a "Garden City," would be, we might think, a questionable compliment; but, if Dom Pedro has a taste for that kind of thing, he might see around London many acres of "residential mansions" which have grown as rapidly as short-lived plants. We have got Tyburnia, and we might perhaps get an emperor to look at it, and the *Daily Telegraph* would report, with embellishment, his remarks. Small growing towns thickly scattered along a line of railway may also be seen in England, and one of them is much like another. The waterworks of Chicago are probably worthy of the admiration ascribed to the Emperor, and it may be hoped that they will suffice to prevent a second conflagration. Dom Pedro was pleased to say that Chicago is a fine city, and a crowd of citizens which collected at the railway station made "quite a favourable impression" on the Imperial party. The Visconde de Bom Retiro declared that he did not know any city of Europe that could compare "for the general high character of its architecture" with Chicago. We do not know whether this nobleman was selected for his extensive travels, his taste in architecture, or his command of language and feature, as companion to the Emperor; but he is a good man all round for the place. Americans may expect an additional zest in European travel now that they are assured that it will teach them to admire more intelligently "the great commercial centre" of their own West. It appears that Dom Pedro is travelling by train to California, and the reporter who transmits to us his remarks cannot help allowing his Majesty to confess that the journey is rather dull. The history of the rise of the town of Corry interested him specially, although all that we hear of this history is that in nine years it has grown up from nothing to be a flourishing city of eight thousand souls, with many imposing public buildings. As Dom Pedro travelled he must have become aware that towns like Corry rise in exactly the same way *ad infinitum* in the United States. There is indeed one redeeming feature in these new towns, that they cannot have any excuse for holding centennial celebrations. When there is nothing to look at from the train the travellers begin to talk, and the reporter asks how the Emperor enjoyed himself in New York. The Emperor answers, "Very much. I went to a primary school

The system is admirable. Afterwards I visited the Normal School, and heard selections by the pupils. Very good." Afterwards there is a comparison between New York and London, which the reporter handsomely allows to have been advantageous to the latter. We may perhaps venture to say that the amusements which our capital offers to foreign visitors are about as lively as visits to normal schools and hearing "selections" by pupils. Sovereigns nowadays are expected to take interest in what reporters call the "educational institutions" of a people, but they might, if they pleased, stop short of saying that they enjoyed all they saw and heard. The waterworks and the grain elevators of Chicago, and the smelting-works of Omaha, may excite and repay intelligent curiosity; and the spectacle of continuous progress and unbroken prosperity must be, in general, deeply impressive; but when it comes to details, the imposing public buildings, and the exercises at the High Schools, as well as the scenery along the line, appear monotonous. If the Emperor had been taken to hear a "crooked whisky case" in the District Court at Chicago, he might have gained some notion how "palaces" are sometimes built and lived in by "energetic" people.

By an extension of the Monroe doctrine Yankee-land stands for North America, and even for America in general, and so it is perhaps right to call Dom Pedro the "Yankee Emperor." The *New York Herald*, having got an Emperor, naturally makes the most of him, just as vulgar people are likely to do with an Empress here. The reporter delights to write, as his public like to read, about "our Imperial visitor," and although Dom Pedro chooses to be spoken to as "Sir," he cannot help being spoken of by the biggest words that can be made available. He stayed at New York at the Fifth Avenue Hotel, and he left the Empress there during his visit to California. His presence at this hotel had "a magnetic effect on the public," and "the most favoured patron" could only obtain storage for his luggage and the promise of a bed in the parlour. We perhaps do Americans injustice in thinking that they attain heights of flunkeyism beyond our reach, and if an Emperor could be got to stay at an hotel in London we are not sure that the price of beds might not be raised, and a profit—in some cases greatly needed—be thus secured to the proprietors. But still the idea strikes us as new and droll that even Republicans should be willing to accept a shake-down in a parlour for the sake of sleeping under the same roof with Majesty. One does this sort of thing willingly at hotels which are desirable head-quarters for excursions among lakes or mountains, or when a town is filled to overflowing by some interesting event. But there are plenty of hotels in New York where a room could probably have been procured for less money than was paid for a bed in the parlour, or, to speak accurately, the promise of a bed in the parlour, at the Fifth Avenue Hotel. The *New York Herald* represents that type of vulgarity which is not ashamed to own itself, and it is profitable reading, because we have on this side of the ocean the same fault, but not quite the same candour. When the "Imperial party" has started, the reporter becomes indignant at the "roughs" who crowd upon it whenever the train stops. He seems to forget that these "roughs" only follow the example of their betters. If they were rich, they would take beds at the Fifth Avenue Hotel, or as near thereto as possible, and stare at the "Imperial party" without trouble or scruple of any kind. One of these "roughs," after carefully examining the Emperor, remarked that after all he was only a man, and the managers of the railway were perhaps under the same impression when they kept him waiting three-quarters of an hour before starting the train. The inventor of the saying that punctuality is the politeness of princes did not perhaps contemplate that the politeness would be all on one side. Happily on the line to the "Pacific Slope," with its one train per day, punctuality is not of so much importance as at Mugby Junction. But it seems that the habit of unpunctual starting described by earlier travellers in America still prevails. A steamer was announced to start at 2 P.M. An intending passenger having heard what was the usual practice, asked whether 3 P.M. would not be soon enough to come on board. The captain answered, "If you want to go with *us*, sir, you'll be on board by 2 P.M." The passenger took the warning, but at 3 P.M. and long afterwards the steamer was lying apparently immovable at the wharf. The manners and speech of Dom Pedro have intensely delighted the reporter, and, no doubt, his readers also; and, on the principle of promoting the greatest happiness of the greatest number, a few emperors and empresses ought to be kept on, simply that people in general may have something to talk about. It may not be pleasant to be an emperor any more than it is pleasant to be a lion at the Zoological Gardens, but if there were no wild beasts in cages there could be no satisfactory holiday on Easter Monday. There are still, we believe, some Republicans in England, although they keep themselves tolerably dark. When next they appear on any platform they should be invited to explain the general interest and pleasure excited by the arrival of an Emperor and Empress at New York. The Emperor departed almost immediately, but he must return, and there is a Municipal Committee, certain as quarter-day and inexorable as fate, waiting to conduct him to such of the public institutions of New York as he may be pleased to visit, and especially those connected with education and with scientific and literary pursuits, to which, "amid the graver cares of State," he is known to have directed assiduous attention. Emperors and workingmen are the only classes of society that are conscientiously supposed to be incapable of frivolous amusement. In the middle classes a little beer and skittles or its equivalent is sometimes allowed. But the emperor in his palace, or the mechanic at his Institute, never goes lower than astronomy or universal history. An American deputation could not avoid comparing "popular institutions" and "paternal government" in their effects; but it is easy in addressing an emperor to assume that both come to the same thing, and the emperor can politely concur in this agreeable and comprehensive estimate of the future of mankind.

THE RAILWAY CLOAK-ROOM.

A FEW years ago a question arose as to the effect of certain conditions printed on a ticket issued by a Railway Company to a passenger for his journey from London to Paris. The Court before which this question came felt itself bound by authority to hold that when a man takes a ticket, with conditions on it, he must be presumed to know the contents of it, and must be bound by them. It was admitted to be harsh to hold a man liable by the terms which might be inserted in small print upon a ticket which he only gets at the last moment after he has paid his money, and when he is hustled out of the place at which he stands to get his ticket by the next comer, and moreover when he believes that he has made a contract binding the Company to take him, subject to the ordinary conditions of the general contract, to the place to which he desires to be conveyed. But still the law was assumed to be thus settled.

Last year, however, a Scotch case came before the House of Lords in which the opportunity was taken to apply a more rational principle to this class of cases. The passenger in that case took a steamboat ticket, having on the face of it only the words "Dublin to Whitehaven," and on the back of it a notice that the Company incurred no liability for loss, injury, or delay to the passenger or his luggage. The passenger stated that he had never looked at the ticket nor seen the notice on the back of it, no one having directed his attention to either. It was held that the passenger was not bound by the notice. The contract was complete upon the face of it, and the passenger, receiving the ticket in that form, without knowing of anything beyond, must be taken to have made a contract according to that which was expressed and shown to him. The Lord Chancellor described himself as asking with some anxiety what was the authority for the proposition that a member of the public was to be supposed to have contracted as alleged by the Company in that case. He considered that no satisfactory authority was shown, and, he said, "it is a question simply of common sense." Can it be held that when a person is entering into a contract containing terms which *de facto* he does not know, and as to which he has received no notice, he ought to inform himself upon them? It seemed impossible to hold this. Lord Chelmsford, like the Lord Chancellor, was anxious to be referred to the authorities; but none were produced establishing that presumption of assent is sufficient. Assent, he said, is a question of evidence, and the assent must be given before the completion of the contract. The Company undertakes to carry passengers for a certain sum. The moment the money for the passage is paid and accepted the obligation to convey arises. It does not require the exchange of a ticket for the passage-money, the ticket being only a voucher that the money has been paid. Or, if a ticket is necessary to bind the Company, the moment it is delivered the contract is completed, before the passenger has had an opportunity of reading the ticket, much more the endorsement. "It may be a question whether, if a passenger were to read the endorsement, and decline to agree to the terms, the Company could refuse to take him as a passenger." This question of Lord Chelmsford deserves attention. He was dealing with the particular case of a Steamship Company; but we may apply what he said also to Railway Companies. You cannot, if you would, obtain a ticket until shortly before the train starts, and several persons besides yourself are eager to be served. It is practically impossible to read and consider, much more to discuss, conditions, whether printed on the face or on the back of a ticket. Your choice is that or nothing. We assume that, as regards Railway Companies, the Legislature has limited their power to impose conditions as to passengers' luggage; but we have mentioned a case in which a condition was imposed, and the judge, who held himself bound to give effect to it, nevertheless expressed clearly his opinion that the passenger was allowed no option in the matter. We all know from our own experience that this judge was right. Such conditions, if any, as are proper to be imposed on passengers ought to be settled by some general authority and conspicuously exhibited. A little of the space devoted to celebrating the virtues of pills and pickles might advantageously be used to inform passengers of what they ought to know. "A ticket," said Lord Hatherley, in the Scotch case, "is in reality nothing more than a receipt for the money which has been paid." It would be well, we think, that a ticket should be nothing more.

This Scotch case has been followed lately in the Common Pleas Division at Westminster on a question as to passenger's luggage left at a railway station and lost. It is usual, as we all know, to receive luggage at what is called a "cloak-room," giving a ticket for it and charging 2*d.* for keeping it. This business, be it observed, is separate from the carrying business of the railways, and the Companies, so far as we know, might impose any conditions they please upon those who deposit luggage with them, provided

they make a clear agreement. The ticket in the case lately decided had on it the words "See Back," and on the back was a notice that the Company would not be liable for lost property beyond the value of 10*l*. Now, if the clerk who received the money and delivered the ticket had stated to the depositor that which was printed on the back of the ticket, and he, understanding the condition, had deposited his property, he would have been bound by it. In this case the primary object of the ticket appears to be to ensure delivery of the article to the right person. The depositor might think that all he had to do was to get the ticket and put it safely into his pocket, and if so, he might be excused for not noticing the words "See Back" upon it; and accordingly the jury found that he did not notice the words, and that he was not guilty of negligence in not noticing them. Thus the case was thought to come within the principle established in the House of Lords. A contract of "bailment," as the law calls it, was completed in ordinary terms unless it could be made out that the bailor had entered into any special contract.

The conclusion arrived at in this case is opposed to that of the same Court in a similar case decided fourteen years ago. In that case a lady deposited a bag, containing wearing apparel and jewelry of the value of 20*l*., at the cloak-room of the South-Eastern Railway Company at London Bridge station, receiving for it a ticket and paying 2*d*. There was printed on the back of the ticket a notice that "The Company will not be responsible for any package exceeding the value of 10*l*." The lady applied for her bag on the evening of the day on which she deposited it, but the bag was not forthcoming, having been delivered by mistake to a wrong person. The Company afterwards obtained it and forwarded it to the lady, but, on examination, a great part of the jewelry it had contained was missing. It appeared in evidence that there was a large placard posted up in the cloak-room containing a printed notice similar to that on the back of the ticket which the lady had received; but she stated that she did not see this notice, and she was not examined as to whether she had read the notice on the back of the ticket. The Court under these circumstances held that "the plaintiff must be considered to have known the terms imposed by the defendants in accordance with this notice, and to have conformed to them." The defendants having used all reasonable means to give knowledge to the depositors, and amongst them to the plaintiff, of the terms on which they received deposits, and the plaintiff, knowing that there were special terms, and what they were, or having the means of knowing what they were, chose, said the Court, to make the deposit. It will be observed that, even if the plaintiff had stated that she had not read the notice on the back of the ticket, the decision would have been the same, for the Court said that she either knew or had the means of knowing the terms of deposit. "In a contract of bailment the bailee may impose whatever terms he chooses, if he gives notice of them and the bailor has the means of knowing them, and if he then chooses to make the bailment he is bound by them." We are quoting from the judgment of Lord Chief Justice Erle, who further said that this was not a carrier's contract, and the defendants were at liberty to make any contract they pleased, and the reasonableness of the terms would be an irrelevant inquiry. But, he added, "Considering the nature of the accommodation, the condition appears to me very reasonable." Three other judges concurred in this judgment, and it is interesting to note the various reasons which they gave. One of them remarked that the plaintiff in her evidence did not deny that she did read the terms, or that she knew they were there. Another judge would have wished that the notice had been on the face rather than on the back of the ticket. But, said he, "a person could hardly put it into his pocket or take it out of his pocket without seeing that there was printing upon it." That being so, and it being plainly expressed, there was such an implied assent as would constitute a contract. This judge also thought that the limitation of liability was reasonable.

In the recent case the same Company were defendants, and they no doubt think it hard that, although they have adopted the additional precaution of printing "See Back" upon their tickets, their liability is now greater than it was. The plaintiff stated in his evidence that he looked upon the ticket as a mere receipt, and that he knew nothing of its contents; and the jury found that this was true, and further that the plaintiff had not been guilty of any negligence in being unaware of the contents of the ticket or the existence of a placard containing the same notice. There is, indeed, this difference between the two cases, that in the former the plaintiff was not asked whether she had read the notice, whereas in the latter the plaintiff stated that he had not read it. One of the judges in the former case expressed the opinion that the plaintiff really had read the notice, and that her counsel at the trial had relied on a view of the law which the Court overruled. But, be this as it may, the Court dealt with the supposition that she had not read the notice; for the judges said that she either knew or had the means of knowing the terms of the deposit. It is perhaps another aspect of the same change of public feeling which makes Mr. Disraeli Premier that judges now demand less intelligence and activity of mind from travellers than they used to do. "Rest and be stupid" might be taken as the motto of our age. How can an officer in a marching regiment be expected to look at the back of a ticket which he takes for a voyage across the Irish Channel? How can any gentleman be expected to look at the back of a ticket which he takes at a cloak-room for a portmanteau? It is true that fourteen years ago a lady was expected to do this; but ladies, as a rule, if not more intelligent, are more curious than gentlemen. We are reminded of one of Dickens's characters who declared with much disgust that he had something better to do than thinking. Nobody now can be expected to waste his time in reading the back of any ticket which he gets at a railway station, even if the ticket has "See Back" upon the face of it. The Court in this case, as in many others, made convenient use of the jury, who had found that the plaintiff was not negligent in not knowing the terms of deposit. In the former case the Court, being both judges and jurymen, held that the plaintiff either knew or ought to have known the terms. The moral of the recent decision is that reading is a dangerous accomplishment which had better be forgotten when we enter a railway station. Where ignorance gets damages 'tis folly to be wise. If you cannot keep your eyes and mind inactive, look out among the advertisements for the particular quack medicine most suitable to your complaint.

The decision of the House of Lords has, we think, been generally approved. Railway and Steamboat Companies had gone so far in imposing conditions on travellers who had no option as to accepting them that it became necessary, as Lord Chief Justice Erle was fond of saying, "to have recourse to common sense." But the application of this principle to the cloak-room at a railway station demands consideration, because the liability, whatever it may be, which the Company incurs by keeping such a room, is not a liability as carriers. It may be conceded that under Sir William Erle's presidency the Court of Common Pleas was generally averse to enlarging the responsibility of Railway Companies, and in many respects the advance made since that time has been improvement. We decidedly think that the conditions which Railway and Steamboat Companies may impose on passengers should be regulated by statute, and that it is absurd to suppose that a passenger in the hurry of departure can exercise an intelligent judgment in the matter. Nor would it be unreasonable to make some general regulations as to cloak-rooms.

THE ROYAL ACADEMY.

II.

PURSUING the practice of previous years, we shall attempt to give an analysis of the contents of the Exhibition according to the subjects. We will begin with those exceptional pictures, now happily on the increase, which, without being precisely ideal, are something more than real—pictures which after some sort embody noble thought, and show man in his higher aspects, whether it be man individually as seen in biography, or collectively as portrayed in history. In judging of the merits of this class of art it may be well to remember the conditions to which it has to conform. All writers are agreed that a certain remove from common nature is imperative, and yet so close must each figure be to nature, that the painter abandons at his peril the living model even for a moment. We fancy that in the present day there is not an artist of mark who would venture to paint without the life, though it used to be said of Overbeck that he trusted to his inward sense. Certain corollaries follow almost as a matter of course. The drapery can scarcely be that of the cottage, and yet seldom quite that of the forum; the chiaroscuro is all the better when removed a little from the light of common day; as for chronology, it is well when the mind can be thrown from the immediate present into the middle or remote distances of time. Some of our English painters have of late adopted so imaginative a mood that the present Exhibition serves to confirm these fundamental principles.

Mr. Armitage, in the undraped, life-size figure of Phryne (909), challenges comparison with the greatest of Grecian artists. Apelles, in his most famous picture, the "Venus Anadyomene," is said to have taken Phryne as his model; and Praxiteles, it is supposed, in the Cnidian Venus, copied from the same original. It is probable, for more reasons than one, that the Greek picture and statue—both destroyed—were nude, as is the picture before us. The replica of the Venus of Cnidos in the Vatican has been in modern times half draped in bronze, a proceeding which we have never heard spoken of otherwise than with contempt and reprobation. Mr. Armitage has not been oblivious of ancient precedent. Phryne is on the seashore; her draperies are at her feet; she is preparing for a plunge into the blue waves. The style is something more than modern; on the other hand, it cannot be accused of the soft modelling of flesh which distinguished Praxiteles. As to Apelles, Reynolds conjectured that in his masterworks, did they exist, "we should find the figures as correctly drawn as in the Laocoon, and probably coloured like Titian." This "Phryne" is better drawn than coloured. The picture is one of the very few which come up to the high and austere standard of Continental schools. To an inferior order belongs an undraped girl, "After the Dance" (927), by Mr. Alma-Tadema.

"Atalanta's Race" (943), by Mr. Poynter, A.R.A., is the most uncompromising adaptation from antique sculpture and Renaissance painting that we have seen for many a day. The well-known story has been closely followed. Atalanta, finding her father's behest of marriage distasteful, made it a condition, being swift of foot, that her suitors should compete with her in public race; those that failed were to be killed, and only he who outsped her should wed her. After many had perished, there came forward at last Meilanion, favoured by Venus with three golden apples. During the course he dropped them one after another, and Atalanta, being charmed by their beauty, could not refrain from stopping to pick them up. This is the moment chosen; Atalanta,

by no means graceful, is in the act of bending to the ground, while Meilanion in hot pursuit is within a figure's length of his prize. Mr. Poynter has arranged his composition into three parts, distinct, yet connected in action. On the left is a group of eager spectators come to witness the contest. It is scarcely an accusation to say that by far the best figure has been taken from Michael Angelo's roof of the Sistine. The centre of the composition is occupied by as masterly a figure as was ever seen in an English Academy—that of Meilanion; rapid movement animates every limb, and possesses indeed the whole torso. Moreover, as is always found in the best antique sculpture—and the figure has much that is sculpturesque—this athlete, when thrown into rapid and headlong motion, preserves a perfect equilibrium; the lines and proportions fall into almost geometric symmetry; and so completely is the figure under the control of volition, that even in this last extremity of strife there seems the possibility of repose. This was a governing principle of the Greeks. Yet our English Academician can scarcely take full credit for absolute creation. There is at least one figure in the Elgin frieze, there are sundry running or dancing figures in Italian museums, also figures of Athletes and Discoboli from which he may have compiled—we do not say copied. Mr. Poynter, it must be admitted, has so well assimilated his materials as to make them here in the aggregate his own. Atalanta, the third and most important member in the composition, is a breakdown in more senses than one. She stoops to pick up the golden apple—a most difficult attitude—and it has been justly observed that, were she to rise, she would knock her head through the gold frame of the picture; yet the same objection might be urged against "The Death of Procris," by Piero di Cosimo, in the National Gallery. But, in an art point of view, a more unpardonable fault is that the figure becomes a confused heap of anatomies and draperies, that all breadth in masses, all distinctive emphasis in line, are absolutely lost. Strange also to say, calculated by historic styles, not less than twenty centuries intervene between the suitor and his captive, although they are within less than ten seconds of each other; in other words, the picture passes within the space of a few square feet from the age of Phidias to the eighteenth century of Italy and France. Thus from what has been said it will appear that three distinct epochs are brought together—the Greek, or Græco-Roman, the Italian Renaissance, and the Modern. It must be confessed that the problem to be solved was most difficult; and it must also be admitted that the work, whatever may be its mistakes, does honour to the English school. Some few pseudo-classic compositions may be briefly noticed, such as "The Nursling of the Muse," a repulsive abortion by Mr. P. Cockerell (972), and "Pallas Athene and the Herdsman's Dogs" (496), by Briton Riviere, an utterly mistaken composition which may recall a criticism passed on a picture of Balaam, the Angel, and the Ass. The artist, it was remarked, was an angel when he painted the ass, and an ass when he painted the angel; and so here of Pallas Athene and the dogs. Mr. Harrison has endowed "Alecto" (447) with metallic wings evidently of Brummagem manufacture. The drawing of the figure, indeed the treatment of the whole picture, is direful.

It is always interesting to observe, either in England, France, Germany, or Italy, the attempts, mostly unsatisfactory, which are made in these modern times at religious art. The inspiring faith has departed, and yet faith is not always found to be in itself sufficient; take, for instance, Mr. Herbert's impotent figures "Judith" (578) and "Mary Magdalene" (584). Each stands at too great a distance from nature, and the vital principle of a sound mind in a sound body has been so completely set at nought that we are sure no Insurance Company in the world would take these lives at any premium. Besides, the religious sentiment here and elsewhere becomes a negation; all that is positive has been eliminated, so that the personality left is little more than passivity verging on nonentity. Mr. Goodall has sometimes erred in this direction, yet "The Holy Mother" (182) will be generally accepted as a reverential embodiment of religious thought. But the Infant—by far the better part of the group—might equally well serve for a secular composition. The colour, though pure, is over-pale; the general style is that of the popular but passionless Sassoferrato. Mr. Long's enticing Pool of "Bethesda" (891) may be assigned to the school of Guido, or of a later decadence. The composition is so little of a sacred character, that it might almost be mistaken for a mutual consent to commit suicide by drowning. It is true that the principal figure, a mother with a child in her arms, turns up her eyes; but so did the mother in the Niobe group. By far the finest study is that of an old woman lying on her back, seen at an angle of sharp foreshortening. The identical subject has been treated in quite an opposite spirit by Mr. Robert Bateman (30); here we have not only the Pool, not only the awaiting sick, but a full-winged angel stopping down marble stairs to move the waters. The suspicion will be that the artist has looked overmuch at German engravings from Düsseldorf, though we do not happen to recall among them this special subject. The lack of colour and decisive chiaroscuro would also tend to the same conclusion. The painter has, however, well thought out his subject, and the execution, without ostentation, serves simply to give expression to the idea.

Sir John Gilbert brings us to history in "Richard II. Resigning the Crown to Bolingbroke" (165). The crown is handed across a small central table with due solemnity, and a bishop and ministers of state stand in solemn waiting. The composition is deliberately symmetric; the colour, as is habitual with this master, is deep and golden. "Crusaders," a medley (139) by the same artist, recalls the colour and the impetuous action of Rubens in the famous battle on a bridge in Munich; but it does not remind us of the studious design and accurate drawing of Da Vinci in "The Battle of the Standard." Mr. Hart, we presume, must take rank among historic painters, inasmuch as he depicts the children of Charles I. with their caretakers at "Dinner-time at Penshurst in the year 1655" (153). The performance lies rather beyond the reach of criticism. Artists have been known to mingle with the crowd in order to profit by the observations passed upon their works. Mr. Hart should be cautioned against an ordeal which might prove painful. Though we see him here in his most serious mood, he provokes amusement; a lady was heard to exclaim as her eye caught one of the Royal children, "O that hideous little object!"

"The genre of history," though a term more French than English, is usefully applied to certain picturesque byplays, wherein humanity is somewhat merged in draperies and accessories. Mrs. E. M. Ward's "Newgate, date 1818" (120), affords a favourable example of the style. Mrs. Elizabeth Fry is here seen in one of her visits to Newgate prison; the gaolers have opened the door, which reveals a crowd "of half-naked women struggling together for front situations with the utmost vociferation." The biographer, who was an eye-witness, adds that "she felt as if she were going into a den of wild beasts." Mrs. Fry, as we were accustomed to see her some fifteen years later, stands calm; she ever possessed her soul in peace. But the picture lacks somewhat of the supreme dignity and command which doubtless were a secret of her power in the conflict with evil. It may be objected also that the Quaker greys are a little gay. The works of Mr. Alma-Tadema this year deal less with man than with realistic accessories. Mr. E. M. Ward has certainly not changed his style for the better since the time when he raised himself to the dignity of an historic painter by scenes from the sufferings of Marie Antoinette. Certainly the picture now before us, "A Year after the Battle" (239), is little else than picturesque *genre*. In the same category must be placed Mr. Gow's animated scene, "The Relief of Leyden" (381). The figures are eminently life-like, as if depicted on the spot by an actual spectator; but somehow the art is comparable, not with a page from history, but with a paragraph from "Our Own Correspondent."

The speakers at the annual dinner on Saturday last threw out some scattered comments on the Exhibition which are worth recording. The President stated that the works sent in this year reached the unprecedented number of 5,025. "We could," he continued, "hang only 1,500"; that is, not quite one picture for every three tendered. This painful state of things, fraught with disappointment to more than three thousand artists and their friends, does not, we are sorry to say, admit of easy remedy. The existing walls cannot with advantage be more crowded than they are; and to add to the present suite of rooms is all but a structural impossibility. Moreover, the outside public feel that ten galleries and a lecture-room all devoted to pictures, together with three halls dedicated to sculpture, already sufficiently tax their time and strength. Also, it is not unreasonably thought that 1,500 works constitute a tolerably fair representation of the talent and produce of the year; and it certainly is to be feared that, if numbers are augmented, the standard of merit will be deteriorated. Much, however, depends on fairness of selection, and the charge has long been made that interest prevails over merit. One inference to be drawn from the ever-growing multitude of supplicants knocking at the door for entrance is that the power and importance of the Academy are year by year increasing, and this condition of things becomes all the more remarkable when we consider the constant multiplication of what might be deemed competing exhibitions. The Academy gathers strength by windfalls, such as legacies; thus, during the present year there accrues the bequest under Chantrey's will, estimated at an annual sum of 3,000*l.*, to be expended in the purchase of "works of fine art of the highest merit in painting and sculpture." The President's comment thereon is significant of the monetary relationships subsisting between artists and dealers. "The Council," said Sir Francis Grant, "had hoped to purchase some pictures out of the Exhibition, but they found to their regret that the dealers had been beforehand, and had already secured every picture which they thought worthy of purchase." This does not open a hopeful prospect of the early commencement of "a national collection of British art." The speeches at the dinner were not without gist. Sir James Paget contrived to give freshness and meaning to the threadbare duality of "Science and Art." Men of science and men of art, he observed, "study nature from different and distant points of view, yet both may gather and display the evidences of the same truth; for surely the principle of beauty which the artist seeks, and the principle of order which the man of science searches out, are alike the issue of divine law maintaining all things in mutual fitness." To these aphoristic words may be added Mr. Disraeli's glowing prophecy of immortality for British artists. The Premier claimed pre-eminently for the English school "originality"; "and where there is originality there will be immortality. The sap always rises, the spirit always is present."

THE TWO THOUSAND GUINEAS.

THE two-year-old running of 1875 was so contradictory that, of by far the larger proportion of the candidates for Two Thousand honours, it might have been said a few days ago that

one was pretty nearly as good as another. The best performers of the season were either not entered for the great three-year-old race at Newmarket, or were placed *hors de combat* by some unfortunate casualty. The names of Skylark, the Mineral colt, Farnese, and Springfield are missing from the list of nominations, and Petrarch, who won the Middle Park Plate with unparalleled ease, met with some accident which caused his preparation to be interrupted at a critical moment. Even had Farnese been entered, his infirmity, which steadily increases with age, would have effectually prevented him from winning; but the presence of Skylark and the Mineral colt would have relieved the first of the great three-year-old races of the year from any appearance of mediocrity. If we look at the antecedents of the fourteen competitors who came to the post on Wednesday last, we shall find that, as far as the majority of them were concerned, and of course excluding Petrarch, the most natural course for a person in search of the winner would have been to put their names in a hat, and depend on the first he might happen to draw out. There were Lord Falmouth's pair, Great Tom and Fetterlock. Last year the former ran once, and was beaten by Twine the Plaiden, and this year he has run once also, and has been beaten by Wild Tommy. The latter appeared in public on six occasions last season, but was only successful once. He was beaten by Kaleidoscope, Twine the Plaiden, and other horses; but in his solitary winning race he managed to beat Wild Tommy. On this running he would be superior to his stable companion Great Tom. But, despite the defeat of the latter the week before last, the stable continued to repose the utmost confidence in him, and averred that the Two Thousand would show the Biennial to have been all wrong. Nine times out of ten, when a horse is beaten he is beaten on his merits, and his subsequent performances fail to justify the excuses which are often improvised in explanation of his failure. Then we come to the French pair, Camembert and M. de Fligny. The two-year-old running of the former was so indifferent that he may be passed over without further comment; but the latter earned some sort of reputation as a sound honest horse who was thought capable of making improvement. Though he was only successful in three out of eleven races, his three victories were gained over fair performers, such as Retrospect, Bay Wyndham, Rosinante, and Hellenist; and when he was beaten he was beaten in good company by Skylark, Lady Mostyn, and on three occasions by Farnese. In the autumn he went off, and in the Middle Park Plate, where however he had the full penalty to carry, he was never conspicuous; but, on the whole he had a wear-and-tear appearance which gave his friends a certain amount of confidence in the prospects of his three-year-old career. Rosinante, a roarer, and Rascal, who ran five times without attracting the notice of the judge, may be passed over, while we take note of the doings of Kaleidoscope. This son of Speculum was a very uncertain horse last year, and had he not won his last engagement at Newmarket against a good field he would hardly have been promoted to the position he has occupied among the Two Thousand favourites. He was nowhere in the Middle Park Plate; he was beaten by Brigg Boy in a match at even weights; he was beaten in the Troy Stakes at Stockbridge by Retrospect and Hellenist as well as by the winner Margarita, and in the Woodcote Stakes at Epsom by Bay Wyndham, Father Claret, and Charon. On the other hand, he defeated Red Cross Knight, Levant, and Hellenist at Sandown Park, and the first named of this trio, as well as Fetterlock, Julius Cæsar, and Father Claret in the Prendergast Stakes at Newmarket; but it must be observed that on this occasion the moderate daughter of Scottish Chief and Gong got within half a length of him. Undoubtedly a horse with a fine turn of speed, but with questionable staying powers, the son of Speculum had, in our opinion, small public credentials to justify his being placed above the rack of the Two Thousand candidates. King Death won two races out of seven, but beat nothing of importance save Red Cross Knight. Coltness jumped into fame by winning the New Stakes at Ascot against a field which afterwards was shown to be of indifferent quality, but he positively declined to repeat the performance on any future occasion. At the Craven Meeting this year he was reported to be much improved, and his looks were certainly in his favour; but he failed to make even the show of a fight against Great Tom and Wild Tommy. Julius Cæsar was another hero of a solitary victory in 1875, but Charon won three out of seven races, and twice defeated Julius Cæsar, besides disposing of Father Claret and Bella. Father Claret himself, to make confusion still more confounded, beat Kaleidoscope at Stockbridge; and thus, in the case of at least a moiety of the Two Thousand runners, it would seem hopeless, on their two-year-old running, to give the preference to one over another.

Finally, there was Petrarch, whose running could not be in and out, for the simple reason that he only appeared in public on one occasion last season. That single engagement, the Middle Park Plate, he carried off in a style that has never been surpassed; and though, just as one swallow does not make a summer, so one race is not always a sufficient test of the real merits of a racehorse, yet what he had to do no horse that ever was foaled could have done better. Looking, too, at the history of the Middle Park Plate, we find that it has hardly ever been won save by a horse of distinguished ability; and, looking at the appearance of Petrarch, at his breeding, and at the racing powers of most of the progeny of Laura, it was only reasonable to assume that he was the best of his year, and to uphold him as such till the time came when he should prove himself undeserving of his position. The public certainly were prepared to trust implicitly to Petrarch as their representative in the great three-year-old races, but the news of his sale shook their confidence. There is always a prejudice against horses which are sold out of a stable shortly before a great race, and we think in the majority of cases the prejudice is just. It is felt that an owner of racehorses who has for years aimed at the highest prizes of the Turf would not be likely to let the chance slip out of his fingers just when his prospects were most promising. It is felt also that the buying and selling of horses is very often a conflict of shrewd wits, and that the seller generally knows more than the buyer. The price paid for Petrarch was so enormous—ten thousand guineas, we believe—as to be considered in itself a high testimony to his merits; but then, on the other hand, high-priced horses have often signally failed to return their purchase-money to their new owners. Kangaroo was sold for twelve thousand guineas, and never won a race afterwards; and many similar instances will readily recur to the recollection of racing-men. Certainly, from the moment it was known that Petrarch had changed hands, his position was shaken in the market; and even had all gone well with him, it is probable that he would never have firmly re-established himself in public favour until he had carried his new colours to victory. But things did not go well with the son of Lord Clifden and Laura. Only a few weeks ago he was stopped in his work for several days by an accident, and, according to all precedent, a preparation thus suddenly interrupted within a month of a big race could not under any circumstances be successfully completed. His stable companion Kaleidoscope, whose speed it was thought would enable him to get home first in a moderate field, speedily supplanted him in the market, and, though the supporters of Petrarch still clung to him for the Derby, his chance for the Two Thousand was abandoned as hopeless. In the Craven week Petrarch and Kaleidoscope were galloped together, and the result was to extinguish the last gleam of hope that the former could be got ready by the Two Thousand Day. It came to this, that his name was included among the doubtful starters; and when at length it was known that he was going to run, it was understood that he was only going to compete for the sake of some bets that had been laid as to his starting, and an almost unknown jockey was selected to ride him. Thus up to the very last moment Petrarch remained disregarded, while the battle for favouritism was carried on between Great Tom, despite his Biennial disaster, Kaleidoscope, Charon, Julius Cæsar, and Glacis, the last-named being pushed to the front on the principle, we suppose, that a very moderate horse is worth supporting in a very moderate field.

Whether the luxurious innovations of grand stands, refreshment-rooms, and the like, now in progress at Newmarket, will work a change in those good old simple virtues of punctuality and precision for which the famous Heath has been so renowned, we know not; but certain it is that last Wednesday there was an unwonted delay in weighing out and despatching to the post the fourteen runners. It was nearly fifteen minutes after the appointed time when they formally came under the control of the starter, and then the fractiousness of Glacis still further delayed the commencement of the race. When the flag did fall no complaint could be urged against the fairness of the start, and indeed on the Newmarket course there can be no excuse for those irregularities to which we are accustomed at other places. As soon as they had fairly got into their stride Camembert rushed to the front to make the running for his stable companion M. de Fligny, and he managed to maintain his lead for nearly half a mile. But after the first half-mile the race was over; for directly Petrarch was allowed to take the lead, he took it with such effect as never to suffer any of his antagonists to approach him. He never had to be ridden, for nothing ever got near enough to challenge him; but, pursuing the even tenor of his way, he sailed along down the Abingdon hill, and reached the winning-post, without having once been called upon, three lengths in advance of Julius Cæsar. So evident was it to the jockeys engaged in the race that Petrarch had it at his mercy at any point, that probably few of them seriously persevered after a certain point. We think, however, that Julius Cæsar was entitled on his merits to second honours, though some were of opinion that, if Petrarch had been out of the way, Kaleidoscope might have won. Yet the latter was ridden rather hard at the finish, but failed to get within two lengths of Julius Cæsar, who justified the assertions of his trainer that he would show himself a greatly improved horse. Close up with Kaleidoscope were a cluster, including Coltness, Great Tom, M. de Fligny, and Fetterlock, every one of the quartet being as good as the other, as might have been expected from their inability to get out of one another's way last year. The result of the race shows that Petrarch has preserved the superiority over the horses of his year which he manifested in his solitary race in 1875, that Julius Cæsar has made some advance, and that the rest are very much where they were before. Of course the ridiculously easy victory of Petrarch excited some feelings of astonishment. We are not thinking of the average spectators, who invariably discover the good points of the winner, when he has won, and who, after Petrarch returned to the birdcage, were positively lost in admiration at his magnificent appearance. We are thinking rather of those more intimately connected with the horse, who have been concerned with him either as owners or trainers, or lately as residents in Newmarket, with opportunities of seeing him from day to day, and who of course would not have allowed him to be

knocked about in the market and made the sport of the bookmakers unless they had despaired of his success. They must have been astounded at finding how utterly unfounded were their fears, and possibly they felt a little ashamed—if indeed racing-men ever do feel ashamed at anything—at the pusillanimity with which they threw overboard a horse who bids fair to earn a name second to few of the greatest celebrities that have ever trod the Turf. Such persons may plead that Petrarch had been stopped in his work, and was manifestly not wound up to what is considered a high point of preparation. But some horses run much better when they are on the big side than when they are worked up to the trainer's pitch of condition. Of course races have been lost through want of condition, but a far greater number have been lost through over-training. When Petrarch won the Middle Park Plate he was decidedly backward. Last Wednesday he was decidedly backward, and won the Two Thousand in a common canter. His owner and trainer will do well to bear this in mind. They have got a horse who can run away from the best form of the year when but half prepared. Let them be satisfied with the knowledge, and not strive to make assurance doubly sure by training Petrarch as fine as a greyhound, so that he may win the Derby by six lengths instead of three. Otherwise they may defeat their own object and lose the Derby altogether. There have appeared of late months in the pages of a popular magazine some reminiscences of a racing-man of the old school, and an excellent judge of horses and the proper method to treat them, Mr. Thomas Coleman. That veteran trainer narrates how often in his experience good horses have been spoiled and their chance of winning great races altogether thrown away through overwork and over-much trying. Lord George Bentinck was a great offender in this way. Strong work and constant sweatings were his one idea of preparing his horses for their engagements; and in their trials no task he could set them was hard enough for him. Then, if they accomplished what was asked of them, it seemed almost too good to be true, and he would try them over again to see whether there had not been some mistake; so that by the time the day of the race came they would be stale and done up. This evil example has been extensively followed in our own days, to the ruin of many a gallant horse, and the disappointment of his owner. The occasional victories of a horse like Petrarch, who had been indulged in his work before both the races in which he has taken part, may serve to show the impolicy of exhausting a horse's strength in preparation for a race, instead of reserving the full display of his powers for the race itself.

REVIEWS.

LORD ALBEMARLE'S REMINISCENCES.*

NO attempt has as yet been made to establish a copyright in witticisms; but every man has a moral claim to a "good thing" first said or told by himself. Lord Albemarle is therefore fully justified in repeating once more an excellent though now time-honoured jest, of which he was the original victim, although "it has several times found its way into print," the last who quotes it being "Charles Greville, and he had it from George Villiers, afterwards Lord Clarendon, who had it from me." Lord Albemarle, at that time Mr. Keppel, had recently published an account of his overland journey from India to Russia, of which he had presented a copy to Lord Wellesley, under whom, as viceroy of Ireland, he was then serving as aide-de-camp. The publisher of the book had induced the author to re-christen it as the "Personal Narrative" of his travels, and it was to the adjective "personal" that Lord Wellesley insisted on objecting. At dinner he sarcastically inquired from Lord Plunket what was his definition of "personal," to which the Chief Justice replied, "My Lord, we lawyers always consider *personal* as opposed to *real*." To the reminiscences before us Lord Albemarle has preferred to give a title on which it would be difficult to be witty or even censorious, since it would be worse than ungrateful to cavil at the circumstance that his record of fifty years of his own life is preceded by a sketch of the life of his house during the course of something like seven centuries. But, leaving this Introduction aside for the present, we may add that Lord Plunket's witticism would have been as stingless, if applied to these personal reminiscences, had they presented themselves to the public under that title, as it doubtless was to the record of Mr. Keppel's overland journey. We have never read any autobiographical memoirs with a better claim to be called both "personal" and "real," so long as those adjectives may be used as implying nothing more than a vivacity which never gives offence, and a truthfulness which is never dull. In a word, this *Fifty Years of My Life* is a thoroughly delightful book of its kind; and, if we were desirous of finding fault with it, we should have to take refuge in its misprints, which we cheerfully leave unenumerated.

Among the evils to which the family motto of the house of Keppel urges its members not to give way, that of inaction must assuredly have always seemed to them especially repellent. For the younger son of a great Whig family, and for an absolutely beardless ensign who had obtained his commission early in the year 1815, the prospects of an active life might not have seemed very hopeful; but fortune did something for the boy who had just "broken bounds" at Westminster School, and his own energy did the rest. On the day on which George Keppel precipitately left a school furnishing no sufficient opening for his talents (he had scaled the wall of his boarding-house once too often, and his father had been recommended to choose for him a profession "in which physical rather than mental exertion would be a requisite"), Napoleon entered Paris on his return from Elba. Hardly, therefore, had the lad received his commission, and consoled himself with the consciousness of it for having been told by his mother at an evening-party at Lansdowne House to "run away" for cakes into the tea-room, than he was ordered to join his regiment in Flanders. With his regiment—humorously called "Calvert's Entire," from its colonel being brother to a brewer of fame, and the regiment being in possession of its full complement of battalions, after the disbandment of one of which its *sobriquet* was exchanged for "Calvert's All Butt"—he served through the Waterloo campaign. In the battle he carried one of the colours in rotation with two or three of his comrades, the "boys" being encouraged by a colour-sergeant of the name of Moore, after the following judicious fashion:—"'Now you see,' said he, 'the enemy always makes a point of aiming at the colours, so if anything should happen to either of you two young gentlemen, I ups with your colour and defends it with my life.'" Soon afterwards poor Sergeant Moore was carried off the field; but Ensign Keppel came out of the battle without having suffered any worse casualty than the following, which, though it seems already to have been told in print, shall be given in his own words:—

> We were now ordered to lie down. Our square, hardly large enough to hold us when standing upright, was too small for us in a recumbent position. Our men lay packed together like herrings in a barrel. Not finding a vacant spot, I seated myself on a drum. Behind me was the Colonel's charger, which, with his head pressed against mine, was mumbling my epaulette; while I patted his cheek. Suddenly my drum capsized and I was thrown prostrate, with the feeling of a blow on the right cheek. I put my hand to my head, thinking half my face was shot away, but the skin was not even abraded. A piece of shell had struck the horse on the nose, exactly between my hand and my head, and killed him instantly. The blow I received was from the embossed crown on the horse's bit.

"The very young battalion of the 17th," to which Mr. Keppel belonged, received special mention in the Order of the General of its Division for having displayed at Waterloo "a gallantry and steadiness becoming veteran troops"; but on its return to England, in January 1816, it was disbanded, Mr. Keppel being thus saved from the fate of the troops embarked in its stead for Ireland in the *Sea Horse*, which, together with two other transports, was lost off Kinsale. Lord Albemarle mentions that, "beyond a short paragraph in the papers, no public notice was taken of the catastrophe," but that among the officers it was argued that

> With the return of peace, soldiers had become a drug in the market, while freight was a costly commodity; that hence our rulers were much disposed to accept the lowest tender for tonnage without examining too closely into the seaworthiness of the ships engaged, and that consequently vessels unfit to carry coals from Newcastle to London were taken up to convey troops to all parts of the world. Nor was the demeanour of the skippers of these transports reassuring; they were generally men of very little education. Their dialect showed that they belonged to the "black country," and though they seemed to have a practical knowledge of the soundings in the Channel, it was a question whether, to many of them, the use of a Hadley's quadrant was not an unknown science. It was frequently my lot, as a subaltern, to sail in one of these coal-tubs; and often in a gale of wind I have fervently wished that the craft in which I was a passenger might prove a better swimmer than the *Sea Horse*.

Being "out of the break" Mr. George Keppel was ordered with a detachment of his regiment to the Ionian Islands; but neither there nor at Mauritius, whither, having been subsequently appointed to an ensigncy in another regiment, and narrowly escaped the charge of a batch of convicts to Botany Bay, Mr. Keppel was next ordered, was there much chance of opportunities for distinction. The young officer, however, kept his eyes open, and his account of the condition of things in Mauritius (of which he frankly confesses he had never heard the name till ordered to form part of its garrison), during a period of peculiar interest for the history of its peculiar institution, is as curious as it is brief. After this his next experience of military duty proper was in Calcutta, where he was at once appointed aide-de-camp by Lord Hastings, a post which he likewise filled under that governor-general's temporary successor. Hereupon, amateur theatricals and jackal-hunting having alike ceased to charm, he set out upon the overland journey home which made his literary reputation, but deprived him of the chances of active service which opened after his departure with the Burmese war. After his return home he was gazetted to a captaincy in the 62nd regiment, and, with characteristic energy, set himself to acquiring the new system of drill then in course of introduction into the army. With equally characteristic sincerity he avows that he had the advantage over his superiors of having "very little to unlearn":—

> To me Torrens' "Field Exercises" were a pleasing novelty, and not the least agreeable days that I spent at this period of my military career were those passed in the "Sixty Acres," as our soldiers used to call the drill-ground in the Phœnix Park.

This enthusiasm was however cooled by a change of colonels; and the personal staff of the Lord-Lieutenant soon supplied the desired refuge. Mr. Keppel's literary reputation afterwards moved the Duke of Wellington to promote him to a majority with convenient promptitude; but, as it was unattached, Lord Albemarle, though he is now a full general, considers this appointment to have virtually put an end to his military career. He was thus obliged to indulge his military tendencies as a student and observer only, in the former capacity attending the Royal Military College at

* *Fifty Years of My Life.* By George Thomas, Earl of Albemarle. 2 vols. London: Macmillan & Co. 1876.

Sandhurst, in the latter paying a visit to Turkey in 1829 at a momentous crisis in the history of that empire. As to Mr. Keppel's acquirements in tactical science, we must refer the reader to his narrative of his interview with the Grand Vizier, Mohammed Redschid Pasha, who plainly informed a roomful of *mecralis* and *binbashees* that this young officer knew more of their profession than all of them put together. To judge from the accounts of the Turkish army recently published in the *Allgemeine Zeitung*, the Grand Vizier's summary of the Turkish military system is not yet out of date:—

> It is not the fault of the Osmanli soldier, for he is brave enough, but of these ignorant fellows, that he is not oftener successful in the field.

Mr. Keppel's suggestions on the subject of military tactics probably failed to impress Redschid Pasha as permanently as did those offered by Herr von Moltke a few years afterwards; but the family promptitude of the young British officer is as undeniable as the sagacity with which he formed an opinion concerning the possibilities of progress in Turkey which, as he justly remarks, is more generally held nowadays than it was half a century ago.

The roll of Mr. Keppel's Parliamentary services is not less brief than that of his military services; though here again, on the occasion of his first appearance as a candidate, he displayed that boldness which is apt to command success, by following the advice of a member of the new Whig Government, to "shy his hat into the ring, and see what will come of it." Lord Albemarle's Parliamentary reminiscences are, however, neither numerous nor important; his politics came to him in his cradle, or at all events from the arm-chair in which Mr. Fox, then in his last days, played trap-ball with the youthful scions of the houses of Keppel and Russell. Nothing could be pleasanter than Lord Albemarle's anecdotes of a man who must have been the most loveable of all our political worthies—unless it be the account of a visit paid in 1838 by the author of these memoirs, the Duke of Bedford, and others to Mr. Fox's widow:—

> We experienced a most cordial reception. Our hostess, who lived very nearly a century, was in her ninety-third year, but still hale and hands me. She insisted upon showing us all over the house herself, pointing, among other things, to the tiny table on which Mr. Fox wrote his "James II." We all underwent a close scrutiny. When she came to George Byng she said musingly, "Ay, good-looking enough, but not so handsome as old George," meaning Byng's uncle and namesake, who represented Middlesex in her husband's lifetime. I reminded Mrs. Fox of my games of trap-ball with the statesman. She well remembered the circumstance, and explained that when the swelling of Mr. Fox's legs prevented him from walking, she used to encourage him to play this game with children as a means of taking exercise; "but," added she, "he required no encouragement from me, for you know, my dear, how fond he was of you all." I now learned that the Duke of Bedford was another of the boys with whom Fox had been in the habit of playing trap-ball.
>
> We spoiled our dinners by a sumptuous luncheon. A profusion of costly wines was placed on the table. The butler, nearly as old as his mistress, kept constantly filling her glass. "If you don't take care," said the Duke of Bedford to him, "you will make the old lady quite tipsy." "And what if I do?" was the reply; "she can never be so in better company." Turning round to the old man, the Duke inquired whether there were many Tories in the neighbourhood. "Please your Grace," was the reply, "we're eat up with them."

Something besides the spirit of Whiggism, and something besides the humour of the man who "considered alcohol the test of excellence" in wine, had lingered round his home. The test of geniality is the capacity of enjoying life in many and various forms, and of keeping a serene mind as well as a brave heart. Such fruits will ripen even under as cold a shade as that in which Fox so long lived and in which the present Lord Albemarle grew up.

It is true that the sunshine of royalty, though not until a late period derived from the central sun itself, never altogether ceased to illuminate the career of the author of these memoirs. Indeed those of his reminiscences which bear upon his connexion with royalty seem to us the most interesting part of this interesting book. George III. was, as a matter of course, no friend to the house of Keppel. Indeed, according to one of its family traditions, it was a paroxysm of rejoicing at having prevented a transfer of property which Admiral Keppel desired to make to the Duke of Cumberland which constituted the first symptoms of the poor King's subsequent insanity. And already in 1780 His Majesty was believed to have intervened in a Windsor election in which the Admiral was a candidate by canvassing in person on the side of his adversary, and entering the shop of a Keppelite tradesman with the muttered words—"The Queen wants a gown—wants a gown. No Keppel—no Keppel." Concerning the next generation of the Royal Family Lord Albemarle's impressions necessarily differ very widely. The kindly, but, if anything, over-punctual, Duke of Sussex he long attended as Equerry; he was constantly at the Court of King William IV., under whom the fourth Lord of Albemarle was Master of the Horse, thus acting an official part in the famous drama of the drive to the House of Lords; and his last Court service was as Groom-in-Waiting to Queen Victoria. In contrast to the regard and loyalty which Lord Albemarle expresses for these exalted personages are the sentiments which he clearly entertained, but wisely refrains from expressing at unnecessary length, in reference to the Prince Regent, afterwards George IV. Unfortunately, he had at a very early period of his life, when a schoolboy at Westminster, gained too close an insight into the Prince's domestic affairs to be able to retain any doubts about them. He was the schoolboy friend and playfellow of Princess Charlotte, to whom his maternal grandmother, the Dowager Lady de Clifford, was governess till driven from her post by an outrageous breach of confidence on the part of the Prince. His father became Mrs. Fitzherbert's trustee for the custody of the documents relating to her marriage; and such of these as still exist Lord Albemarle's brother continues to hold in trust as his father's executor. And in his official position as Equerry to the Duke of Sussex, it was Mr. Keppel's fate to attend a great part of the trial of Queen Caroline, and to keep a watchful eye on much of the secret history of that shameful episode. But when we spoke of the attractiveness of Lord Albemarle's reminiscences of royalty, it was only one personage of royal birth that we had in mind. The Princess Charlotte of these memoirs is the figure which makes them both more personal and more real than any other—a sketch as brimful of life and nature as (*sit venia*) Sir Joshua's Miss Prue herself, with not even the dog missing. We will not mar its completeness by reproducing any fragments of it; but, lest the above comparison should mislead, we may add that no more pathetic and touching tribute has ever been paid to this true-hearted princess than the faithful record of what she was in the eyes of a simple schoolboy, and remains in his memory after more than half a century has passed away.

In his preface Lord Albemarle informs the reader that the present volumes are simply the result of a number of notes jotted down by the author after he had reached the age of seventy, to which time he had thought it safe to defer the beginning of his autobiographical labours. Such being the case, we must congratulate Lord Albemarle on two things. First, if born a Keppel and a Whig, he was also born an admirable teller of good things. Or, if this last gift be due to art as well as nature, its secret is not the less valuable because it admits of analysis. In a good story nine points are made by the way in which the tenth is prepared, nothing being left for addition or explanation afterwards. Lord Albemarle tells his stories one and all after this fashion; and the result is that none of them lose in his hands, whether they be soldiers' stories or sailors', anecdotes of princes and princesses, or reminiscences of the delights of private theatricals, or of the horrors of Westminster School. To have seen much is something, and to have observed it is more; but the freshness of Lord Albemarle's memory is not more striking than the straightforward simplicity of his style, so that he is as entertaining in print as he appears to have been *ore rotundo* when his and Lady Dufferin's gaiety caused Theodore Hook to string fifty or sixty lines on the theme:—

> If any one here is stupid and prosy,
> He has only to look at Nelly and Cosy.

Secondly, Lord Albemarle has provided his autobiography with an introduction which not only itself in a way leads up to and prepares for much of what is to follow, but is worth reading on its own account. The annals of the Keppels of Guelderland, which trace the fortunes of the house up to the knightly line of Van Keppel in the county of Zutphen in the twelfth century, have been put together with sufficient care and spirit. The fuller narrative of the fortunes of the house of Keppel in England has many interesting points, less perhaps in the pages referring to the "boezem vriend" of King William III. and the Duke of Marlborough than in those treating of the second and third Earls. From the papers of the former we here find some noteworthy letters of the ferocious General Hawley, mildly described by Horace Walpole as "clever, with a bias to the brutal," and some curious correspondence with the Pelham brothers, including a letter from the Duke of Newcastle which is chiefly occupied with the merits of a French cook, and ends not less characteristically, "All your secret service [as ambassador at Paris] is paid. The King should know a little *to whom*." But the historical glories of the house of Keppel culminate in the third Earl, favoured, like his predecessor, with the friendship of the Duke of Cumberland, and in his even more famous brother the Admiral, who shared with him and a third brother the chief glory (and the chief profit) of the capture of Havannah. The nation ran wild with rejoicings at this exploit, although Horace Walpole opined that "a Spartan countess would not have had the confidence of my Lady Albemarle without at least one of her sons being knocked on the head." "*The* Admiral" seems to have remained the historical hero of the family; but it is with a still more natural pride that Lord Albemarle reminds his readers that, if "in the last century 'Little Keppel' was the idol of the navy. . . . in these days we have a 'Little Keppel' who is on tolerably good terms with all hands." These introductory records conclude with a singularly frank statement of the motives which led the three famous brothers at an advanced period of life to "toss up which of them should marry"—the result being that the toss was won by the eldest, who died two years afterwards, leaving behind him a son and successor four months old. Warned perhaps by this example of the family spirit, the fourth Earl, when twenty years of age, married a bride of sixteen, in whose descendants we trust may long survive one of the most vigorous growths ever domesticated on English soil and associated with the memories of our later history.

FROM THE HEBRIDES TO THE HIMALAYAS.*

THERE is no conceivable reason why such distant regions should have been connected in these volumes, except that their

* *From the Hebrides to the Himalayas. A Sketch of Eighteen Months' Wanderings in Western Isles and Eastern Highlands.* By Constance F. Gordon Cumming. 2 vols. London: Sampson Low, Marston, & Co. 1876.

names both begin with the letter H. The population, manners, climate, customs, are utterly dissimilar. It is not necessary to see the Cuchullins in order to appreciate the Himalayas; nor is there any reason why a journey to Calcutta should be preceded by a trip to Skye. It is true that the author makes a series of violent efforts to connect the Eastern Highlands with the Western Isles. Celtic legends are with her irresistibly suggestive of Oriental superstitions; and descriptions of scenery, by no means badly done, are followed by a great deal of borrowed erudition, or, if not borrowed, certainly not at first hand. For instance, the triple peaks of Ben Cruachan, near Oban, furnish material for a dissertation on the Hindu *Trimurti*, or Triad of Deities, and for references to the Sanchi Tope; a serpent mound in the same neighbourhood, of which there is an excellent engraving, leads to a dissertation on snakes for twelve or fourteen pages, ranging from the Bible to Macedonia, Congo, and Cashmere; midges recall a vision of Zeus, the disperser of flies; the tale of an old poacher in Skye sends the author to the Mahabharata in quest of a parallel; and from the recital of a quaint custom of "Burning the Clavie," which, by the way, exists not in the Hebrides at all but on the shores of the Moray Firth, is made the excuse for a laboured description of sun-worship, extending from Mexico to the Garo Hills in Eastern Bengal, and from St. Bridget of Kildare to Mount Aboo in Rajpootana. This sort of thing, resumed at intervals over three hundred and seventy pages, becomes rather tiresome. If there are similarities to be found in the habits of remote and unconnected tribes and nations, if coincidences in surviving customs tend to throw light on the migrations, birthplaces, and starting-points of the various races of the earth, such dissertations would be far better in the form of a learned or a scientific treatise. A work like Mr. Tylor's, or Sir H. Maine's, prepares the reader for extensive inquiry and cautious deduction.

A book of travels through regions abounding in picturesque scenery excites hopes of a different kind. Nor should we be disposed to find fault with explanations of local antiquities, if only they were apposite, correct, and of moderate length. But in these volumes there is enough of Orientalism to swamp half a dozen of the lesser Hebrides, while readers who wish to know something about South Uist or Benbecula may be irritated by a surfeit of scraps of Oriental learning on which it would be unsafe for beginners to rely. One statement, for instance, is made two or three times over, so that it cannot be a mere slip. Throughout Hindostan, Miss Gordon Cumming tells us, "the serpent is adored as one of the *Gram Devtas* or corn-gods, to whom special sacrifices are made at seed-time and harvest." That there are local deities with shrines all over India, at which the agriculturist performs his devotions, is perfectly true. Devata or Deota is a god. But *gram* unluckily means "village" and not "corn." The author, no doubt, has heard the word *gram* constantly used in Indian society, but it denotes the Cicer aretinum, or chick-pea, habitually given to horses, instead of or mixed with oats. The word in this sense, however, is a hybrid, neither English nor Oriental. We should, too, like to know the authority for the statement that "high-class Brahmins will eat wild boars to any extent." There are certain low castes, *Kooras* and others, who will eat the domestic pig, and a sportsman has no difficulty in disposing of the carcases of half a dozen wild hogs slain in a morning's hunting; but certainly the majority of Hindus of the better castes will not look at a dish of this animal. The account of the Holi, a well-known Hindu carnival during which natives throw red powder at each other, is evidently confounded with the Churruk Pooja, or swinging festival, in regard to which latter it may be said that people "erect a sort of May-pole, and dance round it." The Persian festival of the New Year should be the Nau-roz, and not the Nauruz; and the *Lat* or Monolith, which is to be seen at Poori on the shores of the Bay of Bengal, is in front of, and not inside, the Temple of Jagannath. Similar pillars, it is well known, are to be met in the Fort at Allahabad and under the shadow of the Kootub Minar at Delhi. But had the Orissa Lat been within the temple, no *Mlechha*, or outside and profane barbarian, could have had a sight of it. The word *Vetal* or *Betal* is used as if it were the name of some Oriental demon, instead of the Sanskrit word for devil. Every subaltern harassed with examinations while he aims at being adjutant or interpreter of a native regiment knows but too well the Hindu tale of the *Betal-Pachisi*, or "twenty-five stories of a demon." It is scarcely possible that these errors can be due to the failure of the author to correct and revise the proof sheets. But they are more excusable than unnecessary dissertations which spring from a suggestive memory and the practice of discursive reading. Nor is the combination of Asiatic researches and "auld wives' tales" the only fault we have to find with the book. Even the accounts of the Hebrides are not at first hand. It was too stormy for the yacht to traverse the sixty miles that separate Harris from St. Kilda, but that does not hinder the insertion of an account of this rocky islet, with its primitive population supported by exports of feathers and oil. While the materials for this sketch are supplied by Dr. Macculloch and an older traveller named Martin, the accounts of other islands are taken from a series of papers in the *Leisure Hour* for 1865. The author is candid enough to admit her indebtedness to these sources, but it is obvious that the life and spirit of personal adventure must be altogether absent from a narrative so composed. We have once or twice lately had occasion to deprecate such uses of borrowed plumes.

This is the less excusable because Miss Gordon Cumming has shown that she can use pen and pencil most effectively, and that she has the spirit of adventure and the readiness of resources and expedients which we might expect to find in a near relation of the lion-slayer of South Africa. The sketches of Hebridean rocks, lakes, and castles are excellent, and the descriptions of scenes familiar to readers only through the *Lord of the Isles* or the pages of Boswell are lively, faithful, and effective. The customs are so quaint, the civilization is so backward, the climate is so peculiar even for Scotland, that a good deal more might have been made out of a trip performed under such facilities. Even as it is, we are thankful for facts which are apt to escape notice, and for glimpses of places not often seen. Including Bute and Arran, these islands are 490 in number, 120 of which are inhabited. Round some the strong swell of the Atlantic sets in suddenly, in deep channels, making access difficult, or isolating chance tourists for hours and days. Others are connected by fords which can be easily traversed for a time by foot passengers. Vallay is connected with South Uist by an "unbroken beach of hard white sand for two miles." Four miles separate North Uist and Benbecula, made up of reefs of rocks and beds of seaweed, and marked out by beacons, many of which have been swept away. Benbecula, which sounds like a dactylic proper name taken from a mediæval Latin poet, is described as a dreary level of dark peat moss and sodden morass, interspersed with shallow lakes, and relieved by the ancient keep of Borve Castle. But South Uist, except in occasional sunshine, appears to distance all competitors in the race for dreariness and desolation; pitchy lakes, bogs and morasses, and mud huts with bulging walls and perforated roofs forming a picture which even Mayo or Galway could hardly parallel. Barra is a contrast, with its green hills, dark rocks, deep sandy bays, and good pasturage. And Bernera, six miles south of Barra, has a wonderful lighthouse erected on a rampart of granite, which can be seen, it is said, thirty-three miles off; and, lastly, there is Mingalay, rising a thousand feet from the sea, and white with myriads of sea fowl of every species. It may be easily conceived that the lives of the islanders are primitive, and that landholders of a practical and developing turn of mind find here very little scope for employment. The sea contributes quite as much as the land to the maintenance of the aborigines. Cockles and periwinkles and other shellfish are collected at low water in such abundance as to permit the export of twenty or thirty tons a week to London. Lobsters swarm, and oysters are, or were, found in numbers. Sea-fowl are killed, salted, and eaten, and their eggs are exported to Glasgow, not for human consumption, but to produce the peculiar glaze required in chintz manufacture. Trees are no more to be looked for than they were in the days of Dr. Johnson; but the Gulf Stream supplies what the soil will not rear; mahogany logs, masts of wrecked ships, carved wood, and even bamboos, are drifted right across the Atlantic into creeks and bays, where they are pounced on for firewood or even for building purposes. With these come such occasional godsends as bales of cotton and bags of coffee, and it is evident that the innovation of lighthouses is not looked on with unmixed satisfaction by these ill-provided islanders. Such scraps of information impart a value to the first of these volumes, and we could have welcomed more of them in preference to a chapter regarding the escape of Charles Edward. We admit, however, that the narrative of his adventures is brief and well put together. We may conclude our remarks on this part of the voyage by three observations which are not more disconnected than Miss Gordon Cumming's manner of treating her subject. First, we think that if Boswell may be thought somewhat of a toady, "his revered friend" is hardly to be hit off by the epithet "pompous"; next, that the author does not seem very well acquainted with the charming Diary which Scott kept of his tour to the Orkneys and the Hebrides in company with the Commissioners of the Northern Lights, from which Lockhart quoted, though she once refers to it for a very trifling incident in the novelist's life; and, lastly, we appeal to all sportsmen whether it is correct to write of the "low whistle of the curlew." This bird surely utters either a scream or a cry rather than a "whistle," and its note is anything but "low." Certainly Scott himself, who had heard it hundreds of times, wrote in a celebrated passage, "Wild as the scream of the curlew, from crag to crag," &c.

We pass at a stretch from Skye to the Taj Mahal, and are glad that Miss Gordon Cumming has spared us such a worn-out theme as the Overland Route. It is difficult to make out how many months of the eighteen were devoted to the study of Indian life and antiquities, but certainly the author made good use of her time. She saw Agra, Delhi, and Benares; she was present at Lord Mayo's Umballa Durbar, of which she gives a very fair and truthful account; she spent three months in the interior of the Himalayas, taking Simla as her starting-point; and she managed to pay a visit to the sacred Hurdwar, or the Gate of Hari, where the Ganges debouches from the mountains on the plains. Now, though a good deal of this is well known, and though the combined magnificence and poverty of Eastern capitals have just been the theme of a dozen "special" pens, a lady of Miss Gordon Cumming's gifts could hardly see a Brahman at his prayers, up to his waist in the waters of the Ganges, or a corpse undergoing cremation, without recording something worth perusal. Generally speaking, we prefer her own experiences, especially when they are set off by a most artistic pencil, to the dissertations which she bases on the works of other authors, or for which she possibly picked up materials at the table of the Commissioner and the General commanding the division. But there are, as might be expected,

many positive errors, several odd misconceptions, and sundry confident utterances on questions which to this day would cause irreconcilable dissension in a whole circle of learned Pundits. We should not recommend candidates for the Indian Civil Service to place implicit confidence in the historical discovery that Akbar, the founder of Agra and the contemporary of our own Elizabeth, was fourth in descent from Mahomet, or that high-caste bearers instruct the *mehter*, or sweeper, in household duties, with a view to his becoming a bearer or valet in his turn. *Paijammas*, or drawers, are the reverse of "tight," being loose, wide, and flowing. It will be news to many readers that the remarks of Hindus on paintings are "always intelligent and to the point," most Anglo-Indians having heard typical anecdotes of natives, when shown the winner of the Derby, gravely replying, "That, Saheb, is a *jahaz* (ship)." The sculptor of the tomb of the Begum Sumroo at Sirdhana was Tadolini, and not Adamo Tremolo; and the first-named artist used to exhibit some years ago a model of the tomb in his own studio at Rome. Sooray Khoond—it should be Suraj is the spring or fount, and not "the mirror," of the sun. Simla, the Viceroy's shooting-box according to Lord Salisbury, was "invented," not by Lord Amherst, but by Lord William Bentinck. It is as startling to be told that white men and women in India are remarkable for "an extreme laxity of Sunday observance," as that the native "language contains no word equivalent for gratitude." We will undertake to adduce terms from Persian, and from the Hindi and other vernacular languages, to show that natives can express a virtue of which before, during, and after the Mutiny they have given most signal examples. *Khudrow*, as applied to the resinous drops of the pine, can hardly mean "honey tears" in any native language. We take the term to be Persian, and to mean "wild" or "spontaneous," which is much more to the point. We are not quite sure about English ladies having to cover their heads with a shawl in the presence of the King of Delhi, nor is it necessary to imagine that a native with russet locks had dyed his glossy black hair. Occasionally high-caste natives and foreigners from Central Asia display red hair and fair complexions, and a Bengali Sudra with a red moustache, and even Albino children, have been seen and examined by competent and skilled officers in Lower Bengal. No native, we think, was ever known by the sweet and endearing appellation of Lullabhy. Probably Lalla or Lakhi Bhai may have been meant. We recently had an animated description of the Prince of Wales, Jung Bahadur, and all the royal suite running away from a wild elephant, which was finally chased and caught by the tame animals. But what is this to the story of a gentleman who informed the author that a rogue elephant had pursued him "for several miles" as he was seated on his own elephant, but that it had eventually to beat a retreat when he struck some lucifer matches out of a box. We must protest also against the introduction of the story of a Brahmin, his goat, and three rogues, as new. Macaulay long ago headed his review of Mr. Montgomery's poems with this very old tale, and by it pointed his warning against puffers of bad literature.

However, our criticism must not be one-sided, and we are glad to finish by drawing attention to some part of the second volume which are as good as the descriptions of Uist and Benbecula. There is one picture of a Himalayan sunset which is gorgeous and true, and another of an inundation which is not in excess of the truth. A Buddhist temple on the confines of Chinese Tartary is well described and illustrated; and Benares affords an opportunity for an exposition of the leading doctrines of the Brahmins and their rites, which has the merit of correctly compressing a great subject into a moderate space. Exceptions might no doubt be taken to some facts as questionable, or to some definitions as too narrow or too sweeping, but the leading points in the creed of that extraordinary aristocracy are correctly set down. Sir W. Jones, in his translation of Manu, made the curious blunder (for him) of translating the word Brahman by "Priest." Miss Gordon Cumming has at once apprehended the striking truth that the right of this caste to social predominance is founded on other considerations than religious teaching; that they enter various secular professions; that they claim to be lords temporal as well as spiritual over meaner Hindus; that their own divisions are infinite; and that a Sudra Raja owning ten thousand villages, or a banker who could lend the Government a million at a pinch, will bow down with reverence before the poor Brahmin whom he has just presented with a change of raiment and a bonus of five rupees. Such a dissertation at Benares is a fitting appendage to a lively picture of the Holy City with its bathers and its bulls; and, with this, we wish the author success in her present expedition to the Fiji Islands.

TAIT'S RECENT ADVANCES IN PHYSICAL SCIENCE.*

THIS volume of lectures might be truly, and yet not quite fairly, described as of a popular kind. The name of "popular science" is in itself a doubtful and somewhat invidious one, being commonly taken to mean the superficial exposition of results by a speaker or writer who himself understands them imperfectly, to the intent that his hearers or readers may be able to talk about them without understanding them at all. Professor Tait's teaching has nothing whatever in common with discourse of this kind. Indeed he not only rebukes it by example, but once or twice goes out of his way to denounce it in terms with almost needless emphasis. Neither does he set himself to make science popular in a higher sense, as some of our leading workers have done and are doing, by investing it with the charms of literature while preserving scientific exactness, and thereby awakening and winning the interest and intelligence of educated people at large. These addresses were given for a special purpose, and to a special audience of persons who did not want to be attracted to learning, but had come asking for it. Yet they are, in virtue of that same purpose, given *ad populum*, not *ad clerum*; they were spoken, and are published, for the benefit, chiefly at least, of laymen. Their object is to give an account, free from minute and technical treatment, but precise as far as it goes, of the leading results of what may be specially called modern physical science, and the methods by which they have been reached. Any one who has even a moderate knowledge of the subject will be aware that this is a task which only a master-hand should attempt; and there will be little doubt, we think, among the few who are really entitled to pass judgment on the execution of it that, notwithstanding a certain roughness in form, due to the manner in which the work was produced, the master-hand is here apparent.

The central and dominant theme of the book is the modern doctrine of Energy, now for some time well established in knowledge, but only just taking its due place in the process of learning. Till within a very few years the recognition of it in the current text-books of mathematical physics was of the most meagre kind, partly because of the natural inertia of established methods of teaching—or let us for once enjoy the luxury of an obsolete and misleading form of speech and say *vis inertiæ*—partly because new conceptions cannot at once be taken into elementary instruction, but must wait until the use of words has been made precise and adequate, which may be, and in this case has been, a rather long time. On this last point of the definition of the vocabulary, as distinct from the establishment of the facts on which the doctrine itself depends, we could wish that Professor Tait had found room to say somewhat more. The history and connexion of the discoveries are clearly given, but it is not shown when or by whom it was ascertained that these discoveries involved an extensive change in the current mode of approaching physical conceptions, and that all this time the books which follow the letter of Newton's words had been blind to the spirit of much of his work. For not the least interesting part of the earlier lectures of the series is that which tells us how very close Newton came to grasping the truth of the Conservation of Energy in its most general form, which he failed to do simply for lack of experimental knowledge which was not then to be had, and how free his own statements were from the weakness and confusion that crept into modern repetitions of them. However, we must be content as it is with noting the changes, at first sight almost startling, which have now, at any rate, been found to be wrought in the first notions of physics as formerly presented. Within the first twenty pages we are told that Energy has as much claim as Matter to be regarded as a really existing thing; while Force is merely a word which for the present affords us the means of describing events in which the real thing Energy is concerned in a more compendious way than we could otherwise do, but whose final resting-place will probably be the limbo "which has already received the Crystal Spheres of the Planets and the Four Elements," and other such matters.

The lecture goes on to describe the several steps by which the Conservation of Energy was established as a settled maxim of physics. He notices Rumford's observations on the conversion of work into heat by friction, which for a long time remained strangely neglected, the more definite experiments of Colding and Joule, and the theoretical argument of Helmholtz, which however rests, as Professor Tait points out, in one of its alternative forms on a hypothetical postulate about the constitution of matter—and to that extent, therefore, is purely speculative—and in the other on the experimental postulate of the impossibility of a perpetual motion, which has long since been inferred as a fact from the failure of all attempts to construct one. All these paths converge at last upon the general truth "that all physical phenomena" (including "everything which is really physical in life") "are necessarily transformations of energy of some kind or other"; where, it seems not superfluous to remark, *energy* is not a word taken at random from common usage, and used in its common sense, but is an exact term of physical science, and can be understood only by becoming familiar with its scientific use, and with the scientific bearing of the facts in whose description it is employed. The process is of course given in outline only; but any reader who can attentively follow it as here given will be enabled to perceive clearly that the Conservation of Energy is altogether a matter of physical experience, and that there is no sort of *à priori* road to it; a warning which appears to be needed by a considerable number of readers, and even by some philosophers. The special region in which the doctrine was first made certain is that of thermodynamics. We can barely glance at Professor Tait's lucid, though condensed, account of Carnot's discoveries in this quarter, and their various consequences, among which the most startling to a novice in such inquiries is perhaps the construction of an absolute scale of temperature—that is, a scale whose zero represents a total deprivation of heat; the absolute zero is found to be approximately 274° centigrade below the freezing point of water.

There goes along with the Conservation of Energy another no less important fact, which is often overlooked; this is the dissi-

* *Lectures on some Recent Advances in Physical Science.* By P. G. Tait, M.A., &c. London: Macmillan & Co. 1876.

pation, or, as Professor Tait prefers to call it, the degradation of energy. Energy is said to be more or less available according as it is more or less capable of being further transformed; in other words, as it is more or less fit to do useful work. Now, not only is the transformation of energy constantly going on, but, after every transformation, the energy is on the whole less available than it was before. "There is a tendency for the useful energy . . . to run down in the scale." Thus there is no limit to the possibility of turning work into heat; but we cannot reverse the process and turn back all the heat into work. Even with the best engine that is physically possible—much more with any that exists—about one-fourth at best of the heat employed is converted into useful work. The rest is sent out in the form of heat, but at a lower temperature, and is ultimately dispersed into space, whence, so far as we know, it cannot be recovered and restored to any higher form. The like results appear in other branches of physics, so that on the whole we find that energy is constantly being frittered down into less transformable modes, and (assuming the physical laws as now known to be constant in time and space) that all the energy in the universe will ultimately be frittered away into diffused heat, and the universe be reduced to an inert mass at a uniform temperature, out of which no more work can possibly be got, it being a necessary condition for getting any work whatever out of heat that there should be at least two bodies at different temperatures. Thus there is no escape from the conclusion that the physical constitution of the known universe, or of any given part of it, such as the solar system, is not stable or permanent.

A set of more detailed, though still of course approximate, results is obtained by a more particular application of the modern conceptions derived from the doctrine of Energy to the earth's history as a member of the solar system. This leads in part to a field of recent controversy upon which we cannot enter; but we must call special attention to the very clear and interesting exposition of the sources of terrestrial energy. We are constantly degrading energy which cannot be restored; converting energy of position into energy of motion, and energy of motion from higher to lower forms; work is frittered down into heat, and the heat ultimately scattered into cosmical space. Whence then does all the energy come which is thus used up? Animals are enabled to do work by taking in potential energy in food, and this is finally traceable to the stored-up energy of plants; and the plant nourishes itself by working up with other things the carbonic acid given out by animals, restoring to the air in the course of the process the oxygen that has been consumed by them:—

> Now, it is quite obvious that if plants were not assisted by some external supply of energy, here would be something equivalent to the perpetual motion on the grandest conceivable scale. If the plant were capable, merely by its own peculiar organisation, of taking the ashes as it were of the fuel burnt in the animal engine, and working them up again into fit and proper food, without external assistance, then that process might go on indefinitely—the animal all the time, remember, giving out animal heat and doing muscular work.
>
> This would be the perpetual motion on a scale never contemplated even by the perpetual motionists. It is obvious then that in order to escape from our difficulty—no less than a contradiction in terms of what we know to be a physical law—there must be some source of energy which the plant draws upon in order to help it to work up that carbonic acid, etc., and store up the available part of it as food for the animal.

That source of energy is the sun, which, according to the only probable hypothesis that can be formed, has in turn acquired its present immense abundance of kinetic energy by the falling together of its component parts.

Three lectures are assigned to the head of spectrum analysis, which, although scarcely twenty years old, is now a branch of physics of the utmost importance and of ever-increasing range of application. Before the days of the spectroscope it seemed merely chimerical to expect any knowledge of the physical constitution of the sun and stars beyond what might be precariously derived from conjectural analogies. We can now affirm with perfect confidence the presence of many known elements in the luminous atmospheres of these bodies; and, what seems at first sight incredible, we can obtain not only qualitative results of this sort, but quantitative evidence of motions which could in no other way be observed. One much vexed question which seems likely to yield to this method is that of the nature of comets. A really good opportunity for observation is still awaited; in the meantime, and by the light of such observations as have been made, Professor Tait has put forward a wonderfully simple and ingenious hypothesis, to the effect that a comet is nothing else than a cloud of meteoric stones.

Another lecture, too closely packed and comparatively too technical to admit of our saying more of it here, deals with the conduction of heat; and the last two are on the structure of matter. Under this head Sir William Thomson's beautiful conception of vortex-atoms is introduced and illustrated. Helmholtz has shown that, if a vortex-ring exists in a perfect fluid, it is absolutely indestructible:—

> Do what you like: bring the edge of the keenest knife up to it as rapidly as you please, it cannot be cut; it simply moves away from or wriggles round the knife; and, in this sense, it is literally an atom. It is a thing which cannot be cut: not that you cannot cut it; but that you cannot so much as get at it so as to try to cut it.

At the same time, if you have a perfect fluid with no vortex-ring in it, no such ring can be produced. The perfection here attributed to the fluid is a mathematical ideal, involving among other things a total freedom from friction, and of course cannot be observed in nature; still the characteristic properties of vortex-rings in their simplest forms can be approximately shown in the manner described by Professor Tait by producing such rings in air previously filled with smoke in order to make the rings visible. The nature of a vortex-ring is better described by a figure than by words, but may be stated thus:—Let there be a cylinder rotating uniformly about its axis; and suppose the cylinder perfectly flexible. Now let the ends of the cylinder be brought together and united, either directly, so as to make a circular or oval ring, or after tying the cylinder in any kind of knot you please; and let the rotation be kept up all the while. The rotating coil thus formed is a vortex-ring. Sir William Thomson's hypothesis is that the atoms of matter are nothing else than vortex-rings formed in a space-pervading fluid. "Thus this property of rotation" (giving a permanent individuality to each vortex-ring) "may be the basis of all that to our senses appeals as matter." Professor Tait is careful to point out that this is at present in the stage of pure speculation; but the speculation is a splendid one, and of the kind most eminently fitted to stimulate and to guide research.

There is one point in which we venture to think the book might have been made more useful. Professor Tait has eschewed mathematics throughout, but the wisdom of such an absolute rule seems doubtful. Audiences and readers who are capable of grasping such things as, for instance, the graphical method employed in Watt's "Indicator Diagram," can hardly be incapable of following elementary work with symbols; and the introduction of a small proportion of such work might have improved the earlier lectures in definition. It would be possible, as they stand, to miss seeing that the laws dealt with are laws of exact measurement, nor are we sufficiently told how the quantities are in fact measured. The measure of energy of position is indeed given incidentally in stating the dynamical equivalent of heat, but we cannot find that the measure of energy of motion is explicitly given at all.

Another thing which seems fair matter of comment even for a layman is the great severity of Professor Tait's judgments on investigators who, though they got valuable results, did not get them by accurate reasoning. It is natural for a worker who practises extreme accuracy himself to expect it in others; but if such measure as Professor Tait metes every now and then, in apportioning the merit of the discoveries of thermodynamics, were meted all round, it would go hard with more than one familiar name. It is notorious that even in pure mathematics there are many theorems of great importance of which no complete or satisfactory proof, or sometimes no proof at all, was given by the men who first enunciated them, and whose names they have always borne. But the credit of the discoverers has never been thought to be materially diminished by this. It has been well said that what is now proved was only once imagined. He does best who can both imagine and prove, but he deserves praise also who imagines rightly, though he leave others to prove, or even make mistaken attempts at furnishing proof of his own. As a corrective to some of Professor Tait's criticisms, we may cite the following words of Professor Clerk-Maxwell's:—"The true seat of science is not in the volume of Transactions, but in the living mind, and the advancement of science consists in the direction of men's minds into a scientific channel; whether this is done by the announcement of a discovery, the assertion of a paradox, the invention of a scientific phrase, or the exposition of a system of doctrine. It is for the historian of science to determine the magnitude and direction of the impulse communicated by either of these means to human thought."

MISS YONGE'S STORIES OF GREEK HISTORY.*

IF we criticize Miss Yonge's book in some detail, and if we find some faults in the course of so doing, we trust that she will look on the one process as on the other as really a tribute of respect. We remember years ago a book of Mrs. Trimmer's on the same subject with which we could not have found any fault at all. We do not speak of finding fault when we simply laugh from beginning to end. The one passage of Mrs. Trimmer which we can quote without book is that "the little Spartans never said they could not eat fat, or asked for nice bits." Miss Yonge, even in writing "for the little ones," and in writing something which is clearly meant to do the little ones good, does not point her moral in so inartistic a way as this. Yet Mrs. Trimmer enjoyed a reputation in her own day which was perhaps equal to that which Miss Yonge enjoys in ours. The difference between the two writers in the treatment of Greek history or of anything else marks the difference between the two ages, and the advance by which it is now possible to be good without being *goody*. We do not say that Miss Yonge has quite reached the standard of a critical history, and it would be easy to make a rather long list of particular slips in detail. But this set of "Aunt Charlotte's Stories" is a wonderful advance upon anything that any Aunt Charlotte could have written in the days of Mrs. Trimmer, or even at a much later time. It is good enough to make us wish that it had been better. It goes a long way towards winning our heart when we come to a History of Greece on any scale which does not end at any of the conventional points which even graver historians have hitherto as yet always outgrown, but of which the first chapter is headed Olympus, while the last records the unhappy event at Marathon a few years back. This is at least a step towards the right thing, a step towards the history, not merely of the land of Greece, but of the

* *Aunt Charlotte's Stories of Greek History for the Little Ones.* By Charlotte M. Yonge. London: Marcus Ward & Co. 1876.

people of the Greeks in all places and all ages. Miss Yonge has even got so far as to grasp that most mysterious and difficult truth that Achaia did not become a Roman province in B.C. 146. We turn over the last fifty pages, and we find chapters on Greece under the Roman Empire, the Frank Conquest, the Venetian Conquest, the War of Independence, the Kingdom of Greece. All this marks an advance which some years back no one could have looked for, and it is cheering to find that it has made its way into a child's book, while it is still far from having always made its way into books of much greater pretension. Miss Yonge has in truth come nearer than some great scholars, German and English, to grasping the true position of the Greek people in the history of the world. To have done this is so great a merit that we can unhesitatingly set it against all the mere slips in names, minute facts, and the like, which we have noticed in the book, though we are bound to say that there are more of them than there need have been. We speak of course of slips of that class which can be corrected. With the former part of the book we have to find a graver fault, against which it will be still more needful to set the real merits of the latter part in the balance. We must say that Miss Yonge's treatment of the purely mythical part of her story is one which goes on an inherent misconception which could not be set right by any correction in detail.

To take one point, which certainly might be corrected in detail by going through the whole book and making changes in a large proportion of its pages, Miss Yonge has most unluckily taken the backward step of calling the Greek gods by the Latin names which are supposed to answer to them. We really thought that we had got beyond this stage of things. We might perhaps endure to see Zeus called by the English form of his name *Tiw*, but we had really thought that the pre-scientific fashion of calling him *Jupiter* was long ago dead and buried. Miss Yonge's excuse is that "the common Latin titles of the gods and goddesses have, by long use, really come to be their English names, and English literature at least will be better understood by calling the King of Olympus Jupiter, than by becoming familiar with him first as Zeus." If this be so, English literature will be better understood at the cost of comparative mythology not being understood at all. Everything lies in that one word "first." When the pupil has first become familiar with the chief god of the Hellenic mythology by his own name, then let him be taught as soon as any one chooses that that name answers to Latin Jovis and English Tiw—that the Latin writers transferred the acts of the Greek Zeus to their own Jupiter, and the name of their own Jupiter to the Greek Zeus—that, till scientific mythology was the right of writers in all modern languages did the same. Such a process as this would be quite enough for the understanding of English literature, while it would not sacrifice scientific mythology to it. The distinction must be made in the interest alike of the Greek and of the Latin mythology. The confusion vulgarizes both, and wipes out the distinctive character of both. As Lord Lytton said long ago, it is hard to charge so grave and respectable a deity as Jupiter Optimus Maximus with the carrying off of Europa, and other like pranks of the Greek Zeus. Then as to the myths themselves, we are not at all clear that these tales ought to be told at the beginning of Greek history as part of Greek history. Should they not rather come when something of the true history is already known, as the belief of those who were the actors in that history? We would not positively rule this point; but we are quite sure that, at whatever stage they are told, they should be told as Mr. Cox has told them, and not as Miss Yonge has told them. A legend and a piece of true history should be told in two quite different ways. It is possible to tell a legend in a way which is perfectly simple, and yet not vulgar or undignified in any way. We cannot think that Miss Yonge has hit the right way of telling such a tale. Thus she says that "Saturn was said to have had the bad habit of eating up his children as fast as they were born, till at last his wife Rhea—who should be Ops, if we are to talk about Saturn—" contrived to give him a stone in swaddling clothes, and while he was biting this hard morsel Jupiter was saved from him." Presently we read, with an odd mixture of later astronomical notions, "Poor old Saturn, after the silver age, had to go into retirement, with only his own star, the planet Saturn, left to him." It is also, we think, a mistake to be constantly dragging in Scriptural references—Javan, the son of Japhet, and the like—and it is an odd style of chronology, after telling the heroic legends, to add, "All these heroes of whom we have been telling, lived, if they lived at all, about the time of the Judges of Israel." It is far safer to attempt nothing at all in the way of chronology till really trustworthy dates can be had. The heroes too, as well as the gods, are entitled to a certain respect in the way of telling their tales. It is not pleasant to read, within the space of a single page, of "poor old Priam," "poor Creusa," "Hector's poor little son," and "poor old Hecuba." And though Sophocles has made us accustomed to a good deal of howling and shrieking, one does not like to read how Philoctetes was left behind "because the poor man had a wound in his heel, which was in such a dreadful state that no one could bear to come near him." Miss Yonge moreover places the scene of his sufferings in Tenedos instead of Lemnos. The whole Trojan story is robbed of its poetry by the kind of treatment which it here meets with. We wish for Mr. Cox to tell the story in every page, and we gladly turn to the latter part of the book, where Miss Yonge is far more at home with Don John and Francesco Morosini than she is with the heroes. Mr. Keightley told the legends in one way, Mr. Kingsley in another, and Mr. Cox in a third. All three ways are good; but the way in which Miss Yonge has chosen to tell them is one which at once confounds legend and history, and takes the whole life out of legend. And we are the more surprised at this, because she shows in many places that the great outlines of mythological science are by no means unknown to her.

When Miss Yonge gets into authentic history, her way of dealing with it is much more to the purpose. A little of the old conventional pre-Grotian prejudice about the Athenian democracy may here and there be faintly seen, but it is very faintly. On the whole, she does far more justice to the great commonwealth than is usual in books of the kind. Indeed, the whole of the strictly historical part is an advance on any of the kind which we remember to have seen. Miss Yonge is clearly much more at home with facts than with fables; she understands them better and tells them better. The slips which we meet with here and there might easily be corrected. Thus, Æsop the fabulist is made an Egyptian, which is perhaps a careless inference from the story of Rhodôpis in Herodotus. Several birth-places are, as usual, attributed to him, but none of them is in Egypt. It is more important when among the illustrations, which form on the whole a very good part of the book, a cut which is surely meant for the Lion Gate at Mykênê is lettered "Ancient Remains at Athens." There are a good many things of this kind to correct; but, as we before said, they are of the class of mistakes which can be corrected, while the fault of treatment in the mythical part is inherent, and no improvement in detail can set it right. It is another kind of fault when the very doubtful story about Alexander's visit to Jerusalem, as told by Josephus, is brought in as if it were quite as certain as his three great battles. This of course is part of the same tendency as the references to Javan and the like. There is an evident wish to bring in Scriptural or other Hebrew talk whenever there is a chance. On the other hand, to bring in the New Testament narrative of the preaching of St. Paul at Philippi, Athens, and Corinth is quite to the purpose. That is really a part of Grecian history. We will not commit ourselves to Miss Yonge's theory as to the silence of the oracles or as to the death of the great Pan. But, whether St. Andrew was really put to death in Achaia or not, his connexion with Achaia is a part of Grecian history; for, at all events in the belief of the Emperor Constantine Porphyrogenitus, his head did great things at Patrai against the Slaves.

There are then some serious faults in "Aunt Charlotte's Stories," and we should strongly counsel the striking out of the whole of the mythical part. We doubt whether Miss Yonge could in any case deal with it successfully. The merit of the book lies at the other end, in the full grasp of the fact that Grecian history is a living thing going on to our time.

THE HAND OF ETHELBERTA.*

IN the description on the title-page of Mr. Hardy's new book, "A Comedy in Chapters," there is something of the affectation which we noted with some dislike in his last production; and we are the less surprised after reading this announcement to find that this unwelcome quality runs more or less through *The Hand of Ethelberta*, which title, it may be observed, has in itself a kind of deliberate oddity. It must be admitted that reasons of various kinds can be found for Mr. Hardy's having borrowed for his work a title from the stage. One is, that some of the situations and dialogues are conceived, as we may proceed to show by instances, in the true spirit of comedy. Another reason less creditable to the author's judgment is that the characters often resemble figures who upon the stage might come in and out, utter quaint sayings, amuse an audience by their bewilderment at events to which the spectator has a key, and by the aid of costume and appearance make each for himself some kind of individuality. These helps to identification are necessarily absent in the pages of a book, and it is also difficult to convey in type, without irritating the reader, such a trick of manner as is, we suppose, intended by Mr. Ladywell's constant "ha-ha," out of which a clever actor might easily enough make capital. It is hard to gain any very clear notion or to make a very consistent figure of Mr. Hardy's central character, Ethelberta herself. The daughter of a butler so attached to his employment that he will not leave it, who finds herself by a whim of chance cast into good society in which she holds a place on condition of keeping aloof from her family, and who afterwards, when money fails her, by turning her cleverness into an original channel becomes a fashionable personage and goes out to dinner at a house where her father stands behind her chair, might no doubt do and say many strange things. An author prepares many difficulties for himself when he invents such a character, and it is not surprising that Mr. Hardy should fail to inspire a reader with any strong belief in Ethelberta's existence.

When Ethelberta first appears—that is in the first page of the book—we are told that she was christened after an infant of title whom her mother nursed, that having grown up and been well educated she became a governess and was married to a son of Lady Petherwin, who died of a chill caught on the wedding tour. After this Lady Petherwin "took by the hand the forlorn Ethelberta, who seemed rather a detached bride than a widow," whatever that may mean, and Mrs. Petherwin became her constant companion, on the understanding that her poor relations were to be kept out of sight and hearing. For the purposes of his story

* *The Hand of Ethelberta: a Comedy in Chapters.* By Thomas Hardy, Author of "Far from the Madding Crowd," &c. 2 vols. London: Smith, Elder, & Co. 1876.

Mr. Hardy finds it necessary to represent Mrs. Petherwin—a butler's daughter, with various brothers and sisters some of whom are artisans, and some of whom subsequently become her own servants—as an accomplished gentlewoman. Such a thing is not impossible, and the author has succeeded in providing a good deal of entertainment for his readers out of the situation he puts before them. At the same time one is apt to get irritated not only at the unreality of which we have spoken as attaching to Ethelberta herself, but at a certain air of improbability which runs through the book; and the irritation is great in proportion to the evidence which Mr. Hardy gives of possessing undoubted and original power with his pen. There is a certain quality, which seems to have some share both of affectation and carelessness, which has been observed in some of Mr. Hardy's former work, and which is yet more observable here. At the opening of the book there is a dialogue between an ostler and a milkman who see Ethelberta passing, some of which is in the author's best manner, which, as all his readers are aware, is very good. But in the midst of it one's enjoyment is disturbed by coming upon such a speech as this from the ostler:—

Ay, the toppermost class now-a-days have left off the use of wheels for the good of their constitutions, so they traipse and walk for many years up foreign hills, where you can see nothing but snow and fogs, till there's no more left to walk up; and if they reach home alive and ha'nt got too old and weared out, they walk and see a little of their own parishes.

It would be rash to assert that no ostler in a country inn could make such a speech as this; but it is certain that the ideas seem to a reader to belong rather to the author than to the man who is supposed to utter them. At the end of the conversation in which this occurs there is an excellent touch:—

"Faith, I don't know the woman's maiden name, though she said to me 'Good evening, John;' but I had no memory of ever seeing her afore—no, no more than the dead inside church-hatch—where I shall soon be likewise—I had not. 'Ay, my nabs,' I think to myself, 'more know Tom Fool than Tom Fool knows.'"

"More know Tom Fool—what rambling old canticle is it you say, hostler?" enquired the milkman, lifting his ear. "Let's have it again—a good saying well spit out is a Christmas fire to my withered heart. More know Tom Fool—"

"Than Tom Fool knows," said the hostler.

"Ah! That's the very feeling I've feeled over and over again, hostler, but not in such gifted language. 'Tis a thought I've had in me more or less for years, and never could lick into shape! O-ho-ho-ho! Splendid! Say it again, hostler, say it again! To hear my own poor notion that had no name brought into form like that—I wouldn't ha' lost it for the world! More know Tom Fool than—than—h-ho-ho-ho-ho!"

"Don't let your cheerful soul break out in such a heathen uproar, for heaven's sake, or folk will surely think you've been laughing at the lady and gentleman. Well, here's at it again—Night t'ee, Michael." And the hostler went on with his sweeping.

"Night t'ee, hostler, I must move too," said the milkman, shouldering his yoke, and walking off; and there reached the inn in a gradual diminuendo, as he receded up the street, shaking his head convulsively, "More know—Tom Fool—than Tom Fool—ho-ho-ho-ho-ho!"

Ethelberta, having passed out of sight of the milkman and ostler, goes for a walk, which ends in a run to see the finish of a race between a duck and a hawk, on a heath near the town; and we may quote a passage describing her progress as an instance of Mr. Hardy's close observation and also of a carelessness in composition which is not common in his writing:—

Her stateliness went away, and it could be forgiven for not remaining; for her feet suddenly became as quick as fingers, and she raced along over the uneven ground with such force of tread that, being a woman slightly heavier than gossamer, her patent heels punched little D's in the soil with unerring accuracy wherever it was bare, crippled the heather-twigs where it was not, and sucked the swampy places with a sound of quick kisses.

On her way back she meets a certain Christopher Julian who has been, and still is, in love with her. Ethelberta inspires various people with various forms of love in the course of the book, and Julian is apparently intended to represent the simple and romantic form; but unfortunately it is impossible to take any deep interest in him; he is a less improbable and incoherent person than Ethelberta herself by reason of his exceeding vapidness, and that is about all that can be said of him. Circumstances bring him and Ethelberta together continually; they meet, but without speaking, for the first time after their encounter on the heath, at a dance in a country house. Julian's family has had reverses, and he, who has turned a musical talent to account, is sent for to play dance-music. We touch upon this incident not for the sake of any bearing that it has upon the story, but because in its narration occur some striking examples of Mr. Hardy's besetting faults of giving incongruous dialogue to his characters, and going far out of his way for laboured similes. A servant has been sent with a trap to fetch Julian, and as they go to the house the musician asks if it is a large party, and the servant replies:—

"No, sir; it is what we call a dance—that is, 'tis like a ball you know, on a small scale—a ball on a spurt, that you never thought of till you had it. In short, it grew out of a talk at dinner, I believe, and some of the young people present wanted a jig, and didn't care to play themselves, you know, young ladies being an idle class of society at the best of times."

A little later on, the same servant, explaining a bas-relief of a battle-piece built into the wall of the house, says:—"When I am in one of my meditations as I wait here with the carriage sometimes, I think how many more get killed at the moment of victory than at the moment of defeat—'tis one of the contradictions of nature." Again, describing the appearance of the ball-room when the light of day is let in upon it, the author writes:—"Christopher turned his back upon the window, and there were the hitherto beaming candle-flames shining no more radiantly than tarnished javelin-heads, while the snow-white lengths of wax showed themselves clammy and cadaverous as the fingers of a woman who does nothing." The simile here is both artificial and untrue. Julian's next meeting with Ethelberta is in an open space in a wood, where he finds her surrounded by two young mechanics and several children, to whom she is telling an exciting story. Between this meeting and the last she has gained some fame as a poetess, and has also, by the death of Lady Petherwin, been thrown upon her own resources for a living. She has a peculiar talent for story-telling, which she is going to exercise in public; and the scene upon which Julian came was a rehearsal. She carries out her intention with success, becomes one of the topics of a London season, and at the same time adopts the singular plan of setting up house with her brothers and sisters as her servants.

Among the many people who aspire to the "hand of Ethelberta" there are two with the somewhat improbable names of Neigh and Ladywell. Neither of these characters is worked out with proper care; but between them some of the most amusing scenes in the book take place. Ladywell, a vain young painter, likes nothing so well as to talk about his passion for Ethelberta, and always selects Neigh as a confiding friend, ignorant that he also is a victim of Mrs. Petherwin. At the end of one of Ethelberta's public appearances the two walk homewards together. After some conversation:—

"How do you really stand with her?" said Neigh, with an anxiety ill concealed.

"Off and on; neither one thing nor the other. I was determined to make an effort the last time she sat to me, and so I met her quite coolly, and spoke only of technicalities with a forced smile—you know that way of mine for drawing people out, eh, Neigh?"

"Quite, quite."

"A forced smile, as much as to say, 'I am obliged to entertain you, but as a mere model for art purposes.' But the deuce a bit did she care. And then I frequently looked to see what time it was, as the end of the sitting drew near—rather a rude thing to do, as a rule."

"Of course. But that was your *finesse*."

Presently Ladywell observes that it would comfort him if Neigh were in such another hole, to which Neigh replies:—

"But what if your fellow-sufferer is not only in another such hole, but in the same one."

"No, Neigh—never. Don't trifle with a friend who——"

"That is refused like yourself, as well as in love."

"Ah! Thanks, thanks. It suddenly occurred to me that we might be dead against one another as rivals, and a friendship of many long—days be snapped like a reed."

The list of Ethelberta's admirers is presently increased by Lord Mountclere, an aged nobleman, who, as we learn in an absurdly impossible scene between him and his valet, is in the habit of taking in *Le Follet* and various other fashion-books, for the sake of looking at the faces of the women portrayed in them. One of the best scenes in the book is one to which we could not do justice by partial extracts, which occurs when Neigh and Ladywell run up against each other at the Hôtel Beau Séjour at Rouen. They have both come there to see Ethelberta, and they discover at the same time that Lord Mountclere, who is also there, is likely to be preferred to them. Here is the end of the scene:—

"She told me she would give me an answer in a month," said Ladywell, emotionally.

"So she told me," said Neigh.

"And so she told him," said Ladywell.

"And I have no doubt she will keep her word to him in her usual precise manner."

"But see what she implied to me! I distinctly understood from her that the answer would be favourable."

"So did I."

"So does he."

"And he is sure to be the one who gets it, since only one of us can. Well I wouldn't marry her for love, money, nor——"

"Increase."

"Exactly: I would not. 'I'll give you an answer in a month'—to all three of us! For God's sake let's sit down here and have something to drink."

They drew up a couple of chairs to one of the tables of a wine-shop close by, and shouted to the waiter with the vigour of persons going to the dogs. Here, behind the horizontal headed trees that dotted this part of the quay, they sat over their bottles denouncing womankind till the sun got low down upon the river, and the houses on the farther side began to be toned by a blue mist. At last they rose from their seats and departed, Neigh to dine and consider his route, and Ladywell to take the train for Dieppe.

The end of the complication between Ethelberta and her lovers is not much more probable than the beginning, and one lays down the book with a mixture of feelings. One cannot but admire the original force which is evident enough in Mr. Hardy's work, and one cannot help being a little put out at his having misapplied it. The book is full of faults, but their existence has not shaken the belief which we have long entertained, that Mr. Hardy is capable of making himself a place in the first rank of novelists. Only to do that he must, it seems to us, abandon such out-of-the-way subjects as he has chosen in the *Hand of Ethelberta*. Mr. Hardy has rare qualities—a keen observation of nature, a knowledge of country life and its ways that George Sand might envy, and, as he proved in his last book, a tragic force which few writers possess. We cannot but think that the *Hand of Ethelberta*, amusing as it is, is hardly worthy of its author's powers.

BANCROFT'S NATIVE RACES OF THE PACIFIC.—VOL. V.*

BEFORE we speak more particularly of the contents of this volume, it is but just to Mr. Bancroft to say that he has worthily

* *The Native Races of the Pacific States of North America.* By Herbert Howe Bancroft. Vol. V. Primitive History. London: 1876.

carried out a great design. He has gone patiently through the vast masses of matter, and worked his way through the multitude of volumes, relating to the political, social, and religious condition and fortunes of the Maya and Nahua peoples of Central America, has carefully examined their dialects, their architectural remains, their sculpture, and their plastic arts. He has thus brought together within manageable compass all the information forthcoming on these subjects to which any importance can be attached; and he has done this with a commendable abstention from theorizing. The promise that he would avoid it altogether was one which we could scarcely expect him to keep to the letter; and in this last volume he has approached that part of his subject in which the effort to keep to it at all would be subjected to the severest strain.

It must be confessed that this pressure has not been resisted as persistently as it might have been; and the result is a volume much of which looks like the work of a man who either has not carefully studied the laws of evidence or has been afraid of applying them in the instances before him. Briefly, he has had to deal with the so-called history of a multitude of nations, a history stretching back professedly over millenniums, crowded with miracles, prodigies, and portents, and exhibiting a fertile crop of inconsistencies and flat contradictions. Such traditions it was manifestly well worth while to relate; but they should have been related precisely as they have been given by the native writers or by the European conquerors, without a word of comment. Mr. Bancroft has thought that, by sifting and simplifying them, he can get at certain general conclusions which may throw light on the growth and decay of these American tribes—in other words, that he can separate grains of truth from beds of tradition, or, it may be, of fiction. Nor is he content to do this only with traditions relating to times not long preceding the Spanish invasions. He has no hesitation in applying the method to legends going back to a time which for Mexico, Palenque, and Copan would answer to the days of the Argonauts and the Herakleids in the old Achaian land: and here we need only ask the simple question why a method should be applied to American history which, by universal consent, has been abandoned by those who examine the early history of the nations whether of ancient or of modern Europe.

At the outset, however, Mr. Bancroft feels himself called on to deal with the earlier problem of the origin of these American tribes; and every theory which has been broached on the subject is examined accordingly with the most careful minuteness, and, we gladly acknowledge, with unfailing impartiality. Much of this portion of his task we might be tempted to regard as a work of supererogation; but he has perhaps done well in suffering no hypothesis to tempt him to a contemptuous dismissal by its absurdity, and in weighing even manifest imposturers in a fair balance. Thus we have here the whole array of notions which have traced these American nations to Mongolia and Egypt, or recognized in them the lost tribes of Israel or the descendants of the Welshman Madoc, winding up with the romance which has served as the foundation for the religious fabric of the Mormonite Prophet, Joseph Smith. Among all these theories there is scarcely one which can be regarded as seriously deserving consideration. The most trustworthy traditions, perhaps, relate to the voyages of the Northmen and their settlements in Greenland; but Mr. Bancroft rightly remarks that, even if these be accepted without question, they do not bear on the subject immediately discussed, for it is nowhere pretended that these settlements introduced men into an uninhabited continent. At most of the hypotheses we can afford to smile. They resolve themselves mainly into the old proof of the identity of Macedon and Monmouth because both have a river with fish in it; and thus the Mexicans are made akin to the Egyptians because both used hieroglyphics, because such writings must be of three kinds—phonetic, figurative, and symbolical—and because all these systems are to be found among both (p. 61). This method of resemblances is carried by those who would bring the Mexicans from the Holy Land to a pitch of extravagance which, but for the mischief done by all false theorizing, might be excellent fun. The division into tribes, the custom of hanging up the heads of sacrificed enemies, the dancing of a king, the death of leaders before they enter the land which they hope to conquer, the use of circumcision, the wearing of scarlet or other gaudily coloured dresses, the offering of water to strangers for the purpose of washing their feet—these and a thousand other things not less irrelevant are, for writers like Lord Kingsborough, proof conclusive that the forefathers of the Central American tribes came forth with the posterity of Jacob out of Egypt. Even these absurdities are capped by the outrageous folly which sees in these nations genuine Greeks from the Egean Sea. The demonstration is easy. "Both were idolaters, used sacrificial fire, indulged in Bacchanalian revels, held formal councils"; and if this is not enough, "strong resemblances are to be found in their marriage customs, system of education, manner of hunting, fishing, and making war, in their games and sports, in their mourning and burial customs, and in their manner of treating the sick" (p. 122). It is a relief when we reach at last the autochthonic theory. Nor do we feel disposed to offer any objection on reading Mr. Bancroft's remark that it is "an opinion worthy of the gravest consideration, and one which, as we may judge by the results of scientific investigation, may eventually prove to be scientifically correct" (p. 130). These words carry us only to independent centres of origination for the several families of the human race; on the further theory of the evolution of this race from lower types reaching back to the monad, Mr. Bancroft contents himself with saying that, as many of the American tribes "are quite content to believe that their ancestor was a dog or a coyote," they "seem entitled to some sympathy from the latest school of modern philosophy" (p. 19). Even with regard to this autochthonic hypothesis, he rightly holds that belief must be premature and unjustifiable until it has been satisfactorily established. It is quite true that "no one at the present day can tell the origin of the Americans"; but when Mr. Bancroft goes on to say that "they may have come from any one or from all the hypothetical sources enumerated in the foregoing pages," we can but protest against the notion of leaving a loophole for notions some of which have been dismissed as absolutely absurd, and others as manifestly impossible.

The habit of reserving opinion may be carried too far, and may easily pass into the profession of reserving it. We must therefore take even a stronger objection to those passages in which Mr. Bancroft sets forth the grounds for giving credence and weight to the main body of American tradition. There can be no question that the Spanish writers are not to be charged with wholesale invention or forgery, or even with conscious dishonesty of any kind. Nor are we justified in dismissing as unworthy of credit the native writers of the age of the Spanish conquest, or even in refusing to Mexican tradition the degree of trust which we should accord to Greek or Roman tradition for times immediately preceding the origin of a contemporary history. But it must be always strictly borne in mind that it is the contemporary character of the narrative which constitutes its value. We accept at once the statements of Herodotus respecting events of his own day; we are ready to believe that the older men with whom he conversed reported faithfully those matters of which they had personal knowledge, and that they gave him not less faithfully the statements which they may have heard from their fathers or their grandfathers. Thus, even apart from written records, something like a connected and trustworthy history may be preserved for three or four generations; but it must be preserved by one who then commits it to writing, for the oral tradition of the third generation is being rapidly modified by the state of flux which is the fate of all oral tradition of any sort and of any time, the briefest as well as the longest. Unless, then, it can be shown that American history rests on contemporary writings, we are manifestly sent adrift without chart or compass on an unknown sea, when we get back to a time preceding the Spanish conquest even by a very few centuries. We are absolutely lost when we go back still further for one or two thousand years or more. In such cases our business is to record the traditions without comment. The attempt to sift them can result only in leaving a residuum of possibilities; and Mr. Bancroft has unfortunately been tempted to speak of this residuum as if it were genuine historical matter. Having carefully weighed the merits and the faults of the various classes of writers who have treated of American history, he expresses his desire of avoiding the latter and imitating them in the former:—

> With the Spanish writers I would tell all that the natives told as history, and that without constantly reminding the reader that the sun did not stand still in the heavens, that giants did not flourish in America, that the Toltec kings and prophets did not live to the age of several hundred years, and otherwise warning him against what he is in no danger of accepting as truth. With Wilson and his class of antiquarian sceptics I would feel no hesitation in rejecting the shallow theories and fancies evolved by priestly fanatics from their own brain. With Gallatin I wish to discriminate clearly, where such discrimination is called for and possible, between the historical and the probably mythic; to indicate the boundary between firm land and treacherous quicksand; but also, like Brasseur, I would pass beyond the firm land, spring from rock to rock, wade through shifting sands, swim to the farthest, faintest light, and catch at straws by the way; yet not flatter myself, while thus employed, as the abbé occasionally seems to do, that I am treading dry-shod on a wide, solid, and well-lighted highway.—P. 155.

All this may show a laudable spirit of impartiality; but it is scarcely the spirit of the genuine historian, whose business it is to determine at the outset the conditions under which it is either "called for" or "possible" to discriminate between the historic and the probably mythic. Far from doing this, Mr. Bancroft takes the narratives of the Popol Vuh, and asserts that, "be they marvellous or commonplace, each is formed on an actual occurrence and has its meaning" (p. 183). The same may be said of the stories of the Argonauts, of Helen, or of the Phaiakians in the Odyssey; and comparative mythologists would assert, not less positively than Mr. Bancroft, that every one of them is founded on an actual occurrence and has its meaning. But they would add that these occurrences may and do take place in any spot and at all times, that the Phaiakian barks may be seen whenever the wind blows the clouds across the sky, and that the form of Helen, stolen from her Western home, is seen at Ilion when the dawn flushes the heaven. The statement, therefore, is manifestly misleading; but Mr. Bancroft obviously means that the given occurrence is a genuine fact of human history; and in this sense, taking the same story of Popol Vuh, he looks on the beasts of the forests mentioned in it as "savage tribes employed as allies":—

> Occasionally men are for some offence or stupidity changed to monkeys, or tribes allied with the self-styled reformers and civilizers prove false to their allegiance and return to the wild freedom of the mountains. It is difficult, if not impossible, to determine the meaning of that portion of the narrative which recounts the immaculate conception of the Princess Xquiq; but Brasseur, not without reason, sees in the birth of Hunahpu and Xbalanque from a Xibalban mother an indication that the rival nations became more or less mixed by intermarriage. The same author conjectures that the quarrels between the two twins and their elder half-brothers record dissensions that arose between the chiefs of pure and mixed blood.—P. 185.

It is easy to read tradition after this fashion, to draw precisely the same conclusion from the feuds between Romulus and Remus

and the people of Amulius, and to call up precisely the same doubt respecting Rhea Silvia and the princess with the less euphonious name of Xquiq. But in truth it is not, as Mr. Bancroft thinks, the only practicable course in such cases "to present the leading points of these early traditions as they are given by the best authorities, and to draw from them . . . some general conclusions respecting the most probable course of primitive history" (p. 189). In the only sense which gives any value to the word, we have no authorities at all, nor do we make a statement or a series of statements one whit the more historical because we have taken care that they shall assert nothing that is unlikely. Further, the name Popol Vuh belongs strictly not to the Quiché MS. so called, but to the national tradition which the later compiler sought to preserve from extinction by setting it down in his book. Whether he has adhered to the tradition with absolute exactness, and whether, if we had that tradition itself before us, we should find in it more of historical matter, we cannot tell; but in the Quiché version certainly we have none. It deals with times which to the Mexicans of the days of Cortes were as the stories of Danaos and Erechtheus to the Athenians of the days of Xenophon; and it is the duty of the historian to deal as trenchantly with the one as with the other. Nay, speaking of this Popol Vuh, Professor Max Müller holds that this remark applies with even greater force to American tradition. "The sooner this is acknowledged," he adds, "the better for the credit of American scholars. Even the traditions of the migrations of the Chichimecs, Colhuas, and Nahuas, which form the staple of all American antiquarians, are no better than the Greek traditions about Pelasgians, Æolians, and Ionians; and it would be a mere waste of time to construct out of such elements a systematic history, only to be destroyed again sooner or later by some Niebuhr, Grote, or Lewis."

We do not deny, and we have no wish to qualify, the importance of the difference thus raised between us. Had Mr. Bancroft's historical method been more rigorous we should have read this volume with more genuine satisfaction. As it is, we may fearlessly say that all historical scholars are indebted to him for the results of years of toil ungrudgingly spent, and spent to excellent purpose.

PRICE'S HANDBOOK OF LONDON BANKERS.*

CHARLES LAMB tells us of a paragraph writer whose work was easily recognized, for when news ran low and wit failed there constantly appeared the following note:—"It is not generally known that the three Blue Balls at the Pawnbrokers' shops are the ancient arms of Lombardy. The Lombards were the first money-brokers in Europe." Mr. Price's volume is an expansion of the information supposed to be conveyed in Bob Allen's paragraph. It does not mistake golden balls for blue, nor say that the arms were those of Lombardy, but it does endeavour to trace our great modern banking-houses to the goldsmiths of the middle ages, and in a few cases succeeds in showing that they are still the representatives of firms mentioned in the *Little London Directory* of 1677 as keeping "running-cashes." As the oldest of these houses is that then known as Blanchard and Child, and as it was in the course of some investigations into the history of Child's Bank that Mr. Price was led to write this book, he naturally gives it a large share of attention. The growth and fortunes of such a business as this are a subject well worth studying, and the wonder is that so few books have been written on our commercial history except dry treatises. There is something fascinating, almost romantic, in the details given us by Mr. Price; and though readers for amusement only may quarrel with his book because a full half of it is devoted to a banking directory, while the business reader may not care for the anecdotes, he has produced an interesting and unpretending little work, which may prove a useful contribution towards the history of a difficult subject. The alphabetical arrangement he has adopted, while it is very convenient for reference, is fatal to the sequence of the facts he narrates. A chronological table might have been added to counteract the effect of this arrangement, but as the list of goldsmiths only dates from 1677, and the list of bankers only begins in 1736, we must pick out and place in order as we best may the information which Mr. Price has gathered as to the older goldsmiths and the makers of coin from the Conquest downwards

The first name might be supposed to be the oldest. "Ade was goldsmith to King Edward I.," says Mr. Price. But at the end of the book we have mention of an older name. "Otto," we read, "was one of the earliest goldsmiths of whom we have any record." This Otto is, it seems, mentioned in Domesday as the holder of lands in Essex and Suffolk. But we could supply Mr. Price with a still earlier name. In the reign of the Confessor "Teodric aurifaber" held a manor in Surrey, and he continued to hold it at the time of the survey. Of the family of Otto Mr. Price has some curious particulars. There appear to have been several successive engravers to the Mint of this name, and Ruding and others have traced the history of the family until, like later bankers, they were absorbed into the ranks of the peerage. Mr. Price for the most part avoids questions of coinage, and stops with Thomas FitzOtho, who claimed by inheritance the broken dies of the Mint in the reign of Henry III., and who presented Ralph le Blund to the Barons of the Exchequer as a proper person to hold the office of Cutter of the King's Dies. This Thomas seems to have married a Beauchamp, and Maud, his daughter, carried the office and its emoluments to the Botetourts, who were barons in Parliament from 1305, and whose title is now enjoyed by their descendant, the Duke of Beaufort.

But, leaving these ancient goldsmiths, we may trace the rise of Child's long-famous house as a typical example. The future fortunes of Temple Bar are just now under discussion. If it is pulled down, it will leave a blank in the façade of Messrs. Child's banking-house. The mysterious little chamber over the archway, with its windows of small panes, looking up Fleet Street and down the Strand, was rented by Messrs. Child from the City for 50*l.* a year, as a place for storing their account-books. This is a fact apparently overlooked by Mr. Price. The name is not very ancient in the City. Two remarkable members of the family flourished in the latter half of the seventeenth century, and most accounts go to show that they were brothers, and that their father had been a very small tradesman. Josiah Child is remembered as Governor of the East India Company, and as the subject of some of Lord Macaulay's strongest language. Evelyn mentions that the fortune of Miss Child when she married Lord Worcester was 50,000*l.* Her descendant, the Duke of Beaufort, thus represents a second great City family. But Sir Josiah Child was not the banker. This was Francis Child, said to be his younger brother, but there is some obscurity on the point; and Mr. Price, like Mr. Parker, makes that darker which was dark enough before. Francis Child married his cousin, the heiress of the Wheelers who had first set up at the "Marygold, hitherto a tavern, next door to Temple Bar." William Wheeler had a partner, Robert Blanchard, and not only did Child marry the heiress of the senior member of the firm, but his mother, Mrs. Child, married the other partner. To Francis eventually came the fortunes of both, and he is remarkable as the first banker who gave up the goldsmith's business and devoted himself entirely to the business of banking. He deserves, therefore, the name given him by Pennant of the Father of the Profession. He lies buried in Fulham Churchyard among the Bishops, under a sadly neglected monument which sets forth his virtues and mentions that he had by the Wheeler heiress a family of twelve sons and three daughters. He and another Sir Francis Child, his second son, were in their turn Lord Mayors, but the second Sir Francis is chiefly remarkable as the introducer of a printed form of promissory notes; in other words, of bank-notes. For this, if for nothing else, he deserves the gratitude of posterity. But though this was the first firm to print notes, it was the last to adopt a printed form for cheques; at least Mr. Price tells us in the same paragraph that it was the last and also the earliest (p. 28); but he probably means that, though the Childs were the first to use printed cheques, they soon abandoned the custom, and did not revive it until it had become universal elsewhere. The old ledgers of the firm contain the names of many people of note. Eleanor Gwynne—so Mr. Price spells the name—Bishop Stillingfleet, Bishop Burnet, the great Duke of Marlborough, Titus Oates, Dryden, and John Evelyn, the diarist, have all left their marks in the books, and Oliver Cromwell is known to have kept his account at the Marygold, but the ledger which contained it has been lost for fifty years. Notwithstanding the number of Sir Francis Child's sons, Mr. Robert Child was in 1782 the head of the firm and the last of the name. It is of him that the famous story is told of his daughter's marriage. Lord Westmoreland, it is said, when dining one day at the bank, asked his host what he should do were he in love with a girl whose father would not give his consent. "Why! run away with her, to be sure," was Mr. Child's incautious reply. Lord Westmoreland took the advice literally, and ran away with Miss Child, the banker's only daughter. Mr. Heywood Hardy's picture, a couple of years ago at the Academy, represented a thrilling scene in the elopement; when Lord Westmoreland, finding that the anxious parent's pursuit had become dangerous, stood up in his carriage and shot the leading horse in Mr. Child's. Mr. Child never forgave the runaways. He left his fortune to his grandchild, Lady Sarah Fane, who carried it into the Jersey family. Lord Jersey is the present head of the firm, yet he is not, strictly speaking, the representative of the last Mr. Child. Lady Sarah had a brother and two sisters younger than herself, but her grandfather's will gave them no part or inheritance with her. It has often been reported that John, Lord and Lady Westmoreland's only son, and also the daughters, were all christened "Sarah," lest the legacy should lapse, but Mr. Price does not tell us whether there is any truth in the story.

Mr. Price's anecdotes of other firms are also entertaining. He gives the history of many houses which have not lasted as long as that of the Childs. The Royal British Bank was opened (with puffs, if we remember rightly), in 1851 and stopped in 1856, "overwhelming many hundreds of families in ruin"; the English Joint-Stock Bank was established in 1866, and stopped in the same year; and there is ancient precedent for this very quick work in the Land Bank, erected by Act of Parliament in 1696 to advance money on title-deeds. Not only did it fail within the year, but its fall brought about no less an event than the stoppage of the Bank of England, an institution then only in the third year of its age. Mr. Price's accounts of such unfortunate houses as those of Strahan and Paul, Masterman and Co. (afterwards the Agra and Masterman's Bank), Neale and Fordyce, and others which have failed through negligence or fraud, contain many interesting particulars; but it is more pleasant to read the full histories he gives of the successful houses. He mentions in the preface that, of the list of goldsmiths who kept running cashes in 1677, five still survive. One of these is

* *Handbook of London Bankers.* By F. G. Hilton Price. London: Chatto & Windus. 1876.

Blanchard and Child, at the Marygold—which Mr. Price, by the way, will only write as "Y^e Marygold," we know not why—now Child and Co.; another is Duncombe and Kent, at the "Grasshopper, in Lombard Street," which claims to represent the firm of which Sir Thomas Gresham was the head, now known as Martin and Co.; it was the Duncombe of this firm that bought the Villiers estate in Yorkshire, and was immortalized by Pope:—

> And Helmsley, once proud Buckingham's delight,
> Slides to a scrivener or City knight.

It still belongs to the family, but Lord Feversham is not a partner in the bank. The other houses which date from before 1677 are those of James Hore, at the Golden Bottle in Cheapside, now Hoare's in Fleet Street; Stock's, at the Black Horse in Lombard Street, now Barnett's; and Williams's, at the Crown, also in Lombard Street, now Willis's. There is a great deal of amusing reading and some valuable information in this book—so much indeed that, with the materials at his command, it is difficult to see how the author did not make a better book. The account of the goldsmiths, though it is specially mentioned on the title-page, is very meagre, and, as far as the early part of the history of banking in England is concerned, we cannot accept this work as more than an instalment.

TWO DRAMAS.*

HENRIK IBSEN is a poet and dramatist of whom Norway may justly be proud, and any work of his deserves respectful attention. But, in planning the long Chronicle-Play which he published in 1873 under the title of *Kejser og Galilæer*, he chose a theme which seems to have proved somewhat too vast for his artistic powers. Skilled as he is in historic illustration, he failed in this instance to treat successfully the motley crowds which figure on his immense canvas. Accustomed as he had long been, both as dramatist and as director, to theatrical business, he produced a drama totally unfit for the stage. Original, powerful, and facile poet as he undoubtedly is, he conceived the idea of what surely ought to have been a dramatic poem, and accomplished it in prose, thus deliberately sacrificing one of his most important advantages. When we see tragedy go sweeping by, when we listen to such a tale as that of Troy divine, a musical accompaniment of some kind seems appropriate, if not necessary. Moreover, just as some great prose writers are deserted by their particular genius when they take to verse, so are there some poets who, when they doff their singing robes, are like a swan-maiden deprived of her feather dress, unable to soar aloft into the sky, and obliged to comply with the requirements of commonplace words and deeds. Ibsen, it is true, does not altogether lie under this disadvantage; for his prose, in the more elevated passages of *The Emperor and the Galilean*, is of a poetical nature, sometimes hard to be understood not merely by the vulgar, but even by an efficient interpreter.

It is said that he at first intended his work to form a trilogy; but the use of that term must not be allowed to suggest the idea that he wrote under Greek influences. Shakspeare and Schiller would rather seem to have been the two models he studied, so far as the form of his drama is concerned. As to its contents, he has closely followed the chroniclers of the period he illustrates, often inserting whole blocks of history but little modified or adapted, thereby rendering hasty admirers liable to the risk of attributing to his imagination incidents and expressions which are matters of fact. That period of history, however, possessing an undying interest, it is impossible to read without emotion the pages in which the Norwegian dramatist has told the story of Julian the Apostate.

First we listen to the ingenuous utterances at Constantinople of the princely youth on whom Fortune seems to frown. Then we hear him talking eagerly with sages and revellers at Athens, and with Christian philosophers and heathen mystics at Ephesus. In Gaul he figures as the victorious general whom his troops adore, and on whom they force the Imperial crown; and there also the close of the first part leaves him, the pagan neophyte whose wrongs have driven him into rebellion against his Emperor and his Emperor's God. The second part opens with the arrival at Constantinople of Julian as Emperor, and goes on to describe the rising of that sea of troubles, both there and at Antioch, into which he is plunged by his resolve to recall the ancient gods from exile. The fourth act reveals "the eastern boundaries of the Empire," and Julian marching doggedly on to the stormy death with which the fifth act ends. In the penultimate scene, it may be mentioned, the dramatist follows the doubtful tradition which asserts that Julian owed his death to a Christian hand, and makes him utter in falling the famous words about the Galilean's victory for which so little authority exists. There is much in the whole representation which is attractive—life and movement, and colour and light. But for our own part, if we are to gaze at the long drama of Julian's career, we prefer to do so by the help of the historian who happened to sit musing one day among the ruins of the Capitol while barefooted friars were singing vespers in what had been the temple of Jove.

The Emperor Julian remains one of the enigmatical characters of history. It is hard to say what he really was, but we may rest assured that he was not exactly what the Norwegian dramatist represents him as having been. In some respects, no doubt, the portrait is accurate. The blackness of Julian's studious fingers, the shabbiness of his philosophic raiment, the unloveliness of his objectionable beard, all these external signs are conscientiously rendered. But the real, the inner nature of the Imperial votary of the fair humanities of old religion—into this we gain but little insight under the dramatist's guidance. Weak, credulous, and modern, he frequently resembles a spiritualist of our own day more than a great general, a mighty monarch, of the days of yore. It must be allowed, however, that he shows a certain amount of force and vitality when contrasted with most of the forms which surround him. On them historic names may be conferred; their words and deeds may even be thoroughly authenticated; but, for all that, they have no more individual life than if they had been labelled "first" or "second citizen." Still, in spite of these drawbacks, this prose poem has no slight merit. There are scenes in it which evince real power, there are passages in which the genius of the poet makes itself unmistakably felt. In the first part, by way of example, may be mentioned at least one very remarkable scene; that in which Julian's wife, under the influence of poison, reveals the secrets of her life. And throughout both parts there are scattered passages which in the original are remarkable for bright and bold imagery, as well as for such vigorous and musical diction as only a master of language can command.

Miss Ray's translation is for the most part literal and accurate to a most praiseworthy degree. So long as the original remains at its ordinary level, the version is, as a general rule, everything that could well be desired. But when the dramatist begins to soar aloft on the wings of imagination, he leaves his interpreter far below him. To the driving storm, or the lustrous calm, of the Norseman's speech the English interpreter fails at times to do full justice. The sense may be correctly rendered, but the garb of words, which in the one case is often rich in colour and radiance, is in the other for the most part devoid of any special attraction. The difference reveals itself most forcibly on those fortunately rare occasions when the translation has to deal with the double difficulty of rhythm and rhyme. The songs which arise, at p. 212, from the contrasted processions of Apollo's worshippers and Christian prisoners, have a somewhat ludicrous ring about them in the English version, especially in the closing lines:—

> Apollo's Procession,
> Sweet to carouse beside Hope's sunny embers!
> Prisoners' Procession,
> We yield to bloody baptism our members!

It is true that for such strange expressions as the "solhåbs-glöden" and the "bloddåbs-döden" of the original it is hard to find English equivalents. To one case in which the sense has been obscured in the translation it may be worth while to refer. It occurs in the striking scene, already spoken of, in which Helena, Julian's dying wife, makes such terrible disclosures. Perhaps Miss Ray may have purposely clouded the meaning of the whole passage, fearing that the dramatist's close adherence to a revolting tradition might shock the feelings of her readers; for when, at the end of Helena's involuntary confession, Julian shakes his clenched fists in the air with a savage cry of "Galilean!" she makes him unmeaningly exclaim "Galileans!"

No one has done more towards making Ibsen known to English readers than Mr. E. W. Gosse, who has now brought vividly before their eyes a series of romantic scenes from Danish history. The story of Erik Ejegod, King of Denmark, has long been dear to Northern minstrelsy, and now it has been told by Mr. Gosse with a pathetic grace which ought to endear it to English hearts as well. The plot is simple, and the persons of the drama are few. The King, driven wild by causeless jealousy, disgraces his innocent Queen, and slays a minstrel on whom he suspects her of having too favourably looked. To passion succeeds remorse. Finding that he has wronged an innocent and loving wife, and conscious of having broken his own strict law against killing a Christian man untried, he vows a pilgrimage to the Holy Land. Attended by his long-suffering and forgiving Queen, he wanders forth an exile from his realm. But before he reaches Palestine he is killed by the foster-brother of the minstrel who fell a victim to his hasty wrath. Mr. Gosse has adhered closely to historic truth, and his fidelity has compelled him to burden his heroine with a somewhat unromantic name, Botilda to wit. In all other respects, however, this reverence for truth has greatly conduced to the merits of his work. There is an air of reality about the scenes which he depicts. We breathe a true Northern atmosphere, we listen to good Scandinavian talk. Mr. Gosse has evidently studied the Sagas to good purpose, and held imaginary converse with Skalds and Sea-Kings long enough to be able to avoid the solecisms and anachronisms which beset the path of a poet who follows his fancy into a foreign country and a far-off time. In telling so simple a tale as that of the King's jealousy and the Queen's patience, a dramatic poet can find but little scope for the development of philosophical theories, but little excuse for the application of minute psychological analysis. But if he possesses the story-teller's gift of rendering clearly visible to other eyes the forms and scenes which memory and imagination call up before his own, and if he unites with it the playwright's faculty of enabling his characters to behave reasonably and speak to the point, as well as the singer's power of casting an indefinable charm about that which otherwise might be but coldly correct, then his comparatively simple work may surpass the elaborate productions of the highest intelligences that ever refused to lower themselves to the level of ordinary compre-

* *The Emperor and the Galilean.* A Drama in Two Parts. By Henrik Ibsen. Translated from the Norwegian by Catherine Ray. Samuel Tinsley. 1876.

King Erik. By Edmund W. Gosse. Chatto & Windus. 1876.

hensions. Mr. Gosse possesses to a high degree the singer's and the story-teller's gifts, and of the playwright's faculty he possesses more than in these days generally falls to a poet's lot; and his tragedy, though neither harrowing nor appalling, is so elevated in tone, delicate in feeling, and felicitous in expression, that it is likely to win its way to the hearts of its readers, as well as to please their critical taste. In the first act the Queen joyfully welcomes home her lord on his return from victorious war. In the second she learns what she had never guessed before, that the minstrel Grimur, whom she had looked on only as a dear friend, has long nurtured a wild love for her, a love utterly unreturned. For, she says:—

> If love
> Be this, to feel a heightened pulse of life
> Beat when the loved one's footsteps touch the stair,
> To lose all drooping sense of bodily ill
> When he is near and smiling; to grow sad
> And weary when 'tis sure he will not come;
> Then once, and only once, since time began,
> Has love come down into this heart of mine.

But this is unknown to Erik, whom slanderous tongues drive into headlong wrath, so that he slays Grimur with his own hand. In the third act the King is about to enter the cathedral at Roeskild, when he is stopped by the Archbishop, whose stern rebuke brings home to him the consciousness of his crime. When we next see the King he is presiding in the Assembly of the People at Roeskild. Around his chair of state sit the nobles; the rest of the open air enclosure in which the Thing is held is occupied by the freemen, who "bustle about and speak noisily together." At length the King arises, and in spite of the protests expressed by his nobles and "the Leader of the Freemen," he announces his fixed resolve to do penance for his crime by means of a pilgrimage to Jerusalem. Then comes a scene described with great feeling and delicacy, in which Erik discovers that he has unjustly suspected his wife, and she forgives him for having so done. With this scene the dramatic interest of the story reaches its highest point, of which it falls far short in the act which follows. But the poetic interest is fully sustained by the brilliant account of Constantinople, where among the Væringar who come to offer homage to Erik is one Gisli, who tells how he had pledged brotherhood with Grimur "in the North, and in the best old way"; the two friends having gone out at midnight to the cliffs, and there let the blood of their gashed arms mingle beneath a loosened piece of turf. Then, hearing of Grimur's death, he vows vengeance on his murderer. This vow is in the fifth act fulfilled, Gisli slaying Erik in Cyprus, just as the King is allowing himself to believe that the time is close at hand when he will be able, free from sorrow and remorse, to return home, and once more steer through gathering storm Denmark's endangered bark. The royal corpse is conveyed on board ship, and the widowed Queen gives orders to weigh anchor at break of day:—

> For lo! the King and I are fain to come
> As swiftly as we may to Palestine,
> Where shortly ye shall leave us, for I know
> That after all the sorrow of our lives
> We shall not toil nor wander any more,
> But seek the sacred river and find rest.

By way of a specimen of the lyrics scattered through the play we may take the following, sung by a boy who says of it, "A Roman wrote it, though the words be Greek"; thereby apparently referring to a poem in the Greek Anthology by Rufinus, a Byzantine writer of Latin lineage:—

> I bring a garland for your head,
> Of blossoms fresh and fair;
> My own hands wound their white and red
> To ring about your hair.
> Here is a lily, here a rose,
> A warm narcissus that scarce blows,
> And fairer blossoms no man knows.
>
> So crowned and chapleted with flowers,
> I pray you be not proud;
> For after brief and summer hours
> Comes autumn with a shroud.
> Though fragrant as a flower you lie,
> You and your garland, by and by,
> Will fade and wither up and die!

ROGERS'S WASPS OF ARISTOPHANES.*

ALL students of Aristophanes will feel grateful to Mr. Rogers, already the translator of the *Clouds* and of the *Peace*, for the help he has now afforded them towards a just appreciation of the *Wasps*. Whilst a certain incoherence of parts forbade acquiescence in the over-laudatory verdicts of Mitchell and K. O. Muller, it must have occurred to most readers who had a competent knowledge of Aristophanic comedy that the *Wasps* did not deserve the sweeping accusation of feebleness brought against it by Schlegel. Extreme opinions are apt to be unjust, and in few cases could this be shown more clearly than in reading and weighing the merits of the *Wasps* under the guidance of Mr. Rogers's translation and notes. If the charge of "spun-out action" is not here answered, at all events such light is thrown on the scope and circumstances of the piece that the prolongation of it does not seem impertinent or superfluous; and certainly a play cannot justly be called dull or tedious which teems with amusing situations, is rich in Aristophanic jokes, and illustrates a phase of Athenian social life distinct from, although, as the translator shows, not without its bearing upon, the earlier subjects of the poet's ridicule and sarcasm. This play, as we are reminded in a lucid and learned preface, was a third labour of the Hercules of Attic comedy after smiting the monster demagogue in the *Knights*, and assailing, although ineffectually, the Sophistical school in the *Clouds*. In it Mr. Rogers sees the effects of the failure of the last-mentioned play ten months earlier, and he finds his clue to the whole structure and plot of the piece, as well as to its unevenness and inconsistencies, in the circumstance of its probable composition during the months immediately before and after that failure. "The grand earlier scenes following the entrance of the Chorus, the noble poetry of the Strophe and Antistrophe, Epirrhema and Antepirrhema, and the orchestral contest with which the play concludes," he takes to have been written before Aristophanes had experienced a check to his unbroken success; while the servile jokes, the sneers at the audience, and the tipsy pugnacity of Philocleon were introduced after he had been bitterly taught that he could not hold his own without retaining "the broad farce, the laughable personalities, and vulgar scurrility" of Cratinus and the older comic drama. These scenes and features, appealing to the lower instincts of the audience, are intelligible if regarded as afterthoughts distinct from the original scheme of the play; the drift of which is, according to Mr. Rogers, not simply, as Grote and others have regarded it, to ridicule the dicasts as monsters of caprice and injustice, but to hit another blow at the second of Aristophanes's two antipathies, the Sophistical school and the demagogues, by displaying the dicasts (Heliasts, or justices and jury in one, who numbered no less than five thousand in Athens), as not really the lords of all, as the demagogues would tell them, but rather the defrauded slaves and cat's-paws of the latter. This is very amply set forth in the preface, which throws considerable light on the Helixa, and the elections, sections, and characteristics of the Athenian dicasts, and at the same time distinguishes, independently of other authorities, the English jury system from the Athenian dicastic system. But a single note of Mr. Rogers on v. 650, where Bdelycleon, the representative of the anti-dicastic views as opposed to the old dicast Philocleon, his father, begins his speech before the arbitrators, sums up in brief the dramatist's main object. "His argument consists," runs the note, "not of any criticism upon the laws or on the practice of the Athenian dicasteries, but of proof that the power obtained by the alliance of the demagogues and dicasts is wielded exclusively for the benefit of the demagogues, and not in any way for the benefit of the dicasts." The two speeches may, in fact, be summed up in a very few words. "Ours is a *μεγάλη ἀρχή*," says Philocleon, "for all men, even the great demagogues themselves, are ready to court and flatter us." "Yours is a *μεγάλη δουλεία*," retorts Bdelycleon, "for the demagogues retain to themselves every substantial advantage, and leave you to penury and starvation." Reading the *Wasps* with this key, we shall see many reasons for believing that the poet's aim was to detach the dicasts from the demagogic alliance and allegiance, and so to contribute towards scotching one of the twin snakes he had vowed to exterminate. Even Philocleon, the blind advocate of that alliance, wedded as he is to the dicastic system, with its miserable stipend of three oboli and little or no liberty of judgment or conscience, owns now and then to misgivings in the course of the play, and in its latest scenes comes out as a thorough convert, though his conversion does but illustrate the evils of all extremes in the tipsy frolics to which the ex-juryman resorts when finally weaned from the absurd routine of a life given up to the law courts. It was probably for the sake of this lesson that the play was lengthened; but it is really in its first twelve hundred lines or so that its chief merit consists, as in the early appearances of Philocleon, and the little traits of his daily life, sketched by the slave Xanthias, and filled in with touches of his own drawing. The following lines from a speech of the slave will exhibit Mr. Rogers's union of exact translation with the life and spirit without which translation is dry bones and empty husks (89-110):—

> He is a law-court lover, no man like him.
> Judging is what he dotes on, and he weeps
> Unless he sits on the front bench of all.
> At night he gets no sleep, no not one grain,
> Or if he doze the tiniest speck, his soul
> Flutters in dreams around the water-clock.
> So used he is to holding votes, he wakes
> With thumb and first two fingers closed, as one
> That offers incense on a new moon's day.
> If on a gate is written *Lovely Demus*,
> Meaning the son of Pyrilamp, he goes
> And writes beside it *Lovely Verdict-box*.
> The cock which crew from eventide, he said,
> Was tampered with, he knew, to call him late,
> Bribed by officials whose accounts were due.
> Supper scarce done, he clamours for his shoes,
> Hurries ere daybreak to the court, and sleeps
> Stuck like a limpet to the door-post there.
> So sour is he, the long-condemning line
> He marks for all, then homeward, like a bee
> Laden with wax beneath his finger-nails,
> Lest he lack votes, he keeps, to judge withal
> A private pebble-beach secure within.

If it were only as an illustration of the features of the Athenian law court, the way in which it was summoned, its way of voting, its measurement of time, its modes of business, there is value in

---

* *The Wasps of Aristophanes.* The Greek Text revised, with a Translation into corresponding Metres, and original Notes. By Benjamin Bickley Rogers, M.A., sometime Fellow of Wadham Coll., Oxford. London: George Bell & Sons. 1875.

such an intelligibly annotated translation as this. Not to go into all the details, we may note that the joke upon the time-honoured lovers' custom of "carving amorous vows on the rhind" or "wood," in v. 98, turns on the similarity in sound of *κηκίς*, the funnel of the verdict-box, to "Demus," the "toast of all the town" in his day. "The long-condemning line" refers to the custom of the judges declaring their opinions on a wax-faced tablet; if for the severer penalty, with a long stroke, and if for a lighter, with a short one. The humorous touch of the old dicast's being represented keeping "a private pebble-beach," lest his means of voting should fail, is repeated in another form at v. 696, where, when Philocleon is being wrought upon by his son's arguments, he cries:—

οἴμοι, τί λέγεις; ὡς μου τὸν θῖνα ταράττεις.

Ah me! the depths of my being are stirred;

or, literally, "how you disturb my seashore," "my beach." There is infinite fun, when this old gentleman means mischief, to find him, at 166, crying out for a sword, or failing that, for a "damage-cessing tablet" (*πινάκιον τιμητικόν*), that waxen instrument on which the "long-condemning line" referred to above could do as much execution; or when, as in 386, he takes a desponding view of things, bidding his fellow-dicasts, if ill befall him, *κατακλαύσαντες θάπτετε μ' ὑπὸ τοῖσι δικασταῖς* ("bewail my fate, and bury me under the court-house floor"); the reference being to the bar or rail which divided the dicasts from the rest of the court, and the sentiment akin to that of a bombastic senator in our own day who threatens to "die upon the floor of the House."

It must not be forgotten that a great deal of the fun of the early part of the play consists in the wily dicast's efforts to outwit his son and his son's slaves, bent on debarring him by close confinement from the exercise of his functions. One of the old man's tricks is to borrow Odysseus's device to escape the Cyclops, and to get out of his prison strapped beneath an ass's belly. He is, however, detected, and it leads to an observation on his son's part, which Mr. Rogers makes more intelligible by his note thereon. Bdelycleon remarks:—

ὦ μαιρώτατος,
ὃν' ὑποδέδυκεν, ὥστ' ἔμοιγ' ἰνδιάλλεται
ὁμοιότατος κλητῆρος εἶναι πωλίῳ.

O the villain,
The place he had crept to! Now he seems to me
The very image of a sompnour's foal.

The word *κλητῆρος* is referred by the scholiast to the summoner of dicasts, and there is more to be seen about this functionary's duties at v. 1408, and in the instructive note thereupon. Here, however, Mr. Rogers surmises that the poet commits a pun, and that "in the Athenian slang of the period a donkey must have been sometimes styled a *κλητήρ*, *a caller*, perhaps from its discordant bray." If this be so, what follows is all the more in due sequence, for the next two lines run in translation:—

PHIL. Come now, hands off! or you and I shall fight.
BDEL. Fight! what about? PHIL. *About a donkey's shadow.*

There is a further justification, if we admit Mr. Rogers's conjecture, for this bringing-in the proverb *περὶ ὄνου σκιᾶς*, which occurs, among other places, in a fable of Babrius. And by the way, we may note that the *Wasps* is full of proverbs. In v. 480, when Bdelycleon deprecates contests with and about his law-court-loving father, the Chorus tells him *οὐδ' ἐν σελίνῳ πούστιν οὐδ' ἐν πηγάνῳ* ("as yet you've hardly entered on the parsley and the rue"), *i.e.* "you've hardly reached the fringe or border of your troubles," parsley and rue being the bordering of Hellenic gardens. In v. 491 *τοῦ ταρίχους ἀξιωτέρα* is as near as possible Greek for Shakspeare's "As cheap as stinking mackerel" (*1 Henry IV.*, ii. 4). There is also the phrase, *σκίαν βλέπειν*, "to look like one who expects the whip." Again, in 928 Aristophanes has a parody of a familiar ornithological proverb, *ἐρυθάκους οὐ τρέφει λόχμη μία*, "One bush doesn't keep two red-breasts," an allusion to the solitary and pugnacious habits of the redbreast. In the *Wasps* the poet for his own purposes makes Xanthias use it as an argument for the condemnation of the dog Labes (*i.e.* Laches) that

οὐ γὰρ ἂν ποτε
τρέφειν δύναιτ' ἂν μιᾷ λόχμῃ κλέπτα δύο.

One bush, they say, can never keep two thieves.

Not much further on in the same very amusing mock-trial Bdelycleon apologizes for his speech failing him in the arduous defence of Labes by an appeal to proverb-lore which English ears can understand:—

O sirs, 'tis hard to argue for a dog
Assail'd by slander.

The appeal is clearly to the venerable saw, "Give a dog a bad name and hang him." Among the test-passages by which Mr. Roger's translation might be tried, we should place one which is a "locus classicus de piscibus," vv. 491-510, and as to which it may suffice to say that the notes to this translation furnish matter for a new chapter on Fish-tattle. But in truth the charm of Mr. Rogers's annotation is the opportuneness with which he blends things old and new—now illustrating an expression by a phrase of Shakspeare, confirming Aristophanes's natural history by Buffon, Cuvier, or Bechstein, and in one place paralleling Philocleon's shame at his own weakness and leniency as a dicast by citation of Lucas Beaumanoir's "crossing himself twice" in doubt whence arose his unwonted softening of heart at the trial of Rebecca, in *Ivanhoe*. The arbitration case, the mock trial of the dogs who represent the Athenian general Laches and the demagogue Cleon, and the famous parabasis of the wasps, are pretty well known to all who have any acquaintance with Aristophanes. From Bdelycleon's pleadings in the first of these we take a few lines of translation from Mr. Rogers, by way of sample. They represent the speaker's proposal for a better way of feeding the people, and of securing the voting power in the assembly, than the dicastic three obols. The orator says:—

Since if they wished to maintain you well, the way to do it were plain enough;
A thousand cities our rule obey, a thousand cities their tribute pay,
Allot then twenty Athenians each, to feed and nourish from day to day,
And twice two thousand citizens there are living immersed in dishes of hare,
With creams, and beestings, and sumptuous fare, and garlands and coronets everywhere,
Enjoying a fate that is worthy the state and worthy the trophy on Marathon plain,
While now like gleaners ye all are fain to follow along in the paymaster's train.—706-12.

The transcript of the original is sufficiently faithful, and the chief point here is Mr. Rogers's boldness in justifying *ἅζων ἐν πᾶσι λαγῴοις* (v. 709), for which so great a critic as Dawes had bidden us read *ἕζων ἂν πᾶσι λαγῴοις*. "The *ἂν*," says our translator shrewdly, "is purposely omitted in order to present a more vivid picture, as of an actual reality and not a mere possible contingency." About seventy lines later in the play Mr. Rogers proves equal to the occasion in translating a few lines placed in the mouth of Bdelycleon, which are memorable for a double pun, which he succeeds in preserving. The original runs:—

καὶ ταῦτα μέν νυν εἰλόγως ἦν ἐξέχη
εἴλη κατ' ὄρθρον, ἡλιάσει πρὸς ἥλιον·
ἢν δὲ νίφῃ, πρὸς τὸ πῦρ καθήμενος
ὕοντος εἴσει· κ.τ.λ.

The son is trying to prove to his father the superior advantages of his proposed domestic law-court. He can try his own servants for their peccadillos:—

And very aptly, if the morning's fine,
You'll *fine* your culprits, sitting in the sun.
In snow, enter your judgments by the fire,
While it rains on: and, though you sleep till mid-day
No archon here will close the door against you.

The equivoque here consists in the derivation of *ἡλιάσει* and *ἡλαία* from *ἁλίζεσθαι*, though it might seem from *ἥλιος*, and *εἴσει* from *εἴσομαι*, though it might seem connected with *εἶσιμι* "to go within doors."

Some points deserve notice as showing Mr. Rogers's editorial acumen. In vv. 39-42, where the two slaves are dream-telling, Sosias, in allusion to Cleon's unsavoury trade, plays on the words *βύσιον δημόν*.

Then the vile grampus, cesles in hand, weighed out
Bits of fat beef, cut up.

And Xanthias rejoins:—

Woe worth the day!
He means to cut our city up to bits.

Here Mr. Rogers surmises a scheme of Cleon to be alluded to, having for its object to split up the city into distinct wards for separate circumvallation and for a system of interior fortification, opposite to the famous plan of Themistocles. Further on considerably, at v. 897, he seems to us to have elucidated thoroughly a line of Bdelycleon's to the god, Apollo Agyieus, in behalf of his converted sire:—

ἀντὶ σιραίου μέλιτος μικρὸν τῷ θυμιδίῳ παραμίξας,

And into his heart so crusty and tart a trifle of honey for syrup instill.

The clue is a play on *θυμιδίον*, the diminutive of *θύμος*, a wild salad herb of the poorer sort at Athens, and *θυμίδιον*, the diminutive of *θύμος*, the mind. If this salad was flavoured with *σιραῖον*, syrup, the sense would be "Mix honey with his temper as he is wont to mix mulled-wine syrup with his salad." Thus we have *σιραῖον* contrasted with *μέλι*, not as the representative of sourness, but as the recognized sauce for *θυμιδίον*; and this is only one amongst the many elucidations which the readers of the *Wasps* owe to Mr. Rogers. It is hardly too much to say that he has given a new interest and value to the play.

FRENCH LITERATURE.

FRENCH historians have lately bestowed a good deal of attention upon Mary Queen of Scots, and several works have been written on the other side of the Channel for the purpose of refuting the statements made by Mr. Froude and M. Mignet. We have on former occasions noticed the volumes of MM. Jules Gauthier and Wiesener; we must now mention the one recently published by M. R. Chantelauze.* It contains the reprint of a journal or diary purporting to have been kept by Bourgoing, physician to Queen Mary, who watched closely all the details of her trial. Bourgoing's journal is a manuscript which its owner, M. Chantelauze, says that he has submitted to the most competent judges, and he has no doubt that we have in it the narrative which Mary, in a letter addressed to Pope Sixtus V., announced her intention of publishing. If we may assume its genuineness,

* *Marie Stuart, son procès et sa condamnation.* Par M. R. Chantelauze. Paris: Plon.

there can be no question as to its value. It must be read in connexion with the correspondence of Amyas Paulet, lately edited by Father Morris.

M. Bougeault's History of Foreign Literature has now reached a second volume *; it is a useful work, written from the point of view adopted by M. Taine's school, and forms an interesting and valuable summary. England, the Netherlands, and the Slavonian races have supplied the materials for the present volume; and we must not expect, therefore, anything beyond a simple sketch. One-half of the Slavonic names to which we are introduced will be new to many readers; and if Lermontoff and Mickiewicz are to a certain degree appreciated throughout Europe, we cannot say that most people's knowledge of Russian intellectual history extends much further. M. Bougeault discusses, as occasion offers, certain points which are still *sub judice:* such as the authenticity of the Ossianic poems, and the oft-mooted question whether genius is not a modified form of madness. This last remark occurs *à propos* of Lermontoff's writings, which our author strongly denounces as unhealthy in tendency and exaggerated in style. In the part on the Netherlands we have an interesting account of Jansenius, Grotius, and the comparative claims of the Jansenist and Arminian schools to a place in the history of modern thought.

Indocti discant, et ament meminisse periti, should be the motto of M. Gustave Merlet's new volume, which is composed with all his usual care and taste.† Selecting a small number of classical authors from the history of the last two centuries, he has been able to go into details, to study thoroughly the personages who have successively sat for their pictures, and to bring to bear upon them information derived from the most various quarters. Each chapter consists of a biographical notice, followed by illustrative criticisms on the writer's leading works. It is certainly difficult to say anything new about such men as Pascal, Voltaire, Bossuet, and Racine; but still it is always pleasant to be reminded of old favourites, and to see one more effort made to proclaim and uphold literary excellence in opposition to the rubbish with which we are deluged every day. In speaking of Pascal's *Pensées*, M. Merlet shows their superiority to Bossuet's apologetical writings, the permanent value which belongs to them, and their special correspondence with the distinctive character of contemporary scepticism. The *Pensées* contain an answer to many of the wants and doubts of the nineteenth century.

M. Charpentier has done much to familiarize us with Paris society as it existed a hundred years ago. The letters of Mlle. Aissé, the memoirs of Mme. d'Épinay, and of the Baroness d'Oberkirch, are invaluable considered from this point of view; and now Mlle. de l'Espinasse ‡ brings her quota to the evidence which critics have laboriously and zealously collected. When we think of the Paris *salons* in the days of Marmontel, La Harpe, and D'Alembert, we at once imagine to ourselves something preeminently artificial and stilted, a system of polished deceit and elegant corruption. Mlle. de l'Espinasse was a striking exception to that phase of life, and her correspondence, now published for the first time, shows from beginning to end as ardent and natural a character as ever lived. It is thus a really curious psychological study, and its chief interest is less in its anecdotal aspect than as a display of passion. Mlle. de l'Espinasse, as is well known, was first the companion of Mme. du Deffand; but after an intimacy which had lasted ten years, the two ladies quarrelled, and the result was the formation of a *salon* which soon rivalled that of Horace Walpole's friend. No greater contrast can be imagined than that between the tempers and dispositions of the two former associates, and the advantage is decidedly on the side of Mlle. de l'Espinasse. The letters addressed to Count de Guibert, originally printed in 1809, form of course a chief part of M. Eugène Asse's excellent duodecimo; but they are completed and illustrated by various other documents, and no pains have been spared to bring out in strong relief one of the most attractive characters of the last century.

This is not the first time that M. Moreau de Jonnès § appears before us as an archæologist and historian; already, in his essay entitled *L'océan des anciens*, he had given proof of ability and acumen. The present work will not detract from his reputation, whatever may be thought of the particular theories which he propounds. A study of comparative mythology has led him to the conclusion that the cosmogonies, theogonies, and mythological fables of the different nations of antiquity are all derived from one primitive idea, developed and modified according to the particular genius of this or that race; and he endeavours to show this by examining in turn the history of the Egyptians, the Phœnicians, the Jews, the Greeks, and the Persians.

We regret to find that M. Vivien de Saint-Martin is obliged to discontinue the publication of his *Année géographique.*‖ The volume now before us is the last, therefore, of one of the most valuable series of year-books published by Messrs. Hachette and Co. Let us join in the hope expressed by M. de Saint-Martin in his preface that another duly qualified writer may step forward and continue a work which has done so much for the diffusion of geographical studies. In the meanwhile it must not be supposed that M. de Saint-Martin is going to remain idle; and when we know that he is at present busy upon a dictionary of modern geography, a universal atlas, and a dictionary of historical geography, our only wonder is that he could find time for the compilation of the *Année géographique.* This thirteenth volume is done with the same care and exactness as the preceding ones; biographical and ethnological notices, descriptions, translations, bibliographical details—everything is complete. Many readers will turn with special interest to the account of the projected submarine tunnel between France and England, a work which M. de Saint-Martin regards as very problematical on account of the nature of the soil through which the tunnel must run. Until geologists have thoroughly done their work in determining the character of the ground, the success of the undertaking cannot be regarded as more than hypothetically possible.

We take up M. de Fonvielle's interesting monograph* with full assurance that on the subject of balloons and aerial navigation we could not have a better guide. His work is a compendium of the annals of that branch of science to which he devotes all his energies. It begins with Montgolfier, and ends with the catastrophe of the "Univers" a little while ago. The wars of the first French Revolution and the last siege of Paris by the Germans have given a fresh impulse to the construction and use of balloons; nor is it possible to deny that science has made important strides in that particular direction. M. de Fonvielle explains succinctly what has been hitherto accomplished. He points out the obstacles which are still to be overcome, and he is sanguine of ultimate success.

The history of the Roman Catholic Church in Russia is so little known to most readers that Father Lescœur's two substantial volumes will have all the interest of novelty. They describe a state of things with which England has nothing to do, and the interest of which seems confined to the Slavonic race.† But still all students of Church history may wish to know at least the leading events in the relations between the Czars and the Papacy, and secular politics are largely affected by the dealings of the Court of St. Petersburg with its Roman Catholic subjects. In spite of the express declaration of Catharine II., the system of persecution exercised in Russia against the Latin Christians began with the partition of Poland; interrupted for a short time under the reigns of Paul I. and Alexander I., it recommenced more actively than ever when Nicholas ascended the throne, and has not yet lost any of its severity. Father Lescœur's book is nominally only a second edition; but he has so completely recast his original work, and added so many fresh details, that it may be looked upon as really a new production; and the recent episode of the Franco-German war has enabled the learned Oratorian to draw a suggestive parallel between the dismemberment of Poland and that of France. The history is subdivided into four books, as follows:—1. The condition of the Latin Church in Russia from the reign of Catharine II. to the year 1860. 2. Preliminaries and details of the insurrection of 1863; its fatal consequences, ending with the diplomatic rupture between Rome and St. Petersburg in 1866. 3. Narrative of the religious persecutions from the year 1866 to the present time. 4. Considerations on the state and relative importance of the two communities. Father Lescœur is of opinion that the Russian Government will be compelled at no distant period to withdraw the support it now gives to the Greek Church, originally established by Peter the Great, and that such a measure must inevitably end in the ruin of the Photian schism. The second volume ends with a few *pièces justificatives* and a good table of contents.

M. F. Sauvage was not much known beyond the limits of the province of Languedoc, where he represented the University of France as Professor of Latin Literature; he certainly deserved the reputation for which he never was eager‡, and which has so often been granted to pretentious and vulgar writers. We are told in the preface, signed with the name Roschach, that M. Sauvage was equally distinguished as a teacher and as a brilliant talker; he has left at Toulouse an impression which his friends will not readily forget, and the volume of detached thoughts now published may certainly make us regret that the author did not care more for the judgment of posterity. The great snare of moralists who adopt the style of apophthegms is affectation, and a constant seeking after *point;* M. Sauvage generally keeps clear of this danger, and his remarks are both ingenious and simple. After some of them we find, by way of commentary, parallel extracts from La Rochefoucauld, Joubert, Chateaubriand, Mme. Swetchine, Alfred de Musset, and other writers, both ancient and modern.

M. Sainte-Beuve's admirers seem bent upon publishing every scrap of paper left by him, good, bad, or indifferent. We cannot help thinking this a mistake, and we doubt whether such indiscriminate editing will add to the reputation of the eminent critic. The *Lettres à la princesse*, notwithstanding a few curious autobiographical details, might have been left in manuscript; and it is not to be expected that the majority of readers will feel much sympathy for a man who was constantly harping upon his physical infirmities, and venting his spite against those who did not share his free-thinking views. The *Premiers lundis* would never have

been deemed worth printing had they not been the early productions of one who is justly considered the journalist *par excellence*; and we may say the same of the *Chroniques parisiennes**, recently collected by M. Jules Troubat. It appears that, during the years 1843-5, M. Sainte-Beuve contributed to the *Revue suisse*, published at Lausanne under the editorship of M. Juste Olivier, the articles now reprinted in the volume before us; they are merely a series of sketches written offhand, in which the French literature of the day is criticized with a freedom which would have been impossible if the *feuilletoniste* had not intended them for Swiss readers. The *Cahiers*†, expressly intended by him for publication, and originally intended to appear in 1868 under the name of M. Jules Troubat, is still more objectionable on account of the cynicism of some of the passages, and the spiteful way in which the writer treats men whom he had formerly praised, and of whose friendship he professed to be so proud. A few allusions which we notice here and there will be hardly understood by readers who are not quite *au courant* of Parisian gossip; some others are so trite and so generally known that we wonder they were thought worth preserving—for instance, M. de Talleyrand's witty remark on M. de Sémonville's "three consciences."

The French press still teems with works on Germany, and especially on the political system of Prince Bismarck. When a volume appears with the title chosen by M. Victor de Saint-Genis‡, we know before opening it what we are to expect. Seventy years ago the "hereditary enemy" would have been "Pitt et Cobourg"; now he is Cobourg, or rather Bismarck. Far be it from us to say that M. de Saint-Genis is merely a rabid pamphleteer, and that his scheme for a readjustment of the map of Europe is a utopian idea which cannot be realized. Such productions at any rate show that the wound inflicted upon France six years ago still bleeds, and that the disaster of Sedan will not easily be forgotten.

We have received an interesting volume on the Brain and its Functions, by Dr. Luys.§ After having for a considerable time lectured at one of the chief Paris hospitals, he now introduces the non-scientific public to his researches. Anatomical details naturally come first, and the second part of the work is devoted to physiological particulars. Dr. Luys reasons with the clearness, but also with the exclusiveness, of a physicist. The supreme contempt with which he refers to speculative philosophy is characteristic of a school who take no cognizance of what is beyond the world of sense, and who, notwithstanding their boasted liberalism, are as violently prejudiced as the staunchest champions of the Papacy.

There seems to be dissension in the Positivist camp. M. Auguste Comte's followers are not at unity with themselves, and the worship of humanity, simple as it may appear, is susceptible of being variously interpreted. Such, at least, is the impression we have derived from the perusal of M. André Poëy's book ‖, one of the most amusing specimens of conceit and scientific bombast we have met with for a long time. M. Poëy assumes that we are anxious to know his qualifications for discoursing about sociology, sociocracy, mesology, and psychophysics. We cannot say that we feel any eagerness on the subject, but his biography is given with such a flourish of trumpets that it is certainly amusing; never was the worship of humanity more thoroughly illustrated. The book treats of Positivism in its general applications to the several branches of human knowledge, and forms the introduction to a series of special treatises announced as being in preparation.

Professor von Hartmann's book ¶ is a curiosity. Attacking with equal energy Catholicism and the different schools of Protestantism, it assumes, on the other hand, in opposition to modern materialists, that religion is necessary, and it proclaims the advent of a system based upon a fusion of Hinduism with the Judæo-Christian element taken in its purity.

The three works we have just mentioned all express certain tendencies of modern science. Must we conclude that empiricism reigns supreme, and that no one protests in favour of the good old doctrines of Descartes, Leibnitz, and Maine de Biran? A reference to M. Charles Secrétan's article in the April number of the *Bibliothèque universelle*** will show that such is not the case; and from the able way in which the preliminary conditions of the inquiry are set down we may hope to see, when the work is finished, a complete refutation of those unpleasant theories which have rendered so famous the names of MM. Auguste Comte and Littré. The same number of the *Bibliothèque* gives us an interesting paper on the points of contact between science and the arts, suggested by the recent lacustrine discoveries in Switzerland. The fourth part of M. de Montalembert's description of Spain may also be quoted as one of the most important articles in this number.

Fiction and poetry are not strikingly represented just now. The four tales published together in M. George Sand's new volume are merely trifles which appeared long ago as the *feuilletons* of a daily paper.†† M. Champfleury's realistic novel is twenty years old*; and although M. André Theuriet's pretty tale is of more recent date†, it still cannot be said to be *inédit*. M. Emile Zola's satire against the Second Empire comes to an end in the volume entitled *Son Excellence Eugène Rougon*.‡ It would be idle to deny the vigour with which some of the scenes are written, and the faithfulness of the descriptions given of French society under the reign of Napoleon III.; but the impression left is a disagreeable one, and, much as the late Emperor deserves to be blamed for the vicious moral tendencies of his system of rule, we should not forget that the state of things portrayed by M. Zola existed long before the *coup d'état*.

Military novels are very fashionable just now. Last month we had to notice two pleasant ones by Mme. de Chandeneux; we would now recommend as entertaining companions, M. Salières's artilleryman §, and M. A. Fiévée's sergeant.‖ The scene of the second tale is laid in La Vendée during the Royalist insurrection, and the author has grouped with much vigour and descriptive power a few episodes around the well-known names of La Rochejaquelein and Lescure, Carrier and Westermann.

M. Gustave Nadaud and M. Pierre Dupont have certainly managed to rival Béranger as *chansonniers*, and the former especially is in his peculiar line a model of wit and of originality.¶ We need scarcely say that all the pieces of M. Nadaud's collection are not fit for general reading, but his satires are amongst the best specimens of the true *esprit gaulois*, and in the two volumes before us there are lyrics to suit every taste. It is impossible to imagine that M. Nadaud will ever rise higher than the famous *Pandore*, his masterpiece; but the small poem entitled *Réactionnaire* is a capital instance of political joking, and if any one affirms that the author is the leading song-writer of contemporary France, we shall exclaim, quoting M. Nadaud's own words, "Brigadier, vous avez raison!"

RETURN OF THE PRINCE OF WALES.

THE accidents and disappointments of human life are so many and so great that it is seldom that anything which man proposes is carried out with such unbroken success as that which has throughout accompanied the long journey of the PRINCE. He has returned after seven months' absence on the day and almost at the hour when he was expected, having been able to fulfil without variation almost every item of the programme with which he started, and having added a visit to Madrid. On his arrival at Portsmouth on Thursday he remarked, in reply to an address from the Corporation, that what had especially struck him in his progress through the distant possessions of the Crown was that he found everywhere the same reign of law that he was accustomed to witness at home. This is a remark which might have occurred to any traveller, but which is peculiarly appropriate when coming from the lips of the Heir to the Throne. Wherever he has trod on soil belonging to the English Crown he has found law, order, good will, and loyalty; and in these days of jealousy and disturbance it is much that this can be said. It deserves also to be noticed that not only was the PRINCE always punctual to his appointments, always ready to do everything he was asked to do, and always pleased with what he saw and with what was done for him, but those whose business it was to prepare for his coming, and to carry out the complicated arrangements for his journey and for his reception at the different stages of his travels, discharged their duties with uniform zeal and efficiency. His safe return to his home has been the subject of unaffected popular rejoicing, and the meeting between the PRINCE and the PRINCESS has appealed with unusual force to the hearts of thousands. There is a universal impression that it was a very good thing that the PRINCE should go to India, a very happy thing that he has returned safe and well, and a most satisfactory thing that he has played a difficult part with marked success. He has done a piece of important business for the benefit of the nation, and the nation is naturally grateful to him for having done it well. The present is taken as an earnest of the future, and the PRINCE has not only been going through a most instructive preparation for the station to which, in the natural order of things, he will one day be called, but he has displayed qualities which inspire the belief that this great opportunity has not been lost on him, and that he will always be willing to do his best. He has what in his position is the immense merit of being ready to work. The QUEEN is one of the most industrious women in the country, and goes through business of the most varied kinds to the utmost limit that her health will permit. The business the PRINCE has to go through at present is necessarily of a different kind from that which occupies the attention of a reigning sovereign. But to many persons it would be even more repulsive and wearisome. It is very hard work going to one place after another, saying the right thing to men of every class, creed, and nation, having every meal turned into a banquet, and every hour bespoken. To go through this labour cheerfully and as a matter of course, and without any appearance of thinking that there is anything to bear, is a sign of many virtues of body, mind, and character. Even a thing so seemingly slight as to show himself at the Opera an hour or two after his arrival marks in the PRINCE a readiness to think of the wishes of others rather than his own comfort, which ought not indeed to be exaggerated into a wonderful act of virtue, but deserves recognition as a proof of the ardour with which the PRINCE discharges the duties which he believes are imposed on him by his birth.

At the very hour of his arrival in London the House of Commons was engaged in a discussion which must have some interest for him. The Opposition was calling attention to the terms of the Proclamation by which the QUEEN has assumed her new title. This, it may be fairly said, is the proper mode of describing what was going on. While the Royal Titles Bill was in Committee, Sir STAFFORD NORTHCOTE observed that, whereas the intention of the Government was to limit the operation of the new title by the form of the Proclamation, the Opposition would be at liberty to call attention to the Proclamation if they did not consider that it fulfilled the declared intention of its authors. The Opposition thought that it failed in many ways to do what it had been promised it should do, and they therefore called attention to it. But to call attention to it on the ground that it did not carry out what the Government had undertaken that it should carry out was to say that the Government had not made good its promises. If this was what was meant, then, as Mr. DISRAELI remarked, a charge was brought against the Government which, if it could be sustained, would show them to be unworthy of the confidence of Parliament. This was not the issue which any one really wished to raise, or thought could be properly raised. It was only in obedience to Parliamentary forms that a very proper criticism on the terms of a public instrument was transmuted into a proposal for a vote of censure. All the virtuous indignation of the Ministry, all the denunciation of unavailing party spite in which it amused one Conservative speaker after another to indulge, had no real meaning. There was only a sham party fight, and all the firing was with blank cartridges. The Opposition was merely accepting the invitation of Sir STAFFORD NORTHCOTE, and calling attention to the Proclamation, and every one knew that this was all that was meant. Whether it was worth while to raise a discussion, in itself unobjectionable, when it had to be raised in so very inconvenient and misleading a form, was a question which it no doubt gave the leaders of the Opposition much trouble to answer. For various reasons, among which the necessity of consulting the wishes of their supporters may probably be numbered, they decided that, even at this cost, it was better to call attention to the Proclamation in this way than to pass it by altogether. Having come to this decision, they were bound to make the best of a very uncomfortable position and to avoid all appearance of disagreement. Lord HARTINGTON very properly repudiated the insidious compliments that were paid him on his supposed reluctance to support the motion of Sir HENRY JAMES. But it was impossible that he and those who are accustomed to act with him should not have regretted that the party should be driven into a course which so extraordinary a conjunction of independent members as Mr. BUTT, Dr. KENEALY, and Sir ROBERT PEEL could agree in denouncing as factious.

As was to be anticipated, the Opposition had little to add to the criticism of Lord SELBORNE, unless it was the discovery of Sir HENRY JAMES that the new title must be introduced into every patent. The facts are really as simple as possible. The Ministry offered again and again

to localize the title and confine it to India. They have not so localized it, and it is not confined to India. They either could not or would not frame the Proclamation so that this promised object should be attained. On the other hand, they undertook that the use of the new title should be kept as much as possible out of the United Kingdom, and they have done much to prevent it from being used here. They promised more than they have fulfilled, but they have fulfilled a substantial part of what they promised. They used rash language, and could not make their rash language good. Mr. HARDY in vain tried to show that they had carried out their contract to the letter, and he had to resort to much uncomfortable special pleading in order to make out a case. Mr. DISRAELI, in a larger and bolder spirit, said that Ministers were not to be tied down to the letter of particular phrases used in the hurry and freedom of debate. This was really to yield the main point on which the Opposition insisted. Phrases which seemed to give pledges that have not been fulfilled were used by leading Ministerial speakers, and the excuse now given, which to some extent may be accepted, is that they were used in the course of conversation, and not as solemn assurances of what would practically be done. The Opposition has protested against the indiscreet use of such phrases, and this, as Sir WILLIAM HARCOURT observed, is their final protest. The controversy as to the title of Empress is now at rest. The QUEEN is Empress of India, and she is not to be called Empress here more than is unavoidable. How far it will in real life be avoided depends not on the terms of the Proclamation, but on the guidance of the Government and the unfailing good sense of the Royal Family. The painful episode of Mr. LOWE's indiscretion had at least the salutary effect of dispelling the illusion that the QUEEN personally had any thirst for a grander name; and the PRINCE's long journey, his reception at every point of his progress, and the warmth of his welcome home may be relied on, among other things, to have fortified his conviction that there is nothing greater or better on earth than to be King of England.

RUSSIAN POLICY IN CENTRAL ASIA.

MR. BAILLIE COCHRANE was fully justified in bringing the question of the Russian advances in Central Asia before the House of Commons. There is a general consent in the conclusion that nothing can be done at present; but the attention of Parliament may properly be called from time to time to events which may probably hereafter lead to serious complications. There are two classes of alarmists on the subject; and the more reasonable of the two justifies its fears by plausible argument and respectable authority. Sir H. HAVELOCK apprehends a collision with Russia within five years; and perhaps other adherents of the same school of Oriental politics may think the danger still more immediate. On the other side are timid and sensitive optimists who fear that Russia, though otherwise harmless, may be irretrievably offended by the expression in or out of Parliament of any suspicion on the part of England of ambitious designs. The most unambitious of Governments, though it is incapable of cherishing designs of territorial aggrandizement, may perhaps invade India in resentment of an unjust suspicion. The *Times* especially deprecates with nervous anxiety any mention in speech or writing of precautions against the Russian advance towards the frontiers of India. It might be supposed, from the flurried warnings against indiscreet apprehension, that the policy of Russia towards Kashgar, Afghanistan, or Persia would be altered to punish Mr. BAILLIE COCHRANE for his interference. The Russian journals are not restrained by the scruples which are urged on the attention of the House of Commons. Official and non-official writers vie with each other in taunts and menaces towards the Power against which, according to their representations, every movement in Central Asia is designed. The Russian Government has repeatedly acknowledged the propriety of the vigilant observation which has been suggested by recent conquests. Three or four years ago Prince GORTCHAKOFF concurred with Lord GRANVILLE in the definition of a boundary which was to separate the respective dependencies of Russia and England. It is difficult to understand how Mr. DISRAELI can have stated that the project of a neutral zone between the Empires had never been entertained. He probably repudiated the phrase without intending to deny the fact which it expressed. Lord CLARENDON and his immediate successor had always spoken of intermediate territory as a neutral zone. If the alarmists who are frightened at a hint of alarm are justified in their dread of discussion, statesmen in England and India who have watched Russian policy for many years must have been systematically and unanimously in the wrong.

It would be both unreasonable and useless to blame the Russians for their successive annexations of Bokhara, Khiva, and Khokand. In some cases the Government has declared beforehand, probably in good faith, that the success of an expedition against turbulent barbarians would not result in the permanent occupation of their territory. If there had been occasion to give diplomatic utterance to the intentions of Indian Viceroys and the Ministers from whom they received instructions, guarantees for the independence of many States which have ultimately been absorbed might probably remain on record. After the Afghan war it was not intended to annex Scinde; and in the first Sikh war the conquest of the Punjab was not foreseen. The Emperor of RUSSIA has more than once condescended to state to English diplomatists that his generals in Central Asia habitually exceed their instructions. It has not appeared that their unauthorized aggressions have been punished, nor is it certain that they have ever deserved censure. The Governor-General of Russian Turkestan has often found that the only effective mode of maintaining order in an adjacent country is to seize and administer the government. The tribes which he has from time to time punished and subdued are predatory, cruel, and untrustworthy. Any settled government must in those regions be a great improvement on a state of society which is perhaps the worst existing in the world. Under Russian dominion increased prosperity will follow the compulsory establishment of peace and order. Some parts of Central Asia were once comparatively civilized, and, under Russian administration, they may possibly flourish again. A Russian general, whatever may be his faults, is a juster and more honest ruler than a Khan of Khiva or Khokand. He might perhaps not compare so favourably with the remarkable chief who has formed a kingdom for himself in Eastern Turkestan. Mr. FORSYTH may have been justified in the assertion that, if the dominions of YAKOOB BEY were conquered by Russia, it would not be the business of England to interfere; but it was perhaps unnecessary to forebode an event which, though it may be inevitable, cannot be contemplated with satisfaction. Mr. DISRAELI's impression that Mr. FORSYTH had anticipated the conquest of Kashgar with pleasure was not unnatural.

The absence of moral disapprobation is compatible with an entire want of active sympathy. As long as Russia is sufficiently employed in reducing Central Asia to subjection, there is little fear of interference with India. The most injurious among the immediate consequences of the extension of Russian dominion is the exclusion of English commerce from regions to which it might otherwise penetrate; but it is impracticable to fight for the retention of markets which indeed are not extraordinarily valuable. When Central Asia is finally subdued and pacified, Russian generals will hope for more attractive and profitable occupation. A share in the possession of India will appear to them a natural reward for their labours, unless indeed Western China should seem to offer an easier prey. All military authorities agree in the opinion that, for the present, India could not be invaded from the North with any prospect of success. On the North-East the passes which were traversed by the mission to Kashgar would not admit of the passage of an army. In the defiles of Afghanistan it is hoped that the natives would aid the defence, and probably the most formidable line of advance would be from the West. It is evident that the enemy would be encountered to the greatest advantage at a distance from his resources and in the neighbourhood of India. The exact line of defence to be selected must be determined on purely military considerations. Sir GEORGE CAMPBELL, and others who think the danger of invasion remote, nevertheless expect that it may occur at some future time. There are many reasons for not guarding against it prematurely. It is not desirable to take an active part in the domestic politics or intrigues of Afghanistan, or to guarantee the existence of any ruler or dynasty. Lord LAWRENCE and Lord MAYO prudently contented themselves with the establishment of friendly relations with the reigning chief, being well aware that his death may probably cause a war of succession.

Mr. DISRAELI retrieved as far as possible the credit for prudence which he had risked by an idle phrase of rhetoric in the debate on the Royal Titles Bill. It is impossible to collect from his later expressions whether he concurs with Sir G. CAMPBELL or with Sir HENRY RAWLINSON. In diplomatic interviews with Russian Ambassadors he may possibly be more explicit. A free country with a Parliament and press absolutely unrestrained has the disadvantage of being overheard when it engages in discussions on foreign affairs. A responsible Minister has no business to think aloud, and Foreign Secretaries can seldom be accused of forgetting the reserve belonging to their office. Russian politicians sometimes commit the grave mistake of attending to colourless official generalities rather than to the utterances of national feeling. Those among them who care to understand English public opinion have ample means of knowing the determination of the country to maintain its power in India by more efficacious methods than the invention of newfangled titles. It is for the purpose of reminding those whom it may concern of the resolution of England that conversations such as that which was commenced by Mr. BAILLIE COCHRANE are occasionally useful. It is difficult to believe that Sir G. CAMPBELL can have seriously inferred from Mr. DISRAELI's random phrases that the Indian Government was about to enter on an ambitious or aggressive policy. Of all orators in high political position, Mr. DISRAELI is the least liable to literal interpretation of words which are seldom carefully considered. The same purpose which was served by PEEL's elaborate circumlocution is attained by Mr. DISRAELI's simpler method of saying anything which may at the moment seem to promote his immediate object. His defiance of Russia meant as little as his celebrated declamation about those Straits of Malacca which have never troubled his repose before or since the time when they were suddenly appropriated to the purposes of the general election. A careless speaker is not necessarily a thoughtless or improvident statesman. Sir G. CAMPBELL's suspicions of a change of policy seem to have been strengthened by the selection of Sir LEWIS PELLY to accompany the new VICEROY to Simla. No Indian official is better acquainted with the politics of the tribes and nations between the Indian frontier and the Red Sea; but Sir LEWIS PELLY is at present engaged in administering the affairs of Rajpootana, and it has not been announced that he is likely to resign his post. There is no occasion to be immediately frightened by Russian policy, and there is still less reason for being frightened at last week's debate.

EGYPTIAN FINANCE.

THE scheme of the KHEDIVE for the consolidation of his debt has at last been published, and a very curious scheme it is. The KHEDIVE is almost, if not quite, an independent sovereign, and he likes to taste the sweets of the sovereignty he enjoys, and does not hesitate to deal with the rights of other people in a princely and free-handed manner. He bastinadoes his English creditors, and smiles on his French and native creditors in a grand Oriental style. It is the will of GOD and ISMAIL that there shall be a consolidated debt of 91,000,000*l.*, and this therefore is the figure. The present funded debt of Egypt amounts to 54,793,000*l.*, and to this amount, therefore, 36,207,000*l.* are added by a stroke of the pen. The existing bondholders suffer, in the first place, by having this enormous addition made to the total; in the next place, by having all their special securities taken from them; and, lastly, by having the date at which their capital is to be repaid postponed to a very distant day. A sinking fund is provided, which it is calculated will pay off the 91 millions in 65 years. A portion of the existing debt, amounting to somewhat less than five millions, ought, according to the engagements under which it was borrowed, to be paid off in five years from the present time, while the bulk of the remainder is not repayable until 1903. Mr. CAVE proposed that the small part of the debt repayable at an early date should be left altogether out of any scheme of consolidation, and should be paid off when due in cash. The present scheme treats the holders of these special bonds in a much ruder manner. Instead of receiving the bonds of the new consolidated debt at par, they are to receive them at 95, and they will thus add a bonus of one-nineteenth to their capital, which is a very small consolation to them for the postponement of repayment. One fraction of this special short-dated portion of the existing debt, known as the Moustapha Loan of 1867, was borrowed at nine per cent., and the holders of this loan are to have an extra quantity of new bonds given them to compensate them for the reduction of interest from nine to seven per cent. The capital represented by this difference of interest is to be reckoned as if now due, and then 70 per cent. of the amount is to be paid by the issue of bonds of the new consolidated debt. Although the terms used by the KHEDIVE are not perfectly clear, it is probable that this means that the difference between seven and nine per cent. is to be reckoned for the five years which are to elapse before the date is reached at which it was promised that the bond should be paid off, and then a new bond shall be given for 70 per cent. of the amount. Thus a holder of a bond for 1,000*l.* would in five years receive 100*l.* more at nine than at seven per cent., and he will therefore receive a new bond for 70*l.* on account of the difference of interest, besides what he receives for his capital in bonds issued at 95. The total amount of the new consolidated debt issued by way of compensation to the holders of the short-dated loans of 1864, 1865, and 1867, will be about 320,000*l.*; and if this is deducted from the 36,207,000*l.* which is to be added to the total existing debt, there will remain 35,887,000*l.*, which is left for the settlement of the floating debt and for what may be decorously termed the margin of the new operation.

When Mr. CAVE was in Egypt, the KHEDIVE stated his floating capital to be at least 21,243,000*l.* Deducting this amount from 35,887,000*l.* there will remain 14,644,000*l.*, or in round figures fourteen and a half millions sterling. These fourteen and a half millions are the poetical feature in the scheme. No one, from reading the KHEDIVE's decree, can form the remotest notion what is to become of them. We only learn that a portion of them is to be devoted to compensating the holders of the floating debt for the loss they will sustain by reason of the difference between the interest at seven per cent., which they will henceforth receive, and the rate at which the advances were actually made. How much is to be paid on this head, and what is the real amount of the floating debt, are facts completely shrouded in darkness. It is probable, or rather certain, that the amount of the floating debt is considerably in excess of the twenty-one millions of which Mr. CAVE was informed. Part of the fourteen and a half millions will be devoted to the repayment of this extra capital, and another part to compensation for the reduction of interest on the floating debt generally. Further, the KHEDIVE may be trusted to have reserved for himself a share not incommensurate with his princely views. Mr. CAVE, in his calculations, thought that a million sterling must be added for the Abyssinian war; but the Abyssinian war is even now not concluded, and the KHEDIVE would naturally like to have a little ready money to start with on his new career of virtue, besides being able to pay for his little war and other casual expenses. Then great financiers do not go through all the trouble of helping the KHEDIVE to frame a scheme without some reward for their trouble. The fourteen and a half millions will therefore soon melt away, and as the existing bondholders will never know what becomes of the amount, their best hope is that the framers of the scheme have treated themselves with sufficient liberality, and that the floating debt will be really cleared off by the issue of the new stock. At the same time they will now understand the meaning of the telegrams which have lately reached England to the effect that the KHEDIVE has lately been working cordially with the French financiers. They, as the great holders of the floating debt, have been bargaining with the KHEDIVE as to the extent of the more ornamental and poetical part of the new issue. He has been looking out for himself; and the end of the discussion is that it is the will of Heaven that fourteen and a half millions should be tacked on to the issue, and that the outer world should have no information as to the mode of its distribution.

If the floating debt is really extinguished, the KHEDIVE well started, and the framers of the scheme made reasonably happy by the new issue, then the bondholders will wish to know whether the promised interest and sinking fund can be paid for the future, and, if it can, whether it will be paid. The total annual charge is 6,443,600*l.*; but from this is to be deducted the sum of 684,111*l.*, which the Daira is to contribute, and Mr. CAVE stated in his Report that the Daira could well bear such a charge. The net sum to

be provided annually is 5,759,189*l.* The sources of revenue from which this sum is to be derived are set out in detail, and we learn how much is to come from each source. The total is 30,000*l.* more than is needed, which is very convenient; and it must be owned that the KHEDIVE is very fortunate to possess distinct sources of revenue the value of which he knows to a fraction, and which, when the whole debt has been fixed after prolonged bargaining at an arbitrary figure, give precisely the right amount to meet the current charges. Mr. CAVE showed, with some hesitation, that the revenue of the country would suffice to provide 4,700,000*l.*, which was the amount of the annual charge payable under his scheme. The revenue has now to meet almost exactly a million more, but still it can bear it. A revenue that could not bear an extra odd million of charge would not be the sort of revenue the KHEDIVE would like to have in his country. The operation of the Moukabalah is to cease, and although this will prevent a great reduction in the revenue hereafter, it will cause a diminution of a million and a half of current receipts. Apart from the Moukabalah receipts, Mr. CAVE estimated the revenue at nine millions, and the expenses of the KHEDIVE, if he would consent to go upon a short allowance and keep to it, at four millions. With the balance of five millions, the KHEDIVE, in his airy way, orders five millions and three-quarters to be paid. Bondholders would be more than sanguine who expected the full interest on the new debt to be regularly paid, and they would probably be quite content if they were sure that six or even five per cent. would be paid regularly instead of the seven promised. If Mr. CAVE's figures are to be taken as tolerably accurate, if the revenue is a real revenue and the taxes have not been augmented by extortion beyond what the people can bear, and if the KHEDIVE will keep within his limit of four millions, which includes his payment to the English Government and the tribute to the Porte, the bondholders, even now that the total of the debt has been swollen to ninety one millions, ought to get five per cent. Will they get it? It cannot be said that the KHEDIVE has not taken some precautions on their behalf. He is to appoint a Commission of competent foreigners, to whom all the assigned revenues will be paid, and the head collectors of these branches of revenue are to receive their quittances solely from the new Commissioners. This offers no safeguard against the various collectors of taxes stopping a portion of what they collect on its way to the Treasury; but it does ensure that the sums acknowledged to have been collected shall be appropriated for the benefit of the bondholders. The bondholders would therefore have something definite to look to for their interest, if they could only be sure that the KHEDIVE had done once for all with borrowing. But there is enough to make them unhappy in the concluding paragraphs of the KHEDIVE's decree. In the first place, under circumstances of great urgency, the KHEDIVE is to be allowed to make exceptional loans, although without encroaching on the assigned revenues, provided that the Commissioners assent to his doing so. What would happen if they refused their assent can only be guessed; but it is obvious that, if the Commissioners could forbid his borrowing under very urgent circumstances, they would really dictate the policy he should pursue at every serious crisis, and the KHEDIVE has repeatedly declared that he will not allow any one to dictate what his policy shall be. In the next place, the KHEDIVE, for his current needs, is to have a banking account which he may overdraw to the extent of two millions sterling in the year. These two provisions certainly open new vistas of a fresh floating debt, and are enough to inspire the bondholders with grave apprehension. Probably the KHEDIVE has wished, while providing as far as practicable for his own convenience, to give his various creditors as much as he saw his way to giving them. But the result for the holders of the existing funded debt is very far from satisfactory.

BARRISTERS AND CLIENTS.

MR. NORWOOD'S Bill for rendering barristers liable to actions for negligence will probably be the subject of an annual motion. When the measure is next introduced it will be judicious to alter its title. It is irritating to any class which may at any time be threatened with hostile legislation to receive an ironical assurance that the proposed change is designed for its benefit. Mr. NORWOOD has, probably without any malicious intention, imitated the deliberately offensive phraseology of the Liberation Society. The Dissenting ministers and others who desire on public grounds to deprive the Established clergy of their revenues and their position indicate by a standing joke in the title of their Association a dislike and jealousy of which some of them are perhaps unconscious. They well know that the clergy of the Church of England share with the laity of all denominations a dislike to projects for liberating or relieving them of their incomes and of other material advantages. It is also notorious that the whole body of members of the Church are, with few exceptions, opposed to the plan of their sectarian adversaries; but the managers of the Association cannot resist the temptation of a sneer. The Bar of England is also in some quarters an object of envy and dislike. Mr. NORWOOD, who spoke in excellent tone and temper, may be acquitted of any ill-will to the profession; but he will perhaps reflect on a future occasion that a proposal unanimously rejected by the Bar need not purport to be an enabling Bill in their favour. It was stated in the course of the debate that there are fraudulent solicitors who cheat young barristers out of their fees; but it may be hoped that the practice is not widely extended. A solicitor is not likely to perpetrate a dishonest act for the benefit of his client; and, if he has himself received counsel's fees, he would, if he appropriated them to his own use, approach dangerously near to the clutches of the criminal law. Mr. NORWOOD, indeed, has no reason for abolishing the old theory of honorary payments, except that a power of recovering fees implies a corresponding liability. It is scarcely worth while to prove, in jest or in earnest, that barristers work for the purpose of earning money, and not, like old Roman patricians, for the protection of dependents who were originally called clients, and for the promotion of their own political influence. Negotiation on the amount of fees is a vicious practice; but it cannot be touched by the law. When a fee has been accepted, no barrister ought to allow his clerk to suggest to the client the propriety of an increase.

The entire unanimity of the Bar, though it may not be conclusive as to the merits of Mr. NORWOOD's Bill, deserves consideration. The risk which would attend unqualified liability for mismanagement would be intolerable, and in the highest degree unjust. A solicitor can always cover his own responsibility, when legal difficulties arise, by taking the advice of competent counsel. The barrister would not be able to devolve the liability on any higher authority. Some of the opponents of the Bill perhaps laid too much stress on the tendency of Mr. NORWOOD's measure to affect the independence of the advocate; but under its operation nervous barristers would perhaps defer more habitually than at present to the instructions of solicitors. The old story about the late Justice WILLIAMS was an oddly chosen illustration of the evils which might result to a client from the pliancy of his counsel. According to the legend, a prisoner was hanged because his counsel, in deference to the urgency of the attorney, had, against his own judgment, asked a question which proved fatal to the defence. If the story had been true, the counsel ought to have taken the whole blame on himself, and he could certainly have found no excuse in the rejected Bill of Mr. NORWOOD, who may perhaps not have been born at the time. As a general rule, solicitors and counsel co-operate with sufficient harmony, each yielding to the advice of the other on the points on which the supporter of the prevailing opinion is more competent to form a sound decision. As far as the exercise of skill and judgment is concerned, litigants would derive no practical advantage from a power to sue the counsel who might have been employed in their cases. In their own interests, if from no higher motive, barristers do their best to ensure success to their clients. Mistakes are unavoidable, but it is the fault of those who dispense the patronage of the Bar if habitual blunderers enjoy continued opportunities of displaying their incapacity. The English system which interposes a solicitor between client and counsel materially affects the alleged need for legal protection to the party in the cause. The advocate is chosen by a skilled agent, who is bound to exercise his discretion for the benefit of his principal.

Although the Bill would render barristers liable for any kind of professional negligence, the complaint which was really preferred related entirely to failure of attendance. There were at least two strong objections to the measure. It would not have abated the evil against which it was directed; and, if it would have been effective, it was not

necessary for the purpose. Solicitors are not compelled to employ the counsel whose services are in the greatest demand. There are always many competent practitioners who would certainly not be absent when a case in which they were retained came on for hearing. It is by deliberate choice that solicitors prefer to obscure merit the reputation of the SCARLETT or FOLLETT of the day. It may perhaps sometimes be for the interest of their clients to secure the probable exertion of the highest ability in their favour, and the certainty that it will not be engaged on the other side. One of the opponents of the Bar made a curious apology for the solicitors who, in deference to the prejudices of their clients, retain a too popular counsel. It was, he said, difficult for a young and struggling solicitor to resist the fashion, or to incur the responsibility of preferring an advocate of inferior reputation. It is not necessary to counteract professional weakness by an Act of Parliament, which, after all, would probably be inoperative. Nothing would be easier than for great advocates to contract themselves out of any measure which might be passed for the purpose of confining them to a limited number of cases. A leader of the Bar who declined to take a retainer except on the implied condition that his attendance should be contingent on circumstances would find that his business was not at all affected by the Act. Experienced counsel are well aware that in the majority of cases a solicitor is offended by the refusal or return of a brief. If he insists on his demand of exclusive service, he can always require a promise that his case shall be preferred to all competing engagements. As such an assurance would not be given by a leading counsel in large practice, both the solicitor and the client have notice of the possibility of what is undoubtedly a serious inconvenience. It is not easy to understand the process by which attendance could be absolutely secured. Neither solicitor nor counsel can control the arrangement of business or foresee the order in which cases may be brought forward. At the Guildhall sittings causes are transferred from one Court to another at the shortest notice, and the barrister who may have been fully prepared to appear in three or four successive cases is helplessly embarrassed when they are all simultaneously tried. Mr. NORWOOD says that the Chancery Bar are not liable to censure. It is true that for many years Queen's Counsel have confined themselves to a single Court of Equity; but it is doubtful whether the rule will long survive the changes in the conduct of business which result from the Judicature Act. There is some reason to suppose that, when Mr. NORWOOD introduces his Bill next year, he will have to include the Equity Bar in his censure.

It would be absurd to contend that some of the practices which were noticed in the debate are defensible; and it may be hoped that they are not common. There can be no excuse for a breach of special promises which need not have been made if there were a doubt whether they could be kept. In the more ordinary case of a retainer which is given and accepted on the understanding that absence is possible, the client has obtained that for which he bargained. Solicitors, who are also liable to be troubled by conflicting engagements, have the comparative advantage of being able to discharge many of their duties by deputy. A managing clerk often commands as full confidence as his principal, and matters of routine can safely be entrusted to less experienced hands. A barrister must either do his work himself or leave it to the care of his junior, or in some instances to that of a substitute selected for the occasion. The practice of giving briefs to friends to hold may easily degenerate into an abuse. The monopoly of favour which is enjoyed at the first start in the profession by the relatives of solicitors would not be satisfactorily corrected by dependence on the patronage of the leaders of the Bar. There are anomalies in the profession, but they for the most part lie out of the reach of the Legislature.

FRANCE.

THE return of the deputies to Versailles finds the advanced Republicans in a somewhat better temper with the Government than they were before the recess. M. RICARD'S words are regarded as better than his deeds, and when words take the form of circulars to prefects they have pretty much the significance of deeds. M. RICARD has called upon the mayors who were not members of the Municipal Councils at the time of their appointment to send in their resignations; he has made new and liberal regulations with regard to the hawking of newspapers; and he has delighted the Republicans and proportionately irritated the Bonapartists by directing the prefects to lend themselves neither to equivocation nor to complaisance. Now under the late Administration a prefect's principal duties were to equivocate about the Republic and to be complaisant to the Bonapartists. Marshal MACMAHON'S name furnished a convenient way of escape from the necessity of defining the political system which the prefect represented; and if he was ever compelled to use the obnoxious word, he was careful to show in the next sentence that to serve a Republic was in no respect the same thing as to be a Republican. A prefect's enthusiasm, so far as it dealt with ideas and not with persons, was carefully kept for that peculiarly conservative policy which consisted in discrediting existing institutions, in the hope that, amid the confusion consequent on their overthrow, the Imperialist position would somehow be improved. Under the system which M. RICARD has now imposed on his subordinates, a prefect will no longer be able to reserve his favours for those who wish to displace the Government of which he is the representative. M. RICARD says, quite correctly, that for several years past persons appointed to conduct the business of the country have thought themselves at liberty, without any dereliction of duty, to maintain their personal opinions and to promote any cause which they might prefer to that of the Republic. The ratification of the Constitution by the votes of the electors has made this no longer allowable. For the future the prefects must declare plainly who and what they are. It is not necessary, indeed it is hardly permissible, that they should ally themselves with a particular political party; for the representatives of the Republic, like the Republic itself, should be above party. But, on the other hand, they must no longer treat the acceptance of the Republic as an open question on which political parties may lawfully take opposite sides. The interval in which the Republic was merely one of several candidates for the national confidence has come to an end. The Republic is now the legal Government of France, and it will assert all the rights which belong to it in that character.

It remains to be seen whether the satisfaction which this language has given to the Left will convert them into active supporters of the Government. M. RICARD has made himself so many enemies in the Right, and especially among the Bonapartists, who are the strongest element of the Right in the new Chamber of Deputies, that he will probably need all the support that he can obtain; and from this point of view it becomes important to know how far the votes of the Left can be depended on. They may be dissatisfied with much that the Minister does without any harm necessarily coming of it; but if they allow their discontent to go the length of a coalition with the Right against the Government, the situation would at once become serious. So far as probabilities go, there is no reason to expect anything of the kind. Allowance must be made for a certain number of Irreconcilables, who would think themselves forsworn men if they voted for any Ministry of which they did not themselves form part. But there is no union between these men and M. GAMBETTA, and so long as this is wanting the Irreconcilables are not really formidable. M. GAMBETTA'S attitude towards them since the elections has been that of a leader who does not wish to break with them until he cannot help it, but who perfectly understands that there is a point at which, if they insist on passing it, he will have no choice but to break with them. He recognizes that it is the duty of an Opposition leader to criticize the Government policy, and he so far defers to the extreme wing of his party as to make his criticisms as severe as he can without compromising interests of real importance. But the Left which M. GAMBETTA leads in the Chamber of Deputies is a very different body from the Left in the old Assembly. It is a homogeneous party, instead of being a mere agglomeration of sections, each distrusting the other as much as its avowed adversaries. In the new Left neither the Left Centre nor the Irreconcilables have the importance which belonged to them in the Assembly. At that time, notwithstanding all the calculations that had been made and all the indications afforded by the by-elections, the precise feeling of the country towards the Republic remained to some extent uncertain; and, until the elections had cleared up this point, it was possible that the Left Centre or the Irreconcilables might turn out stronger than was expected. Since the elections there is no longer any room

for doubt as to what the majority of the constituencies really desire. They are Republicans of a more decided hue than the Left Centre, but of a very much paler tint than the Extreme Left. This was foreseen by M. GAMBETTA at least two years before the dissolution, and his policy throughout the latter days of the Assembly was chiefly directed to gain the confidence of an electorate presumably animated by this temper. Now that the event has proved that France is of the precise political complexion which he believed her to be, it is not likely that he will do anything to forfeit the reputation for moderation which he has taken so much pains to establish.

It is quite consistent with this view that M. GAMBETTA's attacks on the Government should have related to matters on which the difference between him and them has been only one of degree, or to matters on which Opposition criticism seldom possesses much weight. The removal of the prefects is an instance of the former kind. How many dismissals M. GAMBETTA would have liked to see dealt out it is impossible to say; but, inasmuch as M. RICARD was disposed to make the list a small one, no great responsibility was incurred by maintaining that it ought to have been larger. It is pretty well understood that, when an Opposition demands and obtains a sacrifice, it is bound to find fault with the proportions of the victim. Again, M. GAMBETTA, or at least his organ, has been a good deal occupied of late in picking holes in the Duke DECAZES' administration of foreign affairs. He has not published certain documents which it is alleged he ought to have published, and the inference which the *République Française* draws from this reserve is that he has not expressed himself with sufficient force on the Eastern question. But no one knows better than M. GAMBETTA that it is not the business of a French Foreign Minister to make any claims on behalf of his country which would give colour to the supposition that France was contemplating a departure from the policy of devotion to home needs which she has pursued with so much success since 1871. His assaults upon this or that Minister are probably nothing more than so many field days designed to wean the Left from the notion that, if an Opposition is not overthrowing a Minister, and perhaps provoking a revolution, it is doing nothing worthy of itself. How far any attack which M. GAMBETTA may hereafter make upon M. DUFAURE will partake of this parade character is less certain. M. DUFAURE's position is somewhat different from that of his colleagues in the Ministry. He was a member of M. BUFFET's Cabinet, without being a specialist like the Duke DECAZES or General DE CISSEY or M. LÉON SAY, and his natural dislike of anything that looks like insubordination led him at times to associate himself with M. BUFFET more markedly and intimately than was necessary. In a Cabinet founded on the principle of temporary coalition until a particular event has come to pass, differences of opinion, and even of policy, are too natural to require concealment, and M. DUFAURE would have occupied a stronger position in the Chamber of Deputies if he had not supported M. BUFFET so heartily in the Assembly. Added to this, he is disliked by the Left on account of the many stinging speeches which he aimed at them while he was a Minister before 1873. In M. THIERS's Cabinet he was the least Radical element, and as the Left consider that the present Cabinet ought to show a marked advance on that of M. THIERS, they have some reason for objecting to M. DUFAURE as its head. Though it is improbable that any change will be made during the present Session, a serious attack on M. DUFAURE may be expected before the year is out.

THE EXTRADITION CONTROVERSY.

IF the discussion which has arisen in the case of WINSLOW ends in the temporary or permanent abolition of the Extradition Treaty, both England and the United States will incur a practical inconvenience for the exclusive benefit of the fraudulent portion of the community. Both countries will be prevented in many cases from inflicting wholesome punishment on their own criminals, and either will be compelled to extend unwilling hospitality to the fugitive rascals of the other. The temper in which the controversy has apparently been conducted by Mr. HAMILTON FISH is not surprising to those who have watched the course of American diplomacy. There is no doubt that the English Government is hampered by a conflict of law with international obligation; and the American SECRETARY of STATE deliberately affects to take offence, though he is well aware that no wrong was intended. The provisions of the Act of 1870 were perfectly well known in the United States long before the forgery of which WINSLOW is accused had been committed. The provision which has caused the present difficulty was inserted in the Act at the instance of the party which is more especially supposed to enjoy the sympathy of the Republicans of the United States. There can be no doubt that it limits the terms of the Treaty by rendering it impossible for English authorities to comply literally in all cases with the obligation of surrendering criminals. Mr. FISH has probably demonstrated in the correspondence, with superfluous and conclusive force, that an engagement under a treaty cannot properly be superseded by a municipal law; but he would admit that the subject or citizen of a State must at his peril obey the municipal law without inquiring whether its provisions conflict with international obligations. If the SECRETARY of STATE were, through a too delicate regard for treaties, to issue his warrant for the extradition of WINSLOW, the prisoner would at once be released on the return of a writ of Habeas Corpus. The PRESIDENT, with the consent of the Senate, may probably have a right, which will not be exercised, of declaring war against England; and in the meantime the SECRETARY of STATE is entitled to write as many disagreeable despatches as may be thought expedient. The only weak point in his case is that he must prove too much. If the Act of 1870 is invalid, as inconsistent with the Treaty, it follows that political refugees must be delivered up when they are charged with ordinary crimes. Since there is no American statute corresponding to the English Act, the surrender of a Fenian leader who might have shot a police officer could be required by the English Government; yet, if one of the Manchester murderers had succeeded in becoming an exile in America instead of a martyr in England, he would certainly not have been practically liable to extradition. Some years before the Civil War a slave escaped from one of the Southern States to Canada, after killing his master, who had attempted to prevent his flight. The English Government refused to surrender the fugitive, because the act of which he was accused had been performed in vindication of his natural right of freedom.

The sympathy which has been expressed by some English Liberals for the supposed wrong of which the American Government complains is not a little capricious and inconsistent. A few years ago no precaution was thought too stringent for the purpose of securing political criminals against extradition. Mr. MILL, and those who shared his democratic or revolutionary sympathies, thought that the only sufficient safeguard was that which was at a later period embodied in the Act. It is true that their jealousy was mainly directed against the Imperial Government of France, while their successors are anxious to conciliate irritable Republicans in the United States. Some zealous partisans have hastily adopted the American interpretation of the English Act, in opposition to the advice which has been given to the Government by the Law Officers. It might have been thought that the positive prohibition of surrender in all cases where the fugitive was not protected by law or arrangement against trial on a different charge was too plain to admit of dispute. In the 3rd Section, subsection 2, there is no such qualification as "except as hereinafter provided." If there had been any other part of the Act which purported to be inconsistent with the direct enactment, a Court would have determined the doubt in favour of the accused person. A question has nevertheless been raised on the words of the 27th Section, which is indeed expressed with customary awkwardness and apparent ambiguity. By the 27th Section the former Extradition Acts are repealed as to the whole of HER MAJESTY'S dominions. The only remaining power of extradition is conferred by the rest of the section. It was elsewhere provided that future extradition treaties should be brought within the Act by Order in Council. As to existing treaties, "This "Act, with the exception of anything contained in it which "is inconsistent with the treaties referred to in the Acts "repealed" (of which the Treaty of the United States is one), "shall apply in the case of the foreign States with "which these treaties are made in the same manner as if "an Order in Council had been made in pursuance of this "Act, and as if such Order had directed that every law

"and ordinance which is in force in every British posses-"sion with respect to such treaties should have effect as "part of this Act." The contention that the 27th Section virtually repeals the 3rd Section is not a little paradoxical. If the effect of the 27th Section is to provide for the unconditional surrender of accused persons, the prohibition in the 3rd Section of surrender except on conditions becomes wholly inoperative. The purpose of the 27th Section was to put existing treaties on the same footing with future treaties to which the Act might be applied by Order in Council. The exception purports rather to limit than to enlarge the scope of the provision, and yet by a forced interpretation it is made to incorporate in the Act all the clauses of the Treaty. It cannot be decorously assumed, though it may be privately believed, that the framer of the Act thought that one of its most positive and distinct provisions was inconsistent with the international obligation created by the Treaty; yet, unless the 3rd Section is included in the exception of the 27th Section, the whole Act, including the 3rd Section, is applied to the United States. Although the draftsman of the Bill has, according to custom, done his utmost to create confusion and obscurity, the general effect of the Act scarcely admits of reasonable doubt. Parliament, for reasons which were thought sufficient, passed a law which deprived the Government in certain cases of the power of fulfilling an international obligation. The proper course would have been to call the attention of all the Governments which had extradition treaties with England to the decision of the Legislature. As the precaution was neglected, the Government must take the consequences of having given the United States the satisfaction of a grievance. It was probably supposed that there would be no difficulty in obtaining from a Power which has always jealously maintained the right of asylum some legal or informal assurance which would have satisfied the conditions prescribed in the 3rd Section. It ought to have been known that the President had no power of controlling the action of State or Federal Courts of Justice. If the American Legislature had passed an Act prohibiting the trial of a surrendered criminal on a new charge, it would still have been necessary to obtain similar enactments by the several States.

The limitation imposed by the 3rd Section of the Act of 1870 on the power of extradition is evidently too large. There would be no reason for declining to satisfy Mr. Fish by a repeal of the section if any other security existed for the protection of political fugitives. On one occasion a criminal surrendered on one charge by the United States was tried on another charge in England. If there had been an American law corresponding in terms with the Act of 1870, either the criminal would not have been surrendered or he would not have been liable on a new charge. It seems not to be beyond the scope of legislative ingenuity to frame a clause which might by consent be inserted in a new extradition treaty. Probably the simplest course would be to secure immunity to political fugitives, and to leave to either Government on its own side a discretion to determine whether a criminal claimed for extradition was to be included in the political category. There is no reason why the American Government and Legislature should raise vexatious objections to a reasonable compromise. Their own policy with respect to the right of asylum is identical with that of England; and both countries have a common interest in facilitating the prosecution of ordinary criminals. It is a mistake to balance the mischief of surrendering a political fugitive against the evils which would follow the abrogation of the extradition treaties. In England and in the United States public opinion would condemn with irresistible force any legislation which seemed to infringe on the principle of an inviolable asylum for political offenders.

THE ROYAL ACADEMY.

SOME time was wasted in Tuesday's debate on the Royal Academy in discussing whether that body was amenable to Parliamentary control. Whatever may have been the circumstances under which the institution was originally established, the arrangements which have since been made by agreement between the Academy and the Government settle the question as to the right of the latter to exercise some kind of supervision; and it may be believed that the members of the Academy themselves are well aware of the suicidal effect of repudiating the public character of their society. It is rather idle to say, as Mr. Baillie Cochrane did, that the House of Commons has no more right to interfere with the Royal Academy than with any other body of gentlemen in the country. Masters of foxhounds are exempt from official supervision because they are engaged in a private amusement; but the Academy has no right to be an Academy at all except on public grounds. The real question is, whether there is any reason for bringing external pressure to bear on the management of the Academy, and, if so, in what way this can be effected without doing more harm than good. Sir C. Dilke, with a certain degree of perception and fussy activity, appears to be incapable of bringing general principles into logical relation with practical proposals. He lately attacked a number of local bodies on the strength of the loose gossip which he had picked up during a pleasure tour; and he now arraigns the Royal Academy in the preamble of a Resolution as grossly neglectful of its duties, and winds up with a weak proposal for an Address to the Crown for copies of various documents published by foreign Governments. It is obvious that, if the organization of the Academy is really as bad as Sir Charles asserts, this would be a very ineffectual remedy. It is true that the Academy has not carried out all the recommendations of the Royal Commission of 1863, but it has carried out some of them; and the House of Commons itself has often set the example of dealing very freely with the Reports of Commissions.

As to the general question of the efficiency of the Academy, the first point is of course to ascertain what the Academy is expected to do. The pedantic pretensions with which it was started, with a staff of Professors of Ancient History and Literature and Secretaries for Foreign Correspondence, never had any real vitality, and have long ceased to be anything but empty forms. The functions of the Academy at the present moment may be said to comprise those of a school of art, a charitable foundation, an exhibition, and a corporation for the distribution of honours and the official representation of art. And, on the whole, it discharges these duties, if not in all respects with perfect success, at least without egregious failure. The members of the Academy not only give up to teaching an amount of valuable time which would perhaps surprise those who have but a vague idea of the working of the body, but also spend upon the school some 5,000*l.* a year. It is absurd to say that, because some artists have risen to distinction without having been trained by the Academy, the Academy is of no use. Genius does not always turn up exactly in the soil where it might be expected; but the Academy school can show very respectable results. Again, the charities of the Academy have apparently been managed satisfactorily; and if there has been delay in carrying out certain bequests, it has been from practical difficulties, and not from any lack of good intentions on the part of the Academy. As an official representative of art, the Academy has been, at least in recent years, somewhat weak; but this is a temporary and accidental circumstance. Perhaps, however, the critical question is as to the management of the annual Exhibition, and the distribution of honours. In regard to the latter, there does not appear to be much ground for the outcry which is raised from time to time. Some years ago there was no doubt a very narrow and prejudiced temper on the part of the majority of the Council, and there are still some traces of a want of sympathy with the higher and more original forms of art. The Academy discredited itself when it admitted commonplace artists while such men as Cooke, Leighton, and others were kept outside the doors. But it is only fair to observe that this obtuseness lasted only for a time; and it can hardly be seriously contended at the present moment that, with the exception of a few artists who have for their own reasons deliberately held aloof from the Academy, that body does not contain, on the whole, a fair representation of artistic capacity. It may possibly be desirable in the Academy, as in the army and navy, to quicken the flow of promotion; but, allowing for the ordinary weaknesses of human nature, the distribution of honours in art is about as impartial as could be expected.

In filling up vacancies in the Academy or any other corporation it is inevitable that there should be occasional mistakes; and the same remark applies to the exhibition of pictures. There is no substantial proof of the charge that the Academy is guilty of jealousy or favouritism in the selection of pictures. The members no doubt monopolize somewhat too much space as a matter of right; but, apart from this

rather excessive provision for themselves, they appear to be sincerely anxious to get together as good a show as possible; and it is their interest to do so. Here, again, blunders will of course occur, especially as long as the work of judging is performed in the same hasty and superficial manner as at present; but, as a rule, a good picture has always a fair chance. If there is a fault in this part of the Academy's work, it is mainly, we should say, in its overflowing good nature. There is much kindly feeling among artists, and Academicians, like other privileged persons, naturally wish to conciliate the outside community, who might otherwise be their enemies, as far as they can. The larger the number of pictures which are accepted, the stronger is the external support; and thus the interests of art are apt to be sacrificed to social expediency. In his evidence before the Commissioners of 1863 Mr. WATTS pointed out the root of the evil. "The Academy," he said, "has always been apathetic; I do not see its influence on our architecture or our taste in any way whatever." This indifference is perhaps what Mr. CARTWRIGHT the other night called "catholic taste," and Mr. GLADSTONE "diffusive liberality." The Academy is nowadays not the only Exhibition open to artists, and in order to justify its position, it ought to set itself resolutely against all contributions except those of a high class. It is not enough that the Exhibition should make a bright, pretty show; it ought to express the deliberate and serious critical judgment of competent and trustworthy judges on the art of the day, and anything below a certain standard of merit ought to be rigidly rejected. Just now more than a third of the space at Burlington House is covered with mere rubbish, bad in drawing, bad in colour, and imbecile in invention. This is injurious, not only because official countenance is thus given to a low and unwholesome style of art, but because the crowding of every spare inch of surface with miscellaneous pictures of the most diverse and antagonistic kinds is damaging to the effect of good works and confuses the taste of the spectators. A body like the Royal Academy, if it is to exercise its functions satisfactorily, ought to have the courage to take high ground.

The general conclusion would seem to be that, as far as the present machinery of the Academy is concerned, it would do very well if it were worked in a proper spirit. It is not an increase of numbers that is wanted, for this would probably tend rather to lower than to elevate the body, but a more ambitious and resolute spirit. An Academy exhibition ought not to be a mere bazaar for the sale of pictures or a fashionable lounge. It ought to do something to educate the taste both of the profession and of the public; and, though it ought to behave liberally in regard to novelty or even eccentricity of idea or treatment, there is a low range of art, trivial, mechanical, and without ideas, from which it ought to separate itself absolutely. We doubt whether this nobler spirit is likely to be infused into the Academy by any Parliamentary interference. It must come from a general rise in the spirit of the profession; and the most effective way of cultivating it would be by an increase of taste and judgment on the part of the classes who buy pictures. As long as a large majority of the patrons of art are ignorant and vulgar, ignorance and vulgarity in art, as in other things, will find their market and the inferior kinds of work will swamp the higher. The Academy has it in its power to do much in the way of diffusing sound ideas on art generally. As Mr. BERESFORD HOPE remarked, it ought not to be merely an Academy of painting and sculpture. It has indeed recognized architecture, but not in a cordial or sufficient way; and even then, the range of art is not complete so long as designers of art workmanship, architectural carving, glass-painting, and mural decoration are excluded. Of course any attempt to introduce these branches under the existing system of loose and careless selection, limited only by space, would be bewildering and depressing; but if the true principle of an Academy—the scrupulous choice of only the best work in each class as a standard of taste—were adopted, the general result would be a powerful stimulus to artistic feeling throughout the country. The efforts of the South Kensington Department are useful in their way, but they are necessarily weighed down by the conditions under which they must be carried on. What is wanted for the artistic elevation of England is not a vast production of mediocre art, but the cultivation of the highest aims and abilities, which are never to be found except in a small and select class, but which give the tone to the whole world of art, and keep it moving in the right direction. The practical enforcement of this principle must be looked for, not from any formal remodelling of the constitution of the Academy, but from the growth of a more healthy opinion among artists and their patrons. The great thing at present is to keep down the mushroom growth of puerile and meretricious art, which threatens to choke the better sorts, or to bring them down to its own level.

MR. FORSTER ON THE NEW EDUCATION CODE.

MR. FORSTER'S speech at the opening of the new buildings belonging to the British and Foreign School Society at Stockwell deals with a provision of the Education Code of the present year which has not met with the attention it deserves. It is a decided advance in the direction of a change of which Mr. WALTER was for some years the prophet. Why, he used to ask, should not the principle of payment by results be applied to teachers as well as to children? The object of sending a child to an elementary school is that it should be able to read, write, and cipher. Provided that this end is attained, what does it matter by what means it is attained? At present the great majority of teachers are brought up at some training college, they pass a difficult examination in subjects different from those which they will ordinarily have to teach, and they get a certificate. If this process enables them to turn out better scholars, by all means let it be retained. But, supposing that a rougher process would be equally serviceable, why not let this have a fair trial at the same time? It is the interest of school managers to employ the teachers who get the largest number of passes and the largest Government grants; and school managers may be safely left to find out for themselves whether the teacher who has been to a training college, or the teacher who has passed at once from the form to the desk, best answers to this description. So long as the children are examined individually, and only those who satisfy the Inspector are passed, the antecedents of the teacher are a matter of no consequence. If they have been such as to disqualify him for his work, the fact will come out the first time that the Inspector visits the school. The present system is a system of protection to certificated teachers. If it is so certain that they are better than non-certificated teachers, why not leave them to make good their claim in the open field?

The answer to this plausible theory is to be found in the fact that Inspectors cannot long remain uninfluenced by the condition of the schools which they have to examine. The standard by which an Inspector judges each child that comes up before him to read a sentence or two, to write a line in a copybook, or to work a sum, may in theory be absolute, but in practice it is sure to be relative. If the best children in the schools he visits are pretty much on a level, that level will represent to him the limit of what he can in reason expect, and those who come up to it will be sure of getting passed. Consequently, it is not safe to trust to Inspectors to maintain a high standard of education in elementary schools unless good teachers are there to give them their co-operation. If the quality of teaching were generally to decline, the attainments of the children who knew enough to satisfy the Inspector would decline in proportion; and though there might come a point at which the insufficiency of the instruction would become too glaring to be passed over, a great deal of time would have been lost, and in the end the Education Department would have to restore the very machinery of certificates which is assumed to have been abolished. It is a very great mistake to suppose that anybody who can read and write himself is fit to teach reading and writing to others. Teaching is a distinct art which must itself be taught. Even if it were not so, the ability to teach is not all that is wanted when children are gathered together in school. The power of maintaining discipline is not less important, and this again, though partly the result of native capacity, can be greatly developed by good training. Even if we allow, therefore, that the mere amount of knowledge imparted would remain the same after certificates were abolished, the standard of discipline would infallibly be lowered. There would be less order and less method in schools, and thus the characters of the children would inevitably suffer, even though their proficiency were maintained. The attempt sometimes made to represent the distinction between certificated and non-certificated teachers as merely a matter of "dogies" indicates a com-

plete want of acquaintance with the essentials of good teaching in any grade. The possession of a certificate does not simply imply that the holder knows more subjects than a non-certificated teacher; it also implies that the holder has been taught in some degree how to communicate knowledge to children, and this superiority is equally valuable whether the particular knowledge to be communicated is elementary or advanced.

Since 1870 three attacks have been made upon the provision which renders the employment of trained teachers a condition of a Government grant to elementary schools. The first of these seemed at the time to be a necessary concession to the needs created by the Education Act, though the use which has since been made of the principle suggests a regret that it was introduced. Under the code of 1871 masters and mistresses not under thirty-five years of age who had been teaching for ten years, could obtain a certificate of general efficiency from the Inspector, and could present thirty children in their school for examination, of whom not less than twenty could pass in the second or some higher standard, were excused training and examination, and given a third-class certificate which held good for a year. In 1874 the present Government extended this privilege by reducing the age to thirty for women teachers, and requiring only twenty children to be presented, and fifteen to pass. The Code of the present year makes a further and serious alteration. It reduces the age after which the concession may be claimed to twenty-five alike for men and women; it only asks that they shall have been teaching in a school for five years; and it is satisfied if fifteen children out of the twenty presented pass, and that in the very lowest standard. Whatever reason there may have been for relaxing the requirements of the department in the case of teachers who were too old to undergo an examination, and who had been teaching for a considerable length of time, there seems to be none for exempting young men and women of twenty-five from both examination and training, or for allowing them to qualify for exemption by so short a term of service as five years. The change would be more intelligible if the number of children to be presented or the proportion or character of the passes to be obtained had been raised instead of lowered. It might then have been pleaded that, though the age and the term of service had been reduced, the reduction would only take effect in the case of teachers who had shown by the number of children they had presented, the number of passes they had obtained, and the high standards in which these passes had been made, that they possessed exceptional qualifications for their work. But when the reduction of age and service is accompanied by no such increase in the number of children or passes, and by a positive reduction in the standard, this argument is altogether inapplicable. The change is then seen in its true colour, and becomes a simple concession to incompetent teachers who are too old to go to a training college, and too ignorant to pass an examination. If Mr. FORSTER'S fears are justified, and managers who wish to do the thing as cheaply as they can will try to get hold of this class of teachers without a certificate, nothing can save the quality of elementary education in this country from being seriously lowered.

In so far as this change has been effected in deference to the wishes of the managers of voluntary schools, it only proves how thoroughly the friends of an institution can misunderstand its true interests. When the present cold fit about education has given place, as it is certain to do some time or other, to a revived interest in the subject, the fate of voluntary schools will be largely determined by the answer they can give to the question, Have they tended to raise the standard of instruction by maintaining a healthy rivalry with Board schools? If they have done this, a practical nation will probably congratulate itself on having attained so excellent a result by means of a machinery which, on the whole, has tended to save expense. If, on the other hand, the greater cheapness of voluntary schools has been purchased by such a decided lowering of the standard of instruction as will follow upon the disuse of certificated teachers, they will assuredly go to the wall. If the Birmingham League had desired to draft a clause which should do the greatest possible harm to Denominational schools, it could hardly have been more successful than the authors of this provision in the Code.

THE PHILADELPHIA EXHIBITION.

THE Centennial Exhibition at Philadelphia was opened on Wednesday, and promises to be a success, so far at least as popular enthusiasm is concerned. The Americans evidently feel that this is a great occasion, and are determined to make the most of it. The President delivered what must be regarded as, under the circumstances, a singularly modest speech. He remarked that the necessities of a new country had compelled them chiefly to expend their means upon building dwellings, factories, ships, docks, warehouses, roads, canals, machinery, &c.; but that, even under this burden, they had endeavoured to rival the older and more advanced nations in law, medicine, and theology, in science, literature, philosophy, and the fine arts. He added that, while they were proud of all they had done, they regretted that they had not done more; but their achievements had at least been sufficient to make it easy for Americans to acknowledge superior merit wherever found. That the Americans now find it easy to make this admission may be taken as an indication that they have begun to understand their own position more precisely. The tone of bravado in which they were in the habit in other days of proclaiming their intention and ability to whip creation rather suggested a want of confidence as to what might happen in the event of their capacity being tested, and a desire to substitute assertion for proof. Every one must admit that America is a great country; but it has had to learn that it does not combine all the elements of greatness, and that, if it is strong in some points, it is weak in others. A Correspondent of the *Daily News* has given a description of the opening day at Philadelphia, which in some respects perhaps might be applied to the present condition of the country. The Centennial Exhibition is a great design, apparently as yet imperfectly developed. On Wednesday all the principal buildings in Philadelphia were, we read, covered with flags. The fronts of many private houses were also elaborately decorated; but "the mud beggars all description." "For half-a-mile and more around the Exhibition grounds everything is new; the streets are half-paved; the walks unfinished. Here the deep red mud renders the roads almost impassable; and many of the avenues are unfinished." This is not a bad picture, in some ways, of the condition of the United States. There has been a great scheme of national life, much enterprise and energy have been displayed, and a huge and showy edifice has been run up; but one cannot help noticing the want of finish and the miry paths. The "mud beggars all description," and the sense of national greatness scarcely compensates for the prevalence of social roughness and discomfort. A new country has many advantages, but it lacks the smoothness and steadiness of life of an older one, which has digested its experience, and settled down into fixed habits and convictions. It would be unfair to fasten upon the political and other scandals which have been disclosed in sad succession in recent years as a fair sample of the general state of society; but there can be no doubt that, among much that is noble and sound in American life, there is also much that is mean and dirty. The Erie Ring, Tweed's case, the Beecher case, Belknap's case, and the other disorders which have lately been exposed do not show what, in American phrase, is called a clean record. These things find no place in the Centennial Exhibition, but they can scarcely be kept out of sight of visitors to the States. The truth is that the period of fermentation is still going on. The yeast has been working briskly, and one day there will be a fine liquor, but for the present there is a good deal of unsavoury froth and refuse to be worked off.

There was a little incident at the ceremony of Wednesday which shows that the Americans are becoming liberal and tolerant in various ways, and that, though staunch in their Republicanism, they are rapidly getting over any prejudice against a monarch. It appears that the Emperor of Brazil shared with the President of the United States the honours of the occasion. The Emperor was there only in a private capacity, but this did not prevent him from taking up what is called a prominent position. The Americans would seem to be just now deriving intense enjoyment from the close study of an Emperor in the flesh, and feel rather elated by the presence of such a personage even as a casual and temporary importation. It is natural that, as a guest, the Emperor should be politely received; but there is evidently also a certain fascination in his rank which acts upon the public, and it is, to say the least, curious to find the Emperor joined with the President in the ceremonial of the day. In the Machinery Hall, we are told, the President and the Emperor together laid their hands on the levers of Collin's great sixteen hundred horse-power steam-engine, and, as they turned it with united grasp, the whole vast collection of machinery started into life. There is certainly no likelihood of Dom Pedro seeking to extend his dominions in this direction, but General Grant has himself been suspected of Imperial aspirations, and a permanent President might come to be very like an Emperor. That the Republicanism of the United States should ever be shaken may seem at the present time an extremely wild and foolish speculation; but stranger things have happened in the world, and it must always be remembered in reference to the States that the population is not of a homogeneous and continuous race, but varies in its elements from time to time according to the flow of immigration. It can hardly be said that the immediate effect of the introduction of new blood from Ireland and elsewhere has been of a strengthening or purifying kind; and though there is, it may be hoped, a sufficient power of healthy reaction in the

general body of the people to make head against evil tendencies, it would be idle to pretend that these do not exist. The progress of the United States has been so rapid, and down to the time of the civil war so uninterrupted, that it is no wonder the people should have had their heads turned a little by such unparalleled success, and should have imagined that the conditions under which they had achieved it would continue for ever. In the flush and elasticity of lusty youth, free from the anxieties and restraints of older and more complex societies, they exulted in their strength, and took no thought of the morrow. They have now, however, begun to learn from sad experience that young communities cannot expect to be always young, and that, as they grow up, they must be prepared to confront the difficulties and perils of a more mature condition. Till within a comparatively recent period the American Republic has had almost everything in its favour—a virgin soil, abundant food, and plenty of elbow-room; primitive and simple habits such as lead to savings, and an exemption from the ruinous cost of standing armaments. The civil war, though it shook the country at the time, stimulated its energy, and, when the war was brought to an end, a new period of prosperity set in. This has now been discovered to have been somewhat artificial, and the country has had to find its level. The truth is that the Americans have been moving too fast, and have not allowed time enough for the consolidation either of their political or commercial system. The problems with which older countries are troubled have already arrived, or are beginning to appear on the horizon. The questions of Protection or Free-trade, of capital and labour, of education, will have to be worked out there as they have or are now being worked out in England and various other European countries.

There is no reason to suppose that a nation so alert and spirited will break down under the responsibilities which its growth and prosperity have naturally imposed on it; but the struggle will cost it much effort and anxiety, and the political system which has hitherto prevailed will require to be thoroughly purified. As the President observed, the United States has been so absorbed in its "great primal works of necessity, which could not be delayed"—that is to say, the organization of its material resources—that it has given little thought to other things. It may be hoped that the scandals of every kind which have lately come to light, though they must long before have been known to, or suspected by, most people in the States, will serve a good purpose in sobering and steadying American character. What must strike most observers as at present the most conspicuous feature of that character is a dangerous faith in the possibility of leading two very different lives at once. It seems to be supposed that public life is to be one thing, and private life another; and that unscrupulous conduct in the former is neutralized or compensated for by general good behaviour in the latter. Whenever any bad Fisk or Tweed scandal arises, it is always pleaded that this is only one side of American society, and that there is a great body of respectable people who live quietly and honestly, and keep the community fresh. It is obvious, however, that there must be some connexion between these different classes, since they apparently do not operate in antagonism to each other, but work together in a friendly way. The respectable people seem to be quite willing that the disreputable ones should have public business as their portion, while they themselves are allowed to enjoy a snug private existence. No division of labour of this kind, however, is possible. As long as the respectables tolerate the disreputables, they are practically conniving at the malpractices of the latter, and must be regarded as responsible for them. It is quite certain that the Tweeds and Fisks and other vermin could not have flourished as they have done if there had not been some tacit encouragement on the other side. No doubt when disorders reach a climax and become insufferable, there is an outcry against the offenders; but it must have been known very well what was going on all the while, and some measures should have been taken to check it. It is often not so much what people do, or do not do, that produces evil results, as the spirit in which they act; and hence the dishonest conduct of public men in the States must be attributed in a certain degree to the countenance and toleration of the respectable classes, who in their love of ease and pursuit of a selfish material happiness are willing to compound with the rogues up to the point at which they begin to plunder too extensively. There will probably be no trace of this aspect of American life in the new Exhibition; but, as we have said, it is one which cannot be hidden or explained away. Nobody supposes that the great body of intelligent and respectable Americans in their hearts sympathize with such people as Tweed or Beecher, but they condone their practices as a matter of compromise. You can go your way, they say, and we will go ours; we really cannot take the trouble to look after you. And this is the cause of the hollowness of public life on the other side of the ocean. It may seem ungracious to speak of such things in connexion with such a celebration as that of the Centennial Exhibition, but no one who wishes well to the United States can doubt that, whatever may have been their advance in material prosperity, there is still a serious want of morality in their political life. And if it has been thought, in the President's words, "appropriate to bring together for popular inspection specimens of our attainments in industrial matters, agriculture, fine arts," and so on, in order that there may be "a more thorough appreciation of the excellences and deficiencies of American achievements," it is just as well that the process of instruction should be carried all round.

THE LOVES OF A PHILOSOPHER.

AMONG the many people who have read *Sandford and Merton* and the *History of Little Jack*, there are probably few who know anything about their author, although Thomas Day's life was full of interest, and, in spite of his eccentricities, he seems to have impressed all those with whom he came in contact with a sense of singular activity of mind and honesty of purpose. It is not that there is any want of materials from which details about him can be gathered; but the books in which they are to be found are difficult to meet with, and there is no memoir which is worth reading. Richard Lovell Edgeworth proposed to write the Life of his friend, an undertaking which, unfortunately, as happened also in the case of Dr. Darwin, fell into hands far less competent to perform the task. The information which Edgeworth had collected he gave to Mr. Keir, observing at the same time:—"The anecdotes I send you are very few; but they are all I could select to suit your plan, as we differ so materially in our ideas of private biography. You believing that nothing but what concerns the public should be published; I thinking that to entertain mankind is no inefficacious method of instructing them. When Mason was reproached by somebody for publishing the private letters of Gray, he answered, 'Would you always have my friends appear in full dress?'" It is not to be wondered that, holding these views, Mr. Keir wrote a very dull book, although he so far modified his opinions as to introduce an episode which he had before spoken of as "impossible." In addition to this, there is a small compilation printed in 1862, which, however, contains nothing that was not already in the possession of the public.

Thomas Day was born in London in 1748. His father, who occupied the post of Collector of Customs, died in the following year, leaving his son an estate of 1,200*l.* a year in Berkshire, and other property, out of which his widow had a jointure of 300*l.* It is any one has ever felt inclined to call the exemplary Sandford a prig in his pursuit of knowledge, it is likely that he would apply the same term to the author of Sandford's creator. Existence. Day was the ideal schoolboy, the first, and probably the last, of the kind. He did not take birds'-nests, he gave to [illegible] one, looked on mankind as his fellow-creatures, did not beat the poor, or hunt animals, drank water, ate vegetables, improved his mind [illegible] was the type of [illegible] and never used an improper expression. He and thirsting [illegible] all "enfants terribles." When still in petticoats of Babylo[illegible] for information, he asked his mother who the Whore parish, [illegible] was, and, on being referred to the clergyman of the by no [illegible] obtained the answer that the figure was allegorical. This [illegible] formation seems satisfied the inquirer, who, after looking at his in- "He knew with contempt, exclaimed in a loud voice to his mother, *and Mer*[illegible] was nothing about it." How far the incidents in *Sandford* many of the represent his own life at school we do not know; but As a schoolboy, we imagine, are drawn from his own experience. of money, and [illegible] he seems to have had the command of a good deal [illegible] many years afterwards, to have "found premature occasions for bestowing favours amongst persons not his equals in fortune or benevolence." This habit was continued through the whole of his life, and the little gratitude he met with may have been one of the causes of the misanthropy he displayed. After spending eight years at the Charterhouse, he went to Oxford as a gentleman commoner, where his main object is represented to have been the discovery of moral truths, and where we may picture him interrupting a lecture after the manner of Tommy:—"Sir, I am sorry to disturb you, but I shall be much obliged to you to inform me what sort of animal a camel is.' It was while Day was at the University that he made the acquaintance of Lovell Edgeworth, who was at that time engaged in the experiment of educating his eldest son in accordance with the system of Rousseau. *Emile* was now and remained through life Day's guide, and the two young men formed a lasting friendship. Day, however, carried his philosophical principles further than his friend, and in his protest against the luxury of the rich and the vices of fashion, neglected both his manners and his dress, censuring, like Tommy, the fine gentlemen and ladies who knew nothing but how to dress their hair and buckle their shoes. These indeed, it will be remembered, were not Tommy's opinions until he had gone through a long course of oral instruction from Mr. Barlow; for when he told him that, though he preferred Keeper, he would have washed him and combed him until he looked as well as Jowler, his tutor rebuked him by saying that, in that case, Keeper would have grown idle, fat, and cowardly like Jowler. Under these circumstances it was a pity that the study of moral truths could not wholly content the philosopher. Unluckily a perfect woman was conceived of as possible of attainment, and therefore had to be found; and it is a distressing but well-known fact, that among the many qualities in men that have at different times excited the interest and love of women, there has never yet been reckoned high moral excellence. Nor was Day's opinion of women such as was likely to prepossess them in his favour; for he speaks of them, when he has arrived at the age of twenty-one, as that sex whose weakness of body and imbecility of mind can only entitle them to our compassion and indulgence. In the spring of 1768, the year before these sweeping comments were made, he paid a visit to Edgeworth Town, where, in spite of his manner of eating and his slovenly habits, he recommended himself after three months to Miss Edgeworth so much as to induce her to say that, if he continued for a year in the same mind, and could in that time make his appearance becoming a man of his situation in life, she might be prevailed upon to give him her hand. Accordingly Day went to London, and entered himself at the Middle Temple;

but before the close of the year the engagement had come to an end.

Nevertheless he was not to be deterred from his search for Sophie. She was to be a woman possessed of a charming disposition, of beauty, of health; with a taste for literature, science, and moral philosophy; simple in her dress, diet, and manners; fearless as a Spartan wife or Roman heroine, and willing to spend her life in the society of her husband only, and in the retirement of some perfectly sequestered country spot. This was all he wanted, but London in 1769 was sadly like London in 1876, and she was not to be found. If, however, she did not exist, she might be created; so Day, with his friend Bicknell (with whom he shared the composition of a poem called "The Dying Negro," which has the merit of having been one of the first anti-slavery productions), went off to the Foundling Hospital at Shrewsbury, where he chose a golden-haired girl of eleven as a fitting subject for his experiments. She was called Sabrina, from the Severn, and Sidney, from the patriot. But two strings were better than one for his bow; so another child of twelve years old was chosen from the Hospital in London, and named Lucretia. A house was then hired for them near Chancery Lane, and their education was begun; but the general interest shown in the experiment by friends and neighbours induced their tutor to take them to France, unaccompanied by any servant, as he wished that they should receive no communication except from himself. On his arrival at Avignon he writes to Lovell Edgeworth, and passes, as might be expected, the severest censures upon the French, inveighs against their climate, their indecency and vapidity, and their miserable subjection to the female part of the community. The girls are model pupils, such girls as never were seen at the same age, are always contented, and think nothing so agreeable as waiting upon him. An original letter from Sabrina is sent by Day as a faithful display of her heart and head:—"Dear Mr. Edgeworth,—I am glad to hear you are well and your little boy. I love Mr. Day dearly and Lucretia. I am learning to write. I do not like France so well as England. The people are very brown; they dress very oddly. The climate is very good here. I hope I shall have more sense against I come to England. I know the cause of night and day, winter and summer. I love Mr. Day best in the world, Mr. Bicknell next, and you next." Miss Seward, who disliked Day cordially, gives an entirely different picture of the foundlings. According to her, they teased him, and quarrelled with one another continually; they caught the small-pox, and Day had to play the part of nurse and sit up with them at night. They were all upset in crossing the Rhône, but as Day carried his theories on the advantages of swimming into practice, he was able to save both the girls. After an interval of eight months he came back to England, and as Lucretia was hopelessly stupid, he got rid of her, giving her, however, three hundred pounds, a sum of money which in time procured her the hand and heart of a small linendraper. With Sabrina, who is described as having long eyelashes and auburn hair, he settled near Lichfield, where the society was of no ordinary character, and where a group of eminent men gathered round Mr. Seward, who was a canon of the Cathedral and lived in the Bishop's palace. Sabrina's education was proceeded with in strict conformity with the precepts laid down in *Émile*. That youth was to display no fear of firearms, and with that object Rousseau recommends that powder should first be flashed in the pan, then a small charge fired, then a large one, so that gradually he might become accustomed to "détonations les plus terribles." Sabrina was not an Émile, and when her guardian fired pistols at her petticoats which she believed to be loaded with balls, she howled with unphilosophic terror. Nor, though doubtless Day often read to her the story of the Spartan boy and the fox, could she forbear from wincing when he dropped melted sealing-wax upon her arms. So far from being able to naturalize these experiments in England, by which a race of patient and submissive women might have been produced for our benefit, we regret to say that thirty years later these methods were held to be peculiar, and in Wilson's *Eccentric Mirror*, published in 1802, a special engraving is devoted to Sabrina being fired at by her tutor. The creation and education of the ideal was an uphill task. Sabrina disliked books and science, could not keep a secret, and no doubt (though we have no authority for the statement beyond Mr. Thackeray's generalizations on the subject) fell madly in love with the little boy who cleaned her shoes and fetched the coals. The end of it was that the *école des femmes* was broken up, Agnes was sent to a boarding-school, and in 1771 Arnolphe started afresh on his chase.

Mrs. Seward at this time had the charge of Honora Sneyd, a daughter of Mr. Ralph Sneyd, of Bishton, in Staffordshire. At first she did not please Day. Her arms were not sufficiently round or white—a quality he always insisted upon; no doubt in order that the impressions of sealing-wax which he proposed to make might be brought more into relief. But gradually his indifference passed away, and on the departure of Sabrina the philosopher drew up a system of life for a married couple which he submitted to her. Packets were interchanged; the rights of men were asserted to be met on her side by a dispassionate statement of the rights of women. If moral excellence were unavailing, logic might succeed. It was thus that William Godwin conducted his courtship of a second wife, and with much the same success as Day. Miss Sneyd did not like the notion of retirement, and said No; her lover behaved with a great want of stoical self-command, for he went to bed, and was bled by Dr. Darwin. Man, it must be admitted, as well as woman, is an uncertain and changeable animal. In a short time Mr. Sneyd came to Lichfield with his other daughters, of whom Elizabeth was the youngest. In three weeks Day was in love with her, unwittingly complying with the fashion of the nineteenth, if not of the eighteenth, century, which requires that a man who has been refused by one sister should propose to the next. Elizabeth had prejudices in favour of the graces, so Day went off to Paris with his friend Lovell Edgeworth, to acquire them. "I have no prejudices, live on little, love nothing, and say all I think," was the creed of Marmontel's philosopher. But under the influence of Clarice the sage forgot himself; "the bath is a natural institution, let us bathe; the earth gives us her perfumes, let us not disdain them. 'En mangeant de tout, il déclamait contre la profusion des mets. Ah l'heureux temps, il disait, quand l'homme broutoit avec les chèvres! et il s'énivra en faisant la peinture du clair ruisseau où se désaltéroient ses pères.'" Day did not go quite so far as this, but in his endeavours to become a second Chesterfield he sadly forgot his *Émile*. He spent eight hours a day in dancing and fencing lessons, he pinched and squeezed his knees in boards in the hope of forcing them outwards. It was, however, as might have been expected, all labour spent in vain, and he returned to Lichfield more *gauche* and awkward than ever. Elizabeth gave him the same answer as her elder sister, considering the second state of her lover worse than the first. Soon after this, Lovell Edgeworth's wife died, and in the summer of 1773 he married Honora Sneyd. Day wrote a charming letter of congratulation to his friend on his marriage with his old love, in which he says:—"As to myself I can, I think, give no better picture of my own mind than what I wrote to you last winter from France; an indifference to all human affairs, an aversion to restraint and engagement and embarrassment continue to increase in my mind; so that there is great probability I am marked out by fate for an old bachelor and an humourist, destined perhaps to become very old because I am very indifferent about the matter, and to buy hobby-horses for your grandchildren; and perhaps as an old friend to be family admitted to mediate for some of the future Miss Edgeworths, when they run away with a tall ensign in the Guards or their dancing-master." Seven years later he was present at Edgeworth's marriage to his sister-in-law, Elizabeth Sneyd. During the next few years he led an active life, taking a keen interest in the political controversies of the time, writing against the slave-trade, living now in his chambers in the Temple, now on the Continent or in Berkshire. Meantime Sabrina had grown up, and he determined to marry her. But alas! for the hold of reason and the influence of systematic education on the minds of women. One evening in his absence she went to a party in long sleeves, and he gave up consequently all idea of making her his wife. The episode of Sabrina sounds as if it might be introduced with effect into fiction, and another "History of a Foundling" written to delight the world. But Miss Edgeworth has not succeeded in her attempt in Belinda. Virginia St. Pierre is too weak a character to interest any one, and least of all Clarence Hervey, who in no respects resembles his prototype. Virginia is an exaggeration of Sabrina; at seventeen she is unable to write, she is indolent, romantic, falls in love with a phantom, faints at the sight of a picture, and, to sum up, is a special fool. The future career of Sabrina was commonplace enough. Some years afterwards she married Mr. Bicknell, to Day's disgust; he gave her, however, five hundred pounds, and settled an annuity upon her when she became, after her husband's death, Dr. Burney's housekeeper at Greenwich.

It is no small proof of Day's perseverance and confidence in his own mode of treatment of women that he was not prepared to abate any of his theories. The name of a girl fitted to be the mother of future heroes was submitted to him by one of his friends, when the following inquiries were made:—"Has she white and large arms?" "She has." "Does she wear long petticoats?" "Uncommonly long." "Is she tall and strong and healthy?" "Remarkably little, and not robust." The young lady in question was Miss Esther Milnes of Wakefield, at that time about twenty-four years old, and in possession of a large fortune of her own—namely, 23,000*l*. The courtship was a long one, the details of which, we regret to say, have not been handed down to us. We may assume that the lover ran pins into her arms, broke her china, alarmed her with cries of fire in the dead of the night, tore her dress, fed her on vegetables, and made her learn the "Dying Negro" by heart. In spite of it all she was in love with him, passed through the ordeal successfully, and in 1778 the philosopher at last found a wife. It is not often that we are able to learn anything about the studies and thoughts of a girl belonging to a country town in the middle of the last century, and therefore the miscellanies of Mrs. Day, published by her nephew, who ultimately succeeded to her property, are not devoid of interest. The editor was not a modest youth, for he prefaces his uncle's and aunt's writings with fifty-two pages of his own, in order to increase the size of the work, and show the propriety of the motto he adopts, "Tria juncta in uno." Nor did he display in his actions that contempt for the female sex which his education should have produced. He prints some verses "Upon a Lady who repulsed me as I was going to salute her, and put on a grave and angry look":—

> Oh, that I could but change my shape,
> And be an insect, too,
> That I might lovely Delia kiss,
> And all her beauties view.

Had he read his *Sandford and Merton* attentively, instead of conducting himself in this impropar manner, he would have requested leave to tell Delia the story of Polemo, or the Debauched Young Man. Had he read his *Émile*, he would

have remembered that Sophie quarrelled with her lover during their engagement, because he kissed the hem of her gown. Miss Esther Milnes was educated at "Mrs. Dennis' justly celebrated female boarding-school in Queen Square, and, like Cowley, was inspired by the muse at a very early period." Indeed she wrote nothing after the age of sixteen. We have no space to devote to either her themes or her poetry; but they show considerable cultivation and command of language. Some verses written after the purchase of *Tristram Shandy*, at the age of sixteen, are interesting as evidence of what was read by young ladies in 1768, though Bishop Porteus censured the book in question in one of his sermons, and Fordyce, in another, stigmatizes the novels of the day as the "infernal brood of futility and lewdness"; "the beautiful productions of Mr. Richardson's pen," he adds, "are the only books in the style of novel that can be read with safety and advantage"—a verdict which perhaps would scarcely be endorsed at the present day.

Mrs. Day, we have heard, on arriving at her husband's house, was taken into the kitchen, shown the uncooked constituents of a dinner, and told to get it ready. In order to accustom her to this mode of life, some wretched lodgings were taken in Hampstead by Day, where he kept no servants. He put a stop to his wife's correspondence with her Yorkshire relations, forced her to give up music, and continued his experiments on her temper; but she was a second Griselda, and acquiesced in all his vagaries. They first settled in Essex, where Day made some additions to the cottage they occupied. The late Sir Charles Monck built his house without a staircase, but we do not know that he did so intentionally. The masons asked Day where the window of a room on the first floor was to be. Could not the wall be built first, and the place for the window cut afterwards? The masons suggested that it was unusual; but Day had his own way, and three years later the house was sold without any window having been opened in that room. He next migrated to Anningsley in Surrey, where he began farming, living at the same time a life of the most complete retirement. His endeavours to benefit his fellow-creatures did not give him a better opinion of them. On being asked by one of his friends why he chose the lonely and unpleasant situation in which he lived, he replied that the sole reason was its being out of the stink of human society. He draws a picture of his own habits in the description of Chares in *Sandford and Merton*, where he says, "Amid tranquil and innocent employments my life flowed gently away like a clear and even stream." His farming was not profitable to him, for he lost 300*l.* a year by it, nor were his attempts to carry out his theories attended with more success. Considering the methods of breaking horses then in vogue to be cruel, he adopted some peculiar means of his own, the result of which was that the raw colt he was riding took fright at a farm engine by the roadside, threw him, and killed him on the spot. Mrs. Day only survived her husband two years, and died in 1791. It was during the last six years of his life, while he was hiding from the world at Anningsley, that Day wrote and published the book by which he will be long remembered. It is not necessary to be acquainted with the politics of the time to appreciate *Gulliver's Travels*, and to enjoy *Sandford and Merton* a reader need not reflect upon the social and moral lessons it is meant to inculcate. The book was published in three parts at intervals between 1783 and 1789, but we cannot find any allusions to it in the contemporary letters of that date. The fashion had just begun of writing for children, for whom there had been previously nothing except *Robinson Crusoe*, the *Arabian Nights*, and Fairy Tales. Mrs. Trimmer was reforming Brentford and writing her *History of the Robins*, which had no great sale at first, though Hannah More made an unfortunate friend buy three dozen of her books. Moral tales, however, were destined to carry the day, if we may judge from Charles Lamb's complaints long afterwards. "'Goody Two-Shoes' is almost out of print. Mrs. Barbauld's and Mrs. Trimmer's nonsense lay in piles about. 'A horse is an animal, and Billy is better than a horse.' Hang them; I mean the cursed reasoning crew." He little foresaw the dismal time when, for Billy's sake, such exquisite gems as "Cinderella" and "Beauty and the Beast" were to be travestied into the vulgar monotony of social life. But *Sandford and Merton* is far from being the commonplace moral lesson. Tommy's delightful conceit and adventures are a fitting counterpoise to the terrible propriety of Harry, and the stories which are introduced, with a complete violation of time and place, are full of vigour and models of style. It is true that the respectable mother of a family little knows that she has been brought up on *Emile*, and that Rousseau still spreads his influence over her schoolroom. Nearly all the teaching of Mr. Barlow and the sentiments of Harry will be found in *Emile*; and if the character of Sophie has only been hinted at in that of Miss Simmons, it may well be that his own experience of that "imbecile sex" deterred Day from representing either Harry or Tommy in their searches after a wife.

SYMBOLICAL PAINTING.

THE Bristol riots—we fall instinctively into a formula which had a well-known and ugly meaning more than forty years back—may have the effect of setting some minds thinking on one or two points in the history of art. As almost always happens, the popular outcry, absurd as was the form it took, had really something in it: like most other popular outcries, it had got hold of a half-truth. The captain or colonel who reviled Gregory the Great can be excused only on the theory that he is the one surviving believer in Woden; but it was not so easy to answer those who objected on historical grounds to Gregory wearing a triple crown and to Jerome wearing a Cardinal's hat. We may freely allow that there is not the least reason to believe that either of them ever wore or ever saw any such covering for the head as they are severally represented with. But it does not follow that, under some kinds of circumstances, they may not be lawfully represented as arrayed in this purely ideal fashion. Setting aside the theological madness which has been called forth by this particular case, the whole thing resolves itself into the question whether, in all times and in all places, it is necessary for painting and sculpture to represent a man as nearly as may be to his actual appearance in the flesh. The answer to this surely depends on the object of the representation. Some people are disposed to give painters and sculptors a very wide license indeed in departing from the truth of nature or history. We did once hear it argued that a painter might rightly paint Frederick Barbarossa with a black beard, if he could thereby make a more effective picture. And it was answered that it was open to him to paint any number of men with black beards, but that he had no right to call any of them Frederick Barbarossa. If a painter undertakes to paint a certain man who had a known physical peculiarity, who has even had a surname given him from that physical peculiarity, it does seem strange indeed to leave out that which has become his distinctive mark. But when it comes to peculiarities which are not personal but national, the case is less clear. For instance, a fair question for debate is supplied by those pictures of New Testament scenes in which Eastern costume and character are strictly preserved, and all who were Jews by birth are given the national look of Jews. Many people have doubtless been surprised, and even pained, at seeing subjects of this kind treated in a way to which they are so unaccustomed, even though it be a way which undoubtedly comes nearer to the historic truth of the scene. The comment will of course be that their surprise and pain arise from the treatment being different from that to which they are accustomed; that, under other circumstances, they might have been equally accustomed to the naturalistic representation, and equally displeased with any other. And this is of course strictly true; but this at once starts the whole question between conventional and naturalistic treatment. To put Gregory the Great in a triple crown and Jerome in a Cardinal's hat is certainly not naturalistic treatment, but it is not therefore follow that it is in itself objectionable.

Works of imagination will easily fall into two classes, those which are simply works of art and those which are works of art and something else as well. Some pictures, some statues, are simply creations of the artist's fancy. He represents a beautiful scene or a lovely figure, according to a pattern in his own mind. In such cases he paints as he chooses, with no standard but that of nature before him, and that nature, anatomically correct; we may ask whether his human or animal figures are physically correct; we may ask whether his representation of the sky, hills, the sea, in any given state of things is such as it is physically possible. But we do not ask whether the man that he paints has the possible, or whether any such man exists; we do not ask whether the faces that he paints are like those of any actually existing human beings. Such a work is purely artistic, and is to be judged by a purely artistic standard. The artist is a poet; he invents, and may rightly invent. He may create his story, his actors, his scenery, everything that he needs. He may paint black beards or red as he thinks good; but if he paints a black beard, it is not likely that he will write the name of Redbeard under it.

But if, instead of scenes and figures of his own creation, the artist undertakes to represent something which has any kind of distinctive and separate existence, the case is changed. If, instead of a beautiful landscape or a beautiful woman out of his own imagination, he is called on to paint this or that beautiful landscape or beautiful woman, he is bound by a stricter law. His work does not cease to be a work of art; but it is something else as well. He is bound by a law of accuracy by which in the other case he was not bound. His landscape or his portrait must be like the scene or the person that he professes to represent. If it be otherwise, it may be a very beautiful picture, but it is not the picture which it professes to be. So, if the picture assumes any character beyond what is simply artistic; if it professes to be historical or devotional, commemorative or instructive in any way. In all these cases an element comes in which is analogous to the necessity that is laid on the landscape or the portrait of being like the place or person which it represents. The picture is judged, not merely by a standard of art, but by a standard of accuracy of some kind. The historical, devotional, or other commemorative picture or sculpture must be, not necessarily like the persons represented, of which there may often be no means of judging, but like some conception of them of some kind. Besides purely artistic questions, such as whether the colouring is good or the anatomy correct, each spectator judges the picture by a certain standard of likeness in his own mind. Perhaps he judges the picture according to some conception which he has already formed of the things and persons represented. Perhaps, without having any such previous conception, he forms one out of the picture itself; the picture at once approves itself to him, or at once fails to approve itself to him, as a fitting representative of the scenes or persons which are painted. In the one case, he has already an idea of the subject and its proper treatment; in the other case the picture itself—positively or negatively—supplies him with such an idea. And he judges the picture by its conformity to that idea,

however formed. And, to fall back on the instance with which we set out, there must be very few people to whom a picture of Frederick Barbarossa which showed him with a black beard would seem to be a treatment of the subject that at all answered their ideas.

The whole class of works of art which we will call commemorative must, therefore, besides the purely artistic standard, be judged by a standard of accuracy of some kind. Do they fittingly represent the subject which they undertake to represent? But what is to be looked on as a fitting representation—what, in short, is to be the standard of accuracy—admits of a good deal of questioning. Let us suppose that the artist wishes to represent an historical scene which has never been represented before. He has surely a wider choice than if he undertakes a subject which has often been treated before, and about which many people will have preconceived ideas. Above all, he will have a freer choice than he can have if he undertakes a devotional subject, or one which brings in persons or things which large classes of people look on with religious reverence. In a subject absolutely untouched the only check on his treatment is the degree of historical accuracy which may be thought necessary in treating an historical subject. This is a point on which there is fair room for differences of taste and opinion. It would probably be now agreed on all hands that some degree of accuracy, some degree of attention to the time and place where the subject is laid, may fairly be looked for. But it should be remembered that this is quite a modern notion. The artists both of the middle ages and of the Renaissance were wholly indifferent to local and antiquarian precision. Jerusalem is represented as a German or Italian town, of Gothic or Palladian architecture, according to the taste, age, or nationality of the painter. Roman soldiers are put into the chain armour of mediæval knights or into the costume of Francis the First's day. This last practice no one would follow now; no one would represent the Holy Sepulchre as watched by soldiers in English, Prussian, or Austrian uniforms. As to the representation of Jerusalem, a little more license might be allowed; few painters would think themselves bound to make an exact architectural reproduction of the real city; still they would shrink from making it exactly like modern London or Paris. In all these matters there is a wide field between making the picture an antiquarian pattern-card and bringing in any monstrously violent anachronism. But what shall we say to the painter who painted Lady Godiva—the Godgifu of history—riding through a Coventry already adorned with St. Michael's spire? The anachronism could hardly be worse; yet there is something to be said for it. It was an artistic way of saying "This is Coventry, and not any other city." It was at any rate like something that really is; an attempt to reproduce the Coventry of the eleventh century might have produced something unlike anything that ever was in any time or place.

In short, to draw Lady Godiva riding by St. Michael's spire was a distinct case of symbolical painting. Let such a practice be established as the received way of treating the subject, and it becomes conventional painting. Now, when a particular way of treating a certain subject is in this way established, the custom has an historical value, even though the treatment itself cannot be historically justified. The conventional ways of representing persons, especially saintly or other famous persons, are endless. Many of them are historically inaccurate; many of them are physically impossible. Not only illuminators of service-books and makers of stained glass, but the great masters of painting, have represented holy persons with *nimbi* on their heads which are quite inconsistent with the laws of nature. The mediæval artist painted or carved the founder of a church with the church in his hand; it would be a very cold critic who would argue that he was meant to be carrying a model. On many a tomb the parents are seen, with the sons getting smaller in order behind their father, and the daughters getting smaller in order behind their mother; yet in real life the youngest child may have been the tallest of the family. In a well-known print of the installation of a Chancellor at Oxford, the hero of the day is made distinctly bigger than anybody else in the theatre; yet there is no physical law which decrees that the head of the University should always be the largest of its members. By the same instinct the sign-painter draws Charles the Second in the oak, not only larger than either his friends or his enemies, but with the crown royal set on his head. So in the illuminations to Froissart, Pope Clement and Queen Joanna of Naples are both shown on their death-beds with their crowns on their heads, and, according to the usage of the time, with nothing on but their crowns. And those who have the privilege of possessing an unmutilated copy of Stumpff's Chronicle will remember a picture of a Pope decked out in full pontifical array at a yet more unlikely moment. All this is of a piece with the ordinary symbols of saints. Nobody ever believed that St. Peter always carried a key and St. Paul a sword, or that Ignatius commonly walked about accompanied by a lion. All these are simply ways of pointing out who a person is; they are ways purely symbolical and conventional, which regard neither strict historical truth nor strict natural possibility. So to give Gregory the Great a triple crown, though the Popes certainly did not wear a triple crown in his day, is simply the shortest way of saying "This is a Pope." It is just the same as when, in pictures of the Exaltation of the Cross, Heraclius is often shown with an Imperial crown such as Charles the Fifth might have worn, but such as Heraclius certainly did not wear. But all that is meant is to say "This is an Emperor." The case is exactly the same as the case of Gregory; only theological frenzy is not likely to be awakened by the figure of an Emperor, while it is very likely to be awakened by the figure of a Pope. Had he been made with a tall mitre, such as surmounts the arms of modern Bishops, the departure from historical costume would have been quite as marked. But in that guise he might perhaps have been endured by all save those Welshmen or Wodenites who are determined to have no Gregory at all. If Gregory may not have his conventional crown, nor Jerome his conventional hat, because they certainly did not wear them in real life, a great sweep must be made, not only of stained glass, sculptures, and wall-paintings, old and new, but of many of the greatest works of the greatest masters.

EXCURSIONISTS BY CONTRACT.

ONE sometimes alights at a foreign hotel where one falls into the midst of a queer assortment of one's own countrymen and women. They have come over in a body for a Continental tour of a certain length of time, and are now doing their Paris conscientiously. All the stock sights—Napoleon's tomb, Père la Chaise, the Gobelins, Sèvres, Versailles, the Panorama of the Siege, and the Jardin des Plantes—are gone through with precision and diligence; but they do not go to the theatres, none of them being strong in the language, and most of them knowing nothing about it at all; nor even to the Grand Opera, where marble and gilding, the *foyer* and the vestibules, the decorations, the music, and the rest of it, have an eloquence of their own which indemnifies the unilingual spectator for his ignorance of the libretto. They do nothing out of the beaten track marked out for them by the managing authorities of the firm or company to which they have subscribed; but go the mill-horse round in herds, obediently, as they are directed, and are perfectly satisfied with what they get for their time and tickets. At the end of the week they believe that they have done Paris as it should be done; that henceforth they too are entitled to be classed among the experienced sojourners in strange cities.

Distinct enough in personality, there is very little difference in social status among our tourist compatriots travelling in these oddly constituted batches. For the most part they belong to what we may call the lowest third of the middle classes, with here and there one or two among them a degree lower still. Very many of them speak with a broad provincial accent, and many are pure Cockney: there are some rich brogues to be heard, and some unmistakable Glasgow voices; but very few speak good English both in grammar and accent, and style is no more to be expected than the rest. Their pretensions to be held as gentlefolk are of the most meagre kind, though some of them hold up their heads and tower above the others, at least in their own conceit. These others are mostly retired tradesmen with a snug little competency which yet does not admit of extravagant expenditure, who accordingly, when they want to give their "good lady" a treat, do it with commendable foresight, and pay down the lump sum which is to take them from Charing Cross to Turin and back again, with hotel charges and sight-seeing included. Or they are young men still in business, clerks and junior partners in small concerns, who want to know more of the world than can be known even in Manchester or Liverpool, Stockton or Newcastle, or wherever else it is that they turn their honest pennies and build up their future fortunes. Sometimes they are superior artisans who have laid by a few pounds, which they think will bring them more pleasure and profit in taking them to foreign parts than in being exchanged for bad tobacco and worse beer; or they number among them the widow and daughter of a professional man who have been left only just enough to live on "genteelly," but who by close economy for a couple of years or so have saved what will take them for a fortnight or three weeks abroad, and so have been able to fulfil the dream of the elder woman ever since she was a young one, and to give the daughter the vague "advantages" held to be included in the journey. The party is sure also to include the young couple just married, who, before settling down to the warehouse in Leeds for him, and the six-roomed house with its green door and brass knocker in the suburbs for her, think that a fortnight spent on the road between Leeds and Turin will be the most delightful way of passing half the honeymoon, and giving them a charming store of memories for the future; in which perhaps they are right. But, whoever these tourists may be, they are all generally well behaved enough, if a trifle rough, and for the most part good-tempered and amenable to reasonable discipline.

Now and then, to be sure, a black sheep gets into the flock who scandalizes the hotel by drink and bad language, by late hours and rowdyism, giving the sober foreigner but a mean idea of the British milor in tweed and a flashy tie, with a brass chain and a felt wideawake. At times, too, the travellers are sour and ill-tempered; and have that odd idea—apparently ingrained in a certain kind of mind—that mounseer is a born fool and their inferior, very plainly marked in their manners and language. These are the people who stick to their British habits as a soldier sticks to his flag, and disdain to adopt any of the modes and manners in use among their temporary hosts. They drink tea in the morning, and the "kickshaws" produced at breakfast and dinner are passed by with evident disgust; but good plain beef and mutton please them, and they appreciate the fowls, if they are given to such tender diet at all. Even here, however, some among them will recall regretfully the strong-coloured legs of the English bird, and hold the foreign creature tame compared with his congener at home. Woe to the hotel-keeper with whom the "conductor" contracts who should dare to put before his insular guests *soupe à l'oseille*, or the familiar

pot-au-feu. They are at home only with the dishes to which they have been accustomed from their youth up; and the choicest dinner at the Café Anglais would fall dead upon their palate. As for the wine, whenever they can they change it for honest Bass, one glass of which they hold to be worth all the Burgundy or Bordeaux ever made; and when they drink it they draw a deep breath and say, "That's something like!" approvingly. This is the general rule; but some of them, who aim at higher things and want to be men of the world and cosmopolites without more ado, go in for all the foreign fashions wildly, and can be got to praise the vilest *piquette* that ever disgraced a table, if only they are made to believe that it is the right thing to admire it.

The women of the party are often even more extraordinary than the men; and the first thing about them which strikes the critical eye is the fearful and wonderful manner in which they are attired. On this head they may be divided into two classes—the women who despise the current fashions altogether, and those who distort them by bad copies and exaggerations. There is the "good lady" of the retired tradesman living her tranquil life in the country, where she dresses for use and not for show, and takes no heed of what the local Worth propounds; and there is the town-bred damsel who dresses for show and not for use, and who would rather have the flimsiest bit of vulgarity, if made "as it is worn now," than the best gown that could be given her if made in the fashion of a year ago. Between the two beauty has no foothold anywhere; and the impossibility of an Englishwoman's dressing herself with taste becomes an article of faith with Alphonse and Josephine, not to be removed by any after experience of *les grandes dames qui ont du chic*. Dresses of a "good travelling colour"—chiefly a dirty brown—and oddly constructed heads are the main characteristics of these women. Sometimes we see the faded face of fifty and the familiar ringlets of our youth: sometimes a huge coil of false hair is stuck on the top of the head, more like a porter's knot than anything else, giving one the uncomfortable feeling that it will slip off, being top-heavy and badly balanced; sometimes a more than middle-aged woman appears with her "four hairs" gathered into a little screw at the back of her head, with never a cap or a bow to hide the nakedness of the land; and sometimes, early in the morning, a radiant young person comes down with her multitudinous tresses elaborately pulled and frizzed and ornamented with ribbons and stars as if she were going to a ball. Or one, sadly conservative, wears her hair hanging down her cheeks in a loose braid like a rabbit's ears; one has hers frizzed audaciously in front, like the forehead of a young bull; while a third wears hers parted on the side like a man, and a fourth shows the length and thickness of hers in a flowing cascade down her back.

The more particular among them—perhaps the widow and daughter of the professional man—are very particular indeed in some ways, finding most things inferior, and very scrupulous on the score of cleanliness. They examine the plates carefully, and send them away if only a shadow falls across the white; they sniff at the eggs and have them changed on the very slightest provocation, or on none; they turn and twist their *petit pain* on all sides, and scrape away the smallest spot as if it were so much poison left on the crust; giving you to understand that nothing is so good here as they have it at home, and that even the coffee fails to satisfy them, accustomed as they are to something so infinitely better. Though in the herd, they are not of it, and are careful not to form acquaintances among their fellow-travellers. In this they are singularly unlike the generality of their companions, who knit up what looks like friendship in an incredibly short space of time, having mutually told before three days have passed the whole story of their birth, parentage, education, and condition, with an engaging frankness that at least disarms the suspicion of skeletons in the closet at home. The stranger who stands by and listens to it all hears what is substantially to him a foreign language. Sly allusions are made at which the whole company laugh, and of which he neither understands the point nor sees very well how there can be any point to understand. There does not seem to be much humour in, "Well, Mr. Smith, how's your knee this morning?" but the whole table is in a titter when the question is asked; and the gentlemen look sly, while the ladies look demure, when "Were you late last night, Mr. Smith?" is the next joke set afloat, carrying with it a sense of exquisite subtlety and delightful humour to all concerned. There is always one funny man in the party who cannot open his mouth without his hearers beginning to laugh in anticipation, sure that some good thing will come. He is the man who keeps the table alive with these subtle allusions to the state of Mr. Smith's knee or to the hours which he is supposed to keep; and when he happens to be absent the whole party are flat, and feel as if half their life had gone from them. Sometimes there is a clergyman in their ranks who tries to check the exuberance of the wit, and who divides with him the feminine following in fairly equal shares; and sometimes there is a retired captain, who looks on the whole thing with the true military scorn of civilian snobbery, and fraternizes only with the widow and the daughter, alike disdaining the wit and contemptuous of the parson. The radiant young person with frizzy front and many ribbons is, however, the main supporter of the funny man among them, and her shrill laughs and "Oh my!" "Goodness me, if ever!" that drop at intervals act on his jocularity as spurs on the speed of a horse, and sometimes get her into trouble with the rest. For, if frank, the band is both decorous and censorious, and has its code of propriety like other communities, with anathemas of a mild kind on those who disregard it. The young married people "spoon" and giggle a little apart, and the matrons take a friendly interest in the bride and give her good counsel in whispers. The men talk business when they drift away from the jokes of the wit and the sights that they have seen; for not one among them knows anything of art or literature or history. Sometimes a couple of friends, men of culture and of limited means, have joined these ticket tourists, and keep themselves rigidly apart from the rest. But this is not often the case; for it is hard to be associated for days, perhaps for weeks, with the same people and not enter into some kind of relationship with them, more especially at a time when all are in high spirits and good humour.

Still, though the party is given to silly jokes and brainless conversation, though it is noisy, unintellectual, and underbred, it is good to see such happy faces and to know that so many worthy folks, if deadly bores, are thoroughly enjoying themselves, and that things are opened to them which a few years ago would have been hopelessly inaccessible. Certainly they are an infliction to those of their countrymen who may chance to be quartered with them; but even this vexation is not quite without its compensations. The hotels which these travelling hordes frequent are commendable for the English custom of sitz-baths and the like to which these visitors have used them; the tea is better than French tea in general; and the people get so tired of their odd customers that they appreciate any one with *savoir faire*, as they say, and make much of one who can talk fluently in their own tongue. It is a queer study, however, to see these tourists with tickets—a new phase of life for those who travel on their own account; but, if rightly viewed, it is one to teach toleration even through suffering. We may well endeavour to be glad that others can enjoy what we enjoy, though undoubtedly—such is the weakness of humanity—we could wish that that enjoyment was to be had anywhere but where we ourselves may chance to be.

TALL TALK AT THE MANSION HOUSE.

THE so-called "representatives of literature" at the Mansion House have added one more proof that there are many clever men who cannot make a good after-dinner speech. The Lord Mayor indeed makes so many speeches both before and after dinner that practice must in time make him perfect. The representatives of literature were entertained on Saturday last, and on Monday an "interesting ceremony" in which the Lord Mayor was a principal performer was transacted at the Mansion House. The old colours of the 77th Regiment were to be deposited at St. Paul's Cathedral, and for this purpose a detachment of the regiment, headed by the Colonel, came from Woolwich and marched through the City. "The Lord Mayor, who had been previously apprised of the ceremony, presented himself with the members of his family to welcome the escort as it passed." This account of the proceeding is given by a sympathetic reporter, and the Lord Mayor is thus convicted, after orating and perorating abundantly on Saturday night, of making of malice prepense a further oration on Monday morning. The reporter does not indeed tell us what the Lord Mayor said, but he leaves us to infer what his speech was from the answer to it. Colonel Kent on horseback responded to the Lord Mayor on foot, and if he talked the taller talk of the two, we must allow that he had the advantage of position. He mentioned that he was on his way to the grand old Cathedral dedicated to the greatest of the Apostles, and hallowed by the dust of Wellington and Picton. He might have added that this Cathedral is adorned with a remarkable variety of monuments of military and naval heroes. The Colonel expressed the satisfaction of the regiment at the resting-place chosen for its old colours, which will be well cared for and secure, "for there no foreign foe dared come." Strategists generally assume a hostile landing near Dover, and an approach to London from the south-east; and it is a comfort to know that, if an invasion should occur, the Lord Mayor will be ready at the Mansion House with an oratorical broadside, which will effectually confound and frustrate the enemy's march from London Bridge towards St. Paul's. Additional security for the trophies in the Cathedral might perhaps be gained from the probability that the invader would turn aside to the Bank of England.

It is again rather hard on the Lord Mayor that we can only gather by the same inductive process the purport of the speeches which he made on Saturday. Mr. Sala, in responding to the toast of "The Drama," assumed that those professors of theatrical art who were engaged elsewhere would read with pride and gratitude that their profession had been spoken of in such terms as the Lord Mayor had used that night. Unfortunately for this complimentary supposition, actors cannot read, either with or without pride or gratitude, what the Lord Mayor said of them, because the reporters who sat at his table have not cared to preserve his words. "The Lord Mayor then proceeded to propose the toast of the evening," and the reporter, who no doubt knew his business, took copious notes of the responsive speeches. As one line is to a quarter of a column of print, so is a Lord Mayor to a representative of literature, even when the Lord Mayor provides a dinner which his accomplished friends condescend to eat. However, the Lord Mayor may consider himself a modern Falstaff. He is not only a tall talker himself, but he stimulates his guests to mount the highest altitudes of eloquence. Like Colonel Kent on his Crimean steed, all these visitors to the City are mounted each on his peculiar Pegasus. Mr. Sala, in a burst of tempestuous hilarity, reminds his host that a person of the name of Dutton died on that very day, after bequeathing a collection of manuscripts to

the nation. The "cheers" which followed this announcement might indicate the company's appreciation either of manuscripts or of the mortality of the race of Cotton. Mr. Sala had mentioned that a manuscript of his own is still preserved at one of the theatres; and perhaps if the Lord Mayor wishes to imitate Sir Robert Cotton, he might obtain this unsuccessful play as the nucleus of a literary museum. If the materials for Mr. Sala's burlesque were chosen on the same principle as those of his speech, it might easily be a dismal failure. Mr. Froude, in dealing with another head of the same toast, mentioned that authors of former times had large experience of gaol and pillory, and he might have added that they got little venison or champagne. A Lord Mayor or any other giver of dinners deserves the gratitude of those who eat them, but dining in the name of history or poetry or dramatic art is a proceeding of questionable taste. Mr. Froude perceives an advantage which we do not in calling together many members of the literary profession, so that they may see each other and feel that they are members of one great body. There is a story of the late Lord Cardigan objecting to being invited to meet "writing fellows"; on which his hostess answered that she was a "writing fellow" herself. Although we do not form an exaggerated estimate of Lord Cardigan's conversational ability, we can conceive that a slight infusion even of the heavy-dragoon element might be better than having all "writing fellows" at a party. We do not know whether the Lord Mayor intends to give a succession of "banquets" to all the professions which flourish in London. Lawyers, for example, or doctors are quite capable of drinking their "noble selves," which is about what the performance of the literary gentlemen, as expounded by Mr. Froude, came to. Lawyers are quite willing to see each other across a dinner-table or any other table, and the more the merrier; for where one would starve two or three grow sleek. And they are always capable of feeling that they are members of a great body. They had probably happened to hear, before Mr. Froude quoted it, the saying, "Let me make the ballads of the country and you may make the laws"; and their mental comment thereon would very likely be, that in England, happily for them, very few people make ballads and a great many make laws. Just now the legal profession is in high spirits at finding that the last new law reform causes as much litigation as it cures, and if the Lord Mayor will invite the lawyers to dinner, they will certainly make a jolly night of it. He can have three Judges of a Common Law Division fresh from one of those arguments on the Judicature Act which read like a burlesque of the "Three Witches" in *Macbeth*, and he could proceed to propose the toast of the evening—namely, "Conveyancing, Equity, and Common Law"—with which he would associate the names of those eminent practitioners, Mr. Quirk, Mr. Gammon, and Mr. Snap. In emulation of Mr. Sala's rejected burlesque some draftsman might mention that a set of interrogatories prepared by him had been struck out with costs, and we believe that one of these compositions would be as lively as the other. There is, indeed, one difficulty in the way of such a festive gathering as we have suggested, that, although there are lady authors, there are no she lawyers; but perhaps a few elderly judges in full-bottomed wigs and robes might supply an adequate feminine element in the company, particularly as we know that bishops at the opening of Parliament have sometimes been mistaken for peeresses in their own right.

The Lord Mayor has at least succeeded in showing how much nonsense clever men can be got to talk. We saw until this week nothing wonderful in the fact that a nobleman who has written poetry should become Governor-General of India. But now it may almost be said that the presumption is that any "representative of literature" will behave foolishly on a sufficiently conspicuous occasion. There has been nothing like this dinner at the Mansion House since the *Dunciad* was written; and there is this difference, that Pope meant to be satirical, whereas the reporters of these speeches mean to be complimentary. The late Lord Campbell used to say that he only reported Lord Ellenborough's decisions at *Nisi Prius* when they were good law, and it were to be wished that reporters of after-dinner speeches could exercise some discrimination. It is pitiable to read Lord Houghton's expression of satisfaction at meeting at that great and friendly board the "Lords and Commons" of literature and journalism. He assumed that his audience knew who were the Lords and who the Commons, which is more than we know. He seems to compare authors to one House and critics to the other, and to suggest that by dining with the Lord Mayor each House may get on comfortably with the other, and ultimately an author may rather like to have his book cut up by a critic, if only they have partaken of the "loving cup" at the Mansion House together. When Mr. Carlyle's letter of apology was read one might almost have been tempted to exclaim that "he was too wise and too honest to be there." But if he had been there, and had described in his own style what he saw and heard, the world might have gained instruction and amusement. We are quite prepared nowadays to find that even Common Councilmen or their "ladies" write books, or at least pamphlets, and therefore we do not doubt that all the guests of the Lord Mayor were in some sense "representatives of literature in its various branches." The gentlemen who returned thanks for the army and navy might, if they had to justify their presence at this "banquet," contend that the forces to which they belong are to a great extent paper forces. And, besides, liberality in the issue of invitations might be justified by an august precedent:—

> From drawing-rooms, from colleges, from garrets,
> On horse, on foot, in hacks and gilded chariots.

Allowing for the amelioration of modern habits, these lines fairly describe the motley character of the assembly. There seem to have been poets, historians, dramatists, booksellers, and critics, all united for the time in a mutual admiration society of the most harmonious and delightful character. As was said on a memorable occasion, "We cannot be all tailors," and it was perhaps to prevent the "intellectuality" of the company becoming too tremendous and overpowering that a few Common Councilmen with their "ladies" were introduced. They mix earth with nitroglycerine to make the dynamite of commerce, and perhaps a tradesman here and there might promote the cohesion and "stability" of the literary compound. We of course assume that one who makes or sells paper is as much a representative of a branch of literature as one who only spoils it. Here again the Lord Mayor might justify himself by a celebrated example:—

> With authors, stationers obey'd the call.

It is a pity that, instead of merely proposing and acknowledging toasts, the company could not have occupied itself in a revival of the antique ceremonies of the *Dunciad*. Competitors and prizes for heroic games were ready to hand, and the scene was almost the same. The only difference would be that in Pope's time journalists worshipped lords, and now lords worship journalists. In that sense it is still true that

> He wins this patron who can tickle best.

But in this, as in former ages, some flatteries are clumsy and ineffectual. Cringing as a fine art requires careful study, and it must be remembered that there is little pleasure in kicking a limp and abject victim.

THE PROTESTANT REFORMATION SOCIETY.

THE Protestant Reformation of the sixteenth century, from whatever point of view, favourable or unfavourable, it may be regarded, is universally allowed to be one of the most momentous and pregnant events in modern history. Its influence, indeed, as a factor in the course of human development, has been rather of an indirect than a direct kind, having mainly consisted in the impulse it has given to intellectual and political progress. Religious liberty, as a modern author has justly observed, owes nothing to it as a dogmatic system. On the contrary, "persecution among the early Protestants was a distinct and definite doctrine, digested into elaborate treatises, indissolubly connected with a large portion of the received theology, developed by the most enlightened and far-seeing theologians, and enforced against the most inoffensive as against the most formidable sects." And yet to the Reformation, though not to the Reformers, "is chiefly due the appearance of that rationalistic spirit which at last destroyed persecution." The public revolt against the established religion of Europe created a general spirit of insubordination, and, through the number of questions which it became necessary virtually to submit to the decision of the multitude, provoked a spirit of restless inquiry, and led to the formation of a great variety of opinions on other subjects besides those which are handled in creeds and articles of faith. Hence Protestantism, notwithstanding its rigid and dogmatic character as it came from the hands of Luther and Calvin, has gradually developed what has been called, by friend and foe alike, "its admirable flexibility of doctrine," very much against the intention of its original founders and the will of some who inherit their name. The results of the Reformation, as a great movement of the human mind, are certainly visible enough, for good or for evil, at the present day, and hardly less visible, we may add, in spite of the seeming paradox, within than without the pale of the Roman Catholic Church itself. But the Reformation as an ecclesiastical and theological scheme or conception is a thing of the past, and it is the veriest anachronism to attempt to revive it. Reformed Churches there are, of course, both in this country and elsewhere, but their standpoint is not that of the men who moulded or remoulded them three centuries ago. The Church formed by Luther himself in Germany had long silently dropped his characteristic tenets, and now no longer even bears his name. The Anglican Church may have altered greatly for the better, but there can be no doubt that it has departed widely from the tone and spirit sought to be impressed upon it by such authorities as Cranmer and the authors of the almost forgotten *Second Book of Homilies*. The "Counter Reformation" in the Church of Rome which Ranke has so vividly depicted, and the general fermentation of civil and religious life which may be said roughly to date from the first French Revolution, are both in different ways fruits of the Protestant Reformation; but they have also gone far to obliterate from the modern world all traces of the state of things which it originally created or assailed.

Such are evidently not the thoughts familiar to the friends and supporters of the Protestant Reformation Society, which held its annual field-day this week at Willis's Rooms under the presidency of Sir Thomas Chambers, the veteran champion of the claims of deceased wives' sisters to marry their brothers-in-law. But they are thoughts inevitably suggested to our mind by the report of the proceedings. The Society represents just one of those "survivals" which are no less frequent, and certainly no less curious, in the moral than in the material domain. It is not so many years since a distinguished divine of moderate, though somewhat Evangelical, views unwarily suffered himself to be entrapped into presiding at a branch meeting of the Society for Converting Irish

Roman Catholics. His consternation may be imagined when the energetic "deputation from the parent Society" opened his address by glibly announcing as the fundamental principle on which it took its stand "that no Roman Catholic could be saved." Such startling avowals are, of course, not likely to find their way in the present age into the pages of a popular magazine. Yet we were rather surprised the other day to come across a sentence in the current number of the *Contemporary Review* which breathes a very similar spirit. "Where the Spirit of the Lord is, there is liberty; where the Church of Rome is, there is none." There is not, to be sure, much civil liberty to be looked for where the Court of Rome, as at present minded, has its way; but St. Paul was not speaking of civil liberty in the passage quoted by the Reviewer, and the Church of Rome is not the same thing as the Curia. But to return to the Reformation Society. The Annual Report of the Society appears to be not yet published, and we are therefore obliged to trust to the brief account of it contained in the newspaper reports of the meeting. But, as far as our information enables us to judge, there is the strangest want of logical coherence between the reasons urged for supporting the Society and the recorded results of its labours. "The Report," we are told, "stated that it became every year more evident that the attempt to subjugate our country and Romanize its Church gained in force." And the Chairman seems to have fully endorsed at least the second half of this alarming announcement. "It was a great calamity that so many parties in the Established Church of the country were *now* actively endeavouring to pervert others, and bring them over to the Romish faith." Without pausing now to inquire into the grounds for these startling allegations, one cannot help feeling that, if there is any truth in them, and if their truth is really "becoming more evident every year," the Protestant Reformation Society, which has been at work, we believe, some thirty years or more, has been, to say the least, anything but a success. And it is therefore not easy to understand why the sentence we have just quoted from the Chairman's speech should have been immediately followed up by the remark that "all this showed the value of this and other similar Societies." It would appear on the contrary to an outsider to show how useless they have proved. There may of course be a great difference of opinion as to what precisely constitutes "Romanizing" the Church of England. Thus, for instance, at a meeting last Tuesday of the Church Association, which is a body expressly organized for putting down such practices, a clerical speaker and Canon is reported to have observed that "few abuses in public worship could be more painful to a heart longing to join in the service of God than that of a whole assembly of professed worshippers remaining silent, whilst a choir performed for their pleasure." But that is just what has always been, and is still to a great extent, the ordinary practice of our cathedrals, which are not usually regarded as centres of a Ritualistic or Romanizing movement. On the other hand, lovers of music are rather apt to complain, not without asperity, of the passion of so-called Ritualists for introducing congregational chanting of a character more fervent than harmonious. Be that as it may, there has been and is, according to the testimony of the Reformation Society, a terrible advance of the Romanizing propaganda, in whatever sense they understand it; and we therefore fail to apprehend how the facts, as stated by themselves, bear out their claim to having rendered valuable service in repelling it.

But this is not the only indication of a rather perplexing inconsequence in the statements of speakers at the meeting. The Rev. Dr. Blakeney proposed a Resolution, which was passed, "That at no period since the Reformation has the Church of Rome displayed greater zeal, or pursued a more fiery proselytism, than during the period between the last Œcumenical Council at Rome and the year 1876." It would again be obvious to observe on this that the efforts of the Protestant Reformation Society do not seem to have been signally blessed during the last five years. But we have cited the words of the Resolution for a different purpose. They apparently imply that proselytism is not only mischievous when conducted in the interests of "Romanism," but wrong in itself. And forcible proselytism cannot be intended; for, whatever may have been her will, the Church of Rome has had no opportunity of imposing her creed by fire and sword since "the last Œcumenical Council," as the Resolution expresses it, thereby putting the Vatican Council on a par with the Council of Nice. But the dwellers in glass houses should not throw stones, and if proselytism is wrong, it is wrong for everybody alike. A benighted Romanist may be altogether mistaken in his creed, but clearly, if it is right to convert people to the true faith at all, his only course is to try and convert them to the faith which he holds to be the true one. And the Chairman of the Reformation Society not only thinks it is right, but actually bases the special claim of that Society to public support on the fact that it is distinguished from all others by being a directly aggressive and proselytizing body. "The Chairman said, the Society, as distinguished from other Societies, *attacked the religion and the faith of Rome*, its object being directly to convince Roman Catholics of the errors of the Romish faith." That is to say, it does precisely what it condemns the Church of Rome for doing. The difference, according to its own estimate, is not in the policy pursued, but in the success, which does not seem in its own case to have been as yet translated from the pleasures of hope to the pleasures of memory. "All this" appears to us to show, not "the value," but the worthlessness, if not positive mischief, "of this and similar societies." If there were any reason—as there is not—for believing the rodomontade talked on such occasions about the subjugation of the country to Rome, and the like, which is periodically reproduced by such speakers as Sir T. Chambers and Mr. Whalley when the question of Convents or Roman Catholic Prison Chaplains comes before Parliament, there would be not the less, but the more, reason for deprecating the feeble fury that irritates and invites the aggression which it can do nothing to repress. It was currently believed at the time of the Civil War of the seventeenth century that Jesuit missionaries were in the habit of assuming the garb of Puritan preachers in order to aid in accelerating the downfall of the Established Church. The rumour was probably fabulous, but it was not altogether irrational. If we were privileged to enjoy the confidence of the modern Jesuit Camarilla, we may safely affirm that it would be found to regard with a mingled feeling of amusement, and of something more akin to complacency than impatience, these annual demonstrations of the "Holdfasts," as the members of the Reformation Society dubbed themselves the other day by a final Resolution. All the leading Tractarian converts began life as strong Evangelicals, and Exeter Hall has proved in the long run a most efficient forcing-house for the Vatican. We are more than half afraid that, if its annals were too curiously inspected, even the Protestant Reformation Society might turn out not to be immaculate. Indeed there is a suspicious ring about this closing exhortation to its members to "receive" the name of Holdfasts, "and commend it to all who waver, or are tempted by the seductions of Romanism." We will not quote the Scriptural warning to those who think they stand; but, if our "Protestant" friends would only take the hint kindly, we should be disposed to suggest that their Protestantism might be none the less unsuspected if they did not protest quite so much.

DAHOMEY.

THE King of Dahomey is required to pay an indemnity of five hundred puncheons of palm oil for an outrage committed on a British subject, and is threatened in case of refusal with a blockade of his coast by a British squadron. The King has answered the demand for indemnity by an invitation to the British commander to come and take it, and thus a prospect begins to appear of another African war, probably successful, doubtfully glorious, and certainly expensive. The blockade is sure to cause heavy losses to British traders, and it may or may not bring the King to reason. One version of the King's answer promises, if Commodore Hewett liked to come and get his fine, to pay him in powder and bullets. Another more polite form of response expresses the King's inability to pay the fine until he has seen the Commodore and judged whether the amount is correct. But it seems that the more brief and peremptory message is the genuine product of the King's mind, and, besides, the circumlocution adopted by the intermediate "authorities" comes practically to the same thing. We are told, and we should be glad to believe, that Commodore Hewett has not threatened more than he can perform. He will strictly blockade the two rivers by which Dahomey receives merchandize, and this will inflict so serious a loss on the revenue that there will be no need to accept the King's insolent invitation to his capital Abomey. We are also informed that the King's army have a considerable number of Snider rifles with ammunition, and are well practised in their use. The celebrated Amazons, if they exist, will probably not inspire British sailors with terror. But it may be expected that the Commodore, if compelled to adopt hostilities, will confine himself to the coast, and will await instructions and reinforcements from home before risking an attempt in which failure might be disastrous. If the blockade should bring the King to reason, it will show that an African potentate is capable of feeling in his pocket, and this will mark a decided advance in civilization.

If an expedition should become necessary, our recent experience of Ashantee will be useful. The Gold Coast and the Slave Coast extend from Cape Three Points to Lagos, and behind them are these two countries, Ashantee on the west, and Dahomey on the east, with the river Volta between them. The Kings of Dahomey occupy a conspicuous place in the literature of the last century, when the slave-trade was pursued with the same unhesitating energy with which we now "open up" a new market for ivory or palm oil. These Kings, observing that the greater part of the exported slaves were obtained from their territory, strove with vigour and success to bring themselves as sellers into immediate contact with European purchasers. As this policy commenced more than one hundred and fifty years ago, it may be hoped that the present King has an enlightened commercial intellect capable of appreciating the disadvantages of a blockade. He might, indeed, argue that the stress of it would fall firstly on European traders, secondly on his own subjects, and only in the last extremity on himself. He is, of course, cruel, and, if he is also obstinate, he may determine that, as long as his people have, he will not want, and thus the question which awaits solution seems to be whether his pride or his pocket is the more sensitive. Yet the first of his predecessors who came in contact with the English is described as a man of remarkable talent as well as ambition and ferocity, a character which might have been written for Peter the Great, under whom Russia first began to claim a place in civilization. All these African potentates have wants, real or imaginary, which only Europe can supply, and thus our naval commanders have perhaps

a hold upon them. Lieutenant Cameron lately described his reception further south by a King wearing a state dress consisting of a cocked hat and a Scotch plaid. The King of Dahomey, it may be believed, has at least an equal sense of what is due to his own dignity and comfort; and indeed the more courteous of his two supposed answers, which may be accepted as at least a plausible forgery, purports to invite Commodore Hewett to stop, or, as they say in the navy, stow, all war palaver, and be a merchant, and load his ships with rum, cloth, and other articles, and come and trade with him. The young lady lately quoted by Mr. Disraeli could no doubt favour him with an extract from some treatise on geography to the effect that the chief ornament of the Royal residence at Abomey is human skulls, and that, when a ceiling requires to be newly decorated, it is usual to massacre some scores of persons for the purpose. This statement may have been true when it was written; but, on the other hand, Lieutenant Cameron mentioned that the King whom he visited possessed and highly valued an arm-chair, and there can be no doubt that the desire to possess a solid and impracticable piece of furniture is one of the most powerful and general of human motives. Nobody, we believe, ever rested at an inn in the most inaccessible part of Switzerland without observing a ponderous sofa or bedstead and wondering how it got there. It may therefore be guessed that the King of Dahomey has got beyond the raw-head-and-bloody-bones style of domestic ornament, and requires clothes and furniture; and it may be further assumed that rum, or perhaps champagne, is necessary to his comfort. We do not know whether the ladies of his bodyguard appear on parade in Parisian bonnets; but we may be sure that they would wear European finery if they could get it, and, on the whole, we may assume that civilization is progressing in Dahomey. As long ago as 1724, when the King of Dahomey, fighting his way towards the sea, captured the chief town of the kingdom of Ardra, and made prisoner Mr. Bulstrode Lamb, factor for the English African Company, he had sense enough to treat his captive with kindness and consideration, although this was the first white man he had ever seen. The earliest account of Dahomey existing in our literature is, we believe, a letter written by Lamb after he had been some months in captivity, to his superior, Mr. Tucker, Governor of the English fort at Whydah, and dated from Abomey in 1724. It will appear from this piece of history that Commodore Hewett, is not the first Englishman who has been invited to come and stay at Abomey. Three years afterwards this same King marched to the coast, conquered the State of Whydah, laid in ruins the English, French, and Portuguese forts, and made prisoners of the captains of these forts, and all the European residents. We can imagine our countrymen bearing this adverse fortune with the same constancy and sense of duty that appeared in the Indian Mutiny of our own time, and it is not to be supposed that in moments of pain or danger their consciences were disturbed by any scruples about the morality of the business in which they were engaged. They would perhaps have argued that men were better off as slaves than giving their skulls as paving-stones for their King's palace.

Attention has been lately drawn to the life of one of the leaders of that philanthropic band which "rescued Africa from the woes and the British Empire from the guilt" of the slave-trade; and it may be interesting to observe by way of contrast those records of our early intercourse with Dahomey which belong to the latter half of the last century, when Bristol and Liverpool did a steady business on the Slave Coast. This trade was begun by Portugal as a religious work, pursued by all commercial nations for the sake of gain, and abolished for the reasons expressed on Zachary Macaulay's monument. Portuguese discoverers of Africa believed no less than the abolitionists of Clapham that they were guided in their counsels and labours by a "favouring Providence"; and as they showed us the way to India, we shall probably conclude that, on the whole, they did more good in the world than harm. Our own establishments on this coast, as in India, were originally commercial. The African Company of 1754 was charged with the maintenance of all the British forts between Cape Blanco and the Cape of Good Hope. This Company, unlike others which preceded it, was prohibited from trading on its own account. But all the forts and garrisons were vested in it, and it admitted, on payment of 40*s.* fine, any merchant to be a member of the corporation and to enjoy all the privileges of the African trade. The Government was vested in a Committee of nine persons, elected annually by the freemen of the Company resident in London, Bristol, and Liverpool. For the purpose of maintaining the forts and garrisons, an annual sum of 13,000*l.* was voted by Parliament, for the due disposal of which the Committee were responsible to Government. The salaries of their clerks and agents, with all other expenses of management, including compensation to the members of the Committee for their trouble, were allowed out of the sums received as fines of admission from the freemen. In the course of time it happened that the whole expense of the Company came to be defrayed by the public, and for this reason the charter of incorporation was recalled by Parliament in 1821. The possessions of the Company on the West Coast of Africa were by this Act annexed to, and made dependencies upon, the colony of Sierra Leone.

It is estimated that during more than a century one hundred thousand persons were annually removed from Dahomey as slaves. In the years that followed the abolition of the slave-trade there was a great decline in the number of vessels that visited the coast. Many of the numerous factories and forts erected for the protection of the slave-trade were broken up and abandoned on its abolition. The principal English fortress was Cape Coast Castle, which is still maintained. Next to this in importance was Accra, and the furthest of these fortified settlements to the east was the English fort of Whydah, where the present "difficulty" with the King of Dahomey has arisen. Similar establishments of French, Dutch, and Danes were thickly studded along this coast. The unhealthiness of the climate was proverbial. It was said that there were always two Governors of Sierra Leone, one going out to his post, and the other returning home dead. But it was a convenient place for Government to bestow on a supporter who affected Parliamentary independence. This settlement, be it observed, was founded in 1787 by philanthropists who undertook to show that colonial productions could be obtained without slave-labour, in which enterprise they have indifferently succeeded. We do not know whether those were also philanthropists who settled a lot of negroes in Nova Scotia; but we cannot help suspecting that, if they had known whither they were going as freemen, they would have preferred to remain as slaves in the West Indies. They could not bear the severity of the Northern climate, so they were removed to Sierra Leone, whither another lot, who had been living in destitution in London, and probably doing the "man and brother" business, had previously been carried. Then a lot of Maroons, probably rebels, were transported from Jamaica, and a black regiment disbanded in the West Indies were also added to the new colony. Thus the colony has continually increased; but probably, after the manner of their kind, these negroes have confined themselves to raising as much colonial produce as was necessary for their own consumption. The town has had during many years the advantage of whatever money its traders could make out of the squadron maintained for the suppression of the slave-trade. It lies, however, far to the west of Cape Three Points, which has usually been taken as the western limit of the Gold and Slave Coasts. It seems that there are still French and Portuguese as well as English "houses" or "forts" at Whydah, and all traders are alike interested in the peaceable settlement of Commodore Hewett's demand on the King of Dahomey. But whether it will be settled peaceably we cannot tell. If it be not, the present Government will obtain whatever glory is to be got out of a second edition of the Ashantee war.

THE OPERAS.

MR. GYE this year opened his musical campaign a long time before the other house entered an appearance. In the earlier part of his season, in accordance with what seems to be an established custom, he produced various new singers, none of whom have yet made any marked impression. Nor were the well-known operas which he presented given with any remarkable degree of excellence. It would be difficult to find anything much more ragged than the performance of the *Huguenots* which took place with Mlle. d'Angeri as Valentine. It is enough to say of it that its most satisfactory part, on the whole, was the Marcel of Signor Bagagiolo. Mlle. Marimon, who is too seldom heard, has appeared as Norma in *Don Pasquale*. She sang with rare perfection, and gave a singular charm to Norina's coquettish graces. But not even the acting and singing of Mlle. Marimon can save the fun of *Don Pasquale* from being somewhat heavy. In the performance of *Faust* at the same house Mlle. Albani appeared as Marguerite, and M. Maurel filled the place of M. Faure, in whom Mr. Gye has lost a tower of strength, as Mefistofele. Mlle. Albani has improved both as to singing and acting in the part of Marguerite. Her delivery of the jewel song was especially good, and her acting in the trying scene of Valentine's death had much feeling and skill. M. Maurel's performance of Mefistofele was more curious than satisfactory. M. Maurel was, as is known, a pupil of M. Faure, and he has, as we think injudiciously, been told that he can rival his master. In playing for the first time in London one of M. Faure's finest parts, the younger singer seems to have wished to show that he need not depend upon imitation for success. In the acting of the character he secured originality by being as little diabolical as may be. He was pleasant and gentlemanlike throughout; but that is hardly one's idea of all that Mefistofele should be. In the well-known scene of shrinking from the cross handles of the swords held up to him M. Maurel played with what has been justly termed an absence of exaggeration; but this included also an utter absence of spirit and effect. His singing was throughout steady, if inclined to tameness; he was at his best in the delivery of the serenade, which was for the most part modelled on M. Faure's. But the good-humoured laugh which he has added as he goes up the stage at the end might be judiciously omitted. M. Maurel has devised a new costume for Mefistofele, whom he dresses in black for the beginning and end of the opera, and in grey satin slashed with black, for the market and garden scenes. It has been objected that the conventional red is too eccentric, and would attract too much attention from the crowd. But it may be noted that many of the crowd are also dressed in red; only their costumes are less brilliant than that of the ordinary Mefistofele. In the cathedral scene M. Maurel appeared draped in deep black, with a living flame substituted for the feather in his cap. We may next expect to see him appear with a practicable tail.

The event of the season, as yet, at Covent Garden has been the production of *Tannhäuser*. It would in some respects have been more reasonable to bring out this opera before *Lohengrin*, which was a later development of the composer's ideas. *Tannhäuser*

consequently has much more resemblance to the usual forms of opera than is contained in *Lohengrin*. There are airs, or something very like them, to be found in it, and there is no passage so difficult to admire as the dreary dialogue between Friedrich and Ortrud in *Lohengrin*. The story of the opera, which is constructed out of more than one legend, has considerable beauty and interest.

The first scene, introduced by an overture through which there runs what we can best describe as a wave of tender, penetrating music, but which is, we think, disfigured by the undue prominence in one passage of the clashing of cymbals, opens in the Hörselberg, where Tannhäuser is lying asleep, watched over by Venus and surrounded by her attendant nymphs, who go through a kind of bacchanal dance, while the alluring song of sirens is heard from the background. Here the magic properties of the place must undoubtedly have been called in for Tannhäuser's benefit. No mortal under ordinary circumstances could have slept through the din of the ballet going on around him. In the course of this ballet, according to the stage direction, *una stanchezza e sonnolenza generale* seize upon the dancers, who disappear gradually, while a rosy vapour rises and conceals them, leaving Tannhäuser and Venus alone in front of it. The scene would be more effective if a greater attempt were made to carry out the composer's intention in this matter. There was certainly no sign of weariness in the activity with which the dancers ran off the stage, and there was very little mystery about the rosy vapour painted on the flat which shut in the scene. The stage of Covent Garden gives every facility for mechanical illusion, and it is a pity that its capabilities should not be turned to account when illusion is especially desirable. Left alone with Venus, Tannhäuser wakes from a dream of his life on earth before he entered the enchanted mount, and presently, taking up a lyre and addressing Venus in a passage of singular beauty, of which the theme reappears afterwards, he, judiciously beginning by celebrating her beauty, ends by pointing out that it is too great a privilege for a mere mortal to gaze on such divinity, and begs for his freedom. Venus is naturally enraged at this, and there follows a discussion between them. There is a striking simplicity in the English version of this given in the book of the opera:—

> *Venus.* Well, then, thou faithless traitor, mortal hateful,
> My prisoner, hence to thee you'll try in vain.
> *Tannhäuser.* To thy love, believe me, I'm not ungrateful,
> But still I can no longer here remain.

Venus cajoles and threatens by turns; but Tannhäuser's longing to return to earth is unchanged, and, when Venus tells him that he has already forfeited his safety on earth and in heaven, and had better stay with her, he replies by invoking the Virgin Mary, upon which, with a clap of thunder, Venus disappears, and Tannhäuser finds himself in a sunny valley, with the Castle of Wartburg at the back of the scene. Here there occurs a song, supposed to be sung to his pipe by a shepherd boy; and perhaps such music may have been produced by shepherds in the thirteenth century, but its reproduction in the nineteenth appears unnecessary. The scene is presently filled with a procession of pilgrims, by whose presence Tannhäuser is moved to repentance and prayer, and to these succeed the Landgrave of Thuringia and his attendant bards, returning from a hunting-party. They recognize Tannhäuser, who had disappeared a year before, and greet him with joy. He is, however, bent on leaving them and pursuing his way alone, until Wolfram speaks of Elizabeth, the Landgrave's daughter, whose hand Tannhäuser had won in a tournament of song just before he was enticed into the Hörselberg. This alters Tannhäuser's resolution, and he consents to go home with the Landgrave's party, filled with joy at the prospect of seeing Elizabeth again. There is much to admire in the music of this scene, of which the brightness and clearness make a contrast to the whirling and passionate strains of the former scene. But Herr Wagner's terrible fondness for the blasts of horns has produced an effect which is to us singularly unpleasant at the entrance of the Landgrave.

The second act is opened by Elizabeth, who comes into the Hall of Song in the Castle of Wartburg, and sings her delight at the return of Tannhäuser, who presently enters and joins her in a duet of great power and beauty. Then the Landgrave comes in, and shortly after his appearance preparations are made for a song tournament. To the music of the march, which is probably the best known piece in the opera, the Landgrave's nobles, knights and ladies, enter and take their places on a huge daïs ranged along the side of the stage. There is much that is impressive and majestic in this scene. As group after group come in, and, making their obeisance to the Landgrave, go up to the daïs, the music seems to swell both in volume and meaning until it carries with it an almost overpowering sense of vastness; and the eye, ranging over the immense crowd on the stage, takes up the suggestion made to the mind through the ear. When the court is assembled, the bards, robed picturesquely, crowned with wreaths, and each bearing a lyre, enter, and, after an address from the Landgrave, the contest begins. The theme given is love, and Wolfram (a character finely sung and acted by M. Maurel) begins by praising ideal love. There was much delicacy and feeling in M. Maurel's delivery of this passage, of which the music is strikingly tender, and his phrasing here, as throughout, was excellent. Tannhäuser replies to him in a strain indicating that he admires a more material form of love than that which Wolfram has sung. The contest is taken up by the other bards, Walter and Biterolf, to whom Tannhäuser replies so insolently as to excite the wrath of the assembly. The Landgrave rises to enforce peace, and Wolfram again puts forth his views, upon which Tannhäuser, burning at what seems to him the impious insult aimed at Venus, of whose memory he is full, bursts wildly into the song of the Hörselberg, and reveals the secret of his visit there. Consternation seizes the assembly at having harboured and listened to such a monster, and the bards are rushing on Tannhäuser with drawn swords, when Elizabeth throws herself between them, and obtains his pardon on condition of his making a pilgrimage to Rome and praying for absolution from the Holy Father. The music of this act is full of fire and depth. Towards the end there is a tempest of passionate sound rising and swelling in intensity to a very whirlwind. But it is so controlled and ordered that one thinks rather of the sweep of some planet through a vast orbit than of the chaos of a storm. The act ends with Tannhäuser's kneeling and kissing the hem of Elizabeth's robe, while the Landgrave and bards stand around in pity and grief. The poetry of the situation and the passion of the music are in the highest degree moving.

The fine effect of the whole scene was due in no small measure to Mlle. Albani's singing and acting as Elizabeth. She gave the music well throughout, although there was a slight tendency to force the high notes; and her acting was excellent, as well when she was listening to the bards as when herself engaged in the action of the scene. At the discovery of Tannhäuser's secret, and at her interposing to save him, Mlle. Albani displayed a power that one might not have expected. Signor Carpi (Tannhäuser) rose to the occasion much better than could have been guessed from his somewhat hard performance in the first act. Signor Capponi's fine voice and delivery told well in the Landgrave's music. He would do well to modify his costume. The gorgeous robes and the curious head-dress, which resembles a jewelled tea-kettle, make one think of the Emperor in "Aladdin."

The last act, which passes in the Valley of Wartburg, as does the latter part of the first, is in some sense an anti-climax. There is a beautiful prayer to the Virgin for Elizabeth, sung admirably in expression and execution by Mlle. Albani; and there is an address to the evening star for Wolfram, which M. Maurel gave with complete feeling and skill. The rest of the act is taken up with the return of Tannhäuser from his pilgrimage, his despair at the Holy Father's answer that he should be forgiven when his staff blossomed, his appeal to Venus, who reappears to him, and his salvation from her by the holy influence of Elizabeth, whose funeral passes across the stage just after Venus has vanished in baffled rage. The interview between Wolfram and Tannhäuser is too long, and should if possible be cut down. Indeed the whole opera is of a merciless length, which is partly due to the fact that almost all the times are taken too slow, with the exception of the march, which is played too quick.

Mr. Mapleson has not been very long in the field at Drury Lane; and one is naturally inclined to wait until M. Faure arrives to hear several of the operas which have been put up. When he comes Mr. Mapleson should be able to present a cast of very unusual strength. Meanwhile there are several fine singers besides him assembled at Drury Lane, and we hope to find an early opportunity for saying something of Mr. Mapleson's performances.

RACING AT NEWMARKET AND CHESTER.

A PETITION of some importance was presented last week to the stewards and members of the Jockey Club. It purported to emanate from owners and trainers of horses, but nine-tenths of the signatures belonged to the latter class, while not a single leading owner appended his name to the document. The petitioners draw the attention of the Jockey Club to the evils of the practice commonly known as touting and horse-watching, and to the fact that information as to the work, health, condition, capabilities, and private trials of racehorses is systematically, though surreptitiously, obtained from servants, boys, and apprentices in training-stables by the paid agents of the sporting papers. They proceed to say that the result of this system is to corrupt and demoralize the persons employed in training-stables, and to destroy the confidence that should exist between them and their masters; and they appeal to the Jockey Club to take immediate steps to resist the growth of a practice "so entirely subversive of the morality and best interests of the Turf."

Now, to a certain extent, the prayer of this petition is quite legitimate. Horses are the private property of their owners, who have to pay for their keep, their training, and their engagements, and who may reasonably object to any interference with them on the part of the outside public. And so far as trainers stand in the place of owners, and carry out the instructions given to them by their employers, they, too, are entitled to raise a similar objection. There is no doubt that the facts stated in the petition are in the main correct. The public, in its insane passion for betting on horse-races, will pay any price to get information about horses in training; and whether that information is accurate or not is a matter of comparative indifference, so long as it comes early. The sporting papers undoubtedly supply a part of this demand, and furnish intelligence as to trials and other training matters which it is reasonable to suppose can often be obtained only by unfair means. But it is ridiculous to allege that the sporting press alone is responsible for the nuisance of touts and horse-watchers. A great many people who are rich enough to afford the luxury employ touts and horse-watchers of their own. The big book-makers would be little satisfied with the scraps of news they can pick up in the sporting papers, but must have more regular and more authentic intelligence before they risk their

thousands; and the big backers of horses, though far more reckless in their ways, yet from force of example follow suit, and pay for information by which they do not always profit. We should be surprised if even the members of that distinguished body the Jockey Club could one and all lay their hands on their hearts and declare that they had never availed themselves of the services of that irregular body against which the trainers have declared war. Anyhow, the sporting papers are only responsible for a small part of the touting and horse-watching which regularly go on. We need hardly say that we have no sympathy with such practices. We regret the love of gambling, but for which there would be no such persons as touts and horse-watchers in existence; and we regret that, for the sake of gratifying an unhealthy passion, men presumably respectable should stoop to the meanness of bribing the servants of their neighbours—possibly of their friends also—and of sneaking after information which they cannot otherwise obtain. On the other hand, we have little sympathy with the owners and trainers who have just worked themselves up into a state of righteous indignation. They preach of morality and honesty, of the duties of servants towards their masters, and of the happy confidence which ought to exist between the two. But they say not a word as to the reasons why the secrecy with which their operations are conducted is necessary, or why it should be forbidden to the outer world to know anything that goes on within the prison walls of the great training establishments. Yet this is a question which lies at the root of the whole matter. Why should owners and trainers wish to make a mystery about the work, the health, the condition, the capabilities, or even the trials of their horses? Would their horses suffer in health or deteriorate in condition because that portion of the public which troubles its head about racing matters became acquainted with their several merits? What advantage is to be gained by keeping the public in the dark? We fear that there is a very intelligible answer to these inquiries. The few owners who race for honour and glory cannot care how much or how little is known about their horses; but the majority who race for profit are compelled to keep their training operations as much as possible from the light of day for fear of endangering their profits. These considerations of pecuniary gain actuate alike those who employ horse-watchers and those who clamour for their suppression. The employers of touts hope to make money by the information they may succeed in ferreting out; and owners and trainers hope to make money by the information they strive to keep to themselves. Sportsmen like Lord Glasgow in the past and Lord Falmouth in the present, having nothing to conceal, are not disturbed when all the world knows that one of their horses cannot go more than half a mile and another can stay for a week. Rather, when they have a good horse, they are proud that all the world should be aware of his merits, and they would not take the trouble, even if they condescended to the meanness, of bamboozling the public with mock gallops, and false trials, and laborious attempts, unfortunately too often successful, to make the worse appear the better horse. Such sportsmen, however, are the exception, not the rule; and the many in whose eyes a racehorse, to use the late Lord Derby's words, is nothing but an instrument of gambling, are naturally indignant at the thought that any outsider should pick a plum or two out of their own particular pie. The petition we have mentioned has been referred by the Club to a Committee appointed to revise the rules of racing, but we suspect we shall not hear very much more about it.

The field for the One Thousand Guineas was about up to the average in point of numbers, but the race attracted comparatively little interest, it having been clearly shown in the principal two-year-old races of 1875 that the fillies were much inferior to the colts. We may just refer to the performances of the most conspicuous among the thirteen runners. Camelia, the French-bred daughter of Macaroni and Araucaria, won two out of four races last season. At Newmarket she ran a dead heat with Gilestone for third place in that celebrated race which Fordham on Levant just snatched by the shortest of heads from Farnese, a like distance only separating the dead-heaters from Lord Falmouth's horse. This was Farnese's first appearance in public, and, looking at what he afterwards accomplished, as well as at the fact that the Mineral colt finished behind the four we have named, the performance was a good one on the part both of Levant and Camelia, and might seem to contradict what we said just now as to the inferiority of the fillies. Levant, however, never forgot the punishment she received in this race, and Camelia was none the better for her exertions on the next day, when her stable companion Allumette gave her 3 lbs. and an easy beating. Subsequently Camelia beat Solitude at Goodwood, and Gilestone and Levant at Brighton, after which she retired for the season. Allumette, a daughter of Caterer and Feu de Joie, gained her solitary victory over Camelia, but was beaten afterwards by Brigg Boy, Rosinante, and Red Cross Knight. Last week it appeared to be forgotten that Allumette had once beaten Camelia, for while the latter was second favourite, the former started at an extreme outside price. La Seine, also French-bred, by Tournament out of the famous La Touques, was made first favourite, though her two-year-old running hardly warranted her elevation to such a position. She was beaten a long way in the Middle Park Plate, and also in two Nursery handicaps at Newmarket and Brighton. Twine the Plaiden won five races out of seven as a two-year-old, but the company she met was not of the highest order. She beat Zee three times, and Camembert, The Flirt, Fetterlock, and Great Tom; but both Skylark and Springfield disposed of her with great ease. The Flirt and Zee were apparently held safe in the One Thousand by Mr. Bowes's filly, though it must be said that, as soon as the former passed out of Lord Falmouth's possession, her form began to show a wonderful improvement, and her new owner carried off three or four good races with her assistance. Margarita won two races out of six as a two-year-old, and her second victory was of great merit. It was gained at Stockbridge against a good field, including Kaleidoscope, Retrospect, and Hellenist. Later in the year, however, she failed to exhibit the same form, and was beaten at Doncaster by Ithona and Charon, while, in the second edition of the Troy Stakes at the Houghton Meeting, Kaleidoscope took ample revenge for his defeat at Stockbridge. Of the remainder of the One Thousand field, to which Mr. Crawfurd contributed a couple, and Lord Falmouth and Lord Rosebery one each, we need not speak. It was generally thought that Twine the Plaiden had not improved, and La Seine and Camelia attracted the greatest share of attention. There was only one false start, and when the flag fell La Seine and Twine the Plaiden took the lead, with Camelia and Allumette, on different sides of the course, in close attendance. To this quartet the race was confined after the first half-mile, and when Twine the Plaiden stopped in the last two hundred yards, it was clear that the French fillies would secure the first three places. The first of the three to give way was La Seine, and thenceforth a close struggle between the stable companions Camelia and Allumette was maintained to the finish. The issue was in doubt to the very last stride, when Camelia just got her head in front, and gained the judge's verdict. It is clear that the defeat of Camelia by Allumette last year was not such a mere matter of chance as was imagined at the time, and Count de Lagrange is fortunate to have two such good strings to his bow in the forthcoming Oaks. Lord Rosebery's representative, Majesty, ran sufficiently forward to give him some idea where Levant would have finished; and probably the daughter of Adventurer would be a dangerous antagonist at Epsom if her temper could be relied on. The more she ran, however, last year, the more shifty she became, and such dispositions do not generally improve with age. Twine the Plaiden will probably be in better condition by the 2nd of June; but she ran in the One Thousand very much like a non-stayer, and according to present appearances the Oaks seems destined to fall to the foreigners.

As far as the general racing was concerned, Newmarket never showed to less advantage than in the Two Thousand week, and it is well nigh impossible to discover even half-a-dozen items worthy of comment. Earl of Dartrey carried off the Prince of Wales Stakes in good style from Dalham, Tartine, Stray Shot, Lacy, and Timour. Mr. Savile's horse had beaten Timour in the Craven Meeting, but, as he had now to give 7 lbs. extra, it was thought that Prince Soltykoff's horses would turn the tables. He was beaten, however, far more easily than before, and Earl of Dartrey, who, though of a first-class quality, is yet superior to the average of handicap horses, had no difficulty in bringing his 8 st. 9 lbs. to the front. On the third day of the meeting Camembert, Wild Tommy, Coltness, and Dandelion met on the Rowley Mile, and a good race between the first three ended in favour of Camembert by a neck, a like distance separating Wild Tommy from Coltness. The winner ran very fast in the Two Thousand, and, though not persevered with at the finish, was evidently quite as good as, if not better than, the majority of the field. For the Newmarket Stakes only Skylark and Gheis put in an appearance, and Lord Falmouth's unbeaten son of King Tom cantered away at his pleasure from Mr. Crawfurd's horse, who, it will be remembered, had been suddenly made a leading favourite for the Two Thousand only a few days before the race. If Skylark stands his preparation for the Derby he will be a worthy antagonist to Petrarch; but there are threatening rumours as to his ability to do the work required of him, especially if the ground continues hard during the next fortnight. It will be a pity if anything should happen to Skylark; for he is, as far as outward appearance goes, a thorough Derby horse, and he has proved himself a worthy son of a worthy sire.

We may just add a few words about the Chester Cup, which brought out a fair field of the class usually represented in this contest. It is not every horse that can manage the merry-go-round course at Chester, nor every owner who cares to risk a valuable animal upon it, nor every jockey who cares to run the chance of being knocked over the rails and having his neck broken. If only on account of the badness of the course, the decline of the Chester Cup would fail to excite surprise or regret. The eighteen runners last Wednesday included several old hands at Chester, such as Freeman, Organist, and Prodigal, as well as Tam o'Shanter, a fair handicap horse last season, Grey Palmer, Snail, Pageant, and a couple of three-year-olds of superior class, John Day and Julia Peachum. The handicap was, as usual, framed on a very mild scale, especially for the old horses, and the five-year-olds in the race carried under 8 st. each, while the two aged horses, Freeman and Prodigal, were only burdened with 8 st. 2 lbs. and 8 st. 6 lbs. respectively. The former of this pair was within an ace of repeating his victory of last year (when he carried only 7 lbs. less than on this occasion), but was just beaten by a short neck by Tam o'Shanter, who won the Liverpool Cup last summer with about the same weight allotted to him at Chester. Grey Palmer and Pageant, some way behind the leading pair, ran a good race home for third place, while the three-year-olds were nowhere. Indeed, if a five-year-old with 6 st. 11 lbs., and an aged horse with 8 st. 2 lbs.—both of them, it must be remembered, previous winners of large races—

cannot dispose of three-year-olds, unaccustomed to the course, with 6 st. and 6 st. 2 lbs. on their backs, they must be worth very little indeed. In some handicaps the handicapper's object would seem to be to weight the old horses out of the race altogether. That fault cannot be imputed to those who take the Chester Cup in hand. The old horses are indulged by them to the utmost, and even the winner of the Cup one year is only raised in the weights 7 lbs. the next. We should be much surprised if, when the weights for the Cesarewitch and Cambridgeshire come out next September, it were found that Duke of Parma and Sutton had only 7 lbs. extra each to carry on account of their victories in 1875.

REVIEWS.

ENGLISH VISITORS TO TIBET.*

THERE are some occasions when a traveller, whether his observations are profound or superficial, must possess a certain advantage over those who read or review him. He has actually looked on the bazaars, mountains, temples, rivers, and marts which he describes. But here we have a work in which, in one respect, the author and his critics stand on exactly the same footing. Very few Europeans have seen any part of Tibet, and only one Englishman has succeeded in reaching its capital. Whatever can be done by official diligence, geographical research, comparison of the works of British and foreign authors, and careful editing, to make a volume on Tibet accurate, interesting, and suggestive, that has been done by Mr. Markham. His volume is principally devoted to the reports of two Englishmen who managed to traverse a great deal of the country, the first just a century ago, and the latter within living memory. Their accounts are supplemented by some papers of certain Jesuits and missionaries, and there is a long introductory chapter of 160 pages into which Mr. Markham has skilfully packed everything that could throw light on the attempts made to open up a region almost as little known as the highlands of Central Africa. We have an excellent geographical sketch; a condensed account of the religion of Tibet; notices of Nepaul, Sikkim, and the Bhootan Duars; some fair illustrations and maps, old and new, and a summary of the English and native explorations in which pioneers, official and unofficial, for the last hundred years have tried to overcome the decided repugnance evinced by the Tibetan authorities to reciprocity of trade. The inaccuracies are so trivial as to be scarcely worth criticism; but we think that Mr. Markham has been so carried away by his zeal for geographical exploration as to overlook some of the political difficulties that beset governors and viceroys when they attempt to bring isolated potentates within the world's congress, and to convince them that bayonets and mountain guns are not the infallible accompaniments of pack-saddles, ponies, and piece-goods. In all that he says of the sagacity, the firmness, the tact shown by Warren Hastings, who is the father of Tibetan exploration, we entirely agree. But when he charges the successors of that able statesman with "indifference and neglect," and with carrying on "disastrous wars" not "waged for any broad imperial end, but on account of some petty squabble about boundaries," he forgets the essential conditions of our tenure of India, and he underrates the long series of conquest, war, and diplomacy, which after just a century has placed us where we hope to remain. There can be no such thing really as a "petty squabble" about the boundary of any portion of our Indian Empire from Chittagong or Tonghoo on the east to the sands of Beloochistan on the north-west. A dispute as to the true course of a river, or the rightful occupation of a jungly and pestilential tract at the foot of the hills, must be settled at once. Trade may wait. Questions of dominion or authority cannot stand over.

Before discussing the peculiarities of the two very different travellers whose narratives have now been brought to light by a combination of diligent research and rare good fortune, we may follow Mr. Markham through his account of the adventures in which perseverance, endurance of hardship, skill in overcoming obstructions, and acuteness of observation, have distinguished travellers of our own and other nations. A certain quaint Ralph Fitch, in 1583, had evidently heard of the trade with Tibet, but the honour of first reaching Lhassa belongs to a Friar Oderic of Pordenone, who got there some time between 1316 and 1330. Three centuries afterwards, Antonio Andrada, a Jesuit, penetrated to the sources of the Ganges, and through Tibet reached China. The missionaries Grueber and Dorville reversed this order of travel, and arrived at Agra, from Pekin, in 214 days, spending two months at Lhassa in the interval. Then came another Jesuit, Fra Desideri, who, with a companion, went from Leh to Lhassa, and was recalled by the Pope. This was in 1729. He was succeeded by Orazio Della Penna in 1780, who managed to establish a mission at the capital, which subsisted for a quarter of a century. After this came the conquest of Nepal by the Goorkhas, who expelled the Newars, and an invasion of the little state of Koch or Kuch Behar by the Bhutanese afforded Hastings a legitimate pretext for interference and for the eventual despatch of a mission to Tibet. Hence arose the expeditions of Bogle and Turner, the latter of whom was accompanied by two others, Lieutenant Davis and Dr. Saunders. Mr. Markham is, we repeat, needlessly severe on the successors of Hastings for not following up the commercial policy of their distinguished predecessor. But he knows quite enough of Indian history to remember some of the difficulties, internal and external, which are generally thought to have afforded scope enough for the talents of Cornwallis, Wellesley, and Minto, to say nothing of later Viceroys. The reorganization of the whole Civil Service, the establishment of executive and judicial courts over large provinces, two campaigns against Tippoo, wars in Upper India, and the Java expedition, sufficiently explain why those three statesmen postponed developing a commerce in which the natural impediments were enormous and the results comparatively small. With much better taste does Mr. Markham select for his praises such scholars as Csoma de Koros and Mr. Brian Hodgson, our Resident at Katmandhu for nearly twenty-five years. And he ascribes more merit than we feel inclined to give to Dr. Campbell, for many years Superintendent of Darjeeling. We endorse his praises of Dr. Hooker, and his mention of natives, who are commonly known as Colonel Walker's and Colonel Montgomerie's Pundits. Their adroitness and versatility deceived Tibetan sentinels, and carried them to Shigatze, Teshu Lumbo, Giansu, and Lhassa in the garb of traders and Vakils. It would be hopeless for an Englishman to attempt such disguises, or to

> put on the weeds of Dominic,
> Or, as Franciscan, think to pass disguised.

The odd thing about these Pundits is that in this volume they have no names. Like Jean Valjean at the galleys, in *Les Misérables*, their identity is lost and they become mere ciphers. One man is A, another B, and a third is C. A fourth is designated as No. 9. Oriental titles and names may be a source of perplexity and trouble; but we do think that men who have run the risk of imprisonment and, possibly, death, who have crossed snowy passes nearly 19,000 feet in height, who have been stripped of everything by robbers, and who, in spite of the danger of detection at the hands of a suspicious priesthood, have managed to collect and record a quantity of interesting particulars, ought not to be ticketed like cattle at a prize show or valuables at a sale. Such men are the worthy successors of Purungir Gosain, who, a hundred years ago, rode races on the march with Bogle, wrote an interesting report of the death of the Teshu Lama, and represented us as Diplomatic Agent at the Tibetan Court, after the departure of his English superiors.

The interest of this work centres in Bogle and Manning. Hastings, like every Governor-General of extraordinary capacity, not only achieved success himself, but developed it in others. He was sagacious to detect and employ young men of nerve and character in difficult and dangerous posts. Robert Lindsay at Sylhet, Cleveland at Bhaugulpore, Alexander Elliott on the Nagpore mission, Bogle in the Himalayan passes, all received that support and encouragement which in our time produced men of the schools of Dalhousie or Palmerston. Bogle's narrative seems to have been lost or devoured by white ants at Calcutta. Fortunately, a copy of his journal with bundles of private correspondence was placed in Mr. Markham's hands by a lady who represents the family, that of the Bogles of Daldowie on the Clyde. After graduating in the Revenue department, Bogle was sent to Bhutan and Tibet in 1774. The result, as displayed in these papers, fully justified the selection of the Governor-General. Bogle seems to have possessed exactly the qualities likely to succeed on such a venture. Scotch caution in dealing with treacherous or deceitful Orientals; physical strength, hardihood, and indifference to exposure; that indefinable power of disarming suspicion, conciliating regard, and overcoming prejudice, which Indian military and civil servants have so eminently displayed; a hearty liking for his work; a quick eye for natural scenery, as well as for social peculiarities—none of these qualities were wanting in the Envoy, and he had acquired a style which, if not that of a highly cultivated scholar, is clear, forcible, and correct. He seems to have been absent nearly a year, five months of which were pleasantly spent at the palace of Teshu Lama at Teshu Lumbo. He also stayed at Tassisudon, the capital of Bhutan, at Desheripgay, and at a Tibetan country seat. Nothing but the jealousy of a high functionary, termed the Gesub Rimbochè, prevented his winding up his story with a description of Lhassa. The English envoy and the Tibetan ruler seem, however, to have parted with a sincere regard for each other, which was justified by the good sense of the one and the simple and amiable disposition of the Lama. Much that is new and as interesting as M. Huc's work will be found in the two hundred pages reserved for Bogle and his correspondence with the Governor-General. We have only room for a few details. Bogle showed himself just half a century ahead of his age in condemning the practice of Suttee as degrading and barbarous. The Bhutanese, he remarked, knew of no such custom, which he left behind him with the mild Hindus of the plains. He was entirely against the occupation of Bhootan, or any military expeditions into Lhassa. When he dined with the Lama he was treated to some excellent mutton, dried fruits from China and Kashmir, treacle cakes, and "platted biscuits." When asked to speak English, he repeated some verses of Gray's *Elegy* On another occasion, in order to describe the bleak and desolate aspect of Tibet between Parigong and Desheripgay, he could find no lines more appropriate than those addressed to

* *Narratives of the Mission of George Bogle to Tibet, and of the Journey of Thomas Manning to Lhasa.* Edited, with Notes, an Introduction, and Lives of Mr. Bogle and Mr. Manning, by Clements R. Markham, C.B., F.R.S. London: Trübner & Co. 1876.

Scotland by the schoolfellow of Hastings, Churchill the poet. In the palace of the Deo Raja of Bhutan he lighted on a print of Lady Waldegrave, who subsequently became Duchess of Gloucester; though how this engraving got to Tassisudon, in company with silver pagodas, "silks, ribbons, and other gew-gaws," we are not told. The Vakil of Chait-Sing, whose episode with Hastings has been immortalized by Macaulay, had represented the English as "designing and ambitious," and as persons who insinuated themselves into a country on pretence of trade, and tried to become its masters afterwards. From a native point of view there is a good deal to be said in favour of this description. Yet, in spite of this tribute to our national activity, there does seem to have been some ground for the expectations formed by Bogle and relied on by the editor, of increased facilities for trade with these secluded regions. The real obstacle lay in the predominance of Chinese counsels, and in positive orders from Pekin. Possibly these obstructions might have been removed; but the Teshu Lama, who had reached the Chinese capital after an arduous journey, died there of small-pox, and Bogle himself, who had contemplated meeting his friend by a sea voyage to Canton, was cut off prematurely at Calcutta at the early age of thirty-four. He had just been nominated to a seat in the Board of Revenue, which was to have charge of "all the collections in the provinces."

It is curious that while three Englishmen entered Tibet on distinct missions at the close of the last and the beginning of this century, the crowning triumph of reaching its capital should have been reserved for the one man who, in point of character and qualifications, might have been thought the least likely to succeed. Not that Manning was wanting in talent, and his diary is replete with amusing and ludicrous incidents. But he seems to have been in some points a compound of Boswell, Pepys, and Leech's happy creation, Mr. Briggs. He had the vanity and self-assertion of the first, and the candour of the second; while he occasionally got involved in predicaments which seem fitted for the third in the pages of *Punch*. His education was peculiar. The second son of a country rector in Norfolk, he learnt classics, mathematics, and philosophy with his father, and eventually went to Cambridge, which he left without taking a degree because of his repugnance to oaths and tests. He became, however, the friend of Porson and Charles Lamb. Something turned his attention to the Chinese Empire, and his studies on this subject induced the first Napoleon to exempt him from detention, along with other Englishmen, on the commencement of the long war in 1803. He went from Paris to England, and then to China, and finally arrived at Calcutta during the administration of Lord Minto. Though backed by Sir Joseph Banks, by the Geographical Society, and by the merchants of Canton, he received little or no aid from the Indian Government: and he started with a few native servants, a slender purse, and his own resources, for Bhutan and Tibet, *vid* Rungpore, in September 1811, getting back to Koch Behar on the borders of north-eastern Bengal, in June 1812. Possibly his success may have been due to the unostentatious character of his undertaking, or even to the oddity of his appearance and manners. The man Friday of this queer Robinson Crusoe figures as a Chinese, picked up at Canton, whom Manning calls his "Munshi" throughout, as if he had been a Mahommedan teacher of languages. This person had learnt Latin somewhere from some Roman Catholic priest; but he was given to fits of ill-temper and grumbling. He had no appreciation of the beauties of natural scenery or "relish for prospects." He was cross-grained with sick people who flocked to Manning for prescriptions and were dosed with calomel and less powerful medicines. Once the Munshi substituted pewter spoons for his master's silver, but he was made to restore them by threats such as Frank Osbaldistone used to Andrew Fairservice when he brought him a three-legged animal called "Souple Tam," instead of a sound pony. Manning was equal to this and other trials. Though he more than once complains of the "cruel stones"; though he described the inhabitants as "all cheats," and the interpreter as stupid; though he was assigned a vicious horse, with stirrups of no kindred, like Petruchio's, that ran clean away with him over "concealed holes, frozen knobs of earth, and flakes of ice"; though he arrived at Lhassa, "muddled and dirty, with his face and forehead fiery red, especially on the right side," and though he was subjected to divers other strange inconveniences, he never lost heart or thought of turning back. He made the best appearance in his power when introduced to the Grand Lama, and gave him a *nuzzur* of fine broadcloth, brand-new dollars, some pieces of zinc, and two brass candlesticks; these latter articles, he is candid enough to confess, were the property of the Honourable East India Company, and had been only lent to him out of the stores at Canton. But his "faithful" old Chinaman stowed them away in his trunks at departure. However, Manning consoles himself with the happy thought that the Company cannot but be pleased at the fate of their candlesticks, and the "high and honourable use" to which they were put. Then there is an episode of a mad mandarin, uncombed, unwashed, and begrimed with dirt, whom he physicked with calomel. Indeed he seems to have done little else than prescribe for all sorts of complaints—sore eyes, dropsy, indigestion. The crazy mandarin was a patient who "could do him no credit," and this unlucky official died raving mad. A good and upright mandarin came to a worse end, and was executed because he would not be a party to the surrender of an innocent man to pass for a culprit when justice required one. This is a not very common instance of Oriental regard for truth and innocence. We must refer our readers to the book for other odd incidents; how Manning's clothes, which had been packed in a basket, were dropped into the river by the coolies and converted to solid lumps of ice; and how he threatened to knock down a Chinaman who brought him three coins instead of twenty, which he had fixed as his fee. This incident occurred at Lhassa, and evidently enhanced the respect in which this eccentric and high-handed foreigner was held. Other tender passages—of an interview with the plump and handsome mother of one of the Thalungs or head-magistrates, and with two well-dressed and clean-washed, but giggling lasses, who consulted him for their ailments, real or imaginary—read, as we have said before, like an extract from Pepys's Diary.

The work, we may say in conclusion, is full of interesting matter, arranged and set off by careful editing. There is a first-rate index. It is evident that the main obstructions to our intercourse with Tibet originate with the Court at Pekin. The fear of conquest under the guise of commerce, which is felt at Lhassa, Katmandhu, and elsewhere, might be got over. Mr. Markham's compilation is an abundant proof that this sensitiveness was aroused in the days of Warren Hastings, and there is no need to ascribe our exclusion from these regions to some dreadful incapacity on the part of less capable statesmen than the impeached and badly used servant of the old Company; the great statesman whose portrait, as Macaulay said, with its striking motto, still hangs in the Council Chamber at Calcutta, and who, to borrow what the same author said of Chatham, even now seems to bid India be of good cheer and to hurl defiance at her foes.

WRITINGS AND LETTERS OF DR. WHEWELL.*

THE form of the present work is unusual, and it must be confessed somewhat unattractive. We have abundance of books containing the lives of eminent men, or their letters, or life and letters thrown together. In the present case, however, the circumstances mentioned by Mr. Todhunter in his preface have led to a forced separation between the biographical and the literary part of the task. It appears that a regular biography of Dr. Whewell is under the hands of the persons most competent to do justice to the subject, and will shortly appear; and it is almost to be regretted that the publication of the matter now before us should not have been withheld so as to come after, or at least to coincide with, that of the biography. For this is really to a great extent in the nature of a book of reference to be used as an appendix to the Life, and will no doubt be so used hereafter. It has another peculiarity which makes it ill fitted to stand or to be dealt with as a book complete in itself. The character and contents of the two volumes are entirely different. The second contains a selection of letters written by Dr. Whewell to various persons, mostly on literature and science; such correspondence of a more intimate kind as it is thought proper to make public being reserved, as we understand, for the forthcoming biography. The first can only be described as a very full and elaborate *catalogue raisonné* and bibliography of the whole of Dr. Whewell's works. The history of the various writings, analysis of their contents, accounts of the notices and controversies they called forth, are brought together with minute care, and the editor adds a certain amount of comment and criticism of his own. We do not remember to have seen anything much like this before, and we have some difficulty in understanding what sort of readers Mr. Todhunter had in view in the preparation of it. It will, no doubt, be of great use to the librarian or book-collector who desires to possess or to verify a complete set of the works in question. But then the descriptive and discursive matter which makes up the bulk of the volume would for this purpose be not only superfluous, but inconvenient. In the same way, the historian of science and philosophy will find in various parts of the book a quantity of references and information capable of doing him good service; but these, again, he would find distributed amongst other matters of little or no relevance to his purposes. It is hardly needful to add that, by the very nature and conditions of the undertaking, the book has no pretensions to literary form, and cannot by any stretch of good will or interest in the subject be called readable in any natural sense. In justice to Mr. Todhunter it must be said that he is himself perfectly aware of this. He expresses his own conviction "that the separation of a biographical work into distinct portions under different editors, notwithstanding any apparent advantages, is really a mistake." His preface is not like a preface to an ordinary volume of memoirs; it leads us to expect nothing else than that which in fact comes after it—a severe and exhaustive text-book of Dr. Whewell's literary life. The directions given in the preface afford, indeed, all the means of getting up the book for examination, and, in the event of a Whewell tripos being established at Cambridge, we have no doubt that Mr. Todhunter's directions would be of great value to the candidates. This mode of treatment may have been in part unconsciously determined by the habit of writing mathematical text-books for examination purposes; but we admit that no better was possible under the circumstances. In spite of all the drawbacks, however, it is impossible to look through either this volume, or the volume of letters of which we shall presently speak, without being struck with the wonderful range and versatility of the late Master of

* *William Whewell, D.D., Master of Trinity College, Cambridge: an Account of his Writings, with Selections from his Literary and Scientific Correspondence.* By I. Todhunter, M.A., F.R.S. 2 vols. London: Macmillan & Co. 1876.

Trinity's tastes and pursuits. It is curious that in an early article on Greek mathematics he made a remark on the dangers of omniscience which precisely anticipates, though in a less epigrammatic form, the familiar remark made by Sydney Smith on Whewell himself:—

Eratosthenes was a cotemporary of the Sicilian mathematicians, and was a remarkable instance of great acquirements in very different branches of knowledge. He is generally called by the ancients Eratosthenes the grammarian or philologer; and though he comes under our notice as a great geometer and astronomer, he was also a poet and an antiquary. It is seldom that one person attempts to master so many subjects, without incurring the charge and perhaps the danger of being superficial.

But it is only fair to call to mind the graver testimony of Sir John Herschel on this matter of Dr. Whewell's omniscience:—

A more wonderful variety and amount of knowledge in almost every department of human inquiry was perhaps never in the same interval of time accumulated by any man.

Besides dealing fully with the published works, the editor introduces us in more or less detail to various unpublished pieces found amongst Dr. Whewell's papers. The most interesting of these is a scientific extravagance belonging to the time of the controversy which was excited by the essay on the "Plurality of Worlds." Reversing the usual order of such fictions, it sets forth the adventures of a moon-man who has found his way to the earth, purporting to have been related by him to a European traveller in the East, and by the traveller reported to the civilized world. It is not less interesting than other fictions of the same kind which have become popular in later years, and the physics of it are, as one would expect, much more plausible. Why it was left unpublished does not appear; but Mr. Todhunter has done well to bring it, though tardily, to the light. We cannot equally commend his judgment in printing several pages of stray notes and fragments in prose and verse which are of little interest in themselves and can certainly add nothing to Dr. Whewell's reputation. Some of the critical notes that occur among these are surprising. Take, for instance, this on Lamb:—

Elia (Essays by Ch. Lamb). Ingenious, and shewing a kind and good-humoured disposition in many places; but conceited and strained. The singular narrowness of his materials and mode of speculation forces him to follow out all the phraseological, moral, and metaphysical relations of his subject in the narrow field which his habits of combination and observation give him.

One or two good things are reproduced from occasional and now forgotten pieces in the course of the volume. The following appropriate anecdote occurs in a paper on the Use of Definitions contributed to the Philological Museum in 1823.—

At one of the meetings of the Geological Society of London, a memoir was read on "*The Green Sand*," by an eminent member of the Society. At these meetings, the readings are followed by oral discussions, usually conducted with a rare mixture of acuteness and good breeding. On the occasion just mentioned, a distinguished geologist, well known both for the extent of his knowledge and the fastidiousness of his taste, stated that he had three objections to the *Title* of the paper: First, to the article *The*, since there are several green sands; second to the adjective *Green*, since the stratum spoken of is more commonly red; third to the substantive *Sand*, because in many cases it is more calcareous than siliceous. The subtlety of this criticism was applauded: but the name still keeps its ground, and is to this day a good and serviceable name, inasmuch as it is universally understood to designate certain members in a known and widely extended series of strata.

As a rule, Mr. Todhunter confines himself severely to his bibliographical duties. Once or twice, however, his own feelings on particular subjects break through. The late Master of Trinity had, as is well known, a great fancy for English hexameters, and was always making experiments in that metre. A chapter is accordingly given to this subject, but the editor expresses a pretty positive dissent from Dr. Whewell's views. He sums up with justice the objections to English hexameters, which appear to us as well as to him sufficiently decisive. We are less able to follow him when from Whewell's Philosophy of Science he goes off, not merely to mention John Grote's *Exploratio Philosophica* (which so far is relevant enough, as Dr. Whewell's work is there discussed), but to volunteer some general criticism on it, and in particular to suggest that Professor Grote overrated Ferrier's Institutes of Metaphysic, which are, in Mr. Todhunter's opinion, only a clever academical exercise. Now Mr. Todhunter is by profession a mathematician, and not a metaphysician, and he is not bound to know Ferrier's work at all; but he need not have spoken about it without knowing that the opinion entertained of it by most competent judges, including two or three whose general philosophy was quite opposed to Ferrier's, has been an extremely different one.

We pass on to the volume of Dr. Whewell's letters, which cover a space of something more than half a century. A postscript to the first of them (April 1814) throws in as the last piece of news that "Babylon is fallen, that mighty city. The Allies entered Paris by capitulation on the 30th." A peaceable and private entry into Paris, intended by the writer a few years later, was cut short by a collision in the Channel, where the packet the travellers had embarked in foundered with all their luggage. Little touches like this bring home the difference of the times more strongly than the references to greater matters. Apart from the interest given to them by more distance, the letters of the earlier years are in themselves the most lively and interesting part of the series. They show us the first freshness and flexibility of a powerful mind which, although it remained large and comprehensive to the last, did nevertheless settle in latter days, as indeed commonly happens, except with a few men of surpassing genius or singular happiness of temper, into a certain rigidity. At all times, however, whether earlier or later, there runs through the writer's mind as manifested in his correspondence the same constant strain of scientific culture, and, one may add, without claiming any undue pre-eminence for Cambridge, of that culture as especially pursued in the spirit and method of his own University, which loves to deal with science as not sharply distinguished from common sense, but as being a development of it. Not only was Whewell a man of science, but his science was distinctly of England and of Cambridge. Under the date 1829 we find an amusing passage on the vagaries of some German speculation:—

These Germans are undoubtedly strange hands at system-making. I met with a fellow the other day who had made a system of what he called Biotomy, by which he explained how the elements of time in a man's life and space on the surface of the earth had a marvellous analogy with one another. You would not think it worth while to attend to the details of this wonderful theory, but the man (a very grave professor at Bonn) declared to me confidentially that he considered it as great a discovery as the Copernican system—provided, he said, it be true, of which I cannot doubt. Another man has got a project to determine whether the moon is inhabited by rational creatures; which is of this kind. You must build a huge wall on Salisbury Plain in the shape of the 47th proposition of Euclid. If the lunarians are rational they must by this time have made out a system of geometry, which must be the same wherever reason is. They will see your diagram. They will answer you by building something else, I suppose the 48th proposition. I think I shall go and see this learned Theban, who lives at Munich.

In a letter of 1831 to Mr. Jones are some excellent remarks on scientific method, and the impossibility of learning it in general terms without examples. "If there be any practical inference to be drawn from the nature of true philosophy, it is this, that general propositions can no otherwise be understood than by understanding the instances they include." We regret that we have not space to extract the whole paragraph in which this most true saying occurs. Among other matters of particular interest in this volume, we may mention the various references to the introduction of analytical methods in Cambridge mathematics, and other changes in the current studies and opinions of the place; the letters to Lyell and Faraday on scientific nomenclature, where we see Whewell actually coining the now familiar geological terms of *eocene, miocene, pliocene;* and several letters to Sir James Stephen in the autumn of 1853 on the special subject of the Plurality of Worlds. There is not much political allusion, but such as there is shows a gradual change from Whig to Conservative tenets, of the kind that might almost have been predicted in Whewell's position and circumstances. In 1820 he speaks of the conduct of the Government with the sarcasm of ardent and liberal youth; in 1838 he scouts the *Westminster* Reviewers as "destructives and utilitarians"; and in 1851 he holds Free-trade to be a palpable fallacy. There is a mistake in one letter which must be noticed because it is very common, and every repetition, especially by a man of learning and accomplishment, adds to the prevalent error. In writing to Murchison of the British Association, and of his own intended farewell to natural science, Dr. Whewell fell into the current misquotation of the last words of *Lycidas* as "fresh *fields* and pastures new."

THE GULF OF LYONS.*

M. CHARLES LENTHÉRIC is an engineer (des Ponts et Chaussées) with a strong taste for the study of antiquities, and a habit of collecting facts. Having passed the happiest time of his life on the shores of the Gulf of Lyons, and having always taken the strongest interest in that very curious and remarkable country, he has learned a great deal more about it than the passing tourist could possibly learn, and so it was that the materials for the present volume have slowly accumulated in his mind. It is easy to see how all the different studies pursued by the author, both in his professional capacity as an engineer and unprofessionally as an archæologist, have combined to produce a work which has grown as naturally as the fruit upon a tree. Every critic knows that the really valuable books are those which grow in this way out of the author's life, out of his studies and his experience combined, whilst the worthless books are generally those which have been systematically manufactured. The volume before us is a curious combination of science, history, and legend. It is both sentimental and practical; sentimental, not in any bad sense, but because the author evidently has strong sentiments of affection for the country he talks about, and for the legends which he believes; practical, because he always has an eye to what can be done, or could be done, or has been done, by human effort to alter its natural conditions.

Of all books of geography none are so interesting as those which deal with some very circumscribed extent of territory, thoroughly explored by the author, and known to him in all its minutest details. There is an art in reading such books which is necessary to the full enjoyment of them. The great thing is for the reader to get himself into such a state of mind that he can shut out everything else, and be seriously interested for the time in a little piece of the earth's surface. This ought not to be difficult in the present case, for the country about the mouths of the Rhône is one of the most interesting in Europe, and, although so many travellers pass through Marseilles, it is surprising how little is generally known about it. The reason of this is that the interest of the region in question is scientific or historical, but not picturesque.

* *Les villes mortes du golfe de Lyon, Illiberris, Ruscino, Narbon, Agde, Maguelone, Aigues-mortes, Arles, Les Saintes Maries.* Par Charles Lenthéric. Paris: Plon.

The delta of the Rhône is not a pleasant land, and therefore not a region which the ordinary tourist would ever explore thoroughly for his pleasure. Artists seldom feel much attracted to a desert; so they care nothing for the Rhône after Arles, and get on to Mentone and Monaco as fast as they can. The only tourist who is likely to give any serious attention to this region is either the scientific or the historical tourist; but, to make the enjoyment of it complete, the two characters ought to be united in one person. It would be better, for the enjoyment of such an ugly country, that the explorer should not be too much of an artist, or else he would very likely get out of patience with it, and leave it before his work was thoroughly done. All these positive and negative conditions are united in M. Lenthéric. He is scientifically educated, and has what the French call "le sens historique" very strongly developed. At the same time, although he shows some taste and judgment, we believe that his artistic perceptions are not keen enough to produce any strong repugnances. His style is readable, but a little heavy, like the well-known archæological style. It has no charm except the truthfulness and honesty of the writer and his desire to convey clearly to the reader the best information that he can offer.

The plan of the book is orderly and simple. The author begins in his "Première Partie" by studying the formation of shores and deltas geologically, with reference specially to the shore of the Gulf of Lyons and the delta of the Rhône. In the "Seconde Partie" he becomes more historical and more minutely topographic at the same time, travelling very carefully over the whole of the ground, and telling us a great deal which is not to be learned from ordinary travellers or guide-books. We ought perhaps to observe that M. Lenthéric is an ardent Roman Catholic, and therefore much more disposed than we should be to accept religious traditions, which, if they were only true history, would unquestionably add greatly to the interest of certain localities. At the conclusion of the work the author devotes a chapter to the decadence and regeneration of the region he has been describing, and then come nineteen documents of various kinds which he prints as "pièces justificatives." The book is illustrated by fifteen maps and plans, the only objection to which is that they are too exclusively antiquarian. The first map, for example, is a "Carte du littoral ancien du golfe de Lyon"—that is, a map of the Gulf in the days of the ancient Romans, while there is no such thing in the whole volume as a map of the Gulf in its present state. Out of the fifteen maps and plans ten are antiquarian.

The Rhône is described summarily in the first part of the work. It is the most important river, after the Nile, which falls into the Mediterranean, and it is the swiftest river in Europe. Its total length is 840 kilometres. It becomes "flottable" at Bellegarde, which means that from that point it is used for floating logs of wood. A French river is "flottable" from the place where logs of wood will be carried down the stream, and it is "navigable" from the place where it can be used by canal-boats. The Rhône is not classed as a navigable river till it reaches Lyons, but after that place, being enriched by its marriage with the Saône, it is good even for steam navigation all the way to Marseilles. There are a few rapids, but the ordinary swiftness of the current between Lyons and Beaucaire is from one and a half metre to two and a half metres a second in the ordinary state of the waters, though in flood-time it often exceeds four metres per second. If these measures are accurate, we may say that on an average the ordinary current of the Rhône will be about one hundred and twenty yards a minute, or more than four miles an hour, whilst in many places it will reach five miles, and in the rapids probably a good deal more. This is certainly much above the usual average of navigable rivers. During the whole of its course between Lyons and Beaucaire the Rhône rolls gravel and pebbles which become smaller as they approach the sea. Between Beaucaire and Arles the gravel is finally reduced to the condition of mud or fine sand. In this part of its course the stream becomes almost as level as a lake. At Arles its surface is little more than one metre above the surface of the sea, and yet it has still a course of 50,000 metres before it. The width of the river becomes very great; in some places several miles. In this region the Rhone deposits the burden it has brought down from the upper country, and here it forms islets which are constantly changing. There is also one great island which divides the river in two, and forms the delta. M. Lenthéric is very clear in his explanation of the difference between rivers with deltas, such as the Nile and the Rhône, and rivers with estuaries, such as the Thames and the Seine, a difference which is attributable to the presence or absence of tides:—

C'est à l'action de la mer seule qu'il faut attribuer cette différence radicale entre les formes des embouchures. Les estuaires les plus profonds se trouvent sur les côtes où l'influence du flux et du reflux est la plus sensible; l'oblitération des embouchures n'a lieu, au contraire, que dans les mers sans marée.

On conçoit, en effet, que lorsque les limons et les sables de fond entraînés par le courant du fleuve rencontrent la masse des eaux tranquilles d'une mer intérieure, ils se déposent immédiatement et forment un bourrelet d'alluvions qui affecte la forme d'une courbe dont la convexité est naturellement tournée vers la mer. Ce dépôt est plus ou moins remanié par le mouvement des vagues; mais il finit par atteindre une certaine fixité, se développe et forme une île qui divise le courant du fleuve en deux; telle est l'origine du delta.

Lorsque, au contraire, de fortes marées, après avoir fait gonfler les eaux du fleuve sur une étendue considérable en amont, déterminent par la retraite des eaux une chasse puissante, ces dépôts sont balayés par ce courant énergique et, transportés ensuite par les courants littoraux, vont se perdre dans des parties profondes ou concourir au développement de bancs de sable, à une distance assez grande des embouchures; c'est ainsi que se conservent les estuaires.

This is a good first statement of the case, but the author hastens to qualify it by observing that there are many instances of a mixed kind where islands are formed analogous to those of true deltas, and yet where, between the islands, there are openings of a certain depth, kept clear by weak tides, which have the character of minor estuaries. In all tideless seas the mouths of rivers closely resemble, in principle, that of the Rhône. Having led us to this point, the author goes on to compare the three principal deltas of the Mediterranean.

The sandy beach of the Gulf of Lyons has an almost regular slope to the sea of one in a hundred, and the action of the waves forms a rib of sand all along the coast, which M. Elie de Beaumont calls the *cordon littoral*. This is the line which divides land from sea, but a line continually modified. It is to this *cordon littoral* that M. Lenthéric attributes the formation of the lagunes near the shore, which were all originally shallow bays, and were afterwards separated from the sea by ridges of sand formed by currents running parallel with the coast. The Rhône brings every year an enormous quantity of sediment down to its delta and its mouths, a quantity estimated by an engineer, M. Surell, at 17,000,000 of cubic metres. Our author justly observes that armies of workmen would be required to perform the same labour. The land at the larger mouth of the Rhone advances into the sea at the rate of fifty metres a year.

M. Lenthéric affirms, what we have always supposed, that there is not the slightest connexion between the name of the Gulf of Lyons and that of the city at the junction of the Saône and the Rhône. In old texts it is generally called *sinus Gallicus*; but in the fourteenth century—not earlier—a few writers began to call it *sinus Leonis*, the Gulf of the Lion, which has nothing to do with Lugdunum, Lyons. Some have supposed that the leonine appellation was due to the fury of the winds and waves in the gulf, which made mariners compare it to the most terrible animal they knew.

Hardly anything is really known of the early Phœnician settlers on the coast about Marseilles. They are said to have set up different trading establishments about 1000 B.C., Marseilles amongst the rest; but we get nearer to authentic history when the Phocæan colony comes and establishes itself about 600 B.C. and expands rapidly, doing a considerable trade with the interior. These Greek settlers coined money much better than the local populations, and their coins are still continually found in the interior of France. It is supposed that the remarkable beauty of the women of the lower classes in some of the most southern of the towns on the Rhône is due to their Greek ancestors; and in the humblest arts, such as pottery, there are traditions still practised which have descended uninterruptedly from the Greeks. The Roman influences in the Gulf of Lyons are of course much more visible, especially in their architecture. This brings us to a very pretty example of antiquarian ingenuity. Given the fragment of a wall, how are we to calculate from it the population of a city? M. Lenthéric manages this, at least approximately, as follows. The city is Narbonne, and he wishes to find out how many inhabitants there were in the old Roman city of Narbo-Martius. The way he sets about it is as follows. Are there any remains of the theatre? Hardly any; all that is known of the Roman theatre is that it was situated near the present cathedral, on the site of the old cloister of Saint-Just, where, in the cellars of some modern houses, are still to be seen the vaulted arches which supported the higher seats. Are there more complete remains of the amphitheatre? Yes, there are a few fragments of its exterior wall. From the direction of these it is easy to recover, geometrically, the exact shape of the complete oval. Referring then to other known amphitheatres still in good preservation, M. Lenthéric easily estimates the number of people who could find places in that of Narbonne. The proportion between the number of people which a Roman amphitheatre would hold and the number of inhabitants in the town where it was situated is also pretty well known. That of Nimes is large enough to contain 25,000 spectators. M. Lenthéric affirms that the city never had more than 50,000 inhabitants. The amphitheatre at Arles contained 26,000 spectators, the theatre there contained 16,000, say 40,000 between them, and M. Lenthéric says it is very doubtful whether the whole population of Arles ever got beyond 80,000. After mentioning several other places, he comes to the conclusion that the proportion observed in Roman cities was as two to one between the population and the number of people who could sit down at once in all the great public places of amusement added together. This would give a population for Narbonne of something over 50,000, calculating by the amphitheatre; but as there was a theatre also, the general total may have been about 70,000.

The author gives a very interesting chapter to the strange little city of Aiguesmortes, which is surrounded by walls of the time of the Crusades, still in perfect preservation, and would be therefore, for this reason only, one of the greatest archæological curiosities in Europe; but its geographical situation adds greatly to the strangeness of the place, though not, we should imagine, to its charms as a permanent residence. The town is surrounded by an immense plain, upon which the great marshes and lakes and the barriers of sand that form the *cordons littoraux* are drawn as if on a map, and may be well seen from its lofty towers. In the year 1840 the Rhône covered all this space and washed the very walls of the old town all round, giving it exactly the appearance of a vast mediæval fortress rising directly from the sea. It thus recovered for a time something of its mediæval appearance, for in the middle ages the country around it was more frequently submerged than it

is now, and the *étangs* were both deeper and vaster than they are at the present day. In those days there was no port at Aiguesmortes, but the ships could come within about three miles of the town. In the present day it has a port, which is accessible by a good channel for small vessels; but it has no commerce, being only visited by about three thousand tons of shipping annually, chiefly small Spanish orange boats from the Balearic Islands. There is a good deal of fishing at Aiguesmortes by means of a fleet of forty large lateeners. The marshes in the neighbourhood yield a surprising quantity of salt; no less than sixty thousand tons annually.

M. Lenthéric says that the walls and towers of Aiguesmortes have been more perfectly preserved than any others in Europe of the same age, and perhaps even than any others in the world, having escaped the double dangers of destruction and restoration. At Narbonne Francis I. used the Roman temples, amphitheatres, &c., as a quarry for the building of his new walls, and these walls in their turn are now being destroyed at several different points. M. Lenthéric remarks, with reason, that in France people have gone from the extreme of destructiveness to the other equally dangerous extreme of excessive restoration. At Aiguesmortes the fortifications of Philippe le Hardi remain just as he left them. They form almost a perfect quadrangle, with fifteen towers and nine gates. The plan of this great fortress is that usually adopted by the Crusaders in Syria and all the East. The walls are embattled, but not machicolated, and are constructed of large stones with bosses on them. There is a very close resemblance between Aiguesmortes and the Antioch of the thirteenth century, as M. Lenthéric makes clear by an engraving from a manuscript of that time. All round Aiguesmortes is nothing but a solitude and a desert. The country is flat; there are few trees:—

La campagne d'Aiguesmortes est d'une incomparable tristesse; les marais qui couvrent le sol à perte de vue frangent l'horizon, dont les lignes sont brouillées par des effets de mirage assez confus. Le sol, pénetré de sel marin, ne donne naissance qu'à des plantes ternes, aux feuilles grasses, aux fleurs incolores, des joncs, des soudes, des salicornes, emaillés ça et là de quelques lis marins. La terre végétale n'existe pas encore, et il faudra peut-être des siècles pour que la culture prenne possession des bas fonds de ses étangs saumâtres, dernières lagunes d'une mer disparue. Les blanches mouettes et les flamants roses, si nombreux en Egypte, animent seuls la surface de ces immenses flaques d'eau, sur les rives desquelles on voit errer silencieusement des troupeaux nomades de taureaux noirs et de chevaux camargues, qui ont conserve l'allure sarrasine de leurs ancêtres ramenés par les croisés.

M. Lenthéric gives a remarkable description of "Les Saintes Maries," which consists at the present day of an old edifice, half fortress, half cathedral, with a few wretched dwellings grouped about it. He says that perhaps in all the world there is not a place with a poorer appearance, but to him it seems one of the richest in sacred associations, for he fully believes the legend that the family from Bethany landed here about the year 40 A.D. to escape the persecutions which had already attacked the early Christians. These holy emigrants were the sister of the Virgin, the mother of James the Less, and the mother of the apostles James and John. They were accompanied by a poor servant named Sara, who has since become the patron of wanderers in the Camargue. Lazarus, the resuscitated, was with them, so was Martha, and Mary Magdalene. Lazarus went to Marseilles, Martha to Tarascon, Mary Magdalene to Sainte-Baume, leaving the two other Maries with their servant Sara.

The last chapter of the book is dedicated to the study of the *littoral* in its slow decadence, and of measures which might insome degree restore it. M. Lenthéric is anxious that the authorities should plant trees in great quantities upon the sand-hills, and mentions the success with which this measure has been attended both in Holland and Gascony. Such a measure, if carried out with the necessary perseverance and authority, would, he is convinced, be of the greatest ultimate utility in fixing the sand and permitting agriculture in certain parts of the desert at the mouths of the Rhône. The shallow lagunes, which are very unhealthy, ought, he thinks, to be dried completely as soon as possible, and the navigable ones kept open. Unlike most archæologists, M. Lenthéric seems to have a lively sense of the needs of the present and the possibilities of the future.

MR. LOWELL'S NEW VOLUME.*

THIS book, like everything that Mr. Lowell has done in prose, is a most provoking performance. Few living writers have at once so much knowledge of poetical literature and so much critical power as Mr. Lowell, and certainly none of those who in power and knowledge are his equals would be guilty of the sad faults of taste which he seems to take a positive pleasure in committing. We have not studied the American mind profoundly enough to decide quite accurately how far Mr. Lowell's sins are to be laid to his own charge and how far to his country's; but we fancy we can detect in his extravagance and fondness for display something of the inexperience which besets literary men when they find themselves called on to set the fashion of a young society. No doubt the suggestion will make Mr. Lowell very angry, and he will take it as another instance of that "certain condescension in foreigners" about which in another book he has written in such an entertaining way. Libraries, in spite of what he there says, do *not* "make all nations equally old in all those respects, at least, where age is an advantage and not a defect." Even literary men are not formed by books alone, but by a hundred obscure influences, the taste of their readers being one of the most important. Unfortunately it is too true that Mr. Lowell's readers have not yet learnt, all of them, to distinguish subtlety from farfetchedness, a careful style from a laboured one, richness from decoration dragged in anyhow, vividness of treatment from extravagant illustration where the metaphors are as incongruous as the colours in a badly-arranged opera scene. Would any other nation in the world tolerate from one of its first-rate writers a paragraph like this from *My Study Windows*?—a paragraph, by the way, which Mr. Lowell must have composed as at once the caricature and the condemnation of his own manner:—"The vulgar intellectual palate hankers after the titillation of a foaming phrase, and thinks nothing good for much that does not go off with a pop like a champagne cork. The mellow suavity of more precious vintages seems insipid; but the taste in proportion as it refines learns to appreciate the indefinable flavour, too subtle for analysis. A manner has prevailed of late in which every other word seems to be underscored as in a schoolgirl's letter. The poet seems intent on showing his sinew, as if the power of the slim Apollo lay in the girth of his biceps. Force for the mere sake of force ends like Milo, caught and held mocking fast by the recoil of the log he undertook to rive. In the race of fame there are a score capable of brilliant *spurts* for one who comes in winner after a steady pull with wind and muscle to spare." Here, in a dozen lines, there are four distinct metaphors, none of them of especial elegance, to illustrate a very simple truth. If Mr. Lowell sees the pitfall so clearly, and knows its danger so well that he warns us against it in four different ways, it is distressing that he should fall into it so readily himself.

The passage we have quoted is from a book published some years ago; but it is only too fair a sample of faults which have become inveterate. The volume now before us, a second series of *Among my Books*, absolutely teems with sentences of the same sort. It is a series of essays on great poets—Dante, Spenser, Wordsworth, Milton, and Keats. Mr. Lowell seems to have determined that, as it was difficult to say anything very new in substance about these writers, he would at all events say plenty that was new in manner. Let us give a few instances, premising only that, bad as they are when read by themselves, they are a hundred times worse when the reader comes upon them suddenly in the midst of dignified passages of biography, or fixed like a bit of harsh colour among sober criticisms, or, worst and oftenest, set as pendant and antithesis to some wise saw, such as Wordsworth might have uttered. In the essay on Spenser (p. 155) we have:—

Spenser wrote from a strong inward impulse . . . to escape at all risks into the fresh air from that horrible atmosphere into which rhymer after rhymer had been *pumping carbonic acid gas with the full force of his lungs*.

In p. 168:—

Spenser's notions of love were so nobly pure, so far from *those of our common ancestor, who could hang by his tail*, as not to disqualify him from achieving the quest of the Holy Grail; and accordingly it is not uninstructive to remember that he had drunk, among others, at French sources *not yet debauched by absinthe*.

In p. 184:—

So entirely are beauty and delight in it the native element of Spenser, that whenever in the *Faery Queen* you come suddenly on the moral, it gives you a shock of unpleasant surprise, *a kind of grit, as when one's teeth close on a bit of gravel in a dish of strawberries and cream*.

What follows in the same page sounds very pretty, but, after long meditation, we have given up the attempt to find a meaning for it:—

To characterize his style in a single word I should call it *costly*. None but the daintiest and nicest phrases will serve him, and he allures us from one to the other with such cunning baits of alliteration, and such sweet lapses of verse, that never any word seems more eminent than the rest, nor detains the feeling to eddy round it; but you must go on to the end before you have time to stop and muse over the wealth that has been lavished on you.

Now, after such a pointed beginning, we should have expected that the rest of the paragraph would have been an illustration of the "costliness" of Spenser's style. Nothing of the kind. We go from costliness to cunning baits, from cunning baits to sweet lapses; at one moment we are the object of the bait; at the next we, or our feelings, are the stream that will not eddy; at the next we are going on without musing upon the wealth that has been lavished upon us. If Lord Macaulay had come across that paragraph, how he would have immortalized it!

In p. 237, in the essay on Wordsworth, a protest against the poet's habit of writing prefaces and reducing his naturalness to a system ends in this way:—

The imagination is a quality that flouts at forecordination, and Wordsworth seemed to do all he could to cheat his readers of her company by laying out paths with a peremptory *Do not step off the gravel!* at the opening of each, and preparing pitfalls for every conceivable emotion, with guide-boards to tell each when and where it must be caught.

Two pages further on we find:—

Throughout *the Prelude* and the *Excursion* he seems striving to bind the wizard Imagination with the sand-ropes of dry disquisition, and to have forgotten the potent spell-word which would make the particles cohere. *There is an arenaceous quality* in the style which makes progress wearisome.

In page 246:—

This gift of his was naturally very much a matter of temperament, and, accordingly, by far the greater part of his finer product belongs to the period

* *Among my Books.* Second Series. By James Russell Lowell. Boston: Osgood & Co. 1876.

of his prime, *ere Time had set his lumpish foot on the pedal that deadens the nerves of animal sensibility.*

In the essay on Keats:—

The most profound gospel of criticism was that nothing was good poetry that could not be translated into good prose, as if one should say that the test of sufficient moonlight was that tallow-candles could be made of it. We find Keats at first going to the other extreme, *and endeavouring to extract green cucumbers from the rays of tallow.*

But we will not pursue any further the ungrateful task of condemning out of his own mouth one who is after all a critic of a high order. It is pleasanter to dwell on what is admirable in Mr. Lowell, on his great knowledge of the poets about whom he writes, on his own experience as a poet, and on the good side of Emerson's influence upon him. Long ago he showed that he was not only a competent critic of Chaucer's poetical qualities, but a learned Chaucerian scholar, and there is the same thoroughness about all the essays in this volume. That on Dante is at once the longest and the fullest of work, and, as a consequence, is the emptiest of metaphor—a great gain where we are dealing with a writer whose touch is so undiscriminating as to make no difference between a beautiful image and a vulgar one—between "Most men make the voyage of life as if they carried sealed orders which they were not to open till they were fairly in mid-ocean," and "In the Greek epic the gods are partisans, they hold caucuses, they lobby and log-roll for their candidates." Dante as a whole, not the Dante of the *Commedia* alone, is what Mr. Lowell tries to present us with; and the working in of the *Vita Nuova*, the *Convito*, and the *De Monarchia* is done as only a real student could have done it. And, after all the passages which we have picked out for blame, it is only fair to point to the last five pages of this essay as evidence of the writer's real power of sympathetic eloquence when his theme is great enough to make him forget effect and tricks of style. The study may be ranked near to that beautiful one for which all English lovers of Dante are grateful to Dean Church. "Spenser" is less satisfactory, perhaps because there was less to say, and Mr. Lowell is certainly unfair to these much-abused people, the English and Scotch writers of the fifteenth and early-sixteenth centuries. Still he sums up all the possible criticism of Spenser in the two statements, "Spenser was more habitually possessed by his imagination than is usual even with poets"; and that, in spite of the seduction of Spenser's remoteness, his abstractions have no human interest; "the vast superiority of Bunyan over Spenser lies in the fact that we help to make his allegory out of our own experience." More interesting, though shorter, is the essay on Wordsworth; a paper which, among the numberless ones that the last twenty years have produced, seems to be quite one of the most adequate. Mr. Lowell, like his master Emerson, feels the influence of Wordsworth in every pulsation of his mind, and sees him "in the clouds and in the wind" of the atmosphere in which the modern world is living. "Of no other poet, except Shakspeare, have so many phrases become household words as of Wordsworth." So far as a great poet can be, he is truly popular; not that he can be so in the exact sense of the word, for, as Mr. Lowell finely says, "The highest poetry deals with thoughts and emotions which inhabit, like rarest sea-mosses, the doubtful limits of that shore between our abiding divine and our fluctuating human nature, rooted in the one, but living in the other, seldom laid bare, and otherwise visible only at exceptional moments of entire calm and clearness." But Wordsworth is popular in the sense that in him all readers alike are constantly hearing their names "syllabled with a startling personal appeal to their highest consciousness and their noblest aspirations, such as they wait for in vain in any other poet." Mr. Lowell has plenty to say of Wordsworth's deficiencies, of his want of humour and dramatic power, of his "dry and juiceless temperament," of his curiously artless self-satisfaction, but he never loses consciousness of the poet's penetrative power. Of other poets he writes as of men of letters, who were alive and are dead; of Wordsworth he writes as of a father, whose blood is flowing in his own veins.

To sum up our criticism of Mr. Lowell, we should say, let him read more French—not the poetry, but the prose, not for the matter, but for the manner. There is no writer whose work more tends to bring home to one the crying need which exists in England, and still more in America, for a recognized standard of taste, for an authority to which even men of genius should be compelled for very shame to submit. Whether this standard is to be found in an Academy, as Mr. Arnold thinks, or in some far-off perfection of general education, is another question; all that the reader feels as he closes Mr. Lowell's volume is the need of something, of some correcting force, of some intellectual centre with power enough to keep these wandering bodies in their proper orbit. When Mr. Lowell allows himself to talk, as he did in the *Study Windows*, of art becoming, "instead of 'the world's sweet inn,' whither we repair for refreshment and repose, rather a watering-place, where one's own private touch of the liver-complaint is exasperated by the affluence of other sufferers whose talk is a narrative of morbid symptoms"—when he allows himself to talk in this way he is guilty of a provincialism that would have been wholly impossible to a French writer of powers equal to his. And it is quite certain that provincialisms of this kind will in the long run do irremediable harm to the writer. For a while they may catch the taste of his public and be voted "rich and imaginative"; but in the end opinion settles down, and extravagance and caprice are valued at their just rate; the writer, whatever may be his genius, who allows himself to indulge in them finds himself hopelessly relegated to the second rank.

WHITNEY ON LANGUAGE.*

THERE is something a little puzzling about these books. In a fly-leaf of *Language and its Study*, a work of Professor Whitney's is announced by the name of "Language and the Study of Language; Twelve Lectures on the Principles of Linguistic Science." Of these we are told that Dr. Morris has—with the consent of the author and publisher, as we are further told in his preface—reprinted the first seven lectures, so much as deals with Indo-European languages, with his own Introduction, &c. The fly-leaf adds, "*Life and Growth of Language*, by the same author, is an abridged form of these lectures; therefore the above ["Language and the Study of Language"] is the only course by Professor Whitney which thoroughly discusses the whole of the interesting questions involved in the Study of Language." But when we turn to the *Life and Growth of Language*, we find that it is one of the "International Scientific Series," and it is introduced by a preface coming from Professor Whitney himself, from which we certainly should not call it a mere abridgment, of *Language and the Study of Language*. We should call it a distinct work on the same subject, written on a different scale and with a special object, in which the author has naturally used again many of his old thoughts, and even many of his old illustrations. That is surely a perfectly legitimate process, as of course is also a mere abridgment, if it professes itself to be such. But the two processes are distinct; and certainly in reading *Life and Growth of Language* it did not occur to us that the two books stood in any nearer relation to each other than two books by the same author on the same general subject must stand. As we understand the fly-leaf of *Language and its Study*, it is meant as a warning against the *Life and Growth of Language*—that is, it sounds like a warning by Professor Whitney against himself. This is a little beyond us. We have lately seen something of a controversy in which Professor Whitney was an actor; is there to be another in which he is to be the subject?

But when we read Mr. Whitney's books, we heartily wish that there had been no controversy at all. Mr. Whitney is quite able to hold his own ground without running down Professor Müller or anybody else. In the world of the science of language there is room for both of them. Since we reviewed the last volume of Professor Müller's *Chips*, we have seen by chance some terrible things in the *New York Tribune*, not by Mr. Whitney himself, but by some very warm partisan. But in these books we are bound to say that there is nothing which can be called open running down of Professor Müller. We think that we can discern in the Yale Professor a certain satisfaction in getting hold of a theory of his Oxford brother, and pulling it to pieces if he can; but in the two or three places where the actual name of Müller occurs, whether for agreement or for difference, though it is not perhaps brought in as most English scholars would bring it in, it is not treated with any direct disrespect. Mr. Whitney has a great deal to say against the notion of the science of language being one of the physical sciences. This is a subject which he comes back to over and over again, and it is easy to see at what he is aiming. Mr. Whitney is always assuring us that the science of language is one of the historical sciences; that everything in language is not φύσει but θέσει; that language is "conventional"—that it is, as he puts it, an "institution"; that every language which a man speaks, his mother-tongue among them, he has learned in the strictest sense, as much as anything else which he learns afterwards. We are in no way inclined to dispute all this; and yet there is a side from which it is not very strange to speak of the science of language as a physical science. It certainly has to do with one class of physical phenomena in a more direct way than most of the historical sciences. It is only in a very indirect way that the study of laws and institutions and of recorded facts has to do with any physical phenomena. But the study of language must deal directly with the physical phenomena of speech. Mr. Whitney is, not wholly unreasonably, a little angry with the professors of physical science for the evident wish of many of them to claim the name "science" as belonging exclusively to their own pursuits, and he is unwilling to give up to them any form of science which can anyhow be kept in any other department. But surely it is neither desirable nor possible to draw any hard and fast line in these matters. It would be hard to deny that geology and palæontology are physical sciences; they deal altogether with physical phenomena. Yet they may be fairly claimed as historical sciences also. They are records of past facts, and the method by which they are studied is essentially the same as that by which other past facts are studied. The less the different branches of knowledge dispute with one another, either as to their respective merits or as to their respective extent, the better for all of them all round. In this case we could have wished that the whole dispute had been left alone; but it certainly has enabled Mr. Whitney to bring out many points of importance more strongly perhaps than he otherwise would have brought them.

Mr. Whitney throughout uses the word "Indo-European" for the family of languages which we have for a good while past learned rather to call "Aryan." He objects to the latter name that in strictness it belongs only to one class of the family. And

* *The Life and Growth of Language.* By William Dwight Whitney. London: Henry S. King & Co. 1875.

Language and its Study, with especial Reference to the Indo-European Family of Languages. Seven Lectures by William Dwight Whitney. Edited, with Introduction, Notes, &c., by the Rev. R. Morris, M.A., LL.D. London: Trübner & Co. 1876.

this is in a sense true; for it would certainly be hard to prove that the forefathers of Greeks or Teutons ever called themselves Aryans. But, as Mr. Whitney teaches us, language is conventional and an institution. We must have some name, and a name like "Aryan," even if it strictly belongs only to part of the family of languages, practically does its work perfectly well. To those at least who study language for historical purposes it directly means the whole family, and nothing smaller. It is not as if it were the name of some part of the family which we are constantly using in a narrower sense. It is not as if the whole family of languages were called Greek or German. "Indo-Germanic" Mr. Whitney properly rejects; but that name has quite passed away. He might however, we think, in his list of writers who have done good service to the study of language, have mentioned the man who did most to show that the name Indo-Germanic, besides the awkwardness of all names of that formation, was in itself too narrow. This was certainly done by Dr. Prichard in his work on the Celtic languages. In the same list, too, he hardly does justice to the services of Sir William Jones; and, as he traces philological learning back to its very beginnings in old Greek times, it would have been only fair to give a word to Giraldus and Roger Bacon. Another point which Mr. Whitney tries to make is to establish a distinction between comparative philology and linguistic science, the latter of course being something more abstract and philosophical than the other. In the department of comparative philology he allows that the Germans have done great things; in that of linguistic science he does not allow much credit to them, nor seemingly to anybody else. All this we might have passed by without any special remark, or indeed any special consciousness, if it had not been for certain recent disputes; by the light of these disputes we are tempted to see digs at one particular scholar where otherwise we might not have thought of them. We are tempted to see a certain disposition to make the most of differences, sometimes to imagine them, in cases where things may be differently put by different writers, but where it is hard to see any real practical difference. Thus Mr. Whitney has much to say which is very well worth saying about the growth of dialects, dialectic divergence, and the like. Here is one of the places in which he directly disputes against Professor Müller. He affirms the priority of language to dialects, and argues against certain writers, who, he says, maintained a priority of dialects to languages. Here he directly quotes Professor Müller:—

> "As there were families, clans, confederacies, and tribes," we are told, "before there was a nation, so there were dialects before there was a language." The fallacy involved in this comparison, as in all the reasoning by which is supported the view we are combating, is that it does not go back far enough; it begins in the middle of historic development, instead of at its commencement. If families, clans, and tribes were ultimate elements in the history of humanity, if they sprang up independently, each out of the soil on which it stands, then the indefinite diversity of human language in its early stages—a diversity, however, fundamental, and not dialectic—might follow, not only as an analogical, but as a direct historical consequence. But, if a population of scattered communities implies dispersion from a single point, if we must follow back the fates of our race until they centre in a limited number of families or in a single pair, which expanded by natural increase, and scattered, forming the little communities which later fused together into greater ones—and who will deny that it was so?—then, also, both by analogy and by historical necessity, it follows that that is the true view of the relation of dialects and language to which we have been led above: namely, that growth and divarication of dialects accompany the spread and disconnection of communities, and that assimilation of dialects accompanies the coalescence of communities.

Now here we really cannot see any practical difference between the two Professors; the remarks of both are equally true at different stages. Clans were before nations, if we mean the existing nations of the world; dialects were before languages, if we mean the existing languages of the world. What we mean by modern English and modern French, what we mean by standard or literary English or French in any age, is simply that one among the Teutonic dialects of Britain, that one among the Romance dialects of Gaul, which happened at any time to have come to the front. The English nation was formed by the union of several kingdoms; those kingdoms were each formed by the union of several smaller districts, the *gá* or the *pagus:* and those again were formed by the union of smaller communities still, the clan settlements, which have grown into our modern parishes. But these smaller units, these smaller districts, with their local dialects, had of course at an earlier stage branched off from greater wholes. There may well have been a time when the Teutons had split off from the other Aryans, and still formed one whole. From this doubtless various great branches split off, and from this again the smaller units split off; but it was by the coalescing of these smaller units that the existing languages were formed. There was no such thing as a specially English group—we need not go about to prove that there was no such thing as a specially French group—at any stage of the Aryan migration; the actual languages grew in historic times out of the dialects which had thus split off. We cannot see any real difference between the two statements; only we cannot help thinking that Mr. Whitney has found a certain pleasure in making as much as he could of an imaginary difference.

We are sorry that this should be so, because the essential matter of Mr. Whitney's two books is thoroughly good. He is throughout clear, straightforward, and suggestive of thought. It is much indeed to be regretted that any kind of feud should have broken out between two scholars who might have done still better work by working in harmony than they have done.

BEAUCHAMP'S CAREER.*

IN *Beauchamp's Career* Mr. Meredith has ventured upon a bold experiment. He has striven to combine the study of individual character with the expression and discussion of modern ideas, and, in place of the precise portraiture of contemporary manners which serves the ordinary novelist by way of background, he has here given us a complex network of social and political problems in which the chief figures of the story are caught and entangled. Indeed all the characters, from the highest to the lowest, are made in their different degrees to feel the intellectual pressure of their time. They are compelled to live and breathe in an atmosphere that is heavily charged with the strong and conflicting currents of modern thought, and by the skill of the artist they are made to absorb into themselves some of the elements of this conflict, and to express its progress and development in their own persons. Mr. Meredith is not, however, to be confounded with the novelist with a purpose. His outlook is too wide and his understanding of character too deep to permit him to use men and women as puppets summoned merely to enforce and expound a particular creed, nor is the author in his own behalf disposed to suggest any sure and ready solution of the many problems he loves to present. What he attempts is merely to bring individual character into sharp and close relation with the dominant influences of a chosen period. He forces the actors of his drama, not only to wear the appropriate costume of the time, but to bear its intellectual burdens, and he does not permit them even for a moment to indulge the placid indifference which in actual life is enjoyed by so vast a proportion of the human race. The value of such an experiment must of course in a large measure depend upon the fitness of its author to conduct it with effect, and in the present instance this, we think, has been attained, though in a peculiar way. For it so happens that the peculiar characteristics of Mr. Meredith's style perfectly accord with the conditions of the chosen scheme of art. Like the invention of a Japanese artist, his mode of workmanship reflects the singularity as well as the beauty of actual nature. It is attuned to the discords no less than to the harmonies of a present world, and, just as the changes of common existence are cynical in their abrupt transitions from high to low, so also are the changes of Mr. Meredith's style. The imagination which is one moment charged with a poetic intensity of feeling trips in the next upon a trivial fact, and retreats in discordant laughter, and the eloquence that seems strong enough to be sustained drops suddenly and almost unawares into mere shrewd speculation. Looking further we may perceive that these peculiarities of style answer to deeper intellectual tendencies. Mr. Meredith is never content with the mere artist's enjoyment of the permanent truths of character. His powers have often been proved strong enough for the highest order of work in this kind, and in *Beauchamp's Career* the imaginative insight is as keen and deep as ever; but here, as before, the work of the artist is constantly interrupted by the invasion of an active and restless intellect which seeks material for argument and speculation, arresting the deeper study of character by a brilliant statement of some of the unsettled problems of the time.

It is the special merit of the plan of *Beauchamp's Career* that it affords scope for the expression of both these tendencies. In the social and political aspects of the story the author finds ample opportunity for the play of sarcasm and argument, while in the portraits of Beauchamp himself, of Cecilia Halkett, or of Lord Romfroy, he proves that his control of the higher artistic gift has lost nothing in strength or certainty. But what is most remarkable in the book, considered as a whole, is the skill with which the writer has brought the two elements of his work into combination. The political and social portions of the novel do not stand apart as mere independent episodes in the progress of the story. There is a Parliamentary election, but its description is not dragged into the legend for the mere sake of picturesque or humorous effect, nor is the novelist often tempted to desert the main business of the plot for the discussion of social theories. The means by which he has escaped these defects are at once simple and successful. He has perceived that character may be developed by the agency of political conflict as well and as truly as by any other sort of circumstance, and he has accordingly forced the different persons of the story into political agitation. Love plays a certain part in the progress of the plot, but it is love complicated with politics. The women as well as the men, and the trivial as well as the more serious characters, are all made to circle round a set of political circumstances. Politics are made the test by which individual character is tried and its special qualities distinguished, and in the skill with which each actor is made to express and reveal his whole nature in the presence of these political ideas lies the artistic triumph of the book.

Nevil Beauchamp, the central figure in the story, may be taken as an example of the success of Mr. Meredith's method. Almost from the beginning of the novel he is represented as entirely absorbed by political ideas; but the type of character developed under the pressure of these ideas has an independent existence, easily separable from the special means chosen for its expression. The same type which is here made the champion and exponent of radical principles might with equal truth have been presented in the service of religious fanaticism, and it is of course to the praise of Mr. Meredith's powers as an artist that he has been able to endow his creation with so much vitality that we can

* *Beauchamp's Career.* By George Meredith. 3 vols. London: Chapman & Hall. 1876.

realize the man apart from the special conditions of his growth. We can almost pardon the author's elaboration of the political parts of his work in consideration of the result, and we can feel that a piece of human portraiture of this depth and value was well worth having, whatever the means chosen for the painting of it. Nevil Beauchamp is represented as a man of aristocratic traditions who descends with enthusiasm into the popular arena. With the temper and ambition of a martyr, he is prepared for any sacrifice, either for himself or for his caste, and he never ceases to be indignantly surprised with others who are not equally conscious of their guilt, or equally anxious for chastisement. The secret of a character like this lies in the fact that the desire for sacrifice generally precedes the occasion of it, and, as a consequence, the result is often insignificant and sometimes ludicrous. For it is only by a radical defect of intellectual perception, nearly always accompanied and symbolized by entire absence of humour, that this kind of character can support itself with enthusiasm. Nevil Beauchamp is a type of the class who believe that all evil is curable, and who insist on regarding the permanent characteristics of humanity as moral deformities for which each individual is to be made morally responsible. To such minds contact with the world and experience of practical life do not bring increased knowledge, but only beget fiercer rebellion, and life often ends as it began in a sacrifice that is logical but ineffective. Mr. Meredith has worked out this character with entire mastery and skill, and with astonishing sympathy. Beginning with the youth whose generous instincts are still unpledged to any social theories, and upon whose intellect no excessive demands have yet been made, he traces the gradual ascendency of the social reformer, and marks with unflinching accuracy the sacrifice of proportion and the loss of force as the young man's enthusiasm passes under the control of an intellect too weak for its guidance. The passages of life at Venice and the love-making with Renée mark the transition from the one phase to the other. At first the lover stands confessed, fascinating us as he fascinates his companion by the splendid directness and sincerity of his impulses. We acknowledge the powerful presence of a gallant youth who has a right to woo and to win; but in a little while the spirit of the reformer is aroused, and the force of the individual passion is impoverished by the touch of calculating philanthropy. He begins to argue the social wrong of Renée's pre-arranged marriage with the aged French Marquis, and strives in the most natural manner to rest his own claims to the lady upon the claims of humanity. But this plan of summoning argument to the aid of impulse, though a very natural device for any lover in distress, has a special significance in the case of Nevil Beauchamp. It marks the beginning of a mental conflict which finally throws the character off its balance under pretence of asserting the control of reason. From this moment Nevil's intellect, which is weak, assumes command over his impulses, which are strong, and the passionate lover develops by an entirely natural process into the fanatical politician. Nothing in the book is finer, either in conception or execution, than the description of the night in Venice which closes this first stage in the hero's career. Mr. Meredith has a method of conducting dialogue which is admirably suggestive of the dramatic intensity of critical moments in the lives of his characters. He can reject the trivial realities of the scene without destroying its truth of colour, and so powerfully compresses the sequence of events that speech has no choice but to flash out the innermost meaning of the speaker.

The subsequent events in the life of Beauchamp, though they sometimes carry the reader too far into the realm of speculative politics, are of essential service in completing the portrait thus effectively sketched in. It is very natural, for example, that Beauchamp, on his return to England, should fall under the influence of the Radical Dr. Shrapnel, that in consequence he should find himself in sharp conflict with his own people, and that his next essay in love should be perpetually thwarted by separation of political ideas. And Mr. Meredith has been no less sympathetic in showing the constant courage and nobility of his hero than relentless in marking his feeble mental steerage. Beauchamp continues as he had begun, always ready for sacrifice, and indifferent to ridicule, often blundering, but always with a certain dash and distinction which no intellectual shipwreck can destroy. Once only in the course of a career which is made pathetic by its failures, and once more at its close, the real personality of the man reasserts itself and breaks away from its bondage of theories. Renée, the old love, with whom he had never thought of discussing politics, summons him to her side. She is married now, and he is in the midst of a contested election, but the summons is magical. He leaves his politics with the sudden alacrity of a soldier called into action, and, although the quick insight of the Frenchwoman perceives a change in her hero, he recovers in her presence something of the force and fascination of the earlier time. Here again Mr. Meredith has been peculiarly fortunate in his work. The rapidity of his method, the abrupt and pregnant statement of what is essential to expound the intellectual and passionate movement of the scene, is admirably adapted to paint the sudden meeting of old lovers who must as suddenly part again. But perhaps the stroke of strongest and truest art is that by which the author closes the career of his hero. It is in the logic of such a character that the measured results of its labours should be often insignificant and its courage always unfailing, and in the manner of Beauchamp's death both these truths are sufficiently expressed. He is drowned in trying to save another's life, but this other is not the heroine, nor indeed any character with a place in the story, but a nameless little urchin who had fallen out of a boat in Southampton Water. Beauchamp did not need a life's political conflict to teach him brave or generous instincts; but these instincts were from the first the better and truer part of him, and it is therefore right that they should survive his intellectual troubles and flash out again at the last.

We have only briefly touched upon the central figure in the story, leaving the reader to find out for himself the details of the picture, and to study without interference the subordinate figures who fill the scene. Of these Cecilia Halkett seems the most, and Lydiard the least, successful. It is true that the latter is only a slight sketch, but Mr. Meredith has himself shown in the case of Lord Palmet that the slightest sketch can be endowed with vitality. Among the characters whose portraiture is more decisive Tuckham is perhaps the most unsatisfactory figure, and his union with Cecilia Halkett is scarcely made credible to us. But these minor failures scarcely trouble the general progress of the story, nor do they hinder the expression of Beauchamp's personality. All the characters with whom he is brought closely into contact, Cecilia Halkett, Renée, Earl Romfrey, and Dr. Shrapnel are living creatures, upon whose portraiture the author has spent scarcely less care than upon that of the hero himself. Wider objections which might be brought against the novel depend, as we have already hinted, not upon imperfect skill, but upon defects inherent in the scheme, and which partly correspond with fixed characteristics in the author's method. The combined study of the permanent truths of character, and of the shifting and unsettled problems of political and social life, necessarily imports a discord which no skill can wholly conceal; but where the writer by the nature of his own genius is constantly tempted to this twofold labour it is better that he should choose, as Mr. Meredith has chosen in *Beauchamp's Career*, a theme which provides in itself the material necessary for the exercise both of his creative and critical faculties.

MINOR NOTICES.

MRS. GROTE has done well in reprinting her husband's letters analysing the causes of the civil war which broke out in Switzerland in 1847.* Mr. Grote was attracted to Switzerland by the differences of race, language, religion, civilization, wealth, habits, &c. which distinguish one part of the population from another, and afford an interesting field for the study of historical phenomena. He also perceived a certain political analogy between the Swiss and the ancient Greeks, whose history he was then writing. He accordingly went to Switzerland in order to investigate the conflict on the spot, and afterwards published the results of his observations in a series of letters which attracted a good deal of attention at the time, but has now been long out of print. It has occurred to Mrs. Grote that the recent German embroilment with the Roman Catholic Church imparts a revived interest to the almost forgotten Sonderbund quarrel, which contained the germs of the same problem. "It is," as Mrs. Grote remarks, "the same piece playing over again, only that the theatre on which the drama is enacted occupies a more extensive area of territory." She has therefore republished Mr. Grote's letters, with the addition of one to De Tocqueville, giving a retrospective view of the struggle. Whether the antagonism between the clerical and lay elements in society is destined, as Mrs. Grote imagines, to be sempiternal, there can be little doubt that it will at least find abundant play for some generations to come in various parts of Europe; and Mr. Grote's sketch of the Swiss dispute is a useful introduction to the study of the present aspects of the question. He shows very clearly how clerical influence in Switzerland was organized for political purposes. There were, for instance, eight monasteries in the canton of Argau which throughout 1840 were the great seats of politico-religious agitation. "While," says Mr. Grote, "the leaders from the three cantons held meetings and concerted their measures there, the ample funds of the convents were not spared for the movement, which was impressed upon the neighbouring population as a religious cause in the strictest sense, and enforced as well by the strongest appeals which the Catholic faith and the authority of priests and monks could furnish, as by unmeasured cries of irreligion against opponents." When a rising took place among the Catholic population of the Southern districts, the convents were used for the concealment of arms and ammunition, their funds were employed in distributing money, wine, and brandy among the insurgents, and their armed servants fought amongst the latter. The rising was, however, put down, and the suppression of the rebellious convents decreed, subject to provision being made for the existing inmates. The Clerical party of course protested, and, after prolonged discussion in the Diet, it was agreed in 1843 that the canton of Argau should restore four of the convents. Another revolt subsequently broke out in the Valais, where the Jesuits were in force, and were known to be fomenting public feeling against the civil authorities. This led to a demand for the expulsion of the Jesuits from Switzerland; but it only obtained a vote and a half in the Diet, and would probably have been dropped if the Jesuits had been content to remain as they were—that is, established only in Valais, Fribourg, and Schwytz. But, confident in their power, the Jesuits sought to ex-

* *Seven Letters concerning the Politics of Switzerland preceding the Outbreak of the Civil War in 1847.* By George Grote. John Murray.

tend their influence, and obtained permission from the Diet to add Lucerne to the cantons in which they were entitled to establish themselves. This naturally excited much indignation among the Liberal and Radical public; and *francs corps* were formed in the neighbouring cantons, which invaded Lucerne, but were easily defeated. There can be no doubt that this was a grave mistake on the part of the Liberals, but it was only a retaliation for the previous attacks on the Catholic party. It became obvious, indeed, that the civil Government must either be relieved from clerical domination, or become a mere instrument in the hands of the priests; and this conviction was deepened by the systematic aggressiveness of the latter. When the clerical party found the majority of the Diet against them, they formed a separate league of seven cantons, called the Sonderbund, which established itself as an armed Confederation, in defiance of the authority of the Diet. We cannot go into the details of the struggle which ensued, but may give Mr. Grote's summary of its chief features. He describes the Sonderbund party as "a knot of men trying to turn religion to political account and to put the priest above the political leader, employing for the purpose all the artifices of an ultra-democracy," and receiving the support of the Conservatives, who, though most of them Protestants, sided with the clericals from hatred of their political rivals, the Liberals. It need perhaps hardly be said that Mr. Grote writes as a strong partisan of the Liberal cause, and that allowance must be made for this bias. At the same time, his letters are an admirable example of clear, concise, and vigorous statement, and possess both literary and historical value.

In a paper on the Etruscan Language* Mr. Isaac Taylor exhibits very clearly and fully the present state of the important controversy on this subject which some still regard as shrouded in inextricable mystery. In his *Etruscan Researches* Mr. Taylor had put forth all his reasons for holding that the riddle had been solved, and that the old Etruscan speech belonged to a branch of the Turanian family of languages, now represented most nearly by the Yenisseian dialects. But although he sees no cause for abandoning or seriously modifying any of his positions, the publication of Dr. Corssen's elaborate work renders a complete re-statement of Mr. Taylor's arguments in a small compass especially useful for those who have no time to read either Dr. Corssen's or Mr. Taylor's volumes. The perusal of this short but very able paper will amuse as well as instruct the reader. Among the many attempts to argue from a foregone conclusion, the effort of Dr. Corssen to prove that Etruscan was but a form of Latin is one of the most ingenious, the most daring, and in its ludicrous results the most mournful. If it be impossible to repress a smile at the absurdity of some of his statements, the reader's merriment must soon give way to a feeling of profound pity for a life in great part spent, and prematurely cut short, on an impossible task. Even in Mr. Taylor's armour a few chinks may perhaps still remain open; but no one probably will deny that his conclusions generally rest on foundations not easily shaken.

Whatever may be thought of the speculative system of Shakspearian criticism with which Mr. Fleay has identified himself, there can be no question that he has rendered an important service to the study of the great dramatist by the Manual† which he has just published. The object of this work is, he tells us, "to place within the reach of the student such information as is essential for him to possess, but is at present unattainable unless he purchases many costly books." Mr. Fleay has accordingly prepared a careful and complete digest of all the authoritative information which has been collected with regard to Shakspeare's life, the chronological succession of his plays in order of composition, their relation to the contemporary drama, his manner and method of work, and the development of his artistic genius. This forms the first part of the Manual, while the rest of it is devoted to Mr. Fleay's own theories as to the use of metrical tests in determining the authenticity of the plays attributed to Shakspeare. Mr. Fleay's views on this subject are well known, and need not be discussed here. There can be no doubt, however, as to the value of the earlier and more practical part of his book, in which he presents a comprehensive survey of all the facts necessary to a thorough understanding of the circumstances and conditions under which Shakspeare worked. Mr. Fleay not only gives his readers in a brief and simple form the substance of books which they would find it difficult or expensive to procure for themselves, but he saves them the trouble of wading through a great mass of not very readable matter in order to obtain a few important particulars. He sternly avoids the fanciful style in which it was once the fashion to deal with Shakspeare's biography; sticks to plain, hard facts, and tells his story without any waste of words or idle ornament. In his first chapter, for instance, we have all that is in any degree authentically known about Shakspeare's life put together in concise detail, without any superfluous discussion of doubtful questions. Next comes a collection of the chief references to Shakspeare in contemporary writings. The third chapter summarizes the various grounds on which the authenticity, origin, and date of each play are to be determined; the fourth gives the writer's own views as to the extent to which the works published in Shakspeare's name are genuine, with an account of the chief editions; while the fifth reviews the latest inquiries as to pronunciation, metre, and metrical tests. In the succeeding chapter we get an interesting account of the way in which plays were presented in Shakspeare's time; while the next three divisions supply a connected view of theatrical history from 1575 to 1642, with tables of plays, companies, theatres, actors, printers, and publishers. Altogether Mr. Fleay's Manual is a valuable contribution to the study of Shakspeare.

Professor Tyndall has republished in a revised and, to some extent, remodelled form, and with some additions, a selection of articles and lectures on various questions of science*, such as Putrefaction and Infection (the discussion of which is brought down to the date of the latest experiments), Dust and Disease, Crystals and Molecular Force, &c. There are also sketches of Faraday, Niagara, and a voyage to Algeria. The charm of Professor Tyndall's clear and vivid style of exposition is fully maintained in this volume, and it may be taken up with the assurance that it is not only instructive but entertaining.

It was probably inevitable that the first edition of such a work as Mr. Venn's *Logic of Chance*† should require on various points subsequent correction and elaboration; and this has been supplied in a second edition, in the preface to which the writer frankly acknowledges various faults, including a too polemical tone, which he has discovered in the original publication. Several new questions are introduced, such as the nature and physical origin of laws of error, the material view of logic and probability, the practices of insurance and gambling, &c. At the same time, the writer adheres to the general view of probability which he adopted in the first instance.

Mr. Greg has reprinted from various publications a series of articles‡ showing, on the one hand, the mistakes into which the working classes are apt to fall in regard to their own interests, and, on the other, the means by which they could most readily and effectually improve their condition. This work has been already incidentally spoken of in our columns, and it is now only necessary to say that it is written with Mr. Greg's accustomed vigour and incisiveness, and that it deals not merely with the errors of the Trade-Unions, but with such questions as peasant proprietorship and the general progress and hopes of socialism.

Mr. King's biographies of French political leaders§ would hardly be worth notice in themselves, being only a rather poor sample of the ordinary style of American newspaper correspondence, if it were not that we have to protest against English publishers lending their aid to debase their native tongue by the introduction of American vulgarisms. Such words as "theater," "counselor," "flavor," "somber," "center," "endeavored," "defense" may pass in America, but they are certainly not English; and in reprinting this book the English publisher ought to have taken care to have them corrected. The tone of the work may be imagined from the fact that M. Victor Hugo heads the list of the political leaders of France, and that the sketch of him is chiefly made up of marvellous stories derived from M. Hugo's Memoirs, which is generally supposed to be the most romantic of his works.

Lord Ronald Gower has brought out in two vast folio volumes a series of drawings from the collection of Castle Howard.‖ It has often been said that to write oneself out is a bad thing. To draw oneself out may not be as bad; but Lord Ronald Gower would appear to be desirous of experimenting on its effects. These are two immense books, so big that it is only by the assistance of a confederate that they can be comfortably turned over, and it may fairly be questioned whether they possess advantages on account of their size to compensate for the bewildering and fatiguing exercise of going through them. A process of selection might have reduced the number. Some are not, from an art point of view, worth reproducing. Some again, which are fairly drawn, might, so far as any distinct physiognomy is presented, be labelled as portraits of Wellington and Napoleon, with an alternative of identification reserved to the spectator. When they had been well weeded, all that were left of three hundred would have made a very pretty volume for the drawing-room table, if extra margin had been cut down, and all superfluities of waste paper sternly repressed. But Lord Ronald has preferred to give us the number mentioned, and some people may find his book more useful and more pleasing, as it is certainly more conspicuous, on account of its size. The painter Clouet is better known in England by name than by his works. Lord Ronald, in his very short preface, justly calls him the French Holbein, and undoubtedly some of these heads are very like the drawings of the Court of Henry VIII. preserved at Windsor. Like so much of the art of Northern Europe at that day, the work of the Clouet family took its origin in the Court of Burgundy. Jean, as a receipt dated in 1495 goes to prove, was a miniature painter of Brussels. His son, also John, but known as Jehannot, or John junior, and familiarly as "Janot," was father of Francis Clouet, to whom most of the drawings in the Carlisle Collection are attributed. The frontispiece is supposed to be a study from

the face of Francis I. after death, for the waxen image required at the funeral. No. 2 is the same King alive; and very much alive, indeed, his face appears. No. 5 is labelled "feu monsieur (*sic*) le dauphim Francois," and also looks as if it had been drawn from a corpse, and so do one or two more. An interesting portrait is that marked "Marie Royne descosse en leage de neuf ans et six mois Lan 1552 au mois de Juillet." Unfortunately this is one of those drawings which show little but the outline of a human head, and might represent anybody. There are also portraits of Admiral de Coligny, of Margaret of Navarre, of Henry IV. as an infant, and many other remarkable people, besides some seventy which are without names. It is hardly stated with sufficient clearness in the preface that there is no proof whatever forthcoming that these drawings are by the Clouet family, except the very negative one that no one else could have done them. But we are only told, on the authority of Lenoir, that the fifth Earl of Carlisle purchased them in Flanders; for no record of the purchase is to be found at Castle Howard. Lord Ronald Gower has improved in his mastery of the autolithographic process since he made the drawings from the Sutherland collection (noticed in the *Saturday Review*, September 26, 1874), and he modestly deprecates comparison of his work with that of Chamberlaine on the Windsor Holbeins; but, while acknowledging the value of the present publication, we cannot but wish that a little more time and elaboration had been spent on a few of the heads, and that the rest had been let alone.

Mr. J. P. Fleming has compiled an analysis of Bacon's *Advancement of Learning* *, which will be useful to the student if he does not rely upon it too exclusively in order to avoid the trouble of mastering the original for himself. There can be no doubt that in some respects Bacon's style and phraseology warrant an explanatory work of this kind, and it is also of advantage to have a digested summary of his system, as an introduction to deeper study of it. The work is designed for the use of candidates at military and Civil Service examinations.

Mr. Canning's *Intolerance among Christians* † is a boyish collection of quotations from eminent men of ancient and modern times intended to prove the necessity for greater toleration in matters of religion. His simplicity and confusion of mind are displayed in the conclusion at which he arrives, that it would be the greatest moral improvement which the world has yet seen if "the good and morally virtuous of all parties, religious and political, could recognize a common interest, and alike disown the wicked among their several denominations as the common enemy." As a matter of fact, all denominations do denounce what they think wickedness; but then there is a difference of opinion as to what wickedness really is, and what principles or systems of religion are most powerful in combating it. It may be also asked whether the phrase "morally virtuous" does not suggest the possibility of virtue being sometimes immoral.

The *Concise Law Dictionary* ‡, edited by Mr. H. Mozley and Mr. G. Whiteley, is not only concise, but compendious, and is well adapted for those who desire to refresh the memory or obtain a succinct explanation of legal terms without going through a mass of details.

The official record of the last year's meeting of the Social Science Congress at Brighton § contains, in addition to the usual matter, especially able and interesting papers on the City of Health by Dr. Richardson, on Economy and Trade by Mr. Grant-Duff, and on the Repression of Crime by Lieut.-Col. Du Cane.

The extension of the taste for gardening would seem to be indicated by the appearance of a third edition of *Villa Gardening* ‖ by Mr. Paul, the well-known rose-grower, and of a second edition of Mr. Samuel Wood's *Plain Guide to Good Gardening*. These works are both written by practical men, and give practical instructions which it is easy for amateurs to understand, if not to follow.

Mr. A. Lukyn Williams's essay on the causes and means of prevention of Indian famines ¶ gives an interesting summary of the practical conditions of the subject. He comes to the conclusion that scarcity of food must, from the nature of the climate, be regarded as at times inevitable, but that this danger may, by agricultural and other improvements, be kept within bounds, and arrangements made for preventing the disastrous consequences of famine. Much may be done, he thinks, to increase the productiveness of the country and to introduce new kinds of food; but, on the other hand, the protection of the people against famine must mainly depend on an advance in general civilization.

An "Old Draper" ** has published some reminiscences connected with his trade, which are not without interest. He began his business life as a lad in a draper's shop at Whitechapel. He had to be up very early in the morning to do the rough work now usually done by porters; ten o'clock at night was the nominal hour of closing, but the shopmen were often at work for an hour or two later, and on Saturdays the shutters were not put up till midnight, after which there would be two or three hours of clearing up, for which the young men were consoled by a good supper of beef-steaks and porter. We get some glimpses of the ways of business at this time. People used to chaffer very much about prices, and the system of fixed charges was only just coming in. Window-dressing was also a novelty. Customers were often bullied into buying goods they did not want; and the writer has seen girls going off crying on account of the goods thrust upon them. Business was conducted in the most slovenly manner, both quality and price being settled in a very haphazard way. In some cases the shopkeepers sold goods at a loss, while in others the price was excessive. The countermen were encouraged by tips. Afterwards the writer rose to be first shawl-man at Waithman's, at the eastern end of Fleet Street. His being a shopman, however, did not prevent him being one of the "bucks" of the period, but he admits he was "somewhat of a coxcomb." On Sunday mornings he used to walk in Kensington Gardens in top-boots and buckskins, with his neck tied up in a tall, stiff neckerchief, and in the evening he changed his attire to knee-breeches and silk stockings, which he displayed on the same promenade. The "Old Draper" appears to have been a shrewd and successful shopman, and recounts many of his feats in passing off goods which other shopmen could not dispose of. Among other things in which there has been a change, he notes how rarely made-up articles were on sale in his early days, materials being usually bought for making up at home, and how scanty was the ordinary stock of clothing of people even in a decent position compared with that of a similar class nowadays. The general lesson of the book seems to be that in the drapery, as in other trades, success is usually obtained by steady industry combined with sharpness and a touch of craft.

Mr. O'Leary, who tells us that he began life as a farm-boy and was afterwards a paviour, has visited Canada, the Red River Territory, and the United States as a delegate of the Agricultural Labourers' Union, and now publishes the results of his observations.* He writes in a rough, and occasionally rather wild, way, and the arrangement of the book is fragmentary; but perhaps it may be of interest to the class addressed. He has the good sense to warn English working-people not to expect a Utopia on the other side of the Atlantic, though he thinks there is plenty of room for emigrants who are willing to work hard and can keep away from the drinking-bars.

It is satisfactory to observe the gradual progress of culture and literary tastes in those new countries where the rough and arduous labour of the majority of the people leaves little time for intellectual pursuits. Proof of the advance in this respect which is gradually going on comes to us in the shape of two new periodicals† which have been started, one at Melbourne and the other at Dunedin. It may be taken as evidence that there exists in these communities a healthy appetite for letters when we find publishers, not content with smaller magazines, boldly venturing into the solemn sphere of quarterly reviews. Both of the works before us are of this order. The *Melbourne Review* is a half-crown publication, and the promoters intimate in a very candid preface that they cannot hope to compete with the abundant supply of English fiction and light literature, of which the colonial production is small, but think they are more likely to succeed with "subjects of a more solid character." Thus "articles on Philosophy, Theology, Science, Art, and Politics will form the leading features of the Review," and will be admitted, "no matter from what school of thought they may emanate." It is added that a principal source of interest will be the treatment of important subjects "from a colonial standpoint, and by writers of colonial education and experience." Whether any very great results are likely to be obtained in this direction remains to be seen, but the aim is at least a good one. As far as the present number is concerned, the general character of the articles appears to be very much that of an echo of familiar English voices, with perhaps a special predilection for what are called advanced views. In the pages on the relation of the State to the religious and ecclesiastical bodies of Victoria, we find something of the ring of Mr. Chamberlain, and it may perhaps be thought that the statement that in England "the fury of party spirit within the State Church—a spirit which State patronage provokes and fosters—calls loudly for the remedy of disestablishment" indicates somewhat one-sided information. Party fury has to English eyes been more conspicuous outside than inside the Church. We do not know how far the testimony of this writer is to be accepted within his own local range, but he relates a conversation which he says he overheard between two little boys, one of whom asked the other in regard to a new-comer, "What religion is he? an A or a B?" and, on the other replying, "Neither, he's a O," exclaimed, "Oh, —— him; there's enough of religions"; and the writer adds that he believes this sentiment is shared by a great majority of the people of Victoria. The next article deals with "History and Geography," and men-

tions the startling fact that "most educated Englishmen confuse Thomas with Oliver Cromwell"; and there is another paper on "The Political Future of Europe," which goes to show that a process of reunion among the fragments of the Roman Empire has been for some time in progress, and that the new German Empire is the centre-round which "the still separate parts will aggregate," making her success "certain and irresistible." In an article on "The Drama as a Fine Art," it is remarked that the rise and progress even of opera-bouffe is a hopeful sign, and that the drama of the future will probably be musical in form, while retaining its essentially dramatic nature. The co-operative system is strongly advocated in an article on "Labour and Capital"; and the Rev. J. F. Bird, in discussing "The Basis of National Prosperity," says, "It is high time that we woke up to the fact that self-government can only be safe and practical when the people are educated; and also that we arrived at the frank admission that we are not an educated people." On the whole, the opening number of this Review, if not very brilliant, displays at least earnestness and vigour. The *New Zealand Magazine* is of a similar character. There is a long preface, in which the editors explain "(1) What the magazine is intended to be; and (2) what it is not intended to be"; offer to "make room for the most contrary arguments in successive numbers"; and encourage themselves with the thought that "perhaps the best testimony to success will be, if we find that we have not entirely pleased any one." The New Zealand reviewers, like the Australian, look for support to those "thoughtful and farsighted colonists who understand how greatly the problems and conditions before them differ from the problems and conditions that beset thinkers in old countries"; but perhaps it may prove that life at the antipodes is after all not so very unlike what it is elsewhere, and that young countries gradually grow old. Among the subjects treated in this number are "Darwinian Theology," "The Life and Growth of Language," "The Problem of Poverty" (this article is unfortunately cut short in the middle for want of room to insert the whole of it, but the editor ingenuously apologizes in a note, and adds that "readers will have no difficulty in following out the threads of the argument for themselves"), "Specialization in Government," "Birds of New Zealand," &c. The general style of the work is thoughtful and straightforward, though rather crude.

Although there is no particular novelty in the plan of Mr. Mitchell's collection of sayings and doings, which he calls *Human Nature**, the selections are, on the whole, creditable to his taste and reading, and form an interesting book for an idle half-hour. By chance we came upon a passage from Mr. Disraeli's *Tancred*, which may be acceptable at the present moment:—"All is development. First there was nothing, then there was something; then I think there were shells, then fishes; then we came. And the next change there will be something very superior to us, something with wings. This is development."

Mr. H. F. Biron has produced a model or relievo map of India †, which is embossed so as to give an idea of the undulations of the land. This map is very striking to the eye, which is enabled at a glance to take in the character of a particular region as compared with others; but we suppose it is an inevitable condition of all these model maps that mountains must be exaggerated for the sake of effect. We tremble to think what the Himalayas must be, if Mr. Biron's presentation of them is strictly according to scale.

Mr. Arthur Haygarth, the editor of Lillywhite's *Scores and Biographies* ‡, has brought out a couple of new volumes as a continuation of the series. In the preface it is admitted that, owing to the want of proper materials, many inaccuracies and omissions have occurred, but it is pleaded in pathetic italics that, in such a case "mistakes *must* occur," and we can easily understand it. The work was originally undertaken only for private amusement, but it contains at least the nucleus of a personal history of modern English cricket, which should be interesting to all who are partial to the game.

The Official Catalogue of the British Section of the International Exhibition at Philadelphia § has just been issued in two volumes, one giving a list of "exhibits" and exhibitors, and the other a Commercial Guide, embodying full information as to the American tariff and Custom House regulations.

An authorized edition of M. Jules Verne's stories ‖ has been issued in shilling volumes, with numerous illustrations. They are all very much of the same character, full of thrilling adventures and wild impossibilities, and, though one comes now and then on bits of genuine cleverness, the general effect is rather monotonous. The attempt which is made in some cases to combine scientific information with the marvels of fiction must be very confusing for young people.

Modern Manners—Christianity among the Negroes—The Works at St. David's—Rectories and Rectories—A North-Country Election—The "Yankee Emperor"—The Railway Cloak-Room—The Royal Academy. II.—The Two Thousand Guineas.

Lord Athemarle's Reminiscences—From the Hebrides to the Himalayas—Tait's Recent Advances in Physical Science—Miss Yonge's Stories of Greek History—The Hand of Ethelberta—Bancroft's Native Races of the Pacific. Vol. V.—Price's Handbook of London Bankers—Two Dramas—Rogers's Wasps of Aristophanes—French Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

MUSICAL UNION.—BREITNER, Pupil of Rubinstein, Tuesday, May 23, and RUBINSTEIN, Tuesday, May 30; with Papini, Wiener, Hollander, and Lasserre. No person admitted without a Ticket. No more Free Admissions will be given.—Prof. ELLA, *Director.*

THE SOCIETY of PAINTERS in WATER COLOURS.—The EIGHTY-SIXTH EXHIBITION is now OPEN. 5 Pall Mall East. From 9 till 7. Admittance, 1s. Catalogue, 6d.
ALFRED D. FRIPP, *Secretary.*

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRETORIUM," with "Dream of Pilate's Wife," "The Night of the Crucifixion," "La Vigne," "Soldiers of the Cross," "Christian Martyrs," "Gaming Table," &c.—DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1s.

GAINSBOROUGH.—The BEAUTIFUL DUCHESS of DEVONSHIRE. Mr. SAMUEL COUSINS, R.A., has undertaken to ENGRAVE this magnificent PICTURE.
The Artist's Proofs will be issued at Ten Guineas each.
Subscribers' Names are now received by Messrs. THOS. AGNEW & SONS, the Publishers and Proprietors of the Picture, at 5 Waterloo Place, Pall Mall; Exchange Street, Manchester; and Liverpool and London Chambers, Liverpool.

ARTISTS' BENEVOLENT FUND. Incorporated by Royal Charter, for the Relief of the Widow and Orphans of British Artists.
Patron—HER MAJESTY THE QUEEN.
The SIXTY-SEVENTH ANNIVERSARY DINNER of the Corporation will be held at the Freemasons' Tavern, Great Queen Street, on Saturday, June 17, 1876.
Sir WILLIAM FRASER, Bart., M.A., M.P., in the Chair.
Since the foundation of the Society, the sum of £37,077 10s. has been distributed in relieving widows and orphans of British Artists, and during the past year fifty-three widows and sixteen orphans have received annuities amounting to £1,125. This institution is entirely supported by the voluntary donations and subscriptions of artists and patrons of the fine arts.
Gentlemen's Tickets, 21s.; Ladies, 12s. 6d., may be obtained of the Stewards; at the Bar of the Freemasons' Tavern; and of the Secretary, J. YOUNG, Esq., 4 Trafalgar Square, W.C.

IN the INTERESTS of PUBLIC MORALITY.—Under the Joint auspices of the British, Continental, and General Federation for the Abolition of Government Regulation of Prostitution, and the National Association for the United Kingdom, 27 Great George Street, London, S.W.), A PUBLIC MEETING will be held in St. James's Hall, Regent Street, on Friday next, May 19. Père Hyacinthe, M. Ed. De Pressensé, M. G. Appia, the Right Hon. James Stansfeld, M.P., J. G. Shaw-Lefevre, Esq., M.P., and others will address the Meeting. Amongst those who have promised to attend are A. H. Brown, Esq., M.P., Thomas Burt, Esq., M.P., Thos. Blake, Esq., M.P., C. Cameron, Esq., M.D., M.P., J. Corbett, Esq., M.P., Sir Thomas Chambers, Q.C., M.P., C. R. Hopwood, Esq., Q.C., M.P., Alexander McArthur, Esq., M.P., Duncan McLaren, Esq., M.P., A. J. Mundella, Esq., M.P., Russell Noel, Esq., M.P., F. Pennington, Esq., M.P., S. D. Waddy, Esq., Q.C., M.P., &c. &c. The Chair will be taken at Eight o'clock precisely by Sir HARCOURT JOHNSTONE, Bart., M.P. Admission at the Regent Street and Piccadilly Entrances free. Doors open at a quarter past Seven o'clock. The Meeting is open to Adults of both Sexes.—Application for Reserved-Seat Tickets to be addressed to the SECRETARY, 27 Great George Street, Westminster, S.W.

GUILDHALL LIBRARY.—The LIBRARY COMMITTEE of the Corporation of the City of London hereby give Notice that this LIBRARY will be CLOSED from Friday the 12th to Saturday the 27th of May instant, inclusive.
Guildhall, May 4, 1876. MONCKTON.

WELLINGTON COLLEGE.—JUNIOR SCHOLARSHIPS. There will be an ELECTION to SIX in June next. They are open to all BOYS who on June 1 are between Twelve and Fourteen years of age. The Examination begins on Tuesday, June 20.—For further particulars apply to the Rev. the BURSAR, Wellington College, Wokingham.

CLIFTON COLLEGE SCHOLARSHIPS.—EIGHT or more will be open to COMPETITION at Midsummer, 1876, value from £80 to £50 a year, which may be increased from a special fund to £90 a year in cases of Scholars who require it.—Further particulars may be obtained of the SECRETARY, the College, Clifton, Bristol.

MARLBOROUGH COLLEGE, May 1876.—TWELVE SCHOLARSHIPS, varying in value from £80 to £15 a year, besides a certain number of Free Admissions, will be competed for in June next. These Scholarships are open to Members of the School and others without distinction: Two will be offered for proficiency in Mathematics. Age of Candidates from Twelve to Sixteen. Full particulars may be obtained on application to Mr. SELLICK, the College, Marlborough.

HIGHGATE SCHOOL.—There will be an EXAMINATION for FOUR ENTRANCE SCHOLARSHIPS of £75, £50, £30, £20, June 6.—Application to be made to the Rev. the HEAD-MASTER, School House, Highgate, N.

GROVE HOUSE SCHOOL, Tottenham.—*Head-Master*—ARTHUR R. ABBOTT, B.A., Lond. Terms £120 [illegible]; Junior £50 a year. Scholarship Examination in July.—For information apply as above.

No. 1,073, Vol. 41. May 20, 1876. [Registered for Transmission abroad.] Price 6d.

THE BERLIN CONFERENCE.

THE murder of the Consuls at Salonica, though it had no political motive or object, may perhaps have serious political consequences. The crime and the immediate impunity of the offenders undoubtedly illustrate both the fanaticism of the Mahometan populace and the inefficiency of Turkish administration. The circumstance that the French Consul was one of the victims may not improbably direct popular feeling in France against the cause of the SULTAN; and, although the French Government is not likely to be provoked into an abandonment of its temporary neutrality, one impediment in the way of Russian designs might be removed by a popular feeling in France against the maintenance of the Ottoman dominion. There can be no doubt of the sincerity of the Porte in its professions of regret. The mob of Salonica has gravely increased embarrassments which were already sufficiently perplexing. There will be no hesitation in executing the culprits or in punishing any local functionaries who may have been guilty of connivance or weakness. Public opinion among the Turks themselves will approve of vengeance against the blundering cutthroats who selected as victims of their fanatical fury persons who were entitled to the protection of powerful Governments. The Russians and the philanthropists will have rejoiced in a catastrophe which is singularly well timed for the accomplishment of their objects. The rumour of dangerous agitation among the rabble of Constantinople may perhaps have been suggested by the Salonica outrage, but the reported irritation of the conspirators against the SULTAN himself is not incredible. The populace has not the means of appreciating the reasons which render it necessary for Turkish Ministers to defer to the imperious remonstrances of great European Powers. The SULTAN is probably accused of disloyalty to his faith when promises of religious equality are published in his name. A Mussulman insurrection would tend more than any other occurrence to precipitate the overthrow of the Ottoman dominion. Since the massacre of the Janissaries half a century ago, no domestic revolt has occurred among the Mahometan population of European Turkey. The race of mutinous Pashas has long been extinct.

The Conference at Berlin has certainly not been suggested by trivial motives. The determination of the Emperor of RUSSIA to confer, in company with his principal Minister, with the German EMPEROR and Prince BISMARCK would have been significant even if Count ANDRASSY had not been invited to join in the discussion. It was justly inferred that, in the opinion of the Russian Government, the ANDRASSY Note has proved abortive, although it was readily accepted by the Porte. The refusal of the insurgent chiefs to accept the proposed compromise might easily have been foreseen if it had been known that the allied Powers were not prepared to enforce their own decision. Since the exchange of communications on the Note the Turks have achieved no considerable military success, nor is the bearing of Servia or Montenegro less menacing than before. A few weeks since the Russian press abandoned the pacific tone which it had recently employed; and on some occasions attacks on the policy and good faith of Austria were encouraged or permitted. It seems that at a ceremonious reception at Berlin the Emperor ALEXANDER formally declared that the maintenance of the alliance of the three Imperial Courts was the basis of his policy. Assurances of continued union are sometimes symptoms of commencing alienation; but it may well be believed that Russia would at present deprecate a political rupture with Austria. In the contingency of a divergence, it is not known that Germany would incline to the side of Russia. Count ANDRASSY may perhaps have been convinced by the EMPEROR and Prince GORTCHAKOFF that the danger of allowing the war to continue outweighs the numerous and obvious risks of intervention. Nothing would be more distasteful to Austria than the aggrandizement of Servia and Montenegro at the expense of Turkey. But a military occupation of the disturbed provinces would gain time, and, except indirectly, it could have no tendency to increase Russian influence. It is not known whether a change in the policy of Russia has been the cause of the sudden overthrow of the Turkish Minister. The conduct of the Porte is so far dictated by necessity that a Grand Vizier must for the most part tread in the steps of his predecessor. It matters little whether an unknown MEHEMET or a feeble MAHMOUD is the nominal head of a Government which has scarcely a will of its own. The personal change is less important than the immediate cause of the Ministerial revolution. It seems that a threatening multitude of so-called theological students required the dismissal of the GRAND VIZIER and of the SHEIKH AL ISLAM, and that the SULTAN complied with their demand.

The official announcement that the Berlin Conference has resulted in perfect agreement among the three Courts seemed at first to indicate the continuance of a temporizing policy. It is stated that there will for the moment be no armed intervention, and that the contumacy of Servia and Montenegro will not be rewarded. If the ostensible report may be trusted, it would seem that the three Governments have agreed on another ANDRASSY Note, except that on this occasion the authorship is attributed to Prince GORTCHAKOFF. In a short time the decision which is enveloped in conventional phraseology will become public in an intelligible form. Notwithstanding the vague disclaimer of vigorous intentions, there can be little doubt that a step has been taken in advance, and that it will be in favour of the insurgents rather than of the SULTAN. The Emperor ALEXANDER and Prince GORTCHAKOFF must have determined on some definite proposal when the Austro-Hungarian CHANCELLOR was invited to meet them at Berlin. That their policy is not violently aggressive is proved by the ready acceptance of the project by Count ANDRASSY; but if it had consisted in a new version of the scheme for reforming Turkish administration, it would not have urgently pressed. Perhaps a term may have been fixed within which the Porte will be required to procure the termination of the revolt, on pain of active measures which would tend to the partial independence of the Christian population of Herzegovina. It is not improbable that the real object of the Conference was to confirm a resolution previously adopted to form a permanent Commission representing either the three Imperial Governments or all the Great Powers. The proposal, whatever may have been its nature, was too serious to be accepted by the English Ambassador without reference to his Government. Lord STRATFORD DE REDCLIFFE adds his high authority to the scheme of a joint supervision or protectorate. Whether such a Board would be too entirely controlled by other Powers will be a grave question for the English Government to consider. The difficulty of dealing with the Mussulmans of Herzegovina has not yet been overcome; but it might be more possible to deal

with the insurgents than with the larger population of Bosnia. Whatever conditions may be imposed on the Porte, it seems impossible to restore peace in Herzegovina except by the intervention of a foreign army of occupation, and the difficulties in the way of any arrangement of the kind, though numerous, are perhaps not insuperable. Any objection on the part of the Porte might perhaps be overruled, nor indeed is it certain that the Turkish Ministers might not consent to be relieved from the arduous task of suppressing the insurrection. Count ANDRASSY has up to the present time discouraged all proposals for an Austrian occupation which might also be regarded with jealousy by Russia. An odd solution has been devised in the form of a suggestion that the disturbed provinces should be occupied by an Italian force. The adoption of such a plan would be a curious resumption of the policy of CAVOUR. The contingent which Piedmont sent to the English and French expedition against the Crimea was adroitly offered for the sake both of asserting the position of VICTOR EMMANUEL as already the representative of Italy, and of conciliating powerful allies. It was scarcely pretended that the King of SARDINIA had any cause of quarrel with the Russians, who indeed have never since displayed any resentment of CAVOUR'S astute enterprise. The King of ITALY is now acknowledged as one of the Great Powers; but it may be thought desirable that he should illustrate his new rank in Europe by active interference. The finances of Italy will certainly not suffice for a gratuitous military enterprise to be undertaken in time of peace. It would not be easy to extract from Turkey payment of the expenses of an expedition which would scarcely be distinguishable from an invasion, but the Commander-in-Chief of an army of occupation would be more advantageously situated than an ordinary creditor. Nevertheless the Italian Government would not act wisely in listening to any proposal of the kind. The presence of an Italian army on the Eastern coast of the Adriatic would involve the risk of misunderstanding with Austria, and it is not for the interest of Italy to take part in the possible dismemberment of Turkey. Should it be necessary to employ foreign troops for the purpose of effecting a pacification, Austria would supply with least inconvenience the forces which might be required.

ROYAL GUESTS.

AMONG the many privileges of England and the QUEEN is that of being able to welcome with easy impartiality guests of all nations, parties, and opinions. Even Don CARLOS is said to be intending to take up his abode here, and, as there used to be a Cadet Committee in London, he may enjoy the attention and admiration of a select circle. Crowned heads, or heads that have once been crowned, fly hither in abundance, and enjoy hospitality, shelter, respect, and sometimes the transitory tribute of popular enthusiasm. It is not so very long since the SULTAN came to show himself in person to his admiring bondholders, and India was ordered to give him a magnificent ball as the head of the Mahometan world. The memory of the reception of the SHAH, with his diamonds, and his concessions, and his embarrassment in having to forego the ordinary execution of his attendants, still lingers like that of a fairy story. Other representatives of Royalty frequently come in a less pretentious manner, and it is when visits are made with familiar simplicity, and one guest succeeds another in a free and easy manner, that the thought naturally suggests itself how strange are the turns of fortune which these successive visitors have experienced. Within a very few days the German EMPRESS has been staying with the QUEEN, the Empress EUGENIE has been welcomed at Windsor, and now the King of HANOVER has arrived to claim the sympathy and share the happy fortune of his relations. The fortunes and misfortunes of Royalty could not have been better illustrated. The Empress AUGUSTA is on the very pinnacle of Continental grandeur, and her elevation indirectly cost our other two guests their crowns. One wins and another loses, but winners and losers alike come to England and receive the welcome befitting their respective positions. The best that can be said for Royal visitors is generally said when they are actually here. The German EMPRESS is, indeed, too high in the world to need that much should be said in her favour. She was Queen of Prussia when Prussia was a State despised alike by France, Austria, and Russia. She is now EMPRESS of United Germany; her glory is illuminated by the rays of Sadowa and Sedan; and the CZAR comes to her husband's capital to settle the affairs of Europe. Out of Germany the EMPRESS is principally known as the recipient of the famous telegrams in which her other self announced that he was wading through much slaughter to a higher throne, and was favoured by a peculiar and divine blessing. The establishment of the German Empire appeals to the reason rather than the imagination or sympathy of Englishmen. It costs an effort to see, but when the effort is made it is easily seen, that the establishment of a strong power in the centre of Europe, opposed equally to the aggressions of Ultramontanism and to the predominance of Russia, has incontestable advantages for England. The QUEEN, so far as descent and marriage have connected her with Germany, may have the mixed feelings of regret at the fallen fortunes of the minor German princes and pleasure in the general aggrandizement of the German nation. But she has one source of sympathy with the Empress AUGUSTA which may be one of unmixed delight. Their children have married, and the QUEEN has given in her daughter a prize to Germany such as few mothers have ever sent to a foreign home. The CROWN PRINCESS, better known here as the PRINCESS ROYAL, may be safely said to be, in classical language, one of the most remarkable women in Europe. In addition to the great qualities that befit a great station, she has gifts of intellect and of character which would make her the first woman in any society in any country. Any mother would justly proud of such a daughter, and the QUEEN has not only the delight of possessing such a daughter, but also of knowing that, in sending her to Germany, she has conferred the greatest possible benefit on the race from which she sprang.

The Empress EUGENIE has now resided for some years in England, and has won the respect which always attends the endurance of misfortune with unostentatious simplicity. Her position is in most respects the reverse of that of the Empress AUGUSTA. She has fallen from empire, not risen to it, and has borne the fall well. Of the private character of the German EMPRESS little is known in England, while her political position is one in harmony with English interests. Much is known of the private character of the Empress EUGENIE, while her political history has been one as divergent from the sympathies of ordinary Englishmen as possible. As Empress she encouraged, perhaps more than any one else, the senseless extravagance of the Second Empire, but she set the fashion to all Europe, and she had the higher merits of active sympathy with calamity, of giving dignity to her Court, and of bearing her trials with spirit and equanimity. Politically, she contributed largely to the ruin of her husband, for she sought refuge from the incapacity or recklessness of the Bonapartist following in the dangerous society of scheming ecclesiastics. She entered on the war that was destined to be fatal to her family with a heart even lighter than that of M. OLLIVIER, and she received a severe, if not unmerited, chastisement in finding herself left alone with the Count of PALIKAO to send the last army of France to its destruction. But in the trying times that followed she showed a high sense of what was due to patriotism and to herself, and steadily discountenanced the schemes of BAZAINE to re-establish the Empire at the cost of the honour of France and the miseries of a civil war. The death of her husband made her the head of the Bonapartists during the youth of her son, and the NAPOLEONS have lately been principally occupied in quarrelling among themselves. Nothing could be more fortunate for her personally than the present collapse of the Bonapartists, as it enables her to continue the education of her son in the unobtrusive and happy station of an English gentleman, and relieves her from the necessity of revealing how completely the interests she favours are opposed to the sympathies of at least a very large portion of France. The bread of exile is always bitter, but it is sometimes wholesome; and in the dignified retirement and irreproachable simplicity of Chiselhurst virtues are displayed which might be apt to be obscured if the EMPRESS were restored to the scenes of her ancient splendour, and recalled to share the exultation of the devotees of the Sacred Heart.

The King of HANOVER has many claims on English sympathy. He is an exile, he is blind, he is an English Duke, and he has been ruined not so much by his own fault as by having taken the wrong side. He has lost his

pendents are the wanted them. Like most persons of his class and education, he was governed while he still reigned by two deep feelings, contempt for Liberal ideas and contempt for Prussia. He thought that Liberal ideas led to revolutions, and that revolutions led to misery. He shared the general belief that, if Prussia provoked Austria to war, Austria would eat up Prussia as a cat would eat up a mouse. It must be remembered that this opinion prevailed very largely in Prussia itself, and Prince BISMARCK has recently recorded the complete isolation in which he found himself when he declared that the balance of chances was in favour of Prussia. Expecting Austria to win, and wishing Austria to win, the King of HANOVER did not shrink from doing all he could to contribute to the result he desired. He sent his little army into the field, and the only real resistance offered to Prussia by a minor State was offered by Hanover. At Langensalza Hanoverians actually encountered Prussians in the field, not without much credit to themselves. For a day they even repulsed their assailants, and the King of PRUSSIA said afterwards that he could not claim Langensalza as a triumph to his arms. The Hanoverians could not, however, do more than repel one attack, and the next day they were surrounded and had to capitulate. The Government of the KING had been by no means unpopular, and his people contemplated with sincere reluctance the prospect of being absorbed in Prussia. A Hanoverian deputation besought the King of PRUSSIA not to dethrone a Sovereign who held his throne by a title as good as that of the Prussian KING himself, and whose family could trace their rule through a period of a thousand years. King WILLIAM replied that he honoured the Hanoverians for their loyalty, and would have been much disappointed in them if they had not manifested it so freely; but that, as matters stood, he wanted Hanover, and must and would have it. He took it, and there can be no doubt that, if the end justifies the means, this high-handed act did much to bring about the unity of Germany. Prussia could not have crushed France if a hostile or lukewarm State like Hanover had been interposed to break the unity of its forces. Since the Empire was established, the King of HANOVER has given Prince BISMARCK much trouble, and the leader of the Particularists is returned to the German Parliament by a Hanoverian constituency. But there is no reason to suppose that the mass of the Hanoverians have any feelings apart from those of Germans generally, and they acquiesce with satisfaction in what has been done for them, although it was done against their will. They are better off than their former KING, for they do not now regret the past. It is impossible that he should display equal resignation; but he must, like humbler men, endure what he cannot help, and in returning to England, after a long absence, he has the satisfaction of knowing, and of knowing that England knows, that, although he comes here as an exiled sovereign, those over whom he reigned sorrowed when his reign came to an end.

THE BUDGET DEBATES.

MR. RYLANDS, in his Resolution on the second reading of the Income-tax Bill, assumed that it must pass. The Resolution was not appropriate to the occasion, for the Budget is a mode of providing for the expenditure which Parliament has already sanctioned. It may or may not be a cause of regret that the Government should have proposed an increase of expenditure, but the proper time for raising the question would have been during the discussion of the Estimates. According to Mr. RYLANDS, the outlay which he denounces has rendered it necessary to impose increased burdens on the people, and it seems to follow that the CHANCELLOR of the EXCHEQUER is only discharging a plain duty in adding a penny to the Income-tax. It may be doubted whether Mr. RYLANDS is opposed to the modern practice of imposing on the richer classes, in the form of an Income-tax, any additional burden which may be required. His recommendation that the system of exemptions should be carried further shows the dangerous tendency of any approach to graduated taxation. His assumption that the large increase of expenditure is derived from taxation indispensable is not to be hastily admitted. It would have been at least as reasonable to complain that the direct taxpayer was unnecessarily compelled to contribute to the payment of an instalment of the Northern Debt. Sir S. NORTHCOTE would undoubtedly have preferred, instead of incurring the charge of inconsistency if he had abandoned on the first occurrence of a difficulty the scheme which he had recommended to the House of Commons only a year ago. If the debt must in deference to modern prejudice be paid off, Sir S. NORTHCOTE'S system is simpler and cheaper than that of Mr. GLADSTONE and Mr. LOWE; but the imposition of an unequal tax for the purpose of investing the proceeds at 3½ per cent. is itself a proof that the gratuitous obligation ought never to have been incurred. The error which the CHANCELLOR of the EXCHEQUER has committed in raising the percentage of the Income-tax is illustrated by Mr. GLADSTONE'S recent reference to his own election Budget of 1874. As long as the rate was steady and low, the discontent which has often been caused by the tax would have been latent, if it had not altogether disappeared. It is because the percentage is raised that Mr. GLADSTONE has once more an opportunity of complacently recurring to the bribe which failed to secure the votes of the constituencies. The great objection to the Budget, or rather to previous Budgets, is that from time to time revenue has been unnecessarily sacrificed, with the result of rendering new taxation necessary when the public expenditure has been increased.

In the course of his elaborate and able speech Mr. CHILDERS wasted time and trouble in proving that Mr. DISRAELI, when he was in Opposition, used language which is inconsistent with the present proposal of his Government. HORACE showed that he understood character and the nature of things better than Mr. CHILDERS when he recognized the inutility of denouncing habitual and triumphant inconstancy. Mr. DISRAELI has in his time declared that the National Debt was a fleabite; and not long since he was gravely disturbed by a change in the political condition of the Straits of Malacca; but, as his opponents find,

> simul obligavit
> Perfidum votis caput, enitescit

he appears as Prime Minister with a larger majority than when he entered office. Whatever Mr. DISRAELI may have said, he has the good sense to leave the management of the finances in the competent hands of Sir S. NORTHCOTE; nor have Mr. HARDY and Mr. WARD HUNT any difficulty in convincing him that it is necessary to increase the expenditure on the army and navy. There is little ground for Mr. RYLANDS'S suspicion that Mr. DISRAELI is inclined to an ambitious and extravagant policy. Parliament has long since assumed the responsibility of approving the Suez Canal purchase; and it is an anachronism to go back to the acquisition of the telegraphs. No calculation can be less instructive than Mr. CHILDERS'S comparison of five years of Mr. GLADSTONE'S administration with five years during which the Conservatives were in office. The circumstances were wholly different; and some recent charges, including payments in compensation for purchase of commissions, belong properly to the Government of which Mr. CHILDERS was a member. Complaints of undue parsimony on the side of one party, and of unnecessary expenditure by their successors, are bandied backwards and forwards with little advantage. If stores and ships have at any time not been sufficiently provided, it is necessary to supply the defect. As to the main causes of the late increase of expenditure there is little difference of opinion. Those who possess special knowledge of naval details find fault with Mr. WARD HUNT for not building ships fast enough; and civilians cannot fail to understand that the universal rise of prices and wages must necessarily add to the cost of the army. More than two millions of the additional estimates of expenditure have been appropriated to the wants of the army and navy, and part of the remainder admits of easy explanation.

Criticism might be better applied to the charge of 1,400,000*l.* which has been granted in aid of local rates; but the addition to the Estimates in this case only represents the shifting of a burden. It may or may not have been right to relieve the ratepayers at the expense of the taxpayers; but the transfer cannot be regarded as an instance of extravagance. Mr. GLADSTONE'S Government had already admitted the principle which was afterwards applied by Sir STAFFORD NORTHCOTE. Both Administrations thought it necessary to defer to the strong opinion of the House of Commons, including independent members of both parties. A fourth considerable item of increase consists in the sum paid in reduction of Debt; and on this point also the Opposition is entrapped by its own tactics in attacking the policy of the Government. During a regular stress which will probably pass away, the House of Commons, and more especially the Liberal

party, has suddenly been impressed with the necessity of discharging large portions of the National Debt. Sir S. NORTHCOTE improved on the system of terminable annuities which was, as Mr. LOWE with characteristic candour explained, devised for the purpose of deluding the House of Commons into unconscious prudence. It may well be doubted whether the contrivance and the burden were expedient, inasmuch as taxes were imposed or retained for the sole purpose of investing the proceeds at 3½ per cent.; but the present CHANCELLOR of the EXCHEQUER determined to attain by a simple and straightforward process the object which his predecessors had selected as desirable. Even Mr. RYLANDS can scarcely think that the employment of money in the discharge of debt is a licentious form of outlay. The severest advocates of parsimony shrink from attacking the new system of education, which is unfortunately expensive. The State is every year urged to extend its duties and liabilities, and at the same time everything which it undertakes becomes more and more costly. It must be confessed that there is little prospect of a diminution of expenditure.

Mr. LAING stated that England is the most lightly taxed of great civilized States; and he might have added that, in a comparison of military estimates, the heavy burden of personal service in Continental armies ought to be included in the calculation. One country after another has within the last fifteen years approached or passed England in the amount of its National Debt, nor can any other Government borrow as cheaply. As Mr. HUBBARD and Mr. CHILDERS remarked, a considerable part of the revenue is not raised by taxation. A large apparent addition to the expenditure was made by Mr. GLADSTONE in the earlier part of his career by including on both sides of the account the cost of collecting the revenue, which amounts to six or seven millions. If the net revenue only were included in the accounts, and if the Post Office receipts and some other branches of revenue were excluded, the amount raised by general taxation would be found to fall short of 60,000,000*l.*, of which 28,000,000*l.* is annually required to meet the interest on the Debt. On the whole, the grievances of the taxpayer may be patiently borne by his representatives, as they are habitually endured by himself. Mr. CHILDERS gave unqualified approval to the most questionable part of Sir S. NORTHCOTE's Budget. If, he said, additional income was required, the best way of providing the necessary sum was to increase the percentage of the Income-tax. It may perhaps have been impossible, when the CHANCELLOR of the EXCHEQUER had ascertained the amount of his needs, to supply them by any method which would not have been open to grave objections; but it ought not to be forgotten that alterations in the rate of the Income-tax create anomalies which efface themselves when the tax is permanent and equable. The operation of adding a penny to the tax for the purpose of paying off a portion of the Debt can only be justified on the ground that it was necessary to vindicate the consistency both of the CHANCELLOR of the EXCHEQUER and the House of Commons. If a part of the surplus of 1874 had been retained, the Income-tax need not have been increased. The debate on Mr. HUBBARD's motion disclosed a general agreement in the principle which was nevertheless rejected on the division. No speaker, with the remarkable exception of Mr. GLADSTONE, condemned the Income-tax, nor was there any serious opposition to the limit of 150*l.* a year as substituted for 100*l.* On the other hand, strong arguments were adduced against the reduced liability on incomes of 400*l.* a year. Mr. GLADSTONE calculated that, in the alarming contingency of an Income-tax of 2*s.* in the pound, the revenue would be diminished in consequence of the exemptions by no less than 10,000,000*l.* The question is evidently one of degree, and the deduction which is readjusted by Sir S. NORTHCOTE was first introduced by Mr. GLADSTONE. It was well that a protest should be entered against the further extension of a system which might be used for mischievous purposes by financiers who shared the opinions of Mr. RYLANDS.

THE KHEDIVE'S DECREE.

THE telegraph has conveyed a long and obscure account of the new machinery for regulating his very irregular finance which the KHEDIVE has invented in order to cheer the sinking souls of his creditors. If they are not to benefit by the device, it cannot be worth while to have framed so complicated and laborious a scheme. Their object must be to know that whatever Egypt can afford to pay them shall really come into their hands. The elevation of the consolidated debt to a total of ninety-one millions was a crushing blow to them, and this decree is intended to be a compensating mitigation of their calamities. The KHEDIVE flays them with one hand, and plasters them with the other. He admits an unknown number of outsiders to share in the fund which they fondly hoped was reserved for their benefit; but he strives to convince them that what little is to come to them will not be stopped or squandered on the way. We must judge of such a scheme by the conditions under which it is framed. Its object is to do something without doing too much. The KHEDIVE has been obliged to declare himself insolvent, and he would perhaps have made considerable sacrifices and submitted to many unwelcome restrictions in order to avert a catastrophe which he felt to be humiliating. But no one would help him in any effectual way. He was obliged to own that he could not meet his engagements, and he thought that he could not do better than enter into an arrangement for the general treatment of his debts which should not be without its pleasant features for himself and the more pressing of his creditors. From this course of action he derived, not only some immediate financial comfort, but also the preservation of his own personal authority. He might be bankrupt, but he would be as much of a KHEDIVE as ever. Some change was, however, obviously necessary in his financial administration. His Ministers have been for some years profuse in budgets and estimates and figures of all sorts; and, if the simple system of drawing on imagination for financial facts would still have sufficed, no change need have been made. But, unfortunately, faith in Egyptian financial statements has gradually dwindled away, and a stern incredulity now greets those buoyant manifestoes for the production of which a few strokes of an inventor's pen used once to suffice. The parents of the new consolidated debt naturally wished that their offspring should not die as soon as it was born. It could be no gain to the KHEDIVE or his adroit friends to tack on a few odd millions to the debt unless the new debt commanded a fair price in the market. The use of bonds is to get other people to take them; and, unless the information supplied as to the mode in which the KHEDIVE disposed of his money had henceforth some degree of precision, purchasers for the new issue would be hard to find. The KHEDIVE has therefore offered to let a wondering world know exactly how much he gets in every year, and what becomes of it. But, on the other hand, the KHEDIVE, not having escaped bankruptcy, is not going to lose his supremacy. He is to remain the master of his own policy. He is not to transfer the government of Egypt into the hands of a Commission. He alone is to judge of the supreme necessities of his little State. His new decree has therefore been drawn up under the influence of counteracting aims. The bondholders are to have information, and to see that the revenue of the State is properly applied. The KHEDIVE is not to be lowered in his position, or fettered by the interference of foreigners. It is impossible that a scheme drawn up under such circumstances should not present many inconsistencies, that what one paragraph seems to establish another should not sweep away, or that positive regulations should not be made inoperative by sweeping reservations and exceptions. But it would be unjust to say that the security offered to bondholders is mere moonshine. They will know, with tolerable accuracy, what goes on in the regions of Egyptian finance, so long as no extraordinary causes of disturbance intervene. Had such a scheme been framed and worked with tolerable honesty for the last five years, the KHEDIVE would probably have escaped bankruptcy altogether.

The decree creates a Supreme Council of the Treasury, and sketches its constitution, its powers, and its duties. This Court is to consist of ten members—five foreigners and five natives—and of a President, whose nationality is left undetermined. It is to be divided into three sections. To the first section, consisting of three members, all foreigners, is entrusted the duty of superintending the receipt of revenue and its application to the proper purposes. The third section, consisting of three members, all natives, is to audit accounts. The second section, consisting of two foreigners and two natives, with the President, has functions of a still more important character. The Minister of Finance is to fix the Budget three months

before the close of each financial year, and the estimate is to be referred to the whole Council to see whether its members can suggest any improvement in its wording. This is a very humble task, and its narrow limits sufficiently show that the KHEDIVE intends to retain in his own hands the sole decision as to what money is to be spent and for what purposes. At the end of the year a statement is to be made showing how far the receipts and expenditure have tallied with the estimates of the Budget, and the Council is to receive a copy of this statement. This will inform the Council of the view which the Minister of Finance takes of his figures, but will do no more. But then, with regard to receipts and expenditure, the second section has important duties confided to it. It is in some vague way to watch over all receipts coming into the Treasury; and it has this control over all outgoings, that all orders for payment are to be submitted to it before being acted on, and, if found informal, or if found not to be in accordance with the provisions of the Budget, then the second section can stop their operations until a special order of the Privy Council declares them to be valid. This seems a device by no means deficient in ingenuity for reconciling the restraining power of a Council with the supremacy of the KHEDIVE. If the KHEDIVE wants to plunge into extraordinary expenditure he can do so, but then he must openly say, after express reference has been made to him, that this is his intention. This is the only part of the scheme, as transmitted by telegraph, which is easily intelligible. The nature and limits of the authority of the first section are almost hopelessly obscure. As it is to consist exclusively of foreigners, it might be supposed that it was created for the special protection of the bondholders. It seems intended to create a sphere of office tenanted by none but their friends, and expressions are used which may possibly imply that this section will be empowered to see that the revenues specially assigned for the payment of the bondholders are applied for this and no other purpose. But, again, expressions are used which suggest that, if any irregularity in the application of these assigned funds is detected, all that the first section can do is to get the second section to lay the matter before the Privy Council—that is, before the KHEDIVE—so that here again the check would be the same as that intended to restrain sudden and extraordinary expenditure. The KHEDIVE, if he meant to divert the assigned revenues, would have to say that he meant this. As the third section is to consist wholly of natives, and is to have the entire charge of auditing the accounts, the bondholders have no assurance that any obstacle will be placed in the way of those diversions of public money on the part of subordinate collectors by which no inconsiderable part of the revenue is supposed to be intercepted.

If this is really the basis of the scheme, as to which it is impossible to speak with confidence so long as the obscurity that overshadows a large part of the document is unremoved, then the gain to the bondholders may be said to be this. Revenue collected by natives and audited by natives will be paid into the Treasury. When it is there, so far as it forms part of the funds assigned to the bondholders, it will be held for them, unless the KHEDIVE expressly and deliberately orders otherwise. So far as it is part of the free income of the KHEDIVE, it will be paid in accordance with the Budget of the Minister of Finance, over which the new Council will have no other control than that of knowing, with more or less of exactitude, what it is that he says he is going to receive or has received, and what it is that he says he is going to spend or has spent. If expenditure is not according to the Budget, then the KHEDIVE will have expressly to declare that he accepts the responsibility, and orders it to be so. It must be allowed that something which they need not despise before it is tried is thus done for the bondholders. But everything will depend on how such a scheme is worked, and its working must depend on the character and standing of the foreign members of the Council. If the KHEDIVE respects them, if he feels that to lose their services, or to baffle or mislead them, or to see them condemned by official arts to inefficiency, would be a damaging blow to his credit and power, they may do considerable good. There are many abuses which they will not be able to prevent; but they cannot fail to know much more of the interior of Egyptian finance than has ever been known before, and the control afforded by the power of making the KHEDIVE expressly declare his intentions, if he is, for reasons, as he thinks, of great necessity, departing from his engagements or incurring unexpected charges, is not a slight one, if wielded by men whom the KHEDIVE respects. The foreign members of the Council are to be appointed by the Khedive, and by him according to the bargain he makes with each, and subject to dismissal at his pleasure. It would be easy for him to find five foreigners who would accept precarious posts, slur over their work, and do no good at all. But to make transparently bad appointments in order to nullify his own scheme is not the kind of fault which the KHEDIVE is likely to commit. He has his faults and he has his merits, and it is one of his merits that on conspicuous occasions he likes to employ foreigners who are not merely dummies. A very good start has been made by persuading Signor SCIALOJA to be the first President. It is improbable that he will consent long to hold the office; but it is fortunate that a man of ability and character has consented to watch over the first beginnings of the new system. If the other foreign members are well chosen, and the native members are not very badly chosen, the Council may from the outset establish for itself a position which will enable it to make the apparently limited functions entrusted to it of real utility.

LORD SANDON'S EDUCATION BILL.

WE are only imitating the caution of the speakers who followed Lord SANDON in a rapid succession of short observations on Thursday evening if we decline to commit ourselves to any decided opinion upon the Education Bill. We may, however, confidently say that the introduction of this measure is a landmark in the history of English public opinion on educational questions. It has—at all events since 1870—been the easy commonplace of political controversy to insist that the Liberal and Conservative parties were intrinsically opposed to each other in this matter, and respectively represented willingness and unwillingness to provide some effective process for bringing elementary education home to the entire community. An ostensible justification no doubt existed for this assertion in the fact that the special machinery for carrying out compulsion created by Mr. FORSTER'S Education Act was the detail which, in spite of the general applause with which that measure as a whole was received, was clearly not its favourite feature; while, in the years which have since elapsed, the popularity of School Boards has certainly not increased. The fortunes of war had emphatically thrown the Conservatives on the defensive at that time, and, in their then condition, to draw fine distinctions would have been nothing less than political suicide. Their policy was to criticize the details of Mr. FORSTER'S Bill within its four corners, and leave the future to take care of itself. The Act of 1870 did not venture upon universal School Boards, neither did it venture upon universal compulsion; but it yoked compulsion and School Boards together, with an assurance which served to blind men to the artificial nature of the ligature. The zealots of the Birmingham League were not slow to avail themselves of this casual advantage, and in the hands of Mr. DIXON and his party School Board and compulsion not only became convertible terms, but were synonymous with war against the great voluntary and denominational system which had grown up at a vast outlay of personal labour and munificence all over the country.

In face, however, of this disadvantageous conjuncture, impartial bystanders were compelled to recognize the growth of a conviction within the Conservative lines that the secret of true educational policy was to be sought in some system of wide compulsion which need not involve the burdensome addition of School Boards. Lord SANDON'S Bill is the overt proclamation of this principle, and it accordingly claims respectful consideration even from those who may feel misgivings upon details as to which the VICE-PRESIDENT, with all his clearness of exposition, was only able to give a cursory sketch. We are inclined to think that he did less than justice to his own plans by the carefulness with which he sought to distinguish between the power of "direct compulsion," which towns and parishes are hereafter to be allowed to place in the hands of their corporations or their guardians, and that compulsion which is to work itself all over the country by the stringency with which the educational test is to be made the direct necessary antecedent of all profitable employment. Surely it is only quibbling upon words to say that the latter kind of compulsion will be in-

genious trap for dunces, is not in its own way a very "direct" one, while, as Lord SANDON pointed out, it is undoubtedly free from the apparent meddlesomeness inherent in the employment of search officers. We do not pause to inquire whether, as a mere question of statistics, it will be equally efficient in bringing to school the whole residue of "wastrels"; for those who fight the question merely upon the battle-field of figures forget the very potent element of human nature, which ought pre-eminently to be respected in a period of transition from an old condition of happy-go-lucky to one of general tightening up. No matter how mechanically efficient you make a system, if you succeed at the same time in making it unpopular by your details, you are probably taking the most efficient course for securing the rapid decay of that efficiency. Now if there is one thing which—even more than being patronized by their betters in worldly means—our working classes are suspicious about, it is being hunted up. We do not justify the suspicion, while we recognize its existence; but we must observe that hunting up—however needful and however tactically carried out—is, after all, the essence of what we venture to call decidedly "direct compulsion." In matters of health police, such as—in spite of Mr. GLADSTONE—vaccination, the State must inexorably hunt up; but the process becomes very delicate within the moral sphere. As Lord SANDON proposes, any locality which chooses to put itself under this kind of compulsion may do so *mero motu*, and must then swallow the results, while his Bill is framed to make the process as easy as possible; but for the rest of the country we are not sorry that the directness of the compulsion will continue to be—at all events until the experiment has been fairly tried—a self-working one. Although Mr. MUNDELLA failed to see it, the risk to our national self-reliance in a system which would be after all one of universal police agency is at least sufficiently plausible to counsel caution. The point at which it may be weakest is that of girls in agricultural districts who may be looking, not to work either in the fields or the factories, but to domestic service, with its laxer relations between employer and employed, and we shall watch with curiosity to see if any special provisions are made to meet their case. Such provisions must be necessarily somewhat inquisitorial, but they cannot be more inquisitorial than those inherent in the more extreme form of direct compulsion.

Mr. FORSTER legitimately discharged his duty as critic of the Opposition when he foresaw difficulties in Lord SANDON'S suggestion, founded on a provision of the Act of 1870, to give exceptional help to the schools in places which were so poor that a threepenny rate would not represent six shillings per child. This is no doubt a deflection, so far as it goes, from ideal symmetry; but, as ideal symmetry has happily never been the rule in England, we may afford to consider the proposal in its practical bearings. It is obviously intended to do something towards redressing the illegitimate advantages which the new rate-supported institutions, with their wide powers of compulsory taxation, enjoy over the older and widespread system of voluntary schools—created, and in great part sustained, by immense efforts of spontaneous munificence—without which England would have remained an uneducated country. Lord SANDON no doubt offered the decorous explanation that the poor Board school would, if it made out its case, participate in the same privilege. Consistency required no less from him, but the independent supporters of the proposal had better rely upon less merely ostensible arguments. The stringency with which the Act of 1870 has—we must conclude against the wishes of its authors—pressed upon voluntary schools is a matter of notoriety. There can be therefore no motive for mystification about a suggestion which proposes to redress the existing inequality without creating a contrary injustice to the prejudice of schools set up by the Boards. We cannot see that Lord SANDON'S plan runs this risk, and we are therefore ready, without committing ourselves to any details, to give it favourable consideration.

The vehemence with which Mr. READ and Mr. STORER denounced the supposed interference of the ten years' limit with the needs of the farmer at least shows that this branch of the discussion will not be glossed over; so we hold ourselves exonerated from entering upon it at this moment. But we must note that, while the rhetoric of those members amounted to the virtual assertion that the Government Bill would make all employment of childish labour at an emergency impossible, Lord SANDON had particularly called attention to provisions for excepting the seasons at which the principal crops are harvested.

THE FRENCH MINISTRY.

M. RICARD'S death would have been a more serious blow to M. DUFAURE'S Cabinet if the political intimacy existing between the late MINISTER of the INTERIOR and his UNDER-SECRETARY had not made M. DE MARCÈRE'S succession a natural event. A serious effort seems to have been made to induce Marshal MACMAHON to replace M. RICARD by a Minister of less pronounced Republican views. The precise constitutional position alike of the PRESIDENT and of the Cabinet is still unascertained. In theory Marshal MACMAHON has no more to do with the appointment of Ministers than the Queen of ENGLAND has, but in practice he has hitherto exercised very much larger powers. Circumstances had marked out M. DUFAURE as the Minister best fitted to meet the new Chamber of Deputies, and M. DUFAURE was not likely to give a seat in his Cabinet to any one whom the MARSHAL would dislike. But M. RICARD had come more prominently forward on the Republican side since his appointment than he had done before, and when he was suddenly taken away the old Conservative party doubtless hoped that Marshal MACMAHON might have been frightened by the recent administration of the Interior, and might insist upon the new Minister being taken from the Conservative wing of the Cabinet. Had he done so, M. DUFAURE'S position would have become exceedingly difficult. To resist the MARSHAL might have been to provoke him to try the experiment of constructing a Cabinet more after his own taste, thereby throwing the whole Republican party into opposition and renewing the intrigues which were so rife in the late Assembly. Yet to yield to him would have been no less dangerous. The existing Ministry is essentially a coalition Ministry, and M. RICARD was the acknowledged representative of one-half of the coalition. M. DUFAURE might easily have found a colleague who would have been more in accord with his own views than M. RICARD, but then the Ministry would have become a purely DUFAURE Ministry, and, as such, would not have commanded the confidence of the Chamber of Deputies. The conflict between the Executive and the Legislature, which would have been imminent had M. DUFAURE refused to name a Minister such as the MARSHAL would accept, would thus have been equally imminent if he had consented to name one. It is easy to see how those possibilities must have excited the politicians who had once so much weight in Marshal MACMAHON'S counsels. The Duke of BROGLIE and M. BUFFET have for the present retired from public life, but there is no reason to suppose that they have ceased to interest themselves in politics. With the existing Chamber of Deputies they cannot hope to do anything; but if the MARSHAL could once be brought to quarrel with his Republican Ministers, and to carry on the government by a Cabinet composed without reference to Parliamentary considerations, there would still be a chance for them. It is a difficult matter for French politicians to convince themselves that the influence of the Administration in the elections has really come to an end, and though M. BUFFET cannot resist the evidence of this fact supplied by the composition of the present Chamber, he probably thinks that the change was accidental rather than permanent, and that if he were once more in office, more consistent administrative pressure might produce better electoral results. There is this much of reason in this notion that, if Marshal MACMAHON were governing in direct defiance of a majority in the Chamber, many of the electors might feel that they had to make their choice between the Executive, as the representative of order and public tranquillity, and the Legislature, as the representative of confusion and social weakness. If the case were thus presented, their new-born zeal for constitutional and Parliamentary privileges might not stand the trial.

Fortunately for France the plot, if plot there was, has completely failed. Marshal MACMAHON has accepted M. DE MARCÈRE with a frankness and loyalty which does honour to his political sagacity. To M. RICARD he had in a measure grown accustomed, and to a man of the MARSHAL'S temperament familiarity is probably an important element in liking. He is supposed to be exceedingly unwilling to differ from a Minister to whom he has once given his con-

fidence, and the hostility of the Extreme Left to M. RICARD'S dealings with the prefects had perhaps made him additionally in favour with the MARSHAL. But when it came to choosing a successor to M. RICARD, it would not have been strange if Marshal MACMAHON had hesitated as to persevering in the course to which M. RICARD had gradually committed him. M. RICARD'S policy was now suddenly dissociated from M. RICARD, and the MARSHAL was asked to accept the policy on its own merits. There was besides the fact that this policy had proved to be more decisively Republican than it had promised to be when the Ministry took office. There was a special element in its Republicanism which might very well have been distasteful to the MARSHAL. M. RICARD thoroughly understood that the Republic has only one enemy worthy of serious fear, and none of his Ministerial acts and speeches had been characterized by so much energy and resolution as his opposition to the Imperialists. To assail a Bonapartist in the Chamber was a real pleasure to him, and of all the many passages of arms they have had with the Republicans none perhaps gave the Bonapartists more annoyance than M. RICARD'S contemptuous distinction between a party which has been deposed and a party which has still the power of abdicating. Now, though Marshal MACMAHON is not an Imperialist, he has been a soldier of the Empire, and though he has from the first acquiesced in the establishment of the Republic, and has never shown the least disposition to intrigue on behalf of NAPOLEON IV., he may still feel that attacks directed against the Empire are to some extent aimed at those who served under it, as well as against those who are labouring to restore it. When Marshal MACMAHON steadily put all these considerations aside and accepted M. DE MARCÈRE as Minister of the Interior, he made the greatest concession to constitutional principles that has yet been demanded of him. The result is that M. RICARD'S death, which seemed at first to be fraught with so much danger to the Republican character of the Ministry, has brought its Republican character into fresh prominence. The fear of having a successor to M. RICARD who would virtually reverse his policy has led the Left to welcome M. DE MARCÈRE'S accession to power with a degree of enthusiasm which they have not previously displayed towards the Cabinet. M. DE MARCÈRE enters office with all the credit derived from the Circulars to the prefects, of which he appears to have been the real author, and without any of the unpopularity which M. RICARD had drawn upon himself by the alleged imperfection of his measures for reconstructing his staff in the departments.

The only matter which has occupied the Chamber of Deputies since the recess has been the several proposals made by the Left for an amnesty to the condemned Communists. The real motive of this demand was perhaps to commit M. GAMBETTA either to a quarrel with the extreme Republicans, or to an association with them which would dispose of his pretensions to the leadership of the Moderate Republicans. That any practical result could be expected from the proposal seems impossible. Even M. RASPAIL would probably admit, if he spoke truly, that the concession of an amnesty to the Communists would involve the overthrow of the Republican Government. It is almost certain that, if the peasantry and the middle classes knew that France was full of released Communists, and that these released Communists had been dealt with, not by a series of individual pardons granted as a reward of good behaviour since conviction, and with some ground for believing that they would not offend in like manner again, but by a comprehensive amnesty, which simply wipes out the past, and asks no proof from the objects of it that they have either modified their opinions or repented of the mode in which they gave effect to them, the conclusion drawn would be that the Republican Government either secretly sympathized with the Commune or felt too weak to dispense with the support of Communists. Either of these inferences would be fatal to the existing order of things. Republics have been credited with many virtues, but in France they have not of late years had the reputation of strength. The reconquest of Paris from the Commune did at least prove that a Republic could be as determined and even as cruel in putting down revolution as the oldest monarchy in the world. M. DUFAURE'S speech on Thursday showed that the Government has lost none of the resolution which characterized it five years ago. As regards the Communists now in the hands of the authorities, he asked the Chamber to leave it to the PRESIDENT and his Ministers to determine which of the prisoners can be justly pardoned, and which must, either from the nature of their offences or from their own obstinacy in denying that they have offended, be refused pardon. If the Chamber has not confidence in the choice of the Ministry, let it find Ministers in whom it has more confidence. As regards the Communists who have escaped, and who, living abroad, employ their activity in exciting hatred against their country, or in predicting the reprisals which they one day hope to execute, they accord no amnesty to France, and France can accord none to them. M. DUFAURE seems to have caught the temper of the Chamber, and to have made precisely the speech which was most certain to please it.

RELIGIOUS TOLERATION IN SPAIN.

THE debate in the Spanish Cortes on religious toleration has ended in the adoption, by an overwhelming majority, of the formula proposed by the Ministers. Protestants and other nonconformists are by the letter of the law to enjoy freedom of worship, but they are prohibited from the celebration of religious rites in public. If the law is construed in its natural and obvious sense, the nonconformists have little reason for dissatisfaction. Protestants have no need of processions in the streets, and it may be presumed that prayers and sermons in their own chapels are not included in the prohibition of publicity. Difficulty is most likely to occur at funerals, which are necessarily conducted out of doors, but probably the law which may be ultimately adopted will provide for ordinary and unavoidable contingencies. It seems to be understood on all hands that the fragment of religious liberty which is conceded by law will depend for its reality on the spirit in which the law may be administered. Local functionaries will for the most part be indulgent or troublesome as they may think that liberality or intolerance is for the time in favour at Madrid. The present chief Minister, though he has often shown anxiety to conciliate the clergy, is not personally a bigot. Though his speech in the debate disappointed those who are in favour of religious liberty, his motives for avoiding a rupture with the extreme Conservatives were evidently political and not sectarian. Excessive caution induced CANOVAS DEL CASTILLO at the commencement of the KING'S reign to make imprudent promises to the NUNCIO; but some months afterwards he preferred temporary retirement from office to the redemption of his pledges. During the late discussion the Ministers have steadily adhered to the limited form of toleration which they had previously sanctioned; and they have undertaken that the concession shall not be unduly limited by a harsh and narrow administration. The question of religious liberty in Spain concerns a small part of the native population, and probably English and American residents will not be habitually molested. It is said that the Spanish Protestants number about four thousand, after thirty years of zealous proselytism, aided by a profuse distribution of Bibles. Except at the first beginning of the Reformation Protestant opinions and tendencies have found little acceptance in Spain. There, as in other Catholic countries, the clergy connive at the indifference of the educated laity to doctrines and practices which are successfully inculcated on a portion of the peasantry and on the women of all classes.

The interest of the discussion in the Cortes depended principally on the extravagant and yet logical demands of the Moderates, or ultra-Conservative party. With the exception of the POPE'S little territory on the right bank of the Tiber, Spain is now the only country in which the pretensions of the Roman Church are openly avowed. French prelates affect to found their claims to control education on their zeal for equal liberty of teaching, which is, as they plaintively contend, infringed by the more or less qualified monopoly of the State. In Germany the Catholic hierarchy assumes with some show of reason the attitude of a victim of persecution; and in England, Ireland, and the United States the organs of the Church profess to be the most earnest advocates of religious equality. French and English prelates probably regard with envious sympathy the happier condition of Spain. It is true that heresy is not summarily and finally suppressed by the secular arm; but Protestantism at most enjoys a contemptuous and limited toleration, which is conceded after a protest from orators who have great influence with the dominant party. The demand for religious unity in Spain would scarcely be attributed by Mr. GLADSTONE himself to the newfangled dogmas of the

Vatican Council. Down to the beginning of the present century the Spaniards were proud of the results of the Inquisition; and even in later times they have never heartily adopted modern notions of religious equality. The Concordat which was concluded by the pious GONZALEZ BRAVO four-and-twenty years ago admitted nearly all the pretensions of the Holy See. It was not until the dethronement of ISABELLA that heterodox forms of worship were nominally permitted; and, as soon as the anarchy of the short-lived Republic was at an end, the party which became dominant sought the alliance of the clergy. CANOVAS DEL CASTILLO and his colleagues do the Catholic Church good service in repressing the excessive zeal of their own Moderate supporters, while they professedly adhere to the Concordat. It cannot be the interest of any party to identify itself with a policy which is condemned by the opinion of the civilized world.

As the English papers have not thought it worth while to publish detailed reports of the debate in the Cortes, the arguments on both sides can only be conjecturally known. In substance the extreme party must have contended that, if religious dissidence was an evil to be discountenanced, it ought to be effectually suppressed. The Ministers and their more reasonable supporters probably demonstrated the imprudence of furnishing the adversaries of royalty and order with a plausible grievance. Señor CASTELAR had no difficulty in delivering an eloquent exposition of the rights of man, including freedom of conscience; but in an assembly which is proud of its orthodoxy the arguments of professed free-thinkers exercise little influence. It may be assumed that a brilliant exposition of first principles and general propositions suits the taste of a Spanish Cortes, though it would jar on the taste of an English House of Commons. The Moderates, like all thoroughgoing partisans, had had much to say for themselves, and in exposure of the inconsistency of their adversaries. Persecution has never been successful except when it was severe and uncompromising. If the consequences of intolerant doctrines are shocking and repulsive, the so-called falsehood of extremes is but an enlargement into visible dimensions of premisses which are originally false. It is impossible to reduce a sound proposition to an absurdity. The majority of the Cortes recognized the right of the Catholic Church to supremacy, but not to exclusive existence. The opponents of all toleration carried the same principles further. A hundred years ago the Roman Catholic Church in England and Ireland was subjected to not less stringent disabilities; but Protestant intolerance had some excuse in the earlier connexion between religious and political contests. The few Protestants in Spain have not been accused of disaffection, having indeed never been numerous enough to attain political importance. The Republicans, from whom danger may sooner or later be apprehended, have no sympathy with Protestantism. It is doubtful whether any kind of reformed faith would flourish in Spain even if the most ample license were extended to nonconformists. In the sixteenth century the removal of a certain number of accretions from the prevailing creed left behind it the doctrines and organizations which are known by the common name of Protestantism. No such nucleus is to be found at the centre of the modern Roman Catholic system. The Spanish Protestants have derived their opinions from external sources, and principally from the teaching of foreign missionaries.

The popular belief in the profound sagacity of Jesuits and others who direct the machinery of the Romish Church has been rudely disturbed by the successive alienation of almost all Catholic Governments from their former allegiance to the Holy See. Two or three years ago, while Spain was in temporary revolt, the POPE piteously declared that an insignificant Republic in South America was the only State in the world which retained its pristine fidelity to the Church. The adventurer who then ruled over New Granada has since been assassinated; but, by unexpected good fortune, Spain has voluntarily returned to the sacred fold. It might have been supposed that the policy pursued towards a repentant population would be considered with some degree of reference to the interests of the Church in other parts of the world. An English Cardinal would cultivate popularity at public meetings or charitable committees with more effect if the NUNCIO at Madrid were not incessantly demanding the forcible suppression of the Protestant heresy. It is easy to understand a wish to reduce England, France, and Germany to the condition of Spain; but the object is not likely to be attained by giving practical proof that the opponents of Papal aggression are justified in their apprehensions. Where outward uniformity of faith is, as in Spain, almost universally established, it seems scarcely worth while to call attention to the jealousy which may be naturally felt by the clergy on account of the establishment of a few insignificant dissenting communities. If the NUNCIO had been instructed to affect indifference to the moderate toleration proposed by the Spanish Minister, the representatives of Rome in other countries might have boasted of the liberal policy of the Church. The Syllabus indeed theoretically condemns both toleration and popular government; but the Holy See might have derived credit from a practical demonstration of its power and willingness to explain away its own more obnoxious doctrines. One result of the debate on religious toleration was to show how effectually the Cortes had been packed. There had been some reason to fear that the Moderates might prove troublesome; but in the end the opponents of the Government were left in a small minority.

LAW AND LIQUOR.

IT would be interesting to inquire, if there were any means of ascertaining the facts, upon what sort of evidence the alleged unanimity of the Irish people in wishing to see public-houses shut on Sundays really rests. Experience has proved that upon no question is the popular feeling more likely to be misunderstood. Where the clergy actively support a proposed change, and where a certain number of benevolent gentry are disposed to take the same view, it is not at all difficult to get together a very formidable array of petitions. Those who sign them probably do so with no idea that the prayer which they present to Parliament is at all likely to be granted; and when the danger of signing seems slight and distant in comparison with the danger of offending a neighbour who may some day have the power to do them a good turn, the chances are very much against a refusal. Serious opposition to a measure of this kind has an inconvenient habit of not showing itself until the mischief is done. It is certain that the zeal of the House of Commons for Irish sobriety would very soon grow cool if the news came that several public-houses had been wrecked on the previous Sunday, and that troops had been sent off in all directions to prevent the process from being repeated on a larger scale on the following Sunday. It would at once be discovered that, as the only motive for passing the Bill had been the belief that it was supported by the whole population of Ireland, and as subsequent events had plainly shown that an influential minority, at all events, would not have supported it, even by their silence, if they had understood what was going to happen, the best course to take would be to repeal the Act, and then to refer the whole subject to a Royal Commission. Yet the belief that the closing of public-houses on the Sunday is universally desired in Ireland rests on grounds which, poor as they may be, are irrefutable compared with the grounds on which the belief that such a measure would stop drunkenness rests. We have pointed out before now that this expectation would necessarily be disappointed by the keeping qualities of whisky. However much the noble spirit may have been injured by the addition of an inferior liquor from Scotland, it is not yet so bad that it will not remain good from Saturday night to Monday morning. It would take a week or two to convince people that there was no longer any possibility of entering a public-house between those limits, and during that interval sober Sundays might be more common. But as soon as the necessity of taking thought for the morrow has been mastered, the most careless Irishman will understand that his enjoyment on the Sunday will depend on his laying in a store of liquor on the Saturday. The whisky-bottle will become a still more permanent servant than it is already, and when once it has taken root in a household it is a familiar hard to be dislodged.

We are not careful, however, to go into the question how far the feeling of Irishmen is in favour of Mr. SMITH'S Resolution, because we are not prepared to support it, even if the advocacy of it were virtually unanimous. The compulsory closing of public-houses for twenty-four hours in every week is not a reform to be played with. Either it is right to make the good of the drunkard the measure of the sober man's liberty, or it is not. If it is right, why do we not begin the process in this country? It may be that the opposition likely to be aroused by compulsory closing on Sundays in England would prevent the immediate

passing of such a Bill; but why do we not begin to prepare the way for it? The answer is, that Sunday is the working-man's chief holiday, that it is the day when he sees his friends, and gets out into the country, or into the more open streets, and that consequently it is the day when he most wants to drink a glass or two of beer from time to time. Sunday is often a dull day even to rich men; but if we imagine what it would be to a well-to-do Londoner if his club were shut up, if his friends were all out of town, and if the key of the cellar had been lost, we shall get some idea of what it would be to a poor man if there were no public-houses open. Mr. SMYTH proposes that we should lay the sober population of Ireland under this disability, on the chance that a certain minority which gets drunk whenever it has a chance may learn self-control by being habitually kept out of temptation. There is nothing so specially interesting about Irish drunkards as to tempt us to throw overboard in their favour principles which we still think it right to maintain in the case of English drunkards. Drunkenness causes so much crime and so much poverty that, if only the drunkards were to be thought of, we might be glad enough to see public-houses closed in England as well as in Ireland, and on weekdays as well as on Sundays. But it is essential to remember that they serve other purposes in the social economy of the poor than that of enabling a man to fuddle away his senses in the shortest possible time. So long as these other purposes are served in no other way, the closing of public-houses is a point on which sober men have more claim to be listened to than drunkards; and if this is admitted, the question is not disposed of by the statement that a majority of the Irish people are in favour of Mr. SMYTH'S proposal. There must be a very much nearer approach to unanimity than this before a case has been made out for the closing of public-houses on Sundays in Ireland; and if once the whole population, sober and drunken alike, should come to this conclusion, the aid of Parliament will hardly be required to give effect to it.

The latest nostrum for the cure of drunkenness in England was discussed on Wednesday. Mr. COWEN asked the House of Commons to give a second reading to a Bill transferring the jurisdiction in licensing cases to a special Board elected by the ratepayers, and exercising all the powers as regards the granting or withholding licenses which are now exercised by the justices of the peace. Mr. COWEN must have extraordinary confidence in the sober dispositions of the people of England, or he would never have proposed to leave such a question as this to the decision of household suffrage. We are almost driven to think that he must have cherished a secret design of driving Parliament to prohibit the liquor traffic altogether rather than endure the scandals which would certainly grow up in connexion with such contests as those contemplated by this Bill. Every three years the publicans throughout England and Wales would know that their interests depended on the result of the election to the Licensing Board, and they would move heaven and earth to secure the return of representatives like-minded with themselves. In certain districts no doubt, where the organization of abstainers is complete, and their numbers are large, a victory would be gained for the cause of prohibition. A Licensing Board would be elected as consistent in its opposition to the liquor trade as the Birmingham School Board is to Denominational education. But the example would only serve as a warning in other parts of the country; and even in the district in which it was originally set it would have to hold its own against constant, and probably successful, attempts to reverse the decision of the ratepayers. The tribunal created by this Bill would never be better than the Licensing Justices, while it would in most cases be very much worse. Where it did not embody the principle of fanatical opposition or of interested deference to the publicans, it would consist of men unable to get elected to more important local Boards and glad to profit by the dislike which those whose time is already fully occupied with local business would feel to being members of a new and distinct body. While the country was startled by the violence of abstainers in one district, and shocked by the truculence of the publicans in another, the great mass of the licensing business would be transferred to men of lower social position and inferior social influence than those in whose hands it now is. It is hard to see how a powerful trade interest is likely to be kept under stricter control by such a change as this.

THE BURIALS QUESTION.

THE debate on Lord GRANVILLE'S motion with regard to the law of burial may be taken as a fair representation of public opinion on the subject. There is a general desire to do all that can fairly be done to meet any real grievance which can be shown to exist, and to put an end to a painful and unseemly controversy which jars on every one; but at the same time there is a difficulty in bringing the question into a form that admits of friendly compromise. The Archbishop of CANTERBURY expressed a confident opinion that, if people would only set their minds to the determined purpose of settling the question, it would be settled; but the result of his own cogitations in this direction is hardly encouraging. In the course of a series of remarks in which he ingeniously contrived to say something that could scarcely fail to be unpleasant to every party in turn, he ended by a proposal to settle the question by practically surrendering the rights of the Church without appeasing the hostility of the Nonconformists, or removing the pretexts on which the present hollow and artificial agitation is based. No logical distinction can be drawn between hymns and prayers; for whatever might be said in the latter case might be just as easily sung in the former, and the only effect of restricting the Nonconformists to hymns would be to enable them to argue that their rights were acknowledged in principle, but wantonly and capriciously curtailed in practice. Nothing can be more idle, and indeed mischievous, than a form of settlement which really settles nothing, and leaves the controversy open as before. The truth is that what the main body of those who support this agitation want is not so much anything for themselves as an opportunity of doing something to humiliate the Church. Of course no one doubts the sincerity of such men as Lord GRANVILLE and Lord SELBORNE when they protest that nothing is further from their thoughts than the idea of doing any harm to the Church of England; and, if they were the only parties to an arrangement with the Church, it might easily be made. It must be remembered, however, that behind their backs are ranged a very different set of people, who hold very different views. It is idle, after the distinct and repeated declarations of the Liberation Society, to pretend that, as far as that body is concerned, the question is confined within the narrow limits which Lord GRANVILLE assigns to it. At the meeting of the Society at Birmingham the other day, at which Mr. CHAMBERLAIN, whose aims are well known, presided, Dr. LANDELS, the chief orator of the occasion, boldly proclaimed that the Burials cry was important to his party only as "a step nearer to the ultimate goal. "There will then," he said, "be not much between us and "the citadel. Having taken possession of all the out-"works, the fortress itself will soon fall into our hands; "for we do not conceal the fact that this is our final aim, "and that we cannot rest satisfied until that aim has "been realized." We see no necessity for accepting Dr. LANDELS'S fatalistic view of the future of a Church which was perhaps never so strong, energetic, and successful in its highest work as at present; nor can we admit that the right of getting into the churches should necessarily follow from getting into the churchyards. But it is at least clear that the demands now made are only part of a general assault on the existence of the Establishment; and, under such circumstances, the warmth of feeling on the part of the besieged is certainly not surprising.

It is obvious, indeed, that there can be no chance of an agreement until it is distinctly recognized that, as Lord SALISBURY said, there are two sets of grievances to be balanced. On the one hand, something may be done for the Nonconformists; but, on the other hand, the supporters of the Church have a right to stipulate for securities against that logical development of the present agitation which Dr. LANDELS so gleefully anticipates. As long as the question rests on its present footing, fresh bitterness will continue to be infused into the contest; unreasonable things on one side will provoke unreasonable things on the other, and nothing will be done. Every one will agree with the maxim quoted by Lord COLERIDGE that magnanimity is in politics often the truest wisdom; but the lesson requires to be enforced at least as much without the Church as within it. In itself the burials question is a comparatively simple one, and might be disposed of without much trouble; it is the ulterior objects with which it is associated that constitute the difficulty. It was hoped, no doubt, that the vagueness of a Resolution would attract general support, but it is evident that Lord GRANVILLE made a mistake in not reducing

his proposal to the precision of a Bill, for even the speakers on his own side took care to separate themselves from him on this point. The fact is that a Resolution in such a case was a mere waste of time, since, even if it had been carried, a Bill would still have had to be produced before the proposed plan could be clearly understood. It may be desirable, as the first part of the Resolution set forth, that facilities should be given for the interment of the dead without the use of the Burial Service of the Church of England, when this is desired; but when the second part goes on to propose throwing open the churchyards to "such Christian and orderly religious services" as may seem fit to the relatives and friends, it is necessary to know what authority is to interpret this rule, and what arrangements are to be made for enforcing it.

When the subject is regarded in its matter-of-fact aspects, it is at once seen how unjustifiable it would be to make a sweeping change in order to provide for a small and temporary difficulty. Lord GRANVILLE chose to assume that the existing arrangements are a serious grievance to the whole body of Dissenters; but, in point of fact, it is only a very small fraction of them which, on any supposition, is directly affected. This was shown very conclusively by the HOME SECRETARY in the House of Commons, and the Duke of RICHMOND repeated the facts on Monday night. In all the more populous districts cemeteries have been, or are in course of being, provided; and where there are cemeteries, Dissenters can have their own way without interfering with other people. It is only in rural sparsely populated places that the churchyard is the only burial-ground; and there is no reason to believe that this is found particularly oppressive by the Nonconformists immediately concerned. Lord SELBORNE stated very truly that, though there may be much occasional nonconformity and much preference for irregular over regular ministrations in rural parishes, there is little, if any, real alienation from the Church or its services. The people, whatever may be their tastes as to preaching, like to be married and buried according to the cherished traditional forms; and indeed it is found that, even in the great centres of nonconformity, where there is a choice of consecrated and unconsecrated ground, the former is deliberately preferred by a large proportion of the body. Under these circumstances, with the old churchyards being gradually closed up, and cemeteries being opened, whatever grievance in this respect may have hitherto existed is gradually reduced by a steady automatic process which in course of time will remove it altogether. The actual state of things therefore may be said to be this—that the outcry against the present system comes chiefly, if not exclusively, from those who themselves are not directly touched by it in any way, and who merely complain vicariously on behalf of others, while most of these others are apparently unconscious of the supposed injury which is done to them, and are quite content to submit to it. All that is wanted, therefore, is to make provision in these exceptional cases for a separate piece of ground if it should be wanted, or for opening the churchyard to funerals without the regular service if it is objected to. These are, in fact, the whole dimensions of the only real grievance which exists, and which must not be confounded with the purely imaginary injuries that are conjured up for the gratification of sectarian vanity and malice. There could hardly be a stronger proof of the hypocrisy of the cry, and the reckless perversion of notorious facts with which it is carried on, than the excuse which the *Times* puts forth for the change in the conduct of the political Dissenters. Formerly, it is known, they professed to regard the Church and everything connected with it as an abomination, and to be anxious to get out of its way as much as possible. They were afraid even of the shadow of the steeple. Now they cannot nestle near enough the Church, and dream of getting inside. But this feverish passion for burial in ground "hallowed by sacred" and ancestral memories" is not, as the *Times* pretends, an outbreak of dormant grievances, but a repudiation of old Nonconformist principles and ideas. When some distinct practical proposal for satisfying the Nonconformists without infringing the natural rights of the Church, or jeopardizing public order and decency, is propounded, it will be time enough to give it consideration. The Government has once more pledged itself to deal with the subject, and there can be no doubt that it can do so more advantageously than any one else. It may be regretted that the ecclesiastical dignitaries to whom the official defence of the Church is entrusted should apparently be more concerned in keeping up the forms of empty State than the reality of a distinctive Church; but it is to be hoped that the Government and Parliament will clearly understand that, while it is desirable to grant Dissenters the greatest possible amount of freedom for themselves, it is necessary to guard against those encroachments on their part on the freedom of others which have of late been so plainly and menacingly proclaimed.

SPENSER IN THE EIGHTEENTH CENTURY.

APPRECIATION of Spenser, it is often said, is the best test of true poetical feeling. He is the "poets' poet"; his great poem is the pure essence of imagination, delighting in its own exercise, and therefore delightful to others. Moreover, it has generally been held of late years that the eighteenth century was a kind of poetical interregnum. Pope, according to the followers of Wordsworth or Shelley, was merely a writer of brilliant prose in rhyme. Therefore, it follows, people in the eighteenth century could not appreciate Spenser. Men who worshipped Pope must have had their instincts numbed. To this *à priori* argument it is added that, as a matter of fact, the critics of that period spoke with habitual contempt of this most admirable poet. Southey, for example, in the Life of Cowper gives as the sentiment of the official critics of the day that, "if the tiresome uniformity of Spenser's measure did not render the *Faerie Queen* insupportable, that poem would be laid aside in disgust as soon as it was taken up, because of the filthy images and loathsome allegories with which it abounds." And Southey is merely expressing the orthodox view of the Lake school and their admirers.

We do not deny that this statement contains a measure of truth. The critic must have a very catholic taste who can do justice at once to Pope and to Spenser; and most critics of the last century accepted the canons of taste embodied in Pope's poetry. Still it may be interesting to note some of the exceptions to this general rule; for it may possibly appear that, here as in some other cases, we are too ready to call our grandfathers fools. In our hasty classification we mark whole generations with a convenient label, and forget that a hundred years ago there were a good many people alive who had presumably many different standards of taste. Southey was possibly thinking of one of Johnson's *Ramblers*. Johnson admits in that paper that allegory is permissible, which, as he was much given to allegories after a fashion of his own, is no great concession. But he speaks strongly of the "tiresome" nature of Spenser's stanza, and objects to his obsolete diction. "Perhaps," he characteristically concludes, "the style of Spenser might by long labour be justly copied; but life is surely given to us for higher purposes than to gather what our ancestors have wisely thrown away, and to learn what is of no value but because it has been forgotten." The paper proves, however, whatever it may prove as to Johnson's poetical taste, that Spenser was then (1751) being frequently imitated; for it is expressly directed against the practice of such imitations, "which, by the influence of some men of learning and genius, seems likely to gain upon the age."

That Spenser was enjoyed by a great many readers may be proved by some remarkable instances. We are told, for example, by Warton in his Essay on Pope, that Lord Somers was passionately fond of the *Faerie Queen*, and desired to be painted in his last portrait by Kneller with a copy of Spenser in his hand. Other statesmen followed his example. The great Chatham is said to have read only one book—namely, the *Faerie Queen*—and to have been always reading it. The statement is not to be taken too literally; for, according to Lord Monboddo of ourang-outang celebrity, Chatham once said in the House of Lords that the most instructive book he had ever read was Plutarch's Lives. If a man's library were to be confined to two books, this would not be a bad selection. Spenser, again, was one of the favourite poets of Burke, who refers to him and quotes him with evident affection in the Essay on the Sublime and Beautiful. Charles Fox, too, is reported to have been exceedingly fond of reading Spenser. These four eminent statesmen and orators, all of whom lived in the dark ages of poetry, form a satisfactory catena of authority to prove that Spenser was at least not forgotten by what may be called the literary laity. We should fear that it would not be easy to make out a similar list in our own day from equally prominent members of Parliament.

Turning from the statesmen to the recognized leaders of criticism, we naturally look to Addison and Steele. Addison gave laws, through his "little senate," to all who aspired to have a taste in the beginning of the century. The criticisms on Milton in the *Spectator* undoubtedly did much to spread a general conviction of the greatness of the noblest of English poets. But Addison, it must be confessed, did not appreciate the merits of the earlier poet whom Milton, according to Dryden, confessed to be "his original." He speaks with patronizing contempt of "old Spenser's" vagaries; and seems to think that the *Faerie Queen* will not bear inspection:—

> But now, the mystic tale that pleased of yore
> Can charm an understanding age no more;
> The long-spun allegories fulsome grow,
> While the dull moral lies too plain below.

This is rather an unkind hit from the author of the *Vision of*

Mirror. Steele, however, was a writer who, with less delicacy of perception than Addison, had a more genial and catholic taste; and Steele was evidently a lover of Spenser. A paper in the *Tatler* (July 6, 1710) gives an account of the plan of the tenth canto of the fourth book of the *Faerie Queen*, which shows enthusiasm, if it contains little critical analysis; and in the *Spectator* (Nov. 19, 1712), Steele, after a compliment to Addison's papers on Milton, says: "You will lose much of my kind inclination towards you if you do not attempt the encomium of Spenser also, or at least indulge my passion for that charming author so far as to print the loose hints I now give you on that subject." The "loose hints" are little more than a sketch of Spenser's plan, but are sufficiently indicative of warm admiration.

Steele was not the only writer to protest against Addison in favour of Spenser. M. Taine says of Pope that his favourite amongst English poets was Dryden, "the least inspired and the most classical" of our poets. The remark, like many others of M. Taine's sayings about Pope, gives only a part of the truth, if it be not entirely unjust. Pope said that he had learnt his versification from Dryden—a fact which, in a certain sense, is tolerably obvious. But his favourite poets, until he was twelve years old, were Waller, Spenser, and Dryden, in the order named. To Spenser he was persistently attached. He says that Addison's character of Spenser is false, and that Addison confessed to having never read Spenser until fifteen years after writing it. He had himself read Spenser "with infinite delight" in his childhood; and a perusal in later years gave him equal pleasure. Pope, in fact, was extremely well read in our earlier poets, as appears by some of his thefts; and his taste was sounder than his practice might suggest. We may quote one other remark of his about Spenser. He had just been reading a canto of the *Faerie Queen*, as he told Spence, to an old lady (probably his mother), and she said that he had been showing her "a gallery of pictures." "She said very right," he adds; and indeed the criticism is good, though it may not be very abstruse.

If we come to the next generation, Horace Walpole calls Spenser "a true poet," as might be expected from the author of the *Castle of Otranto*; though, as might be expected from the author of the Letters, he is a good deal bored by the tedious prolixities of the *Faerie Queen*. More serious critics, Jortin, Hurd, and Thomas Warton, wrote upon Spenser in such a manner as to indicate careful study of his writings. Their judgment would not quite satisfy modern critics; but we must make allowance for their writing under the influence of an uncongenial school of taste. Hurd, though his frigid formality hampers his enthusiasm, makes some rather noteworthy remarks. In the letters on chivalry and romance (1762) he argues against Shaftesbury's practice of identifying "Gothic" with barbarous, and he says, with some anticipation of later criticism, that we may justify Spenser against some of the objections of the classical school if we judge him from his own point of view, and illustrate him from the old romances, instead of judging him by the orthodox canons about epic poetry. The *Faerie Queen*, he says, is "one of the noblest productions of modern poetry," though it has fallen into undeserved neglect. Hurd's idol, Warburton, contributed some criticisms upon Spenser to Jortin's essay. The labours of the two Wartons contributed as much as any other cause to the revival of the modern taste for our old literature. Joseph Warton's "Essay on Pope" caused some scandal by his apparent desire to lower the place of the great idol of his time, and by the explicit statement that Pope was to be deposed from the first rank by the side of Milton, and placed in the second by the side of Spenser. Thomas Warton published his observations on the *Faerie Queen* in 1754. They are a long and elaborate criticism upon his author, with many illustrations from classical and contemporary poems. In the concluding paragraphs Warton apologizes for pointing out faults more industriously than beauties; he adds that his task has been "peculiarly delightful"; and that the labour of criticism, generally "laborious and dry," has rather amused than fatigued him, because bestowed upon an author "who makes such perpetual and powerful appeals to the fancy." In a poem published in 1747, Thomas Warton had already expressed his preference of "magic Spenser's wildly warbled song" to Pope's *Rape of the Lock*. We may add that an edition of Spenser's works by Hughes, author of the *Siege of Damascus*, appeared in 1715; an edition of the *Faerie Queen* in 1751, with a Life by Birch, and in two editions, with notes by Upton and by Church respectively, in 1758. Whatever the shortcomings of these editions, they at least show that Spenser was not quite forgotten even in a bookseller's sense.

There is, however, another kind of testimony which in some respects is better than that of critics or independent readers. Johnson, as we have said, attacked the practice of imitating Spenser; and the number of imitations is a curious proof of the continuous popularity of Spenser with men of some poetical taste. Pope's imitation is a mere burlesque, which at best may be forgiven in consideration of his genuine love for the poet with whom he has taken an almost unpardonable liberty. Prior's imitation in an ode to Queen Anne, though more serious, is not much more significant of true appreciation. The two poets who showed the highest capacity in the middle of the century showed their love of Spenser in a different fashion. Gray said that he never sat down to compose poetry without first reading Spenser for a considerable time; and this is perhaps the most legitimate mode in which one poet can pay homage to another. Collins's love of Spenser might be inferred from the taste not ill described by Johnson: "he loved fairies, genii, giants, and monsters; he delighted to rove through the meanders of enchantment, to gaze on the magnificence of golden palaces, to repose by the waterfalls of Elysian gardens." His ode on the poetical character begins appropriately by an appeal to

> That gifted bard—
> Him whose school above the rest
> His loveliest elfin Queen hath blest;

and, in the ode on the popular superstitions of Scotland, there is another affectionate reference in the description of

> Strange lays, whose power had charmed a Spenser's ear.

Other poets had taken the more perilous road of attempting to imitate the object of their admiration. Amongst the poems which encouraged dissent from the orthodox standard of Pope, none, it is probable, produced more effect than Thomson's *Castle of Indolence* and Beattie's *Minstrel*, both of them modelled upon Spenser. The *Castle of Indolence* was the last, and, in the opinion of many readers, as of Wordsworth, the most charming, production of the poet of the *Seasons*. Even Johnson admired it; and it is more surprising as a manifestation of true genius when we remember the period at which it was produced. Beattie's *Minstrel* has some fine stanzas, and begins impressively; though the second part becomes unpleasantly didactic. His popularity was doubtless indicative of an approaching change of taste, as indeed Beattie kept back his poem for some time from an impression that good poetry, and therefore of course his own, was out of fashion. Thomson and Beattie by no means exhaust the list of Spenser's imitators. Shenstone's *Schoolmistress*, though it seems to be one of the cases in which an intended burlesque has gradually turned to serious writing, is still pleasant reading. William Thompson—a now forgotten poet—imitated, and was declared by some critics to have rivalled, Spenser in a couple of poems. Gilbert West, better remembered, perhaps, as a defender of Christianity, in which character his arguments are said to have contributed to guard Chatham and Lyttelton against "the blandishments of infidelity," was another imitator of Spenser in poems highly praised by Johnson. Other imitators were Lloyd, the unlucky friend of Churchill, Wilkes, and Colman; Wilkie, author of that ponderous epic, the "Epigoniad," which Hume tried in vain to defend against the assaults of the critics; Mickle, best known as the translator of the "Lusiad"; and Cambridge, who tried in the "Scribleriad" to rival the "Dunciad" with better success than he attained in the "Archimage"—his imitation of Spenser. The greater number of these imitations came after Johnson's protest against the practice, which, like most protests, may have acted rather as a suggestion than a deterrent. One or two of the forms are as much burlesques as imitations, but the frequency of the attempt amongst men who in their day had a certain poetical reputation implies that Spenser was by no means so much forgotten as Southey's language would imply. The names we have mentioned include most of the eminent poets of the period of Pope's supremacy. We may add that Goldsmith, though he blames Spenser for following the romance-writers rather than Virgil, says that "no poet enlarges the imagination more than Spenser," and that his verses "may perhaps one day be considered the standard of English poetry." Goldsmith thinks that Akenside, as well as Gray, must have studied him attentively. This is not so obvious to us; but if, on the strength of this remark, we may add Akenside's name to the list already given, we shall be entitled to reckon amongst Spenser's admirers nearly every poet of the eighteenth century who enjoyed any high reputation, except Young, Johnson, and one or two less popular writers.

It remains true, of course, that Spenser, though read, as we have shown, by statesmen, critics, and poets, was not treated so respectfully as he has been by later critics. It is also probably true that men who loved his poetry did not venture to trust their instincts. The reverse is now the case. It requires as much courage to call Spenser a bore at the present day as it then required to deny that he was barbarous. The true feeling therefore may be less different than appears on the surface; for men are more cowardly in regard to canons of taste than upon any other subject; and we are certainly greater hypocrites, if we have possibly better tastes in these matters, than our forefathers. Lord Macaulay had the courage of his opinions, and we should guess that he only said what many have felt. Few and weary are those, according to his dictum, who are in at the death of the Blatant Beast. The remark involves a curious slip, which, however, may confirm its general accuracy. The Blatant Beast never dies in the *Faerie Queen*, and indeed Spenser is of opinion that his life is probably not to end in this world. Some critics may be even inclined to fancy that this beast with his hundred tongues, most of them the

> Tongues of mortal men,
> Which spake reproachfully, not caring where or when,

who is ranging the world, and grown so strong that none can restrain him—

> Barking and biting all that doe him hate,
> Albe they worthy blame or cleare of crime;
> Ne spareth he most learned wits to rate,
> Ne spareth he the gentle Poet's rime;
> But rends without regard of person or of time—

is not altogether without modern representatives in the press of some civilized countries. But he has never, in spite of the poet's fears, been able to do much against the "homely verse" of his describer. In the worst of times Spenser was not entirely neglected.

SCIENCE AT SOUTH KENSINGTON.

MR. SPOTTISWOODE, in his address as President of the first of the Conferences which have been arranged in connexion with the Loan Collection of Scientific Apparatus at South Kensington, said that he was disposed to regard this Exhibition as marking an epoch in the history of science; and there are undoubtedly reasons why it may be expected to exercise a deep and beneficial influence on the prospects of scientific culture in this country. We have here brought together, not only a collection of remarkable instruments from all parts of the civilized world, and representing almost every school and period of research, but also a numerous gathering of the men who are at the present moment engaged in extending still further the range of discovery, and the practical application of its results. It has often been a reproach against this country on the part of foreigners that it is indifferent to science except in the forms in which it can be turned to immediate commercial profit; and this criticism, though unjust to the heroic self-sacrifice which has characterized many of our leading scientific pioneers, must be admitted to be in a certain degree true as to the general attitude of the public. The germs of discovery, the truths of science floating about, as it were, in the air, and not yet subdued to the industrial yoke, have hitherto failed to excite popular interest. There is a disposition to think that such things may as well be left to those who have a fancy for them, and that it is time enough for ordinary people to give attention to them when there is a chance of some direct personal advantage. This apathetic feeling in regard to science may be easily accounted for. In the first place, it is impossible to take much interest in science without a degree of preliminary knowledge which, elementary as it may be, does not as yet come within the ordinary range of education; and, further, science has hitherto been rather in the habit of lurking in holes and corners, and not making any impressive public exhibition of its existence. In this country the Executive usually hesitates to do anything unless there is a strong pressure of opinion, and it is tolerably certain that science will have little to hope for from that quarter until it has the public at its back; and it is to it, therefore, that an appeal should be made. It may be hoped that the present Exhibition will be the beginning of a movement of this kind. The fact that it is opened under the auspices of a Government department would seem to show that there is not wanting a certain sympathy on that side; but whether any large, substantial measures will ever be taken, will chiefly depend on the interest which such a presentation of science excites among the community at large. Again, an Exhibition of this kind is useful in bringing to light the actual operations of the scientific world, the problems which have been solved, and those others which are still in a nebulous condition, with just here and there a clue peeping out; and thus the interchange of ideas is promoted. Nothing is more striking in a survey of modern science than the intimate and subtle relations which may be traced between one branch and another. There is every now and again some little link to be supplied, for help as to which a worker must look beyond his own speciality. There are always certain subjects on which many minds are meditating simultaneously, and while one is making way in one direction, another is, as it were, boring through on the other side, like the Abbé and his fellow-prisoner in *Monte Christo*. At present this sort of co-operation is loose, fragmentary, and disjointed; but an Exhibition brings the scattered experimentalists into systematic communication. Thus, both in the world of science proper and outside of it, a keener interest is likely to be cultivated in regard to scientific matters, and researches will consequently be conducted with greater spirit and efficiency, and better prospects of success.

This Exhibition is open on the same terms as the South Kensington Museum, of which it is, in fact, an offshoot—free on some days, and a small admission-fee on others—and it may be presumed that the galleries will continue to be visited by a large number of all classes. To persons of scientific training, or with even a rudimentary taste for such things, it is easy to conceive what service such an Exhibition will render. They will read the Handbook, an admirable summary of the chief branches of scientific study by competent authorities, and examine the objects exhibited; and thus lay up a store of suggestive information as a supplement to or a foundation for private studies. But there will also be a large body of people who will chiefly bring away from the galleries an impression of their own stupendous ignorance in such matters. This in itself, however, will be a good thing, for it may be expected, in some cases at least, to stimulate a desire to know something, and after that to know more. Even the dullest and least imaginative minds can hardly fail to be touched by the sight of the instruments by which the old masters achieved their triumphs, or of their earliest works—such as Tycho Brahe's rude quadrant, without telescopes; Galileo's primitive tubes; the air-pump of Boyle; the digester of Papin; Daguerre's first photograph on glass; Stephenson's first engines; De la Rive's apparatus for statical electricity; Ampère's homely work-table and instruments; the wires over which Faraday pondered, and other emblems of scientific effort. It is likely enough that many visitors will be little the wiser for looking at such things, but they will at least be led to wonder how such great results could be obtained from such simple materials, and wonder is often the beginning of inquiry. On the other hand, this Exhibition displays in a striking manner the wealth and luxury of scientific apparatus at the present day. There are appropriate instruments for almost every kind of work; and the greater part of what had formerly to be done by minute observation and laborious calculation is now done to hand by ingenious machinery. The galleries are crowded with contrivances for the measurement of time, space, gravitation, velocity, heat, &c.; delicate balances of weight and gauges of size; bathometers, for measuring the depths of the sea; tide-calculating apparatus; attraction meters, for dealing with the law of gravitation; telemeters and theodolites. There are also instruments for taking observations as to respiration, alimentation, and all the phenomena of life. A student in these days has obviously an immense start; where he has a firm footing his predecessors had to flounder about as in a shifting morass, and he profits by their painful experiences. Whether the comparative ease and certainty with which scientific investigation can now, up to a certain point, be carried on, tends to the development of that vigour and earnestness by which the highest achievements have formerly been reached, is another question. There are cases in which the difficulties of a task are the best stimulus to the spirit which overcomes them. At any rate it is instructive to observe how much the mind of man has accomplished with the sorriest materials, and this reflection should be an encouragement to make the best use of the facilities which now abound, and which should be valued, not because they make investigation easy, but because they give it a soundness and precision formerly unattainable.

The connexion between the progress of science and the improvement of its mechanism is strongly demonstrated in this Exhibition, as well as in the Handbook which gives a general account of its lessons. It is interesting, for instance, to trace the progress of the telescope with the help of Mr. Lockyer's annotations. Galileo's telescopes are slender tubes of wood, covered with paper, about the length of walking-sticks, with small object-glasses less than one inch in diameter. As the manufacture of glass advanced, the lenses were enlarged, and there are some specimens from Holland which are of enormous focal length, one of them extending to 360 feet. Telescopes of this kind, though powerful, were necessarily very cumbersome, and it was difficult to obtain valuable observations with them. Newton in his telescope substituted a mirror for a lens; and then we have other reflectors made by Sir W. Herschel—whose touching biography by his sister gives them additional interest, as recalling the passionate devotion and self-sacrifice with which he worked, neglecting alike his meals and sleep, and having to be fed by his sister putting food by morsels into his mouth—Lord Rosse, and others. The refracting telescope is now at least as handy and compact as the reflecting one, and the half-inch or so of Galileo's aperture is represented by the 25-inch aperture of the telescope by Cooke of New York, the 26-inch of that by Clarke of Boston, and the 27-inch, of which a model is shown, constructed by Grubb of Dublin, for the Austrian Government. In the class of reflectors, the 2-inch metallic speculum was extended to 4 ft. by Sir W. Herschel, 6 ft. by Lord Rosse, and back again to 4 ft. by Lassell; but, as the silvering of glass has improved, the heavy metallic speculum, sometimes weighing tons, has given way to a much lighter and thinner one of glass, of which the 4-ft. glass of the equatorial reflector at the Paris Observatory is given as a fine example. The use of telescopes has also been greatly simplified, and the awkward apparatus for moving them dispensed with. A single turn of a screw is now enough to adjust them. The introduction and various improvements of the spectroscope have also opened the way for important discoveries in chemistry and solar physics; and Mr. Spottiswoode, in noticing the use of this process not only for the detection of metals by their bright lines, and of other substances by their absorption bands, but, as suggested by Mr. Lockyer, for quantitative analysis by measurement of the lengths of the bright lines in the spectra of the vapours of metals under combustion, justly remarks that its application to practical purposes is doubtless still in its infancy.

Again, in the case of the biological sciences, as Professor Huxley points out, the very conception of many of the problems to be investigated was impossible until the physical and chemical sciences had reached a high degree of development, and were ready to furnish, not only the principles which ought to guide physiological experiments, but the instruments with which such inquiries could be carried out. He also remarks that the improvement of the compound microscope, in the early part of this century, by the discovery of methods of correcting spherical and chromatic aberration, and of illuminating objects, has enabled anatomists "to extend their investigations into minute structures to an unhoped-for degree, and to use magnifying powers of 2,000 to 3,000 diameters with as much confidence as was placed in those of a fourth that amount forty years ago." And again, he says, "Modern histology could hardly have existed in any shape without the modern microscope, inasmuch as the meaning of many optical appearances of animal and vegetable structures becomes apparent only under the high magnifying powers and perfect definition of our present instruments. But the precise and definable form which our notions of structure and development have been acquiring during the last ten or fifteen years is mainly due to the fact that the anatomist has been supplied by the chemist with compounds such as chromic acid, perosmic acid, picric acid, and the like, by which soft organic bodies can be rendered hard enough to be cut into the thinnest slices without alteration of their essential form and arrangement, and by which different

elements of the tissues can be made to assume different colours and thus become readily distinguishable." And he points to the number and variety of the instruments for the quantitative determination of functional phenomena of all kinds in the present Exhibition as a proof of the rapid progress of physiology since 1836. Another example of the value of improved apparatus is to be found in the case of engineering machinery. When a hundred years ago the idea of a steam-engine was at last taking practical shape, the insufficiency of the machine tools for shaping iron was a great obstacle to the progress of invention. The piston in Newcomen's engine was made air-tight by a layer of water on the top of it, and in Watt's first engine, which had a cylinder of only 18 inches in diameter, it was at one time feared it would break down from the difficulty of fitting the piston closely to the cylinder. These difficulties have now, however, been gradually overcome; and among Sir J. Whitworth's contributions to the present Exhibition may be seen a surface-plate which is the nearest approximation yet attained to an absolute plane surface. Sir Joseph has also, on the principle of employing the sense of touch instead of sight, produced a machine by which the accuracy of any measurement can be tested to the millionth part of an inch; and he has exhibited in the Conference Room the actual gauging of a pencil to within the twenty-thousandth of an inch. It must not be supposed that this minuteness is an idle pedantry. The value of a machine in a great degree depends on truth of surface, and it is also a great advantage to have the corresponding pieces of machinery interchangeable. What is called link-work—a system by which the friction of surfaces is greatly diminished—is also illustrated in this collection by the inventions of Sylvester, Kempe, and others, and excites much interest. It is impossible here to go through such an Exhibition in detail, and we can only say that it reflects much credit on those with whom it has originated, and that it is to be hoped that it may not be a mere passing show, but may develop into some permanent organization.

COUNTRY COUSINS AT THE ACADEMY.

WHEN three weeks have passed from the day of opening, the visitor to the Academy who has armed himself at starting with a season ticket finds the time arrive when he may look round. Day after day he has walked through the gallery with rapt gaze. Men and women have been unrealities to him. Skirts have been trodden on, toes have been tripped over, shoulders have been rubbed. So far the wearers of long dresses are nothing but shadows; so far the possessor of the corns is nothing but the utterer of a malediction. The broad-shouldered man is only an impediment to the view of Mr. Millais's "Over the Hills," or Mr. Alma-Tadema's "Bacchante." It is the pictures that have been realities. They have had flesh and blood. They have talked and laughed and cried. But when three weeks have elapsed the enthusiastic visitor finds that their aspect has begun to change. The flesh tint appears to be in the wrong place. It is wanting altogether, as in "Phryne"; it is superabundant, as in Mr. Linnell's landscapes. The smiles have become smirks, the tears do not trickle, the eyes are fixed. Our first gush of admiration is over; we have begun to criticize; we see faults where before we saw only beauties; and at last we find it a relief to turn our backs upon the walls and gaze at the gazers; the people become realities again, and we even remember to apologize for a ruined dress or a broken shin. Then it is that the place of the country cousin among the visitors is recognized, and pictures are to be found in the crowd to the full as amusing as any on the walls, with the further merit of being in admirably harmonious keeping. Country cousins do not differ in essentials from other folk. Mouths have they and eyes, noses, and especially hats. But they come from the country; they come to the Academy because it is their duty to do so, and they never for a moment think of whether or not they enjoy looking at pictures. To look at pictures is the function of the visitor at the Academy. To this end does he exist. And he looks at all, going regularly through the Catalogue, and never for a moment pausing to think if one picture pleases him and another displeases; or to choose what he will look at longest, and what he will pass by. To him there is no special failure in Mr. Cope or Mr. Hart, no special success in Mr. Perugini or Mr. Poynter. He goes to the Academy as part of a predestined programme of things to be done, and he does the Academy as he does St. Paul's and the Tower, with the utmost gravity and a conscience void of either undue interest or undue doubt. For Augustus the pictures may have one kind of lesson, for Arabella another. His eye kindles at a farming scene, hers at a flower piece. He is charmed to see the Duke at the head of his hunt, by Grant; she, to study the Duchess's back-hair, by Millais. She dwells fondly over domestic scenes, fashionable portraits, and babies. He loves the moorside and the kennel, and studies from the nude. And as it is with Augustus and Arabella, so it is too with Mrs. Brown and Mr. Jones. Piety, not painting, attracts the lady. She began the day with a May meeting at Exeter Hall. There is the young clergyman in the soft hat who sat next her. She comes to the Academy as part of the sacred ceremony of the morning. The two places have always been connected in her mind, and when the Academy was in Trafalgar Square their connexion was not so remote. She is all aglow at Mr. Goodall, thinks Mr. Herbert "too high," loves the camel because her uncle went to the Holy Land, and succeeds in admiring both Mr. Thorburn's "Christian" and Mr. Booker's "Ahab." Mr. Jones, on the other hand, who has a villa near Bath, and who began life as a farmer, loves nature. Girls with pigeons, husbandmen with stocks, the long-drawn furrow, the cow and calf, the frozen sheep—all these appeal at once to his taste, his experience, and his imagination, so he very soon feels quite at home.

Two branches of art are, however, as a sealed book to the country visitor. He cares little for architecture, and less for sculpture. Indeed, for the most part, he avoids the sculpture on high moral grounds. The curate, it is true, looks carefully through the drawings of restored churches; but the layman, though under certain circumstances he utilizes the sculpture-rooms, uses them as though they were not. The shadow of the great Duke serves by its height to cloak many a quiet flirtation. The bench by the wall is convenient for lovers. They sit all along it in couples, more or less united according to the exigencies of the space and the warmth of growing affection. There, when the first fatigues of the great galleries prescribe rest, do Daphnis and Chloe resort to linger with clasped hands in pleasant silence; or, gazing with indifferent eye on the throng ever surging past, betray the fervour of acknowledged passion or the incipient evidences of dawning love. There Amaryllis sports in the shade, with demure looks and downcast eyes; there Damon, amid the hum of other voices, woos the coy, reluctant nymph. For quiet flirtations no other place is so secure, no sylvan bower more sacred. And it must be allowed that the refuge it offers is fully appreciated, and that neither crowd nor bustle is able to interrupt the tale of hope or hush the frequent sigh. But to others no such sweet moments are vouchsafed. The country parson toils through the Catalogue, looking sympathetically at the burial scenes, the marriage processions, the christening ceremonies, with thoughts perhaps of his distant parish and the surplice fees. He takes suggestions for next Sunday's sermon from Mr. Long or Mr. Bateman; while his wife is critical over the knitting school of Mr. Crowe, and would speedily provide the "Widower" of Mr. Fildes with a nurse for his neglected children. The doctor wonders what Mr. Mark's "Apothecary" will do with his dried fish-skins and the hanging crocodile, while the young lady from Girton spells hopelessly with frantic shots at the name of Mr. Leighton's "Daphnephoria." Some wish the Cardinal could turn his stony eyes upon the sportive couple beside him, compare the Arctic bears to a well-iced wedding-cake, or think that Zenobia with Palmyra on her breast is like Queen Mary with Calais engraved on her heart. To such irreverent people nothing is too sacred for a joke. They wonder if the ships in Mr. Wyllie's "A. B." are seeking the Boojum, and if Mr. Hardy's hippopotamuses are inquiring tenderly after the poor feet of Noah. When they read the number of Mr. Sidley's naughty little girl throwing snowballs, they think the hanging committee put "555" to it as another way of saying "Fie! fie! fie!" and count it nothing strange that Lear should disinherit so ill favoured a Cordelia. But to most of the country visitors the Academy is the scene of a high and sacred solemnity. They take in the pictures and the people as parts of a memorable historical drama in which they are privileged to take part. They gaze with awe at the portrait of some great personage upon the walls, and step backward in astonishment if perchance they recognize the same features among the throng of sightseers around them. The regular Londoner is so well accustomed to see remarkable people in streets and assemblies that he scarcely looks at them as they pass him in the Academy. He is occupied with thoughts of his own dress or with seeking for a pretty face among the ladies. But to the country visitor such thoughts savour of frivolity. A shilling has been paid for admission and another for a Catalogue, and the value must be taken out of them to the uttermost farthing, and he takes them in the lump, pictures and statues as well as Royal Dukes and pretty faces. In many a country parsonage the results of a day or two in town must form the subject of evening conversation for months to come, and for the present nothing is more important than to hear the price Mr. Millais has received for a portrait, or to listen with retentive ear to the remarks of some audacious critic.

The country cousin appears, however, to the greatest advantage when contrasted with the knowing gentleman about town who shows him or her through the Academy. The simple and confiding faith, the touching belief in the absolute veracity of all he tells them, added to the open and evident admiration of his hat and gloves, his accent, manners, and boots, are all delightful to behold. He does not spend his patronage on them unless, if they are ladies, they are young and pretty, and, if they are of the other sex, rich and of county rank at least. The young ladies are particularly grateful to his feelings in their estimate of his talents and information. He tells them the exact circumstances under which every picture has been painted. He knows the name of the sitter for every head, and is familiar with all the models. He has original anecdotes from all the studios—anecdotes, indeed, whose chief fault is their very originality. Dick Palette, for instance, fell so much in love with Miss Oriana Brown while she sat to him as Dejanira, that on finding his picture was hung and on the line, he made her straightway an offer of his hand and heart. This devotion does not, however, commend itself to our town cousin's views of the fitness of things. Much more approvingly he details the feat of Draco Smith, whose new novel came out on varnishing day, and whose picture and book reciprocally advertise each other. He knows the name of the Ritualist clergyman who figures as first angel in Perugino Green's picture of "Jacob's Ladder." He has often had a friendly round with the prizefighter who lay as Holofernes in one painting, and sat for

Edward III. in another. He has danced at a ball with Lady Glorians, whose portrait is in the great room, and thinks it a poor likeness. He has a scandalous story about Mme. Petitdoigts, whose bust is on the shelf in the round room. He looks particularly mysterious as he tells of pictures not sent in, of pictures sent in and not hung, of pictures sent in and hung, but skied. One artist has purposely delayed to finish his great historical work that he might have an excuse for exhibiting it alone. Another has committed suicide with a toasting-fork, because no room was found for his panoramic landscape. A third is skied because he had boasted in the hearing of an Academician that the colour in his work would kill everything near it. All these tales of wonder, imagination, and humour does he retail at liberty. He knows the fair cousin has never before heard that old, stale anecdote about Byron, or that excellent joke of Theodore Hook's. He is safe and happy, his tongue is loosened, and his ideas and invention flow. Ah, if he could but talk so brilliantly at Lady L. S. Dee's dinners, or when he goes for a midnight smoke at Stodge's studio with fifty of Stodge's witty friends! But he cannot; old jokes will not go down there. The fun, if he has any at command, must be his own. How sweet, then, to him the incense of unaccustomed adulation, the laughter and the blushes of the country cousins. No wonder he should be able to enjoy the society of people who know nobody, who have never been presented at Court, who can give him no little dinners, nor bow to him from coroneted carriages in the Park. On the whole, the strangers have no reason to complain. They probably go away with a more adequate idea of an Academy Exhibition than if they had gone through the paintings only, and never had the poet Black, or the novelist White, or the Secretary at Peace, or the Countess of Purlpoudre pointed out to them.

ANGLIA TRANSWALLIANA.

THE last Teutonic settlement in Britain often passes without notice. The Englishry of Pembrokeshire, "Little England beyond Wales," can hardly be said to be an unknown land while it contains the well-known watering-place of Tenby. But we may guess that a good many visitors to Tenby come away with very faint notions of the remarkable ethnological phenomena of the land which they have been visiting. To many it is doubtless enough that they are in Wales; one part of Wales is the same as another. And certainly the authorities of Tenby have done their best to lead their visitors astray. On the castle-hill of Tenby is a statue of Prince Albert, with a bilingual legend in English and Welsh, in which the Prince has borrowed the epithet of the great British lawgiver, and appears as "Albert Dda." Moreover there is a display of heraldry, and a legend—in the British tongue only—about the Red Dragon of the Cymry. Now there is exactly as much reason for setting up a Welsh inscription at Tenby as there is for setting one up at York or Canterbury. The Welsh tongue was doubtless once spoken in all three places, and all three places are called by modifications of Welsh names. For Tenby must not be mistaken for a Danish *by*; the name is British, the same as the Denbigh of North Wales. It is possible that the *lych* may have been changed into the likeness of Danish *by* by the same kind of process by which Jerusalem becomes *Hierosolyma*; but that is the outside of the connexion, if there be any. In this purely English town in a purely English district, one looks up at the strange beast and the strange tongue with a feeling that the Lion of Justice has in some measure laboured in vain. King Henry the First took some pains to plant good seed in his field; whence then these tares of Red Dragons, and of legends in a tongue not understanded of the people of Tenby and of all South Pembrokeshire? Laying parables aside, we are at Tenby and the coasts thereof in a district of the highest historic interest. We are within the bounds of the last Teutonic settlement in Britain, as in Kent, on the opposite side of the island, we are within the bounds of the first. Henry wrought the last act of the drama which was begun by Hengest. We are here in the Englishry, in Little England beyond Wales. We are in a district where language universally, where local nomenclature generally, is as Teutonic as it is in Norfolk. To its inhabitants "Albert the Good" may give an idea; but "Albert Dda" is quite thrown away upon them. The Red Dragon of the Cymry was to their forefathers only as the Snark or the Jabberwock, a noisome beast to be hunted down without mercy. The strange fancy of Englishmen for turning their backs on themselves, for wiping out their own history to make room for the legends of somebody else, surely never took a stranger shape than in an outbreak of Welsh nationality at Tenby.

There is no doubt, from the direct witness of William of Malmesbury and other contemporary writers, that Henry the First, among his measures to keep the Welsh in order, planted a colony of Flemings in Dyfed, the modern Pembrokeshire. In the district allotted to them, the southern part of the county, they must have done their work thoroughly. The Briton has left but few traces. The one speech of the district is English, and most of the places have received fresh names. Most of them are called after individual settlers—Johnston, Williamston, Haroldston, Herbrandston, names which exactly answer to the Danish names in Lincolnshire, save that they end in English *ton* instead of Danish *by*. Here and there a place keeps a Welsh name, specially the towns of Pembroke and Tenby, just like London, Gloucester, and Winchester in other parts of the island. This Flemish settlement in Pembrokeshire is an undoubted fact; the alleged Flemish settlement in Gower is less certain. It rests on no such direct historical evidence as the Pembrokeshire settlement; but it is a highly probable inference from the recurrence of the same phenomena of language and nomenclature in both districts. We know that there was such a settlement in Southern Pembrokeshire; we infer that there was another settlement of the same kind in the peninsula of Western Glamorgan, and in the smaller district of Llantwit Major in the same shire. But the Pembrokeshire settlement is always expressly described as a colony of Flemings. It is recorded both by the English and by the Welsh writers; but the fact that the colony, which was originally Flemish, now speaks English has given rise to a good deal of puzzledom, and to the talking of no small amount of nonsense. Any one who knows the district and its local antiquaries will have heard the question raised over and over again. In local books, too, we constantly see mention of "Flemish houses," "Flemish architecture," "Flemish chimneys," and even a "Flemish court of justice," as if the Flemings had brought over some special style of art with them from their own country. We have even seen an elaborate comparison, which was meant to prove something, between the "Flemish houses" in Pembrokeshire and a house in some other part of England—in Cumberland, if we rightly remember—belonging to a family named Fleming. It would have been easy to improve upon this last notion; for, in some versions of the story, the Flemings whom Henry settled in Pembrokeshire are said to have been before that settled in the North of England. But the so-called Flemish houses are in no way distinctively Flemish, and they were built ages after the settlement of the Flemings. They are simply good, solid, stone-built houses, with pointed doorways and round chimneys. They show the general prosperity of the district at a time when so many stone houses could be built; and they also show in slight military touches that the days of warfare, or at all events the traditions of the days of warfare, had not wholly passed by when they were built. On the other hand, it marks an old-fashioned district where there has been comparatively little change, that so many of them should have lived on to our own day. But there is nothing special or mysterious about them, nothing on which to found any ethnological theory. To call them Flemish houses, attaching any distinct meaning to the word Flemish, is as much to the purpose as it would be to talk of a West-Saxon style in the stone houses of Somerset, or of a Middle-Anglian style in the stone houses of Northamptonshire.

We have brought in this last analogy of set purpose; for of course the great puzzle always is, how a Flemish settlement came to speak English. People constantly ask how the Flemings came to change their language. The difficulty is by no means a new one; it is as old as Randolf Higden, who looked on Flemings as barbarians, and says that in his day they had left off their barbarous tongue, and spoke good Saxon ("dimissa jam barbaric Saxonice satis proloquuntur"). And of the two Welsh chronicles known as the Brut, the later, fuller, and less trustworthy one tells us how Henry planted Englishmen—in Welsh, of course, "Saxons"—among the Flemings to teach them English, and how into his day they were English. At the Tenby meeting of the Cambrian Archæological Association in 1851 there was a vast deal of talk about the matter. It was clearly a standing local puzzle how Flemings could have come to speak English. What they were expected to speak, what the natural language of Flemings left to themselves was supposed to be, did not appear. Perhaps they were expected, as coming from the modern kingdom of Belgium, which uses French on its coins, to speak French rather than English. That native Britons should have come to speak English was clearly thought a much slighter difficulty than that Flemings should have done so. It seemed like a paradox to many to be told that the settlers in Pembrokeshire had never changed their language at all, and that they spoke English simply because they were Flemings. To one who really takes in the history and the relations of the Teutonic dialects of Britain there is no difficulty at all in the matter. The Flemish tongue is one dialect of Low-Dutch; the English is another. Even now the nearness between modern Flemish and modern English must strike every one who thinks at all upon such matters, and the nearness in the twelfth century, before English had gone through those changes which have parted it off from its fellows, must have been much closer still. The true way of looking at the matter is, as we have already said, to look on the Flemish occupation of Pembrokeshire as simply the last stage of the Teutonic settlements in Britain. First came the various settlements of the Angles, Saxons, and Jutes; then after a while the Danes; then after a while the Flemings. And the Flemish settlement has more in common with the earliest settlements of all than the intermediate Danish settlement has. For the Danes settled at the expense of earlier Teutonic inhabitants, while the Flemings settled almost wholly at the expense of the Celts, just as the Angles and Saxons did ages before. There have been later settlements in Britain, settlements from the same part of the world which sent forth the Flemish settlement in Pembrokeshire. Intercourse with the Netherlands, and the reception of refugees from the Netherlands, has given a certain tinge to East-Anglia in more ways than one. But here was a settlement altogether of the old kind, a settlement where the colonists drove out the old inhabitants, divided the land among themselves, and gave places new names from their new owners. The causes and circumstances of the Flemish settlement in Pembrokeshire were altogether different

from those of the earliest English settlements in Britain. But the process of settlement must have been very much the same; the only difference was that the Flemings were not, like the first Angles and Saxons, mere heathen destroyers. But to the second stage of Anglian and Saxon conquest, the stage represented by Cenwealh and Ine and other Christian conquerors, the settlement of the Flemings must have presented an exact parallel.

We need hardly say, at this time of day, that the question about language—the supposed difficulty of Flemings having come to talk English—is purely imaginary. What else should they talk? The processes which created the standard English tongue, or rather which brought it to the front amid a crowd of local dialects, have affected the Teutonic speech of Pembrokeshire, as well as the Teutonic speech of other parts of the island. The Fleming of Pembrokeshire speaks English for the same cause that the Dane of Lincolnshire speaks English. That is to say, one form of standard English is common to all. How far all parts actually speak it is another matter. It is for some local philologer to find out whether there are any local peculiarities in the Nether-Dutch of Pembrokeshire, and whether they at all approach to any peculiarities in the Nether-Dutch of Flanders. After such complete separation for so many ages, we should not expect to find any such special likeness between the two dialects. Still the point is quite worth looking into; and, though the colony was certainly mainly Flemish, we need not suppose that every single man in it had come from Flanders. There may be truth in the Welsh chronicler's statement that King Henry planted Englishmen among the Flemings, though it is not likely that he did it for the purpose of teaching the Flemings English. We may be sure that there were both French-speaking and more strictly English-speaking settlers among them. Normans, English, Flemings, when they got into Wales, largely forgot their differences, and formed one whole as against the Britons. Pembroke Castle was a strictly Norman foundation, the work of Arnulf of Montgomery before the Flemish settlement began. And the foundation of the castle would naturally lead, at Pembroke as at everywhere else, to the settlement of both French-speaking and English-speaking burgesses around it. And there is every probability that the Flemish settlement was a revival, or a continuation, or a strengthening, of an earlier Teutonic settlement from quite another quarter. Though Tenby is no Scandinavian name, yet other names in the district are. At the meeting of the Cambrian Archæological Association last year at Caermarthen, its president, the Bishop of St. David's, pointed out that the names Hasgard and Freystrop seemed to point, not only to Scandinavian occupation, but to Scandinavian occupation in heathen times. Whatever we make of Hasgard, it seems hardly possible that any place could have got the name of Freystrop—that is doubtless Freysthorp—if it had not been founded by people who still believed in Frey. If any Scandinavian settlements stayed on till the time of Henry the First, they would merge with the Flemings and the English into one Teutonic community, just as the Saxons at Bayeux were merged with the Normans, but helped to keep Bayeux Teutonic later than other parts of Normandy. In all these points of view, ethnological and linguistic, this little out-of-the-way corner of the Teutonic world is of very high interest, and its local history and peculiarities have never been thoroughly worked out from a scientific point of view. It has points in common with another isolated Teutonic land at the other end of Britain. The Scandinavian islands, Orkney and Shetland, speak English. Indeed we have seen documents in those islands drawn up in the Scottish form of English before they were mortgaged by Denmark. Both cases teach the same lesson, how easily a standard form of any language assimilates all the kindred dialects of a country, but how little effect it has on dialects which are not kindred. English has not assimilated, though it has largely displaced, the Welsh and Gaelic tongues, with which it has no connexion beyond the remotest Aryan kindred. But the tongues of the Dane and the Fleming, as well as those of the Angle and the Saxon, have all been drawn together by the attraction of a single type of standard English. The actual local speech of different parts still remains very different. But all understand the same standard tongue, and all read the same English Bible in which that standard tongue appears in its best form.

MARTYRS OF COMMERCE.

WE are afraid that the gentlemen who live at home in ease, pursuing occupations which are not absolutely distasteful to them and which bring them in a reasonable competency, are seldom sufficiently thankful for their mercies. Nothing would be more favourable to the growth of a grateful contentment than occasionally contrasting their good fortune with some other lots taken almost at haphazard. To point a practical and valuable moral they need not go to the lowest extremity of the social scale—to the occupants of city "rookeries," and the inmates of prisons and poorhouses, who may have been the victims of circumstances over which they had little control. They have only to look at men who have been brought up in a condition of life very similar to their own, but whose career, whether it has been more or less prosperous, has happened to lead them into out-of-the-way places of residence. Two incidents which have lately caused considerable sensation may serve as opposite illustrations of what we mean. One is the melancholy assassination of the French and German Consuls at Salonika by a mob of fanatical Mahometans; the other the Circular addressed by Commodore Hewett to the European traders settled at Whydah, intimating the prospect of hostilities with Dahomey, and recommending them to make their arrangements accordingly. Whether civilization advances or recedes, there must always be a broad and ill-defined debatable land dividing it from the strongholds of barbarism or semi-barbarism. Civilization has its outposts, picketed, rather than garrisoned, by men who have voluntarily condemned themselves to the hardships of exile, either in the way of duty, or of business, or of both. Habit reconciles one to much that might seem at first sight insupportable, and perhaps the thick-skinnedness of certain temperaments is more serviceable still; yet, when all is said, a life that has come to be accepted as a matter of course may well have its intervals of despondency and depression. There is of course much of the world that is altogether tabooed to Christians. The most enterprising of European adventurers would shrink from trusting to the protection of the Moorish Government by opening a depôt for the sale of Manchester cottons in the bazaars of some of the cities in the interior of the Emperor's dominions. Certain descriptions of cutlery are in extreme request among the rough and ready Turkoman and Chinese Tartars, and yet it would be considerably more than a man's life was worth to settle as the agent of some pushing Sheffield house in the Khanates or on the plateau of Central Asia; while the roads that lead from the ports of the Red Sea to the spice groves and coffee gardens of Arabia Felix would be the shortest of cuts to the gate of martyrdom, in whatever character you might choose to travel them, unless you knew how to disguise your nationality and faith. But, short of the places where the sojourn of a Christian would be pretty nearly tantamount to suicide, there are many where, on a nice calculation of chances, he may decide that the game is worth its risks. In the fierce struggle of commercial competition the boldest adventurers will push their way towards the front, and that very ignorance of the temper of half-savage populations which is at the bottom of the worst dangers they have to guard against will tempt them on with the expectation of better bargains. It is all, as we have said, a matter of calculation how far it may be worth your while to go in order to distance competitors who would raise the market on you, and to put yourself in direct relations with the savages whose inexperience is to be traded on. And other considerations besides the risk of actual violence are to be taken into account. It needs fully as much courage to face a pestilential climate as to maintain an air of self-relying assurance among a fanatical people who are given to act on sanguinary impulses with small regard to consequences.

A life of this kind must be wearing at the best, whatever the prospect or even the certainty of gain, and probably the prolonged endurance of it implies the cultivation of a certain constitutional recklessness. We can easily understand that elephant-hunters and ivory merchants in tropical Africa may be so exhilarated by ceaseless excitement as to fall in love with their calling. While they are moving forward through perpetual change of scene, they come to find a positive enjoyment in carrying their lives in their hands and facing danger in its manifold forms. Setting a watch over their night camp by way of precaution against an onslaught of skulking savages becomes to them as much a matter of course as making forced marches in search of water, or dodging the rush of a wounded elephant; and when they have come back to the settlement laden with their hard-won spoils, their only idea is to make a fresh start with the least possible delay. But the dull monotony of an unwholesome existence, with death perpetually hovering about one's doors, must be a very different thing. Take the case of a resident in a city of bigoted Moslems. The unfortunate Consuls at Salonica might have been supposed to be comparatively safe and comfortable. Salonica is one of the chief cities of European Turkey, and has long boasted a certain civilization. It possesses a responsible governor with a regular military force, and contains a very large proportion of Christian inhabitants—which, by the way, in this particular instance, was the immediate cause of the deplorable tragedy. But there are many merchants and merchants' agents, and much nearer to England, too, who pass their lives without any of these securities. As we have said, there is no possibility of settling in the inland towns of Morocco, and the few casual travellers who venture into the country go treading everywhere upon mined ground, in spite of Government protection and military guards. But there are great temptations to speculators to try their luck in the trading towns on the western coast. The country is rich in a variety of productions, while the glut of goods in the native markets keeps prices so low as to leave exporters a wide margin of profit. If a man with more enterprise than capital decides to take up his abode in one of these coast towns, the sole assurance he has for the safety of his person and property is probably an occasional glimpse of the flag of his country flying from the roof of some naturalized vice-consul, who is an object of contempt and hatred rather than of respect. As likely as not, indeed, the display of the party-coloured bunting may act on the Moors like a red rag on a bull, especially during the periodical religious festivals which set the people seething with excitement. When the European takes his walks abroad, he is the object of sullen glances which are eloquent of smouldering animosities, and his Frankish garb draws the attention of objectionable boys, who are egged on and encouraged to insult him by their elders. In the frequent disputes which arise with his customers his sole recourse is to the native law courts, where the only chance of obtaining questionable justice is by a lavish expenditure of bribes. Nor is he exempted from the arbitrary impositions of the agents of a needy Government. His

servants, who are generally Jews, are pretty sure to be scoundrels, and are almost certainly spies. Thanks to the climate as well as to other circumstances, he has to resign himself to a good deal of close confinement; and when he ventures beyond the gates for an evening ride in an uninteresting country where sand-hills predominate, it is at his peril. The sword of Damocles is hung over his head, and he has the feeling that at any moment it may break the flimsy thread that holds it. There is scarcely a man among his neighbours who does not regard him with loathing, and who does not believe that the shedding of his infidel blood would be a sweet savour in the nostrils of the Prophet. In ordinary times he may be tolerably safe; for even in Morocco the unprovoked murder of an infidel may entail inconvenient penalties. But it takes very little to warm fanaticism up to blood-heat, and a Moorish Mahometan under strong mental excitement is exceedingly apt to act upon impulse and cast all thought of consequences to the winds. Nor has the stranger the comfort of knowing that, in the event of the place getting too hot for him, the means of a speedy retreat will be at his disposal. There are many chances against Christian vessels happening to be moored in those dangerous roadsteads, and a storm or a ground-swell may easily prevent the coasting steamers from touching on the occasions of their periodical visits.

As, however, there are few lots in life so bad that they might not be worse, the gentlemen we have been compassionating may take comfort in their turn when they look southward to the settlements among the negroes on the coast on which they are vegetating. The seaports of Morocco are, no doubt, very like whited sepulchres; the climate is sultry, and the people are fanatical and unfriendly. But at any rate they compare advantageously in every respect with such heaven-forsaken trading ports as Whydah. Potentates like the King of Dahomey scarcely stand an inch higher in point of intelligence than the bulk of their barbarian subjects. The negroes are as devoted to the worship of their fetishes as the Moors to their Prophet, and the "customs" which embody their conceptions of religion are infinitely sanguinary and demoralizing. Taught to hold their own lives cheap, they are unlikely to have any great regard for the lives of the white strangers. One of the few arts in which they have attained some proficiency is that of poisoning; and in that there are thriving practitioners of no mean skill. The agents of the factories necessarily employ native labour; and as the negro is always on the watch to shirk and to swindle, there are constant difficulties between him and his master. The man who has been scolded or dismissed is pretty sure to be planning vengeance, stimulated thereto by a reasonable certainty of being able to perpetrate any crime with impunity. And the inevitable dangers to life are serious enough without having them aggravated by helpless exposure to assassination. One is quartered in a shadeless factory, exposed to the intolerable glare of a tropical sun. Probably the only vegetation in the vicinity is in the dense mangrove swamps on the shores of the tidal estuary, and these are rotting and steaming under the fierce sun rays. When one might hope for a fresh breeze from the sea of an evening, it comes blowing over festering leaves and stretches of fetid mud. This is followed towards morning by a thick grey fog rolling up along the course of the river, and if the windows are left open for a breath of air, the air that enters has the seeds of death in it. Under such circumstances, the various hideous forms of reptile and insect life are trifling nuisances scarcely worth mentioning, though there are snakes in the rifts of the walls, centipedes and venomous spiders in the cracks of the ceilings, swarms of poisonous flies and mosquitoes, and the certainty of occasional invasion by legions of ravenous white ants. It is well if men so situated do not seek consolation in drinking; yet strict sobriety is a matter of life and death. And most of those who have resigned themselves to this sort of exile cannot even count on the contingency of finding a short cut to fortune. They are mere stipendiaries with very moderate appointments, and their horizon is bounded, if they are given to meditation, by the crowded mounds in the neighbouring graveyard. Thus commerce has its martyrs as well as religion, with the difference that their martyrdom is a lifelong affair, while its end is frequently the most dismal part of it.

TRIAL BY NEWSPAPER

A CONSIDERABLE amount of space has been occupied in the morning papers of this week by a case of mysterious poisoning at Balham, and there appears to be no doubt that the Coroner's inquest on the case was conducted in a careless and superficial manner. This, indeed, is proved by the statement of the Home Secretary, that neither the servants nor the four medical officers who had attended the deceased were called to give evidence, that the depositions were not read over and signed in the usual way, and that he was entirely dissatisfied with the Coroner's conduct, and had ordered a special inquiry on the subject. An incompetent coroner is unfortunately by no means a rarity. In the inquiries into the *Mistletoe* disaster one coroner was so conscious of his own weakness that he was afraid to sum up the depositions, and the other accepted without remonstrance a verdict of which one part was in flat contradiction to the other. It might almost be thought that there is no class of judicial functionaries so destitute of discretion as coroners. There seems to be at least a considerable section of them who divide their time between holding inquests when there is no necessity for them, and muddling inquiries which are of importance. It would be well, therefore, if the Home Secretary could be persuaded to see the necessity of a general revision of this preliminary branch of justice. Considering the sort of people who are usually candidates for coronerships and the manner in which they are elected, as well as the absence of close supervision over their conduct, it is not perhaps surprising that the old reputation of the "crowner's quest" should still cling to them, and that the method in which their inquiries are usually conducted should be anything but satisfactory. As a rule, the use of a coroner's inquest is superseded by the activity of the police; but the general principle of a special investigation by a jury in cases of mysterious death is a good one, and ought to be maintained. It is probable, however, that, as at present managed, inquests tend rather to confuse and obstruct the course of justice than to serve as an assistance to it. It is not very difficult for persons who have an interest in a case to get up evidence which imposes on an ignorant jury presided over by an incompetent judge, or to procure what is called an "open" or meaningless verdict; and when a coroner's jury has given its decision it is usually final. However, admitting all that can be said against this form of tribunal, we must say we should be sorry to see it superseded by another form of judicial inquiry which appears to be coming into fashion—we mean trial by the newspapers. The liberties in which a certain class of journals indulge with regard to criminal proceedings have lately assumed a more audacious character. In civil cases they are perhaps deterred by the fear of actions for libel; but in criminal cases they apparently take it for granted that there will be no question of damages, and that they can say what they like. It is obvious that any interference from the outside with a case which is receiving, or is to receive, the consideration of a competent court of law is a breach of those conditions of order and reticence which are essential to the existence, or at least to the proper administration, of such a tribunal. When a case goes before a court it passes beyond the range of loose public discussion. This is a very simple rule, and it cannot be denied that, on the whole, the press has been scrupulous in obeying it. Of late, however, there have been various symptoms of a disposition on the part of some reckless traders in sensationalism to break the bounds, and to take into their own hands the investigation of cases of crime which attract much attention. In the Wainwright case more than one daily journal thought it necessary to employ detectives of its own, and to publish the results of their researches or imaginative speculations. In the horrible case of the murder of a little girl at Bolton the same thing was repeated; and now we have another illustration of the same tendency in connexion with the mysterious death at Balham.

During the last fortnight there have been various references to this case in the newspapers, and so far as these had to do with pointing out that the Coroner's inquiry was inadequate and perfunctory, and urging that a supplementary inquiry should take place, they were reasonable enough. The inquest was held in a private house, almost secretly, and the evidence at hand was not thoroughly exhausted. It is possible that the whole affair might have escaped public notice if it had not been for influences of some kind or another which have stirred the matter. It does not appear whether any reporter was present at the inquest, but no report of the proceedings was published till some days afterwards, and this consisted mainly of the written depositions. If the newspapers had stopped here, they would only have been doing their duty. It is very important to the public that there should be no risk of such inquiries being hushed up, and it is the business of the press to watch what goes on. Not content, however, with the ordinary way of dealing with such things, the *Daily Telegraph* has instituted what may be regarded as a court of its own. It has opened its columns to the gossipmongers, and has published a mass of rumours and conjectures which has reached it in this way. Among others, a person calling himself "A Barrister" has appeared before this singular court, and it certainly cannot be said that, in the present state of legal education, vulgar stupidity and ignorance of law are conclusive grounds for denying the genuineness of the professional title which he assumes. He begins by saying that he has read with great interest the various communications in the *Daily Telegraph*, and thinks that "some of them let a certain amount of light upon the circumstances of the case"; and that "when they are connected with such positive evidence as has already been made public," it seems to him that "the whole matter lies within a comparatively limited compass." He then lays down what he calls the well-understood rule, that in all investigations "we should move from what we know to what we do not know." Our own impression is that this is a very dangerous rule, at least in the sense in which the "Barrister" applies it, and that it is safer to stop at what you know, and let what you do not know alone. He assumes as a beginning—what indeed seems to be a fact—that the death in question was caused by poison. He then discusses the hypothesis of suicide, calling himself as a witness to prove the cheerfulness and contentment of the person supposed to have committed this act. He admits, however, that there are some points as to which it would be well to have some information, and urges Sir W. Gull "to clear up what actually occurred." Nevertheless, he does not think it worth while to wait for this elucidation, and in the very next sentence dogmatically pronounces that suicide is out of the question. The possibility of accident is next set aside on the ground that "a large dose of tartar emetic is not the kind of thing that goes straying

about at random in an orderly and well-regulated house," and that it would be "a very unusual mischance" if an antimony hair-dye should find its way into wine or soup. Therefore, he holds, the idea of accident is "absurd, on the face of it." He then coolly proceeds to the final alternative—"We are consequently reduced to the terrible conclusion that" the deceased "was murdered"; and not only this, but that "the poison was taken by him during the course of his dinner," and in fact that it was in his wine. Other persons partook of the dishes at dinner, and were not ill. Therefore the "Barrister" concludes that the mischief must have been in the burgundy which the deceased drank at table. This bottle of wine was not produced at the inquest, and there is as yet no evidence whatever as to its contents. But the "Barrister," with true judicial acumen, "takes it for granted." "I arrive at this conclusion," he says, "by what logicians call the 'method of residues'; it must have been in the burgundy, because it could not possibly have been in anything else." The fact is that there is really no evidence, one way or the other, on this part of the subject, not even the negative evidence that the poison could not possibly have been anywhere except in the bottle. Yet the "Barrister" in his confusion of mind says he will confine himself to "absolute and ascertained facts."

The *Daily Telegraph* has also printed a good deal of other correspondence on this exciting mystery, and no doubt there is an abundant stock of this sort of worthless gossip ready to be poured into any utensil that is provided for it. The question is, whether this sort of interference with the preliminary proceedings in what may turn out to be a criminal case is justifiable; and there can be no difficulty in giving an answer. It is very easy for a "Barrister" to conduct a case by evidence invented or coloured by himself, when free from the check of cross-examination; and if this class of practitioners are to find a forum in the newspapers, they will probably not want clients. In the present instance it may be said that the object is, not to assist a guilty person to escape, but rather to bring some person who is supposed to be guilty to justice. But in many cases the effect of newspaper interference in this way would be to obscure and bewilder public opinion on the subject, with a view to the offender's escape, and persons in that position would soon discover the use which might be made of such a system. In any case the discussion of such matters in the press must necessarily be injurious in confusing the public as to rules of evidence and mixing up facts and fiction in an inextricable tangle. The newspapers have a right to report evidence publicly given, and, when the inquiry is over, to comment on it if they choose. But it is certainly not their place to open their columns to all the loose, unauthenticated and unauthenticable gossip that may be sent to them on such a subject. It is to be regretted that the respect of journalists for the character of their profession is not enough to impose the necessary restraint; but if the scandal continues, something will have to be done.

DISCIPLINE IN MERCHANT SHIPS.

A DEPUTATION of shipowners and others has urged upon the Prime Minister the importance of maintaining discipline in merchant ships, and Mr. Disraeli has been advised to answer that the existing law is adequate for this purpose. It may easily be shown, by reference to authority, that the law has always allowed large powers of repression and punishment to the captains of trading ships, these captains being at the same time liable both civilly and criminally for abuse of the powers thus entrusted to them. In a case that occurred nearly fifty years ago, a sailor brought an action against his captain for assaulting and beating him and putting him in irons; and it was conceded in argument by the plaintiff's counsel that, when a ship is on the high seas, where it is impossible to procure assistance, a captain may inflict corporal chastisement on his crew; but it was contended that the rule was different when, as in that case, the ship was at anchor with other British ships within hail. A point of pleading arose in that case, in reference to which the plaintiff's counsel argued that, "if, under the circumstances, the defendant was not justified in flogging the plaintiff, the proceeding was void *in toto*," which perhaps would be small consolation to his client. As may be read in an Oxford translation of Aristotle's *Ethics*,

> Of this alone is Deity bereft,
> To make undone whatever has been done;

and neither Gods nor Barons of the Exchequer can unflog a man. But it may perhaps comfort Mr. P. A. Taylor to know that, if a sailor be flogged illegally, "the proceeding is void *in toto*." In the case to which we have referred, Lord Lyndhurst, who then presided in the Exchequer, laid down the law clearly and sufficiently in support of discipline. The ship was at anchor off Macao, and the captain was on shore. In his absence an inquiry was held by the officers into the conduct of a sailor named Cronan, and they determined that he had been guilty of disobedience to orders, and sent for the captain, who, coming on board three days afterwards, ordered Cronan to be flogged. The plaintiff Lamb, being probably what is called a sea lawyer, demanded by what authority the captain ordered Cronan to be flogged. And he and others riotously and mutinously resisted the execution of the captain's orders to flog Cronan. The other ships, on signals being made to them, sent boats with armed men, who quelled the disturbance, and Lamb was immediately flogged by the captain's order, and afterwards imprisoned and kept in irons. The jury having found their verdict for the defendant, it was sustained by the Court. It was clear, said Lord Lyndhurst, that Cronan misconducted himself, and "for the purpose of enforcing obedience in the ship's crew, the captain has authority to order any of the crew who misconduct themselves to be moderately and properly corrected." Then, as to the conduct of Lamb, he appeared to have been the leader of the persons who opposed the infliction of punishment on Cronan, and whose behaviour was extremely objectionable and mutinous. Under such circumstances the captain was justified in directing punishment to be inflicted on Lamb.

The law may be further illustrated by reference to a criminal case which occurred about seven years later, and which was cited in the opinion read by Mr. Disraeli to the deputation. It was laid down in that case that persons on board ship are necessarily subject to something like despotic government, and it is therefore extremely important that the law should regulate the conduct of those who exercise dominion over them. The captain and mate of a ship were indicted for manslaughter of a sailor who was really in ill health, and they pleaded guilty, but represented themselves to have believed the man to be a skulker. The Court said that the question was whether the phenomena of disease were such as would excite the attention of reasonable and humane men. "This," said Baron Alderson, "is a very aggravated case." The only circumstance stated in the defendants' favour was that the deceased was sent on board by a surgeon as fit for work, and this was not proved. They ought to have known that the man was in such a condition that he was likely to die, and therefore the Court would imprison them for a very long period. In several recent cases of shipwreck we have heard of great disorders and crowding into boats among both passengers and crew, and of the captain threatening to shoot those who resisted his authority. If the captain had shot even a passenger under such circumstances, the law would probably justify his act, but only on full inquiry and consideration of the facts. It might well be in such a case that destroying one life might save many. Within the last ten years a case occurred in which the authority of the captain over passengers as well as crew was recognized. But, said the Judge, this authority is based on necessity, and is limited to the preservation of necessary discipline and the safety of the ship. The captain is not bound to wait for actual mutiny, and he might arrest any movement towards it on the part of passengers or crew. But there must be some act calculated, in the judgment of a reasonable man, to interfere with the safety of the ship or the due prosecution of the voyage. "The necessity for exercising a due control over the exercise of this arbitrary authority was all the greater because it was exercised on the high seas, perhaps thousands of miles from land, without any opportunity, until weeks or months afterwards, of appealing to the law for redress in case the authority was abused." The late Baron Channell, who thus charged the jury, asked them to consider whether, in sober seriousness, it was really necessary for the safety of the ship or the due prosecution of the voyage that the plaintiff should have been seized and imprisoned. They would bear in mind that the ship was of considerable size, and must have had a numerous crew, and could they say that the plaintiff's conduct, whatever it was, rendered such measures necessary for the safety or due management of the ship? They must consider whether there had been any necessity for the exercise of authority, and even if there had been such necessity, whether there had been excess beyond what was necessary? The jury gave a verdict for the plaintiff with 25*l.* damages; so that out of three cases which have been mentioned, redress was given in a criminal Court in one, and in a civil Court in another, while in the third the captain's necessary exercise of authority was justified. The result of all this seems to be, that the existing law is reasonably sufficient; but, like other laws, it is liable to defective execution through mistakes of judges. The Attorney-General, being questioned in the House of Commons in reference to the case of the captain of the *Locksley Hall*, answered in conformity with these authorities. He said that the legality or illegality of a captain's conduct depends upon the special circumstances which existed at the time when he committed the alleged wrong, and it is frequently necessary for him to exercise his power with considerable severity.

Whether or not it be expedient to man British ships with Greeks or Maltese, as a matter of fact many ships are so manned, and in dealing with a motley crew a captain's authority ought to be considerable. This is clearly shown by the recent case of the *Caswell*, whose captain would have been justified in taking prompt and severe measures to quell the mutiny in which he and his officers perished. This ship had originally an English crew, but at Buenos Ayres all except the two mates, the steward, the carpenter, and two apprentices were discharged; and three Greeks, two Maltese, a Scotchman, and an Englishman were shipped in place of those who left. The ship proceeded to Valparaiso in ballast, and some dispute occurring about provisions, one of the Greeks was heard to say that, if the captain lifted a hand against the crew, "they would see the deck running in blood." Nothing else exceptional occurred until after the vessel left Antifogasta with nitre for Queenstown and Falmouth. On New Year's Eve one of the Greek sailors was lying ill, and the mate told another of them, called "Big George," that he would have to go on the sick man's watch. He refused, and the captain went into the forecastle with a revolver. Being asked why he came armed, the captain answered that he meant to use his revolver if necessary. Big George then promised to take the

sick man's place, but he did not, and nothing more was done to compel him. This was on Friday evening, and nothing further occurred until Tuesday, the 4th of January, when, as the captain was instructing Big George how to put the "seasons" round the rigging, he suddenly and without apparent provocation stabbed the captain in the stomach. The two mates and the steward were simultaneously attacked with shots and stabs, and in the result these four Englishmen were murdered by the five foreigners. The plan was concerted, and may perhaps have been a complete surprise to the victims. If the captain had been a more resolute man, he would probably have compelled Big George to go on watch on Friday evening or put him in irons for refusal, and if in attempting to do this he had provoked a premature explosion of mutiny and violence, he might perhaps have saved his own life and the lives of those who perished with him four days afterwards. But, if he ought to have done this as a prudent and resolute officer, he certainly ought not to have been answerable to the criminal law for doing it. Indeed, if such cases as these occur repeatedly, the law is likely to be expounded by judges at least as adversely to mutineers as it was fifty years ago. It may, however, become questionable whether it is worth while to undertake a voyage with half the ship's crew ready to kill the other half at the shortest notice. The foreigners on board the *Caswell* actually did kill four Englishmen, and the only safety of the Englishmen manifestly lay in being as prepared and ruthless as their probable assailants. It seems a misnomer to talk of a ship's "company" under such circumstances, and probably half, according to the old proverb, would be better than the whole; for the Englishmen might have contrived to work the ship without any help at all, and the help which they had was worse than none. It almost seems as if the dangers of the deep were likely to be more largely experienced by the mercantile than by the Royal navy. A naval battle will be very terrible when it comes, but it is a long time coming, and even an ironclad on a holiday cruise in the Irish Channel is a safer place than a merchantman with irascible and long-knived Greeks on board. After the captain, two mates, and the steward of the *Caswell* had been murdered, the ship rounded Cape Horn, and off the river Plate the two Maltese left her, so that there remained on board the carpenter, two British seamen and two boys, and the three Greeks. It was now believed that the only choice for our countrymen lay between killing and being killed, and they accordingly determined to attack, and, after a severe fight, killed two of the Greeks and wounded and made prisoner the third. It is said that the Greeks intended to take the ship to one of their own ports in the Mediterranean, where they probably hoped to escape notice among the miscellaneous scoundrelism of their country. The ship was within a few days' sail of Rio when the second conflict occurred, and the victors with their wounded captive determined to bring her to Queenstown, and in this they succeeded. The statements which they have made are confirmed by the appearance of the cabin where the fight came off and by the ship's log, but, as their prisoner awaits trial, it must not be assumed that he individually is guilty. All we can say is, that those who perpetrate such atrocities and survive them cannot expect on capture and conviction any sentence short of death. Indeed, if there were now any considerable agitation against capital punishment, such a case as this would go far to quiet it. The murderers of the *Lennie* are awaiting execution, and the survivor of the alleged murderers of the *Caswell* will certainly be tried. We do not, therefore, quite agree with the deputation who urged on Mr. Disraeli that these cases, and the generally growing insubordination, show the need of immediate legislation. As the magistrate's decision in the case of the captain of the *Locksley Hall* has been as far as possible corrected by the Home Secretary, we must assume that the magistrate erred, as judges of higher rank sometimes err, in applying a law which, rightly understood, is sufficient for its purpose. The administration of any law will always depend to some extent on public opinion, and after these cases of the *Lennie* and *Caswell* mutineers are not likely to obtain much sympathy. It appears that Mr. Disraeli was right in saying that the ship-masters who addressed him rather underrated the power which they by law possess.

WATER SUPPLY OF HASTINGS.

A REPORT in the *Lancet* on the water supply of Hastings will be read with interest, not only as affecting a popular seaside town, but also as an illustration of difficulties which beset many other increasing towns. This town has outgrown the district from which its natural water supply comes, and a larger quantity must be brought from a longer distance. It has been suggested that the necessary supply might be obtained by boring down to the Lower Greensand at Glynde, about twenty miles from Hastings, and the engineering difficulty of such a scheme would not be serious, although the expense of this or any other adequate plan would be considerable. We believe that a similar method was adopted some years ago at the neighbouring seaside town of Eastbourne, but under more favourable circumstances, as the supply could be obtained nearer to the place requiring it. Expense, however, cannot in such a matter be regarded, and the townsmen of Hastings will find it dear economy to allow any stir to rest on the water supply of their town.

The total watershed area available for Hastings may be roughly described as a triangle, with the sea for base. It covers no more than 3,000 or 4,000 acres, and is broken into glens which run down to the sea. It lies in the Wealden deposit, and consists partly of sand and partly of clay. The surrounding hills are steep, the strata are broken by numerous faults and fissures, their dip is not favourable for the accumulation of water, and a considerable portion of the district is thickly populated. A Report was made last year to the Town Council of Hastings by Mr. Topley, of the Geological Survey, and the Report in the *Lancet* appears to be partly founded on Mr. Topley's statements. The present supply of water is said to be derived, first, from wells; secondly, from surface drainage; and thirdly, from superficial springs. A well at Hollington, which at present supplies St. Leonards only, has been lately acquired by the Corporation, and it is now proposed to add it to the general town supply. This proposal is naturally resented by the inhabitants of St. Leonards, who view it as an admixture of their good water with the doubtful water of Hastings. This well at Hollington is estimated to yield 75,000 gallons per day. An old well near the gas-works yields about 40,000 gallons per day. This well is stated to communicate with subterranean fissures of unknown extent, which prevent the water from rising above a certain height, and it is, in fact, utilized as a large storage reservoir. There seems, however, some danger in this practice, as no one can say how near the fissures come to the surface nor how far they reach. The storage of this reservoir is roughly estimated at 50,000,000 gallons, and it is connected by mains with all the wells and reservoirs of the town, except the well at Hollington, and even that will shortly be included. The supply of water obtainable from deep wells being limited, it is necessary to augment it with superficial spring and surface drainage water. At Shornden and in the valleys of the Old Roar, Clive, and Ecclesbourne reservoirs have been constructed, which are supplied from these sources. Each of these reservoirs collects and stores the water of the surrounding springs, and in one or two cases a stream is impounded. The reservoir in the Old Roar valley is the largest, and it holds 25,000,000 gallons. It is fed at the upper end by the Old Roar stream, which flows down a valley now pretty thickly inhabited. "This stream," says the *Lancet*, "is most objectionable," and we can hardly doubt that the objections stated are to a great extent well founded. "The springs which contribute to the reservoir seem little better"; Ecclesbourne and the two Clive reservoirs are described as presenting similar features. The water in all was "opalescent and swarming with water fleas." The general character of the water drawn from these various sources is said to be "unsatisfactory and dangerous," and although this is matter of more or less disputable opinion, there is the further consideration of quantity, and this is matter of fact. The present population of Hastings and St. Leonards may be taken at 35,000, exclusive of autumn visitors. The reporter estimates that only 30,000 are now supplied with water, and he adds that the private wells, which supplement the town supply, are in many cases badly polluted and should not be used at all. Allowing for the exceptional wants of the autumn, when water is most important, it seems no exaggeration to say that a present population of 40,000 should be provided for. The smallest daily allowance that can be sufficient is twenty-five gallons per head, which gives a daily requirement of 1,000,000 gallons. In London the allowance is about thirty gallons per head, and in some places it is still higher. A smaller quantity would of course be sufficient, with economy, for actual sanitary necessities; but in a fashionable watering-place the supply should be abundant, if only for the reputation of the place. It is highly desirable that a constant supply should be provided, and liberal allowance should be made for the flushing of sewers and the watering of gardens. Last year the average daily consumption of water was about 640,000 gallons, and with the additional works now proposed, and careful storage, the proper quantity might, in favourable years, be obtained. But bad years have to be provided for as well as good ones, and even bad seasons. It is stated that in four months of 1874, and these the most important months of the year—namely, from July to October—the daily consumption fell to 300,000 gallons—that is, twelve gallons per head for a population of 25,000, or seven and a half gallons per head for a population of 40,000, the latter estimate being the more probable. Now it is calculated that the deep wells, the yield of which is pretty steady and the water of which is good, cannot, by any improvement, be made to yield more than about four hundred thousand gallons per day. The rest of the supply must be made up by the impounding and storage of land drainage and superficial springs. It has already been shown that much of the present water supply is obtained in this way. It is now proposed to construct similar works, with the addition of filter-beds, in the Fairlight and Warren valleys. But these new supplies will hardly do more than balance the losses which must be submitted to elsewhere. The Old Roar and Clive reservoirs, if not those of Ecclesbourne and Shornden, must shortly be relinquished. "They are getting too dangerous," says the *Lancet*, adding that its judgment on this point is confirmed by Mr. Topley in his Report. It is also observed that water of this kind is ill adapted for storage, and during a long drought becomes very bad, and sometimes even dangerous.

Large towns everywhere must recognize natural conditions, and, as Hastings depends greatly for its prosperity on London, it need not complain of encountering a share of the same troubles. It is now living through the same experience as London did fifty years ago, with this difference, that it is a much smaller place, and has no considerable river. When alarm first began to be felt as to the quality of Thames water, various plans were proposed for

obtaining water from the upper part of the Thames, or from minor streams such as the Colne and Wandle, and also by boring wells. The popular belief that you could get as much water as you wanted by boring deep enough was soon disproved by experience. The object of such borings was to obtain water from the sandy strata which lie beneath the London clay, such water being originally collected at the points where the pervious strata rise to the surface at the boundaries of the great basin in which the metropolis is situated. But it was long ago concluded that water did not exist in these strata in sufficient abundance to afford a constant supply to the metropolis, or even to a considerable district by raising it from below the clay. Here and there Artesian wells, as they are called, succeeded, but sometimes a second well was found to tap a first, and it was soon discovered that, although these wells had been used immemorially in France and Italy, they were no adequate resource for a population accumulating so rapidly as that of London. Meanwhile, the Thames and its tributaries became more and more polluted by the growing population on their banks, and water was taken for consumption at higher points, and finally the use of the same stream as conduit and sewer was seen to be impossible. All this seems to be now happening over again on a small scale at Hastings, and its Town Council, after trying every means to utilize the water of its own area, will be forced to go beyond it. The very completeness of their arrangements, if they stop short of this final step, aggravates the existing difficulty. St. Leonards is now complaining that its peculiar water is to be mixed with that of Hastings, and for good or evil the two places have been made one. With many advantages they suffer this drawback, that they cannot easily obtain as much good water as they ought to have. Nature has not provided for a large town upon this site where modern society requires one; and the want of nature must be supplemented by art, and the question is how this may best be done. There are usually two plans and only two available, wells and surface reservoirs, and neither can be applied without danger of collision with existing interests. Even the supply from the Lower Greensand, near Glynde, although Mr. Topley believes that it would be very large, would not be unlimited, and we know not what drought elsewhere might be caused by sending this water to Hastings. The story of the two brewers who sank artesian wells in London is typical of the whole subject of water supply in England. It has become evident that economy on a large scale must be practised by preserving our rivers from pollution and by constructing storage reservoirs in suitable localities.

It is rather surprising that the vigorous agitation in favour of temperance or total abstinence does not direct itself, among other objects, to this of improving the general water supply of the country. Perhaps Hastings has too much beer, and certainly it has, or will have, too little water. No amount of scientific or moral lecturing will dissuade people from using alcohol as a supposed corrective of impure water, and beyond all question, much of the water now supplied to English towns is impure, and there are many places besides Hastings where the impetus necessary to real improvement must be supplied from without. An adequate plan for the future wants of Hastings could hardly be adopted without Parliamentary sanction, which is costly. It is not desirable that this Report in the *Lancet* should be used to excite immediate anxiety. But it will convey a useful warning against narrow measures and shortsighted economy. The general result of the inquiry is well summed up in a leading article in the same paper, which, after describing the natural features and circumstances of Hastings, concludes that "its water supply must be small or bad," that is, small having regard to the probable increase of the place, and the character which, as a health-resort, it would desire to maintain. Owners of property have derived benefit from the attraction of visitors to the place, and must accept the corresponding burden. It is to be feared that St. Leonards must surrender its valued well at Hollington, and if it could prevent Hastings from taking this water directly, the same result might perhaps be attained by subterraneous tapping. The inevitable tendency of the age is to deal with these questions, not by piecemeal, but largely. A time may perhaps come when St. Leonards will find itself associated for water supply, not only with Hastings, but with other towns on the South coast, drawing water supply from the lower strata of the chalk hills. The local authorities should remember that, although danger may be distant, panic may be near. Some accidental and limited pollution may be laid hold of by newspapers in want of a sensation, and a cry may be got up which ten years of unblemished sanitary administration will not allay. The general ignorance of the public on these matters makes it an easy victim to interested or hostile agitation, and it cannot be doubted that, in an exceptionally dry summer, the water supply of Hastings would offer a tempting subject to any writer possessed of a little scientific knowledge and a striking style. It may be hoped, therefore, that the warning of the *Lancet* will not be neglected by the Town Council. They have time and they can find means to effect a complete reform.

THE ROYAL ACADEMY.

III.

THE picture of the season, as we have already said, is Mr. Leighton's "Daphnephoria" (241), "a triumphal procession held every ninth year at Thebes, in honour of Apollo." "Its name was derived from the laurel branches carried by those who took part in the festival—the laurel, or more properly the bay, being sacred to Apollo." The procession, though flowing onwards in an unbroken stream, may be divided into four or more constituent parts. It is led by a priest, with the commanding air of a god, impelled by passionate ardour. The figure is moulded after the noblest Greek type; but the rigidity of sculpture has been fitly made to yield to the mobility and suavity suited to a picture. The drapery, too, loses the rigidity of marble, and becomes decorative in ornament, apparently consisting in tasteful adaptations from Greek vases. Next follow three lads, bearing a trophy of golden armour. Thirdly comes a lovely choir of Theban maidens, crowned with laurel and bearing laurel branches, who sing a hymn to Apollo. The procession closes with boys carrying votive tripods. Nor must we forget the surroundings of nature. The climate of Greece, which has always been accounted an inspiring element in Greek art, is here at its prime; sunlight falls in dazzling rays upon the city of Thebes, seen in the middle distance; and the stalwart forms of stone-pines—too gigantic, because they dwarf the figures—together with the luxuriant growth of olivè, bay, and oleander, tell of the fertilizing power of the sun, whose chariot Apollo guided. To this general description may be added a few words of criticism. It is not irrelevant to remark that this procession in honour of Apollo, the art-inspirer, has none of the riot common to the numerous processions and dances in celebration of Bacchus, the wine-inspired. Neither Apollo nor the Muses are present, but their spell is felt. The lines and the tones are mellifluous even to a fault. The joyousness of the scene, so different from the ponderosity of a Roman triumph, is true to the Greek people and their art. The gaiety of the Greeks led them into games and festivities. The artist's treatment of the nude conforms in a good degree to the conditions laid down by Winckelmann; it is guarded by knowledge and guided by beauty. Beauty here, as with the Greeks, moves to worship; it is a beauty calm and serene, unshadowed by a cloud, unmarred by violent action. The ancients regarded slow movements as indicative of great minds. In this procession the movement comes out of repose, and to repose it will return. It may be fairly objected that the colour seems to derive its tertiary concords from Germany, with a possible infusion from M. Hamon and other vaporists in France. The generic style also, like the colour, is composite; assuredly it cannot be ranked as strictly Greek; perhaps it may be best designated as Romantic-Classic. If we mistake not, posterity will assign to Mr. Leighton the honour—shared by artists of all time whose names are recorded in history—of having formed an individual style which, notwithstanding certain infirmities, is essentially his own.

William Schlegel truly says, "When we ground our judgment of modern painters merely on their greater or less resemblance to the ancients, we must necessarily be unjust towards them, as Winckelmann undoubtedly has been in the case of Raffaelle." This passage strikes at the difficulties encountered in the three great classic pictures of the year. We should say that Mr. Leighton's "Daphnephoria" is the most romantic and modern; that Mr. Armitage's "Phryne" is in its modelling the most plastic; and that Mr. Poynter's "Atalanta" is the most of a go-between, two-thirds of the composition being pictorial, and one-third sculpturesque. The better opinion seems to be that in these days the antique needs adaptation to changed conditions, and it is always interesting to observe the varying points of view taken by different painters and sculptors. Mr. Albert Moore is a leader in the school which permits no compromise. "Beads" (258) is the all but meaningless title given to two sleeping figures which in their contour and diaphanous drapery might pass for literal transcripts from antique marbles. Mr. Eyre Crowe, the cynic among the newly-elected Associates, paints a "Rehearsal" (10) of *The Birds* of Aristophanes. The picture, which is of course comic, though in a pseudo-classic sense, might throw tragedy into relief; according to a Socratic saying, "All opposites can be fully understood only by and through each other; consequently we can only know what is serious by knowing also what is laughable and ludicrous." Euelpides and Pisthetairus are depicted by Mr. Crowe as having "fled from Athens and its vices" in order to enjoy a more tranquil region—a community of birds. The artist introduces the "Chorus of Birds," who exclaim, "Ah, ah! we are betrayed." "The scene chosen represents the rebuff of the intruders on being at first mistaken for bird-catchers." The handling of the picture is trenchant in touch, as befits pictorial sarcasm. We may also commend, for sound workmanship as well as for realism in the accessories, "After the Dance" (91), by Mr. Waterhouse. But the intrusion of a pretty girl, quite after the modern manner, into the midst of the antique world shows how hard it is to preserve the unities. Grand as a reading of the character is Mr. Alma-Tadema's "Cleopatra" (1282); proud as an empress, voluptuous as a mistress.

The vocal art of poetry translates kindly into the silent art of painting; speech is, in truth, suggested by the expression of the face, the action of the hands, and indeed by the attitude and movement of the whole body. This, the natural, and for the most part unconscious, language of the human framework, it is the business of the artist to render emphatically and clearly. Mr. Herbert has in good measure succeeded in this endeavour in his carefully studied and symmetric composition, "King Lear Disinheriting Cordelia" (189). Lear, enthroned in the midst, gives vent to a towering rage as he vociferates to poor Cordelia, "Here I disclaim all my paternal care." The three daughters are ranged around, and we must say that they are so little like to the creations of Shakspeare that they appear just as if they had escaped from a convent. Much more true to nature

and to the text of the poet is the well-known picture by Mr. Madox Brown. We have to do with a national tragedy; the scene is laid in Britain, the characters are British, and yet these three daughters as depicted by Mr. Herbert are aliens. The architectural surroundings are alien also. The baldacchino-like portico which enshrines, as it were, the majesty of the King, is in its architecture foreign to our island. This last objection, which we do not press strongly, may yet indicate in how completely a non-natural sense Mr. Herbert has interpreted our national poet. Nevertheless "King Lear Disinheriting Cordelia" cannot be forgotten whenever the history of English art in the nineteenth century comes to be written. Almost the only other illustration of Shakspeare worthy of notice is "The Meeting of Oberon and Titania" (175), by Mr. Poole. The technique is not so strong as might have been expected from what the artist has done in former years, yet the imaginative faculty is still conspicuous. The scene is laid in a wood near Athens, and the painter has taken the liberty of adding a lake glistening under the silver moon with blue ghost-like hills rising against the sky. Upon such a poetic landscape Shakspeare makes to "enter Oberon, on the one side, with his train, and Titania, on the other, with hers." Oberon's first words are "Ill met by moonlight, proud Titania." The artist introduces us to "moonlight revels" of wild weird devilry; strange umbrageous foliage offers a retreat wherein elves might nestle in the night, and elements of air and earth are present which haunt a summer's dream. The conception is not carried out to completeness, yet the artist succeeds in conveying the spectator into a land of visions possessed by spirits of the night. The present Exhibition has fewer pictures from Shakspeare than usual.

Every Exhibition contains a multitude of pictures which almost defy classification. Amongst such miscellanies the following may be thrown together, inasmuch as the artists severally appear to have striven to redeem their subjects from commonplace. In this endeavour Mr. Elmore has not failed in "A Morning Reverie" (50); the theme is a highborn lady, with sorrows laden, in maiden meditation fancy free. The study of lines, both in the pose of the figure and in the disposition of the draperies, is singularly responsive to the sense of beauty. The same room affords space to a repulsive, though well-painted, picture, "The Princess" (80), by Mr. Dollman, inspired by Mr. Tennyson's "Medley." A scimitar lies ready for use on the table, and "two tame leopards couch" on the ground; such would appear to be the threats held out against dissentients from the rights of women. A fanciful and zephyr-like figure, "A Breezy Morning" (528), by Mr. T. R. Spence, though not disagreeable, defies even the most elementary rules as to the composition of lines. Mr. Stokes, taking as his text "Coward Conscience, how dost thou afflict me" (596), falls into spasmodic sentimentality. Mr. Dallarn appears as one of the last survivors of the defunct brotherhood of Pre-Raffaellite painters in "The Forsaken" (419); what a compound of agony and ugliness! Mr. Strudwick would appear to be a disciple in the school of Mr. Stanhope—a painter whom we regret not to meet this year, because, though we often dissent from his art, he has a weight of thought with which it is instructive to come in contact. We are sorry not to be able to say much in praise of Mr. Strudwick's "Songs without Words" (577), because the picture is not only without words, but without meaning. Here, again, we have to contend against a non-natural art; the figure is on a scale at least double that of the landscape; the lady reclines disconsolate on the chilly ground, reckless of rheumatism. Were not the provocation unusually great, we should shrink from a hint at the one step which divides the sublime from the ridiculous. Mr. Dobson, as usual, is refined and not quite weak in a figure called "The Offering" (227). One or two spurious religious pictures are scattered about, we will not say as good seed, but as waifs and strays. Mr. Dickson is divided between divers winds of doctrine in "Elijah confronting Ahab and Jezebel in Naboth's Vineyard" (915); the style is neither wholly classic, Bedouin, nor sacred, but a mixture of the three. One sign of a great artist is unity of motive, while the mark of a man who has nothing worth saying is often a confusion of tongues. As a surprise, but scarcely as a pleasure, we encounter Professor Carl Müller, whose spiritual but feeble effusions in the way of "Christian Art" we have known in Dusseldorf, Remagen, and elsewhere. "The Virgin and Child in front of a Grotto" (355), and "The Virgin and Infant Christ with St. Joseph and an Angel Playing" (1252), are wholly wanting, not only in art mastery, but in the ardour and inspiration of religion. Fortunately the victory of the Germans in arms has been attended by the revival of a more robust and vigorous art.

SIGNOR ROSSI.

SIGNOR ROSSI, in a curiously illogical letter lately addressed to the daily papers, protested against the criticism which has implied that he is incapable of understanding Shakspeare's characters, and gave an explanation of his Hamlet which must have surprised most people who saw him play the part. In speaking of the actor's appearance as Hamlet, we observed that, as far as one could judge of an actor's conception of a character from what he did with it on the stage, Signor Rossi seemed to have settled very definitely the question whether Hamlet was mad or not. The impression naturally conveyed by the actor's extravagant, at times uncouth, behaviour was that he intended to represent a lunatic. From Signor Rossi's letter, however, we learnt with some surprise that this was distinctly not his intention, and that he imagines Hamlet never to have been completely mad. When an actor's meaning in an important part is so generally misapprehended as was Signor Rossi's in Hamlet, it is likely that the fault lies with him as much as with his audience. There are plenty of instances of actors whose means have failed them for transferring their impressions to their hearers, and who, with minds full of passion, have produced a cold effect upon their audiences; but it is somewhat astonishing to find so practised an actor as Signor Rossi giving an impression the opposite of what he intends through the whole of a long part. In the same letter which informed us that, though his Hamlet might appear mad, he was not really so, and that it was not his but our understanding that was at fault, Signor Rossi gave his views on King Lear, which it seems his hearers had been equal to comprehending through the medium of his performance on the stage. There is a novelty in Signor Rossi's method of first acting a part and then explaining what he meant by his acting, but it would perhaps be better if the explanation came before the performance. It would save a lazy playgoer some trouble if with his play-bill there were handed to him a critical account, from the actor's point of view, of the performance he was going to witness.

Signor Rossi's notion about King Lear is that he should be represented as what the Scotch call "doited" at the beginning of the play; and no doubt this view is capable of being sustained. The division of his kingdom between Goneril and Regan was certainly not the act of a wise man; and the dialogue between Regan and Goneril at the end of the first scene may be brought forward to show that their father's mind was in a shaky state. His age is "full of changes"; his poor judgment in casting off his favourite daughter may be the "infirmity of his age; yet he hath ever but slenderly known himself." "The best and soundest of his time hath been but rash"; from which speeches one may no doubt construct a theory that Lear was not only doting in his old age, but had been little better than half-witted even in the heyday of his youth. The commentators who delight in grubbing up meanings out of Shakspeare's text which no one else has ever supposed to exist there might do well to turn their attention to this passage. By sufficiently careful consideration of it they might arrive at the conclusion that Lear was a kind of vicious imbecile, whose slandered daughters were doing the best possible thing for him in refusing to encourage his extravagance and folly. Signor Rossi, from this and other passages, such as Lear's impatience for his dinner, has decided that the King's faculties should be shown from the first to be in a crazy condition. The actor exhibited with finished care in gesture, voice, and look the various symptoms of failing memory and reason with which he illustrates the change in Lear from a senile confusion and incompetence to more extravagant madness; and he may be given credit for carrying out his idea of the character at the expense of stage effect and interest. One can imagine how the representation of King Lear passing from a state of honour and grandeur to one of degradation, through which his grandeur should be yet perceived, would, in the hands of an actor with the necessary gifts and training, appeal to the hearts of an audience. But it is difficult to feel any deep interest in the fortunes of an old man who, when he has handed over his crown, has little token of kingliness left about him; and when King Lear's character is represented as answering pretty nearly to his daughters' description, it is possible to understand their conduct towards him. They might have expressed themselves more becomingly, but it was not strange that they should object to having a hundred knights, subject to no authority but that of a petulant dotard, quartered upon them. Signor Rossi would seem to have forgotten that Goneril and Regan are not the only people from whom one can learn something of Lear's attributes. Kent, in an assumed character it is true, says that he reads authority in the King's countenance, and that is precisely what one cannot read in Signor Rossi's. Kent's word may be taken to be worth as much at least as Goneril's and Regan's; and it is possible that, when they spoke to each other of their father's infirmities, both knew that their speeches were the expression rather of what they found it convenient to assume than of what they believed.

Signor Rossi, starting by presenting for King Lear a figure that fails to arouse any absorbing interest or sympathy, did not—and in this he was perhaps consistent—surprise his hearers' feelings with the more passionate parts of the play. Everything that he did was careful, but hardly once could one think of Lear's sufferings, and, so thinking, forget the presence of a clever actor giving a somewhat mean rendering of a great part. The skill with which the player indicated the gradual increase of disturbance in the King's brain was remarkable; but the burst of passion which one hoped for at the end of the first and second acts was wanting. After having learnt how different Signor Rossi's idea of Hamlet is from the idea which he conveyed to other people, we could easily believe that he had within him in Lear the feeling of his part, as much as the young actor in George Sand's *Pierre qui Roule* has. But, like that actor, Signor Rossi appeared cold when he should have seemed consumed with passion. By far his most successful scene was that with Cordelia in the French camp; here the tenderness which found expression once in the representation of Hamlet was more fully developed; here the actor seemed able to transmit his emotion to the spectators; and it is to be regretted that the whole of his performance was not up to the level of this scene.

As Macbeth, Signor Rossi was more successful than as Lear; but

In this character also there was a want of the quality which rouses an audience to forgetfulness of the stage and the actor, and makes it believe in the presence of the man whom the actor has to personate. The first scenes gave a kind of promise which was not fulfilled by what followed. The actor's air and bearing were, as they should be, those of a man accustomed to mix in strife and turn the current of battle. His byplay was intelligent and cleverly executed; it seemed altogether that Signor Rossi might here have found a part in which he could explain to an English audience the great reputation which he has in Italy. But when he had to grapple with the soliloquy at the end of the scene before the murder, the faults which had been observed in his other parts, of heaviness in diction and inability to carry his audience with him, appeared again. There was more merit in the following dialogue with Lady Macbeth, where the speech "Bring forth men-children only" was especially delivered with good effect. The dagger speech in the succeeding scene suffered from the dragging out of the action with which it was begun; the following of the phantom dagger with eye and hand was not so impressive that one liked to look on it for very long; and the speech itself was monotonous. This defect Signor Rossi avoided in the passage beginning "Methought I heard a voice cry sleep no more," by pitching his voice in a higher key for the imaginary utterance, a device which was not imposing. The actor's tone might well be varied here, but it should take a deeper rather than a keener quality; it should be charged with the echo of a never-ending horror, and ring with prophecies of remorse.

In the banquet scene Signor Rossi took a view of Macbeth's dealing with Banquo's ghost which is often taken by German actors, and for which there is no doubt something to be said. It is not terror so much as rage at finding that when the brains are out the man is not dead, by which he is overcome. The courage which is naturally startled by the first appearance of the spectre asserts itself afterwards to such an extent that Macbeth rushes at it with naked sword as it vanishes for the last time. This pursuit of the ghost was less dexterous in execution than most of Signor Rossi's stage business, and the scene ran some risk of becoming ridiculous by the conduct of the ghost itself, which walked in and out like a neglected guest who on his first appearance was delighted to find an empty place, which he could not but leave on seeing that it belonged to some one else who was irritated at his occupying it; and who on his second entrance wandered aimlessly in search of a seat, and, finding none, went away as humbly and quietly as he could. There was some invention in Signor Rossi's start of terror and flinging away of his crown and sword at the end of the scene; but it did not seem to fit in well with what had gone before. It was difficult to judge of his acting in the scene of the Pit of Acheron, because the stage was needlessly dark and the actor stood for a great part of the scene far at its back. The success of this scene also was on the first night of the play endangered by the erratic behaviour of the show of kings, for which excuse might be found in the very small space in which they were allowed to show themselves. Some of Signor Rossi's best effects were found in the concluding scenes of the play. The action with which he dismissed the messenger who brings news of the advance of the English force was impressive; and the player's bearing was good throughout. But neither in *Macbeth*, nor in his previous performances, has Signor Rossi proved that he possesses any greater qualities than intelligence, care, and experience. In the Lady Macbeth of Signora Glech Pareti, who played Regan in *King Lear* remarkably well, there was much to admire. The part was invested with the tenderness for an individual, Macbeth, which is sometimes found allied with cruelty towards the rest of mankind; and there was a supple courtesy displayed towards Duncan on his arrival and towards the guests in the banquet scene. The intensity of the invocation in her first scene, and the smile of fierce triumph at its end, were admirable.

REVIEWS.

TAINE'S ORIGINES DE LA FRANCE CONTEMPORAINE.*

THAT history is capable of being treated as a science is a well-known theory of M. Taine. Given one "situation," the scientific historian of the future will be able to say that such or such another "situation" must inevitably succeed to it; and by means of this power of foreknowledge man may even hope to acquire a certain mastery over his destiny. He may so modify the circumstances under his immediate control as to alter the whole course of events for centuries to come; his eyes being opened to see the line of rail on which the train of events is running, he may be able at the critical moment to turn the points and send it off in another direction. This may seem to the ordinary unphilosophical mind rather chimerical, but at any rate the theory has its uses. It enjoins study of the past, even to its minutest details, as the only means of acquiring wisdom for the future. It puts an end to the devising of ideal states of society and forms of governments so dear to the French mind. A constitution, M. Taine believes, must be discovered, not invented; and, when found, must be accepted without regard to personal preferences; "d'avance la nature et l'histoire ont choisi pour nous; c'est à nous de nous accommoder à elles, car il est sûr qu'elles ne s'accommoderont pas à nous." M. Taine describes with some humour his early difficulties as an elector before the true theory of constitution-making, or rather constitution-finding, had dawned upon him:—

> En 1849, ayant vingt-et-un ans, j'étais électeur et fort embarrassé; car j'avais à nommer quinze ou vingt députés, et de plus, selon l'usage français, je devais non-seulement choisir des hommes, mais opter entre des théories. On me proposait d'être royaliste ou républicain, démocrate ou conservateur, socialiste ou bonapartiste: je n'étais rien de tout cela, ni même rien du tout, et parfois j'enviais tant de gens convaincus qui avaient le bonheur d'être quelque chose. Après avoir écouté les diverses doctrines, je reconnus qu'il y avait sans doute une lacune dans mon esprit. Des motifs valables pour d'autres ne l'étaient pas pour moi; je ne pouvais comprendre qu'en politique on pût se décider d'après ses préférences. Mes gens affirmatifs construisaient une constitution comme une maison, d'après le plan le plus beau, le plus neuf ou le plus simple, et il y en avait plusieurs à l'étude, hôtel de marquis, maison de bourgeois, logement d'ouvriers, caserne de militaires, phalanstère de communistes, et même campement de sauvages. Chacun disait de son modèle: "Voilà la vraie demeure de l'homme, la seule qu'un homme de sens puisse habiter." A mon sens, l'argument était faible: des goûts personnels ne me semblaient pas des autorités.

If ever his countrymen succeed in finding the constitution which suits them, it will, according to M. Taine's view, only be by studying themselves. Their usual method of procedure must be reversed, and they must understand their nation before they can make a constitution for it. But to know what a nation now is, one must begin by knowing its origin and its growth. The "régime nouveau" is the offspring of the Revolution, the Revolution is the offspring of the "ancien régime"; and, with the view of affording an answer to the question "Qu'est-ce que la France contemporaine?" M. Taine has undertaken to describe each of these phases of national life. It is the first, the "ancien régime," which forms the subject of the present volume. M. Taine assures us that he takes no side, and has no aim but truth; that he is writing history "en naturaliste," and has considered his subject only as if he were looking on at the metamorphosis of an insect. Whether such a scientific state of mind is really attainable may be doubted. The naturalist who watches the insect emerging from its chrysalis state never was an insect himself, and has no personal preference for one stage of insect life over another. But the historian, himself the result of the metamorphosis he undertakes to describe, can hardly be so indifferent. How is the Legitimist, who wishes he had remained a caterpillar and shudders at the memory of the agonies he passed through in the process of metamorphosis, to look at the phenomena under consideration with the same eyes as the Liberal, who feels that he has passed from a lower state of development to a higher, and that, whereas under the "ancien régime" he was a despised and down-trodden grub, he is now a beautiful creature, spreading his wings in the free air of heaven? However, M. Taine has at any rate striven to be fair; and his account of the "ancien régime" is full of interest, considered simply as the opinion of a clever and brilliant writer. It is crammed with extracts from writers of the time—perhaps over-crammed for a book of such pretensions, in which one expects the author to weave the result of his studies into his own narrative. M. Taine pours his materials out before his readers in a stream of quotations, mixed with lively incisive comments, and his work is more of a critical review than of a history or a philosophical study. As an easy and agreeable road to an extensive acquaintance with the manners and literature of the eighteenth century, the work will be a godsend to that class of ready talkers who affect universal knowledge. Who does not know the man who spends the morning in secretly getting up the last new book, and astonishes a dinner-table in the evening by a display of his learning? After perusing M. Taine such a one will be able to discourse with charming familiarity of "the classical school" and the "Encyclopædists," and will be a mine of neat French sayings and good stories. For a bon-mot, a piquant anecdote of private life, a fashion in dress, any and every incident may go towards assisting the scientific historian to form his conception of the period. Doubtless when the history of our own age comes to be written on scientific principles, the narrator will not forget to note how the triumph of the German armies over the French was foreshadowed when Parisian women unconsciously did homage to their future conquerors by assuming the yellow tresses of the Teuton. Seriously, a good deal of the new historical philosophy strikes us as being much on a level with this suggestion. It is easy to see how everything led up to a certain result, when that result has come to pass. M. Taine does not attempt to be severely accurate in the use of political terms. Thus he follows the common practice in speaking of the French *noblesse* as an aristocracy, when in the accurate sense of the word it had long ceased to be such. An aristocracy governs, and, after the establishment of the monarchical power, even the highest grade of the French noblesse, albeit pampered and indulged to the utmost, did not govern. So, in defending the rural *seigneurs* against the charge of tyranny, he says:—"Leur caractère n'a rien de féodal; ce sont des gens 'sensibles,' doux, très polis, assez lettrés, amateurs de phrases générales." Here we see that the writer is not using the adjective "féodal" with any strict political meaning, but simply as a synonym for brutal and tyrannical, just as some people employ 'democratic' in similar dyslogistic senses. The best informed Frenchmen are apt to get astray when they touch English matters, and M. Taine, when he speaks of "Le baronnet ou squire qui est justice sur son domaine," evidently conceives that the authority of a justice of the peace is connected with and limited to his own land. To

* *Les Origines de la France contemporaine.* Par H. Taine. Tome I. L'ancien Régime. Paris: Librairie Hachette et Cie. 1876.

believe in the mythical courtesies of Fontenoy, to which M. Taine alludes, seemingly with undoubting faith, is perhaps a point of honour with Frenchmen, however scientific. Otherwise we would refer him to Mr. Carlyle for an unvarnished account of that famous incident, where Lord Charles Hay's polite invitation to the French Guard to "fire first" resolves itself into a taunting expression of hope "that they would stand till we came quite up to them," and the equally polite answer of D'Auteroche does not appear at all.

M. Taine, with his minute researches into manuscript documents—the correspondence of intendants, farmers-general, magistrates, military commandants, prefects, and so forth, the *procès verbaux* and *cahiers* of the States-General, the reports on the *maison du roi*, and what not—stands in complete opposition to the unhistorical, miscalled philosophical spirit of the eighteenth century:—

Avec de telles ressources [he is speaking of his manuscript authorities], on devient presque le contemporain des hommes dont on fait l'histoire, et plus d'une fois, aux Archives, en suivant sur le papier jauni leurs vieilles écritures, j'étais tenté de leur parler tout haut.

It was just this sort of study which the leading minds of the eighteenth century feared or scorned:—

D'abord on ignorait l'histoire; l'érudition rebutait parce qu'elle est ennuyeuse et lourde; on dédaignait les doctes compilations, les grands recueils de textes, le lent travail de la critique; Voltaire raillait les Bénédictins. . . . La science était tenue d'être épigrammatique ou oratoire; le détail technique ou cru aurait déplu à un public de gens du monde, le beau style omettait ou faussait les points faits significatifs qui donnent aux caractères anciens leur tour propre et leur relief original.

The classical school, whether in fact or in fiction, dealt in abstractions and generalizations, suppressing the individual and the personal. It had no historic sentiment to be shocked when Greeks, Romans, Turks, mediæval knights, were brought on the stage, all talking exactly alike, all uttering the same cold and polished declamations:—"On ne voit dans l'homme qu'une raison raisonnante, la même en tout temps, la même en tout lieu." M. Taine shines in criticism, and his analysis of the classical school and the revolutionary philosophy is one of the most elaborate and best executed parts of his book. It is curious to find him attributing as malign an influence to the eighteenth-century philosophy as the most bigoted old Tory that ever execrated the name of Tom Paine could do. If, to quote his illustration, we saw a man, of somewhat weak constitution indeed, but of healthy appearance and quiet habits, drink eagerly of some new liquor, and then fall to the ground in convulsions, we should conclude that poison was mingled in the draught. And poison, he tells us, was in the philosophy of the eighteenth century. In England, he admits, the revolutionary doctrines did little harm, and soon died out. In France they took root and flourished:—

C'est que la nouvelle semence est tombée sur le terrain qui lui convient, je veux dire dans la patrie de l'esprit classique. En ce pays de raison roi omnante, elle ne rencontre plus les rivales qui l'étouffaient de l'autre côté de la Manche, et tout de suite elle acquiert, non-seulement la force de sève, mais encore l'organe de propagation qui lui manquait.

This philosophy, with its discredit of tradition, its notions of recasting all human institutions according to the principles of pure reason, its application of mathematical methods to politics and morals, its Rights of Man and its *Contrat social*, was fostered by the privileged classes who had everything to lose by it. Like the foolish woman of Scripture, they plucked their house down with their own hands. The edifice was so rotten that probably nothing could have propped it up for long, but the crash need not have been so sudden and so disastrous if the inhabitants had devoted their energies to restoration instead of demolition. M. Taine does full justice to the *privilégiés*—King, noblesse, and clergy—whose virtues as well as whose vices contributed to their ruin. They had once been living and creative forces, as he shows in the picturesque, but slight and rather superficial, notice he devotes to the growth of the Church, of feudalism, and of the monarchy; and even when, politically considered, the nobles had become mere parasites draining the life and strength of the nation, they were not in themselves the purely malignant beings they were made out to be in revolutionary declamations. However haughty the provincial nobility might be towards the *bourgeoisie*, they usually had kindly feelings for the peasants among whom they lived. More especially was this the case after they had become imbued with the new philanthropic spirit. As to the good done by many of the religious houses, M. Taine cites the reclamations in their favour sent up from the rural districts when their suppression was under consideration. The real crime of the seigneur was that he was a perpetual creditor, ever taking toll of the peasant's scanty earnings, and yet doing nothing to justify his existence. The jealousy of the central Government had left him no local authority or influence; twenty gentlemen could not meet and deliberate together without a special permission from the King. The greed of the Court noblesse, privileged among the privileged, monopolized all the good things the State had to give; the higher grades of the army were reserved for courtiers, and no outlet was left for the ambition of the poorer gentry. The Marquis of Ferrières describes the greater part of the lower nobility in 1789 as "si las de la cour et des ministres qu'ils sont presque des démocrates." Still stronger was the feeling of the lower clergy, who were condemned for the most part to abject poverty without hope of rising. Alike in the ecclesiastical and the noble orders, the men in the ranks were jealous of their chiefs:—

On s'en apercevra tout à l'heure à l'épreuve. Si les deux premiers ordres sont contraints de se réunir aux communes, c'est qu'au moment critique les curés font défection. Si l'institution d'une chambre haute est repoussée, c'est que la plèbe des gentilshommes ne veut pas souffrir aux grandes familles une prérogative dont elles ont abusé.

M. Taine's description of the provincial nobility and the lower clergy will be the more interesting to ordinary English readers because the life of those classes has not been made so familiar to them as that of the higher nobility of the Court. A hundred writers have acquainted us with the charming, useless, and wicked society of the "ancien régime," upon whose characteristic traits M. Taine dwells long and almost lovingly. The one thing to which the "ancien régime" gave its mind—social life—it understood to perfection. "Qui n'a pas vécu avant 1789," is the well-known remark of Talleyrand, "ne connaît pas la douceur de vivre." It was, in Mr. Carlyle's phrase, "a Universe all of Opera," and the opera was very well put on the stage—"Il faut dire que le décor est réussi," says M. Taine. Society flung about its money with theatrical liberality; it would have been ill-bred to stop for a moment to count the cost. Sooner than not spend, the *grand seigneur* would have thrown his money out of the window, as Marshal Richelieu actually did throw a purse which he had given to his grandson, and which the boy had, with misplaced economy, brought back to him unspent. The man of this type never agitated his well-bred calm by looking into the state of his affairs. "Monsieur l'archevêque," said Louis XVI. to M. de Dillon, "on prétend que vous avez des dettes, et même beaucoup." "Sire," answered the Archbishop, "je m'en informerai à mon intendant, et j'aurai l'honneur d'en rendre compte à Votre Majesté." They ruined themselves, in George Sand's phrase, "comme de beaux joueurs qui perdent sans montrer d'inquiétude et de dépit." Under the same imperious code of manners every passion was restrained or concealed; and so long as Desdemona and Cassio preserved the *convenances*, Othello, too well trained to make a scandal, only smiled cynically, and extended towards them the same indulgence which he claimed for himself. It is necessary to understand the conventional manners, the repression of individual sentiment and natural instinct, the studied indifference and heartlessness of this society, in order to comprehend how, when the inevitable reaction came, it took up eagerly the affectation of extreme "sensibility," piqued itself on being natural, cultivated the domestic affections, and, knowing in truth nothing beyond the four walls of a salon or the palings of a park, began to "babble of green fields." It learned the new philosophy of liberty, equality, and fraternity, and even began to put its doctrines into practice. "Jamais l'aristocratie n'a été si digne du pouvoir qu'au moment où elle allait le perdre." No previous Government had been so mild and beneficial, no prince so humane and charitable as Louis XVI. Society was dreaming of a golden age to come, and woke only to find itself in the death-throes of the Revolution. That the French noblesse made such a poor fight for their life was, if we believe M. Taine, because by long education they had become too elegant and amiable, too much in subjection to the proprieties, to protect themselves with their own hands. "Jamais on ne verra un gentilhomme arrêté chez lui casser la tête du Jacobin qui l'arrête. Ils se laisseront prendre, ils iront docilement en prison; faire de tapage serait une marque de mauvais goût, et, avant tout, il s'agit pour eux de rester ce qu'ils sont, gens de bonne compagnie." Peter Pindar has caricatured this sentiment in his *petit-maître* rebuking the felon howling in agony on the wheel:—

> "Sir," quoth the beau, "don't, don't be in a passion;
> Pray nought to say about your situation;
> But making such a hideous noise in France,
> Fellow, is contrary to *bienséance*.

We suspect, however, that something more than habitual deference to *bienséance* is needed to account for this predominance of passive over active courage in the French noblesse. Their submission to the power of the day—a weakness not peculiar to them, but even now more or less characteristic of all classes of Frenchmen—was in great measure the natural result of living under a despotic government. What would the blind instinct of hitting back when struck, with the lack of which M. Taine charges them, have availed a French noble against a *lettre de cachet* consigning him to the Bastille? He only bowed to omnipotent fate when personified by the Jacobin, as he had bowed to it when personified by the King. Another cause of the helplessness of those who should have been the defenders of order is pointed out by M. Taine. Their philosophy had been founded upon extravagantly high ideas of the intelligence and virtue inherent in humanity. They talked much about man, but they never took the trouble to study him, and never realized till it was too late that he was but a wild beast, imperfectly tamed at the best. When they had let the brute loose, and his carnivorous nature displayed itself, they still hoped to stroke and coax him into good behaviour. "Au plus fort de la Jacquerie, les sages du temps supposeront toujours qu'ils vivent en pleine églogue, et qu'avec un air de flûte ils vont ramener dans la bergerie la meute hurlante des colères bestiales et des appétits déchaînés." This delusion is not wholly unknown among political theorists in our own day, nor is the spectacle of men playing with doctrines to which, if carried into practice, they would themselves fall victims, peculiar to the eighteenth century.

STEPHEN'S HOURS IN A LIBRARY.*

MR. LESLIE STEPHEN'S second collection of *Hours in a Library*, which will be welcomed by all who read the first,

* *Hours in a Library.* Second Series. By Leslie Stephen. London: Smith, Elder, & Co. 1876.

opens with Sir Thomas Browne; and it would not be easy to find a more entertaining companion in a library than this now too generally forgotten humourist. Mr. Stephen begins his essay with a quotation from a suppressed passage of the *Religio Medici*, in which the author wrote, "Let me not injure the felicity of others if I say that I am the happiest man alive. I have that in me that can convert poverty into riches, adversity into prosperity, and I am more invulnerable than Achilles; fortune hath not one place to hit me." This assertion may perhaps be included among the many things in his writings which Sir Thomas says are to be "taken in a soft and flexible sense, and not to be called unto the rigid test of reason." And yet, as Mr. Stephen observes, the statement may not have been "merely tropical." With a mind that never wearied of accumulating all kinds of disconnected odds and ends of knowledge, which his imagination at once set to work to bind together by some quaint analogy, with a store of poetical feeling and a happy absence from his disposition of any gall or bitterness even on subjects which most men of his time approached as if to the manner born in the panoply of hatred, malice, and all uncharitableness, Sir Thomas Browne certainly seems to have had unusually good grounds for boasting of happiness. His longest and perhaps his best-known work, the *Inquiry into Vulgar Errors*, lets us, as Mr. Stephen says, into some secrets as to his taste and character:—

> Every corner is filled with a strange, incoherent medley, in which really valuable objects are placed side by side with what is simply grotesque and ludicrous. The modern man of science may find some objects of interest, but they are mixed inextricably with strange rubbish that once delighted the astrologer, the alchemist, or the dealer in apocryphal relics. And the possessor of this miscellaneous collection accompanies us with an unfailing flow of amusing gossip, at one moment pouring forth a torrent of out-of-the way learning; at another, making a really passable scientific remark, and then lapsing into an elaborate discussion of some inconceivable absurdity, affecting the air of a grave inquirer, and to all appearance fully believing in his own pretensions, and yet somehow indulging himself in a half-suppressed smile, which indicates that the humorous aspect of a question can never be far removed from his mind. Mere curiosity is not yet differentiated from scientific thirst for knowledge, and a quaint apologue is as good a reward for the inquirer as the discovery of a law of nature.

And in ages when the elephant had no joints, and storks refused to live except in free States, there was plenty of matter for Sir Thomas to collect. There is no extravagant judicial sternness in his inquiry. He, it is true, warns us "that we must not believe on authority that the sea is the sweat of the earth, that the serpent before the Fall went erect like man, or that the right eye of a hedgehog, boiled in oil and preserved in a brazen vessel, will enable us to see in the dark. Such stories, he moderately remarks, being 'neither consonant unto reason nor correspondent unto experiment,' are unto us 'no axioms.'" But he discusses with the utmost gravity the existence of the phœnix, who is mentioned, "not only by human authors,' but also by such "holy writers as Cyril, Epiphanius, and Ambrose." He is spoken of also in Job and in the Psalms. However, no less than eight reasons are alleged against his existence, of which the first is that no one has ever seen a phœnix, and the last that no animals really spring or could spring from their predecessors' ashes. Yet, having marshalled this formidable array of facts against the phœnix, Sir Thomas ends by saying, "How far to rely on this tradition we refer unto consideration," and adds a reflection on the improbability of Plutarch's statement "that the brain of a phœnix is a pleasant bit, but that it causeth the headache." In Sir Thomas Browne's next book, *The Garden of Cyrus*, starting from this garden, he "rambles through the universe, stumbling over quincunxes at every step." One of his quaintest sayings, which Coleridge has noted, is in his peroration where, among other reasons for going to bed, he says that "to keep our eyes open longer were but to act with our Antipodes."

One of his finest and most remarkable characteristics was his toleration. "He doubted whether the damned would not be ultimately released from torture." In passing through Roman Catholic countries he felt no offence at their modes of worship, but rather sympathy:—

> At the sight of a cross or crucifix I can dispense with my hat, but scarce with the thought and memory of my Saviour. . . . I could never hear the Ave Mary bell without an elevation; or think it a sufficient warrant, because they erred in one circumstance, for me to err in all—that is, in silence and dumb contempt. . . . At a solemn procession I have wept abundantly, while my consorts, blind with opposition and prejudice, have fallen into an excess of laughter and scorn.

In another passage, meditating upon hell, he says:—"Men speak too popularly who place it in those flaming mountains which, to grosser apprehensions, represent hell. The heart of men is the place the devils dwell in." This may be compared with the speech of Mephistopheles in Marlowe's *Faust*. Again, justifying his love of church music, he says:—"Even that vulgar and tavern music which makes one man merry, another mad, strikes in me a deep fit of devotion, and a profound contemplation of the first composer." That power, says Mr. Stephen, "of extracting deep devotion from vulgar tavern music is the great secret of Browne's eloquence." There is another peculiarity of Browne's to be found in the *Religio Medici*:—

> His worthy commentators have laboured to defend Sir Thomas from the charge of vanity. He expatiates upon his universal charity; upon his inability to regard even vice as a fitting object for satire; upon his warm affection to his friend, whom he already loves better than himself, and whom yet in a few months he will regard with a love which will make his present feelings seem indifference; upon his absolute want of avarice or any kind of meanness; and, which certainly seems a little odd in the midst of these self-laudations, upon his freedom from the "first-and father sin, not only of man but of the devil, pride." Good Dr. Watts was shocked at this "arrogant temerity," and Dr. Johnson appears rather to concur in the charge. And certainly, if we are to interpret his language in a matter-of-fact spirit, it must be admitted that a gentleman who openly claims for himself the virtues of charity, generosity, courage, and modesty, might be not unfairly accused of vanity. To no one, as we have already remarked, is such a matter-of-fact criticism less applicable. If a humorist was to be denied the right of saying with a serious face what he does not quite think, we should make strange work of some of the most charming books in the world. The Sir Thomas Browne of the "Religio Medici" is by no means to be identified with the everyday flesh-and-blood physician of Norwich. He is the ideal and glorified Sir Thomas, and represents rather what ought to have been than what was. We have all such doubles who visit us in our day-dreams, and sometimes cheat us into the belief that they are our real selves, but most of us luckily hide the very existence of such phantoms; for few of us, indeed, could make them agreeable to our neighbours.

There is much more of interest to be found in Mr. Leslie Stephen's hour with Sir Thomas Browne; but if we dwelt longer on it we should have no room left to speak of his other papers. As it is, we must pass over Jonathan Edwards, William Law, and Horace Walpole, to come to Dr. Johnson's writings, of which Mr. Stephen shows a nice appreciation. He has some valuable remarks on Johnson's style, which, he says, Johnson himself, "like all other men of strong idiosyncrasy, formed as he formed his legs":—

> The peculiarities of his limbs were in some degree the result of conscious efforts in walking, swimming, and "buffeting with his books." This development was doubtless more fully determined by the constitution which he brought into the world, and the circumstances under which he was brought up. And even that queer Johnsonese, which Macaulay supposes him to have adopted in accordance with a more definite literary theory, will probably appear to be the natural expression of certain innate tendencies, and of the mental atmosphere which he breathed from youth. To appreciate fairly the strangely cumbrous form of his written speech, we must penetrate more deeply than may at first sight seem necessary beneath the outer rind of this literary Behemoth.

Mr. Stephen is perfectly ready to admit that the *Rambler* is unreadable and full of commonplaces; but he points attention to what is too little recognized, that much of Johnson's poetry is "noble in expression, as well as lofty and tender in feeling." How many of the people who quote the lines about pointing a moral and adorning a tale know that they are quoting Johnson? Mr. Stephen's explanation of the cumbrous style seems to us true. Johnson was always

> instinctively feeling after the grander effects of the old school. Nature prompts him to the stately lines of Milton, whilst art orders him to deal out long and short syllables alternately, and to make them up in parcels of ten, and then tie the parcels together in pairs by the help of a rhyme.

Mr. Stephen goes on to cite other writers of the time on whom the struggle between impulse and prescribed form had an injurious effect, and compares them to "men who have been chilled by what Johnson would call the 'frigorifick' influence of the classicism of their fathers, and whose numbed limbs move stiffly and awkwardly in a first attempt to regain the old liberty." We are not disposed to agree with Mr. Stephen's suggestion that, but for the inimitable Boswell, Johnson would probably have sunk very deeply into oblivion; but there is no doubt much truth in the sentences with which he ends his paper:—

> He was a great force half wasted, so far as literature was concerned, because the fashionable costume of the day hampered the free exercise of his powers, and because the only creeds to which he could attach himself were in the phase of decline and inanition. A century earlier or later he might have succeeded in expressing himself through books as well as through his talk; but it is not given to us to choose the time of our birth, and some very awkward consequences follow.

We must again pass over two interesting articles on Crabbe and on Hazlitt, and come to the last, which is certainly not the least interesting of the series, on Mr. Disraeli's novels. Here, as in other places, Mr. Stephen has with keen insight and in penetrating language pointed out a fact which is too little recognized, and which will no doubt be denied by many. It is the fashion to decry Mr. Disraeli's novels as impossible and artificial. Their poetry is said to be tinsel, their imagination mere Oriental exuberance. We suspect that most of the people who speak of Mr. Disraeli's novels in these terms speak with that perfect impartiality of judgment which is secured by complete ignorance of the matter to be judged, and we are inclined to go with Mr. Leslie Stephen in wishing that Mr. Disraeli could have stuck to his novels instead of rising to be Prime Minister of England. This opinion, Mr. Stephen is careful to say, is independent of any judgment which may be passed upon Mr. Disraeli's political career. He is, however, equally careful to observe in passing that Mr. Disraeli's ironical method, which is highly valuable in a writer, may not be so desirable in a Minister of State. It is probably the general inability to apprehend or admire this method which has prevented Mr. Disraeli's novels from being even more popular than they are. There are many people who are extremely angry if they find themselves unable to decide accurately whether a writer is in jest or earnest; and, as Mr. Stephen observes, Mr. Disraeli is constantly passing imperceptibly from one phase to the other:—

> The texture of Mr. Disraeli's writings is so ingeniously shot with irony and serious sentiment that each tint may predominate by turns. It is impossible to suppose that the weaver of so cunning a web should never have intended the effects which he produces; but frequently, too, they must be the spontaneous and partly unconscious results of a peculiar intellectual temperament. Delight in blending the pathetic with the ludicrous is the characteristic of the true humorist. Mr. Disraeli is not exactly a humorist, but something for which the rough nomenclature of critics has not yet provided a distinctive name. His pathos is not sufficiently tender, nor his laughter quite genial enough. The quality which results is homologous

to, though not identical with, genuine humour: for the smile we must substitute a sneer, and the element which enters into combination with the satire is something more distantly allied to poetical unction than to glittering rhetoric. The Disraelian irony thus compounded is hitherto a unique product of intellectual chemistry.

This description is happily expressed, and is in the main true; and Mr. Stephen's criticism on the various novels is full of insight and skill; but he has not to our thinking fully appreciated the fine qualities of Mr. Disraeli's writing. In *Contarini Fleming* he says the author "takes a more ambitious flight, and with considerable success." This is somewhat faint praise to give to a book which deals with one of the most difficult themes that could be found—a theme that writer after writer has attempted to handle and failed in the attempt—and deals with it with a success which is certainly little short of complete. *Contarini Fleming* is in fact exactly what its author styled it, "a Psychological Romance"; it is the history of a poet, the story of his character's development. It is no small feat to rivet a reader's attention on the sayings and doings of a dreamy sensitive child who is misunderstood and little liked by all around him, to make him so tell his own story that it catches one's sympathy, without a touch of false or maudlin sentiment, to follow up the gradual growth in him of the poetic faculty and its struggle with political ambition, to make the hero speak constantly of himself, expose all his weaknesses, and yet never become wearisome or disagreeable, and to induce one to lay down the book with a sigh for the abeyance of Contarini's poetic powers. Here we think Mr. Stephen has misapprehended the author; he says that Contarini's architectural scheme, which is the last thing we hear of him, was not the form of ambition to be expected from a poet. Nor was it; but was it likely that Contarini's restless passionate nature would long be content with such a scheme? Mr. Disraeli proved his knowledge of human nature when he told of Contarini Fleming's plan for the spending of his remaining years; but he knew, we fancy, well enough, though he left his readers to find it out for themselves, that the plan would not last, and that, long before the great tower was built, its designer's poetical impulse would overmaster him again. But for this Mr. Stephen's estimate of Mr. Disraeli's writing appears to us admirable; and the whole of his volume may be read with pleasure and profit.

BOUZIQUE'S HISTORY OF CHRISTIANITY.*

IF the merits of M. Bouzique's work fail of obtaining their due appreciation, it will certainly not be for want of a trumpeter. In a brief preface his translator informs us, with a distinctness which leaves nothing to be desired, both what is the true character of the present History and how it differs from all which have gone before it. The author, after tracing Christianity to its primal sources, has "presented the orthodoxies of the successive periods," which, "instead of being the peculiar doctrines of the Gospel, are thus seen to be its corruptions and debasements." This view of the case is too obvious to admit of discussion. "The book is anything but controversial. It is as rigidly deductive as Euclid's Geometry." And whereas all former histories have been "facsimiles of partisan aims and interpretations, here at least is A HISTORY OF CHRISTIANITY ITSELF"—the capitals are not ours—and not only that, but moreover "this History of Christianity is in reality a history of civilization in its chief constituent elements." Nor can there be any doubt of the public recognition of the great treasure thus offered for our acceptance. "Men and women, the young as well as the old, will welcome the volumes," which should "be put into the hands of all ages and all classes." As the author speaks the truth throughout he speaks it in regard to the Papacy, which, "founded in falsities, is seen to be built up of shadows, exaggerations, and assumptions." Finally, the reader will find himself "carried back from Rome to the uplands of Galilee, and the quickening presence of the great religious Teacher of the world." We confess that, after perusing this magnificent programme, we felt almost tempted to shrink in unaffected diffidence from the grave responsibility of reviewing a work which, if one-half that is here said of it were even approximately true, must constitute a new epoch in literature, in theology, and in modern history. We were perhaps somewhat reassured by finding that the entire history, which extends from the Birth of Christ to the year of grace 1870, is comprised in three small volumes, and that, even so, room is found in the first volume for a comprehensive sketch, occupying about one hundred pages, of all "the ancient worships" anterior to the Christian era, from Brahmanism to "Mosaism." Still the prospect looked rather an alarming one. And it was clear, even from a glance at the Table of Contents, that the author's own estimate of his achievements and confidence in the unerring soundness of his judgment were fully equal to his translator's. In the summary of the first chapter we find the dogmatic announcement, as a simple record of facts, that "the Apostle John was not the author of the fourth Gospel;" and in the summary of the second it is stated that "Nero did not persecute the Christians." Turning to the first page of the Introduction, we are told that "the history of Christianity is perhaps that which is least read," though it is that which it most concerns us to know. And a few lines further down we come upon the guiding principle on which the present work has been composed, and which is consistently assumed throughout as an axiom, and as supplying the key to all problems of ecclesiastical history:—

> There is no moral progress with superstitious forms of worship, which live only by the infatuation of the multitude. There is no liberty with sacerdotal castes of which the organisation, the doctrines, the traditions are a continued system of despotism for the chiefs and of servitude for the people.

As "sacerdotalism" in some form or other has been from the first an essential element in the Christian system, and still survives, not only in all the great historic Churches, but, with inconsiderable exceptions, in all the principal sects which have separated from them—that is, throughout nearly the whole of Christendom—no one can deny to this leading principle of the author's the merit of being sufficiently sweeping and absolute. As the priesthood is "the πρῶτον ψεῦδος" of actual Christianity, to borrow the words of another writer, it follows of course that the Christian Church has gone on a fatally wrong tack from the beginning. And that is just what M. Bouzique undertakes to prove, we were going to say, but, to speak more accurately, it is the fundamental assumption on which his History is based from beginning to end.

We have no time to linger over the introductory notice of the ancient religions of the world, which contains nothing new, and, from the attempt to compress so vast a quantity of matter into so short a space, is, if possible, even more unattractive and unsatisfying to the reader than the rest of the work. It is probably with a purpose that M. Bouzique dwells on the close similarity in some details of the Buddhist and Roman Catholic ceremonial and institutions; but the fact, however explained—and it is obviously capable of more than one interpretation—has long been familiar to all readers of M. Huc's interesting *Travels in Tibet and Tartary*. The fault to which we have already adverted would alone be fatal both to the interest and the usefulness of this singularly pretentious and disappointing book. It is in reality not so much a history as one of the dullest and dreariest of abridgments. As such, it might have been more or less serviceable for purposes of reference had it been furnished with a copious index, instead of having none at all, though it would in no case have been comparable in value to such a summary of history as Gieseler's. If M. Bouzique had not the leisure or perseverance for composing a complete Church History—which indeed would have been the work of half a lifetime—he would have done more justice to his subject and to his own peculiar views about it by selecting some special period, whether earlier or later in the Christian era, for careful illustration, just as Dr. Newman, *e.g.*, selected for his own very different purpose the History of Arianism. If it could be shown, for instance, from a review of the early controversies on the Trinity and the Incarnation and the Councils which decided them, that the dogmatic and hierarchical principle was a corruption of the more than Unitarian simplicity of the original Gospel—which is what our author wishes to have understood—he might have been content to leave to others to trace out the inevitable sequel in the later history of the mediæval and modern Church. As it is, he has set himself to crowd the events of eighteen centuries into a space quite inadequate for the treatment of the first three, especially by a writer who aspires to reverse *in toto* the received and traditional view of Christian faith and history. And accordingly he is continually propounding assertions of the most sweeping kind, which, to say the least, ought not to be made without some attempt to examine the evidence on the other side, but the unreserved acceptance of which is a fundamental postulate of the entire plan of his work. Thus, for instance, we come very early across the statement that, "with the exception of brief interpolations, there does not exist in the New Testament any trace of the Trinitarian conception. . . . . In the three first Gospels, as well as in Paul's Epistles, Jesus is veritably a simple man." That the great majority of readers of the New Testament have always understood it differently does not appear to him any reason, we do not say for distrusting his own judgment, but for taking the trouble to refute theirs. Again, a little further on we read, "With Paul you find no traces of the Trinitarian idea. He would have thought it a profanation to entertain the idea, and blasphemy to announce it. No more does Paul speak of the Word and his incarnation; this is a theory peculiar to the fourth Gospel." He had already asserted that the fourth Gospel was not written by St. John, and "its dogmatic portion is the work of a Platonizing Christian, not to say a Gnostic." But as scholars of such eminence as *e.g.* Professor Westcott and Professor Lightfoot are convinced of the contrary, the received view deserved at least the compliment of a refutation. If, however, the fourth Gospel "seeks to establish the deity of Christ," that belief was not received till the end of the second century in the Church; "it is not before the reign of the Emperor Commodus (180-192) that it seems to prevail." It did not indeed take definite shape till long afterwards. From the Council of Nice onwards the Catholic Church and its members are usually designated by the clumsy sobriquet of "Consubstantialists" and "the Consubstantial Church." And it was not till the seventh century that "by successive councils and by heaping no-sense on no-sense the imperial Church had at last succeeded, under the inspiration of Plato and Hermes, in constituting its three and one God, and its god-man Christ." The date is apparently fixed for the convenience of suggesting that Mahometanism was in truth a devout recoil from this corruption of the primitive monotheism.

Even in recounting plain matters of fact, the author, while he never betrays the faintest shadow of hesitation, lacks either the

---

* *The History of Christianity.* By E. U. Bouzique. Translated from the French by John R. Beard, D.D. London: Williams & Norgate.

time or the patience to be accurate. When he comes across a critical question of any delicacy, he is pretty sure either to slur it over or to misrepresent it. Thus we are told that Liberius "subscribes *the formula* of Sirmium"; but there were three formulas of Sirmium, and the question hotly discussed among rival critics is which of them Liberius signed. M. Bouzique seems unaware of their existence. Again we read that Nestorius "did not the less believe, as his contradictors, that that union (of the Godhead and Manhood) took place at the instant of the conception." On the contrary, that was precisely what Nestorius persistently denied; he said that nothing should induce him to call an infant just born his God. Once more we are informed that the Fifth Œcumenical Council "with one voice pronounces the condemnation of Origen and his errors." It is most probable that the Council did condemn Origen by name, though that is disputed, but it is almost certain that the fifteen anathemas on his errors, to which the author is evidently referring, issued from a local Synod held ten years before. He again appears unconscious of the existence of the controversy. With a similar disregard of all critical principles, the Athanasian Creed is represented as a composition of the eighth or ninth century, like the Isidorian Decretals, without even a hint of any earlier date being suggested or conceivable by any one. It is rather startling to be quietly informed, on purely *à priori* grounds, that "the persecution attributed to Nero has all the appearance of an historical error, notwithstanding the [very detailed and explicit] testimony of Tacitus and Suetonius." The following extract on the state of the Church towards the close of the second century offers a fair example of the author's method, and an exceptionally favourable specimen of his style:—

> The greater part, ignorant, or no longer understanding the old discussions, come to believe that there has always been an identity of doctrine between Paul and the Churches of Judea. At the time that they preserve the Pauline doctrine, they none the less think that in all respects they are the disciples of the twelve apostles. The last assume a totally new physiognomy. They are no longer the exclusive preachers to the Jews, but the instructors of the whole human race; there are ascribed to them both the ideas of Paul and the diverse theories which circulate among the Christians of Hellenic origin. The trinitarian form of baptism is introduced into the Greek translation of the Gospel of Matthew. John, the presbyter of Ephesus, fades away to yield his place to the apostle of the same name, who thus becomes the putative author of the fourth gospel, the declared foe of the Ebionites, those zealous disciples of the twelve, and the consecrator of the oriental doctrine of the incarnate Word, of which beyond a question he had never the least suspicion. Peter, in his turn, is carried by the legends through the Hellenic lands, then conducted to Rome, where those same legends appoint him bishop and associate him with Paul in preaching and martyrdom. In the absence of history, which furnishes nothing respecting the last days of the life of the apostles and the first disciples, the same prolific source begins to create for each of them a fictitious existence corresponding to the ideas which prevail in that period in the Platonising Church.

It is hardly fair perhaps to criticize the author's style without having seen the original, but unless his translator has done him great injustice, it is as little inviting or helpful as his method. The narrative is written throughout in the historical present, and cut up into sentences which might have been composed for shilling telegrams. There seems to have been extraordinary carelessness in correcting the press, to judge from such literary curiosities as "there *were* no alternative," "Nectorius," "Philip *the* Bel," and many more that might be mentioned. But for the habitual ignorance or disregard of English idiom throughout the printers cannot be responsible. No one who read half a page anywhere could possibly mistake this for an English book; and were not Dr. Beard's name on the title-page we should certainly have presumed that the task of translation had been entrusted to a foreigner. Not to dwell on such queer barbarisms as "the *ascent* of Gregory VII." for accession, "*suspense*" for suspension, and the like, which are of constant occurrence, what is to be said of the following constructions, culled at random from a few pages only in the same chapter?—"Theophilus has no longer difficulty *to read* the writings of Origen"; "the civil power is an object of its enterprizes"—meaning, apparently, that the episcopate was aiming at civil power; "Constantine entitles himself *bishop of the outside*"; "decrees of councils frequently speak in condemnation of the *dissolution* of the clergy"—which appears from the context to mean dissolute conduct. Then again we read of "articles which are consigned," &c., of a Pope "*loosening* subjects from their oath of fidelity," of the Cardinals "*charging with nullity* the dismissal of Celestine," and plenty more in a similar style, which certainly is not English. And the same word is often written differently in different places; thus we have "clerks" and "clercs," "chorepiscopi" and "chorebishops." All this of course is not the fault, but the misfortune, of the author, whose forbidding style and method of writing has been caricatured rather than relieved in the process of translation. We have spoken already of his curt and careless manner of riding roughshod over critical difficulties. But he is scarcely more happy in his treatment of broader historical questions. Nothing can be more thoroughly one-sided and unappreciative than his estimate of the character and career of Hildebrand, which he might have learnt to understand better from German writers whose views are quite as widely removed from orthodox sympathies as his own. His account of Becket is still more unsympathetic and superficial; and it is simply an ignorant blunder to call him "a martyr to the doctrine of the Papal autocracy," with which he came into collision hardly less than with the Royal power. To call him a martyr to the doctrine of ecclesiastical independence, which is quite another thing, would be a plausible, though an inadequate, view. We cannot follow the author through his review of the Reformation, but we may just observe that to explain Protestant persecution, like Calvin's burning Servetus, by the trite commonplace that "the doctors of Wittenberg and Geneva had not entirely thrown off the old man, and still kept in their hearts the sentiments of intolerance which they had sucked in on the bosom of their Roman mother," is a view which no one familiar with the writings of the Reformers can for a moment admit as even tolerably correct. The translator, it may be added, when he volunteers his own explanations, is quite capable of capping the blunders of his author in the simplest matters of fact. He gives us, *àpropos* of the Vatican Council, a note to expound the meaning of bishops "*in partibus infidelium*, that is, *among the heretics*. These bishops, *having no Catholic charges*, hold an inferior position." We need hardly say that every one who knows anything about the subject, or about the Latin language, is aware that *in partibus infidelium* does not mean "among the heretics," but "among the heathen," and that the bishops in question very often *do* hold "Catholic charges." All the English Roman Catholic bishops before 1850 took their titles from places, like Melipotamus, in heathen countries, as the Scotch Roman Catholic bishops do still.

We must find room for one concluding extract for the edification of our readers, who will be struck with M. Bouzique's peculiarly lucid and appreciative estimate of the contemporary state of religious matters in England:—

> A portion of the Anglican Church allows itself to be drawn away, and a High Church [*sic*] is constituted in its bosom. However the Roman Catholics in no way take part in this movement notwithstanding the prepossessions of which they are the object. Far from that, it is at this moment that Pius IX. publishes the Bull which formed the kingdom of England into an ecclesiastical province. From all sides there resounded among the Protestants the cry *No Popery*. They inveighed against the Anglo-Catholics or Puseyites, whom they considered as the accomplices of the Court of Rome. Some of the latter [the Court of Rome?] give way, but the majority hold firm, and repel the internal tyranny as well as the papal authority. They form an alliance with the partizans of the High Church. Both deny to lay tribunals all power in matters of dogma. Provincial councils [of Oscott or of Canterbury?] proclaim that the Church of England is essentially one, and declining the royal supremacy, affirm to a general assembly of the clergy belongs the exclusive right of representing the church (1854–1855). They aspire to form a free church in a free state.

The subject is pursued through two or three more pages. We hear for the first time of a great assembly in 1865 of Anglican and Russian dignitaries presided over by the Bishop of Oxford and a Legate from the Metropolitan of Moscow, which decides among other things that "the Church of England . . . shall receive into its Universities the Orientals, *who shall be addressed to them* by the clergy of their country." The "Ritualists" will learn with satisfaction, not perhaps unmixed with surprise, that they "are united with the bishops," and that "more than half the Anglican ecclesiastics have given in their adhesion" to the same cause. We must leave our readers to construe for themselves as best they can the oracular summing up, "This is, with a few exceptions, an identity between Anglo-Catholicism and the High Church"; after which lucid announcement the author passes from narration to prediction, and into that shadowy region we must decline to follow him. M. Bouzique evidently took pains to collect a mass of statistics which might have been serviceable to future writers had he condescended to give his authorities, but he lacked either the leisure or the capacity to arrange and systematize them. What sort of history he would have written under more favourable conditions it is impossible now to determine. What he did was to fill three volumes with the undigested contents of his commonplace book. To publish the work in such a form was a great mistake; it was a more unpardonable error to translate it.

IN A WINTER CITY.*

PERHAPS the strongest impression made by Ouida's work is a doubt as to the author's object. She writes all sorts of hard things against the vices of the world, the sins of the age in which we live; but all the time we catch the flavour of the very things that she condemns lying underneath her objurgations, and we feel that she is spinning phrases rather than expressing genuine indignation, doing her best to fascinate her readers by the very naughtiness of the subject she has chosen, while professing to detest it. Why, if she dislikes the theme so much, is she always writing about married women and their lovers, their complaisant husbands, and the *chères amies* of those husbands? generally, ladies of the *demi-monde*, whose personality is in no wise important to the story, and who are dragged in, as it would seem, out of liking for unsavoury subjects. It is difficult to reconcile this incessant reprobation with so much evident delight in questionable details. If Ouida desires to sing the praises of virtue, she might do so in a better way than by chanting the litany of vice; with Mme. Mila and Maurice, Lady Featherleigh, and the rest of the undesirable people of whom she speaks with nauseous reiteration, she weakens the effect of her eulogies on Lady Hilda Vorarlberg and the man for whom she sacrifices all that such a woman would most value—that penniless but chivalrous Duke della Rocca, whose creed was "All for love and the world well lost."

Less coarse than she used to be, but still coarse—less like a

* *In a Winter City: a Sketch.* By Ouida, Author of "Puck," "Signa," &c. London: Chapman & Hall. 1876.

sign-painter and more artistic, but still a sign-painter and inartistic—Ouida indulges her besotting sin of gaudy colouring and profuseness in the *Winter City* as in all her works. She knows nothing of the strength which comes from reticence, from simplicity, from concentration. She never contents herself with one word where she can use two, and she has the trick of repetition to a wearisome degree. Unquestionably clever, she is also as unquestionably shallow; and even in her sharpest sentences we detect a certain ring which suggests successful imitation rather than absolute originality. She inveighs against dress and worldliness, immorality and heartlessness; but we should like to see her library, and to know what novels she had been studying before she wrote her own. She is clever, striking, glittering—but it is only mock work after all; and it suffers, as all such work does, when contrasted with that which is purely creative and real—that which has been honestly thought out by the worker, unassisted by hints and suggestions from foreign sources. The story of *In a Winter City* is simple enough. It is merely the narration of how the Lady Hilda Vorarlberg—a cold, disdainful, beautiful, and artistic young widow, with fifty thousand a year and an unpleasant temper, who has never known the faintest approach to love, and who lives like a passionless statue in the midst of companions who are, to say the least of them, odd—loves and is beloved by the Duke della Rocca, an impoverished Florentine noble, who, with the most urgent need to marry money, has not yet been able to make up his mind to sacrifice his name for any number of thousands to be had with the daughters of "rag and bone merchants from New York, or oil-strikers from Pennsylvania, or speculators from Wall Street." As Ouida says:—"Paolo della Rocca loved his name as a soldier does his flag, and he could not bear the idea of possibly transmitting to his children traits and taints of untraceable or ignoble inherited influences." Wherefore he constantly murmured to his match-making friend—"who, having had him as a lover when he was twenty and she was thirty, felt quite a maternal interest in him still as to his marriage and prospects"—"A little more time!—next year." Urged by his friend the Duke de St. Louis to make his court to Lady Hilda Vorarlberg, Della Rocca begins in the good old way of a little aversion. Here is the thing of all others that he most dislikes, but the thing which "seemed cast across his path by a caress of Fortune from which it would be madness to turn aside." She was cold; but he had little fear, if he once ended yourself, that he would fail in making his way into her graces. With an Italian love is too perfect a science for him to be uncertain of its results." She was a woman, too, of "unusual beauty and of supreme grace, and a great alliance"; but

he had a wholly different ideal for his wife; he disliked those world-famous *élégantes*; he disliked women who smoked, and knew their Paris as thoroughly as Houssaye or Dumas; he disliked the extravagant, artificial, empty, frivolous life they led; their endless chase after new excitements, and their insatiable appetite for *frissons nouveaux*; he disliked their literature, their habits, their cynicism, their ennui, their sensuality, and their dissipations; he knew them well, and disliked them in all things; what he desired in his wife were natural emotions, unworn innocence, serenity, simplicity, and freshness of enjoyment; though he was of the world, he did not care very much for it; he had a meditative, imaginative temperament, and the whirl of modern society was soon wearisome to him; on the other hand, he knew the world too well to want a woman beside him who knew it equally well.

Lady Hilda on her side cannot understand a life without money. For ten years she had had the possession of her enormous fortune of fifty thousand a year, and use had made it a second nature to spend as much as she liked and to gratify every whim, every desire, no matter at what cost. She had also lived on a certain moral pedestal in her own mind:—

She had loved herself very dearly all her life, lived for herself, and in a refined and lofty way had been as absolutely self-engrossed and amorous of her own pleasure and her own vanities as the greediest and cruellest of ordinary egotists.

When she finds that she is in love with Della Rocca, and that she cannot marry him because to marry him would be to give up her fortune and live on the poor pittance belonging to him—and that she cannot make him her lover, as her cousin Mme. Mila would have done, and indeed as any one in her society would have done, because she is cold, proud, and has the self-respect of a modest woman still untouched—then the conflict begins, and the dramatic interest of the story is at its highest. Della Rocca, who had allowed her to feel rather than see his love when he thought her the absolute mistress of her fortune, having so much pride as to be fearful lest she should think it was her money and not herself that he sought, now, when he knows from her brother that she will lose everything if she marries again, confesses himself warmly enough—more warmly, we imagine, than such a woman as Lady Hilda would have allowed, or than one so clever as Paolo, he who had erected love-making into a science, would have thought judicious. But the things of the world prove stronger even than a lover's love; and Hilda puts away the temptation offered to her of "voluptuous sweetness," "amorous endearment," "the joys of great and mutual passion," by which Della Rocca pleads his cause, and gives up the man for the money:—

He knelt at her feet, and held her hands in his.

"Does your life content you?" he said at the last. "Can greatness of any sort content a woman without love? Can any eminence, or power, or possession make her happiness without love? Say that I am poor; that coming to me you would come to what in your sight were poverty; is wealth so great a thing measured against the measureless strength of passion? Are not the real joys of our lives things unpurchasable? Oh, my love, my love! If you had no preference for me I were the veriest fool to urge you; but, as it is—does the world that tires you, the society that wearies you, the men and women who fatigue you—the adulation that nauseates you—the expenditure that after all is but a vulgarity in your sight—the acquisition that has lost its charm for you with long habit, like the toys of a child; are all those things so supreme with you that you can send me from you for their sake? Is not one hour of mutual love worth all the world can give?"

His arms held her close, he drew her down to him nearer and nearer till his head rested on her breast, and he felt the tumultuous throbbing of her heart. For one moment of scarce conscious weakness she did not resist or repulse him, but surrendered herself to the spell of his power. He moved her as no mortal creature ever had strength to do; a whole world unknown opened to her with his touch and his gaze; she loved him. For one moment she forgot all else.

But all the while, even in the temporary oblivion to which she had yielded, she never dreamed of granting what he prayed.

As the story, however, is not meant to be a tragedy, and as Lady Hilda is designed to be a beautiful character, superficially encrusted by the world's selfishness and the vices of the age in which she lives, but noble and pure at the core, we know that before it is too late she will follow the counsel of her heart against her prudence, and marry Della Rocca in spite of his ruined palace and diminished rent-roll. It would not have happened so in real life; but then authors have the rights of parents over their children, and can make them do as they like; and if it pleases them to create a moral harlequinade and make their characters of all colours, that is their own affair. To the critic belongs only the right of remark that the characters are of all colours, and that the actions ascribed to them belong to the same school of art as that which should give a tree the leaves of a pear, the flower of an orange, and the fruit of an apple. Neither Della Rocca nor Lady Hilda would have married into poverty, no matter what the love they had for each other. He, indeed, would have adopted Mme. Mila's view of their possible relations, seeing that anything else would have cost too large a sum in the ordinary estimate of values; and she would either have yielded to this arrangement, had her passions developed in proportion to their vigour at birth, or, more probably, she would have trodden them under foot altogether, and have discarded her love as a weakness to which it would be high treason against herself to yield. Granting all her weariness of society, her emptiness of heart, and her sense of desolation, still her wealth was as her second nature, and we can scarcely think that she could ever have been warmed up to the point of abandoning it. Ouida thinks differently; but we deny her symmetry of drawing, seeing that she has made this action of the heroine appear inconsistent with the earlier and stronger lines of her nature.

All this is, we fancy, a sop thrown to appease the Cerberus of British respectability and sentiment. The real meaning of the book, as we read it, lies rather in Mme. Mila, and in the invectives scattered broadcast against the women of the day, and society as Ouida knows it. And in these invectives the most noticeable points are their bitterness, their fierceness, and their coarseness. One could sometimes fancy one was reading a personal attack aimed at some living woman. Take, for instance, the description of "La Femme Galante" of the present day. "The frivolous and fragile faggot of impulses that is called Frou-frou"; that "poor, feverish, wistful, changeful morsel of humanity, a slender, helpless, breathless, and frail thing, who, under one sad, short sin, sinks down to death," is not, Ouida is careful to tell us, the Femme Galante whom she scourges. This, indeed, is the married woman of high place and fair name "who has studied adultery as one of the fine arts, and made it one of the domestic virtues"; beside whom "Frou-frou were innocence itself, Marion de l'Orme were honesty, Manon Lescaut were purity, Cleopatra were chaste, and Faustine were faithful. She is the female Tartuffe of seduction, the Précieuse Ridicule of passion, the parody of Love, the standing gibe of Womanhood"—and, in short, the peg whereon Ouida hangs pages of unpleasant verbiage, offensive suggestion, and equivocal denunciation. We at no time admire this writer's work, partly because of this very element of unfeminine coarseness which comes out now in one direction, now in another; but Ouida, coarsely moral and indelicately virtuous, is Ouida at her worst. What with foul themes, false sentiment, impossible action, and verbal sign-painting, *In a Winter City* will fail to please any educated taste; but there are no doubt other tastes which, for aught we know, it may suit well enough.

THE LIFE OF SCHOPENHAUER.*

THE author of this very amusing little volume proposes to effect for the general English reader what M. Ribot has already accomplished for the French student of mental science by diffusing a knowledge of Schopenhauer and his philosophy. M. Ribot's book has already been noticed in our columns (*see Saturday Review*, September 11, 1875); and we think he has given a more satisfactory account of the philosophy of the Frankfort sage than will be found in the pages before us. But the biography of Schopenhauer is here far more complete and detailed, and it must be borne in mind that in his particular case the man is quite as remarkable as the writer; indeed the latter cannot be fully appreciated without some knowledge of the former. The material of which Mme. Zimmern has availed herself was ample and easy of access, and she has made good use of it, the bulk of her work being

* *Arthur Schopenhauer; his Life and his Philosophy.* By Helen Zimmern. London: Longmans & Co. 1876.

the Memoir of Schopenhauer by his friend Dr. Gwinner. The tendency of Schopenhauer's theory she perfectly explains, rightly defining his position as that of the earliest representative of that influence of the Indian intellect upon Europe of which we find abundant examples at the present day.

Arthur Schopenhauer was born in 1788 at Danzig, where his family, of Dutch extraction, had long resided, and had been known as great and influential citizens; so great, indeed, that when Peter the Great and his Empress visited the old Imperial city, the house of Arthur's great-grandfather, Andreas, was selected to lodge them. The memorable event gave rise to a family anecdote. When the Imperial pair entered the house assigned to them, they chose for a sleeping apartment, although it was winter, a room without stove or fireplace. Old Herr Schopenhauer met the difficulty by emptying several barrels of brandy over the tiled floor, closing the room, and setting the spirit on fire, to the great amusement of the Czar. When all was burned out, the guests lay down to rest in the hot air, and rose comfortably in the morning to thank their host for his strange display of hospitality.

Heinrich Floris Schopenhauer, grandson of Andreas, lived for many years in France and England, and imbibed a taste for the literature and manners of both countries, which he afterwards impressed upon his son, encouraging him from early boyhood to read the *Times*. He ultimately settled at Danzig, where he carried on the mercantile business of his forefathers with consummate ability, and at the age of thirty-eight married Johanna Henriette Trosiener, daughter of one of the patricians of the city. On the subjugation of Danzig in 1793, Heinrich, sacrificing a tenth part of his fortune, fled with his wife and little son to Hamburg, which still retained its privileges as a Hanseatic city. Two years were passed by the family in a tour through Belgium, France, Switzerland, and Germany, and towards the end of 1804 Heinrich lost his life by a fall from an attic window into a canal—a misfortune which calumny attributed to suicide on account of pecuniary losses. His memory was held in the highest respect by his son. Shortly afterwards his widow Johanna moved to Weimar, where, herself esteemed as an author, she shone as one of the stars of the place, then at the height of its brilliancy. Arthur, meanwhile, in compliance with his deceased father's wishes, had toiled, sorely against his will, in a merchant's office, lamenting that he could not devote himself to literature. At last, acting on the advice of her Weimar friends, his mother allowed him to follow the bent of his inclination, and he entered upon an academic career at Gotha, where, in addition to the ordinary curriculum at the Gymnasium, he took private lessons in Greek and Latin, thus showing a veneration for classical learning which he retained to the end of his life. Both as a student and as a writer of German he gained much local renown, cultivated aristocratic society, and became somewhat extravagant in his attire. However, at the end of six months a squabble with a professor caused him to leave Gotha and proceed to Weimar, where he took lodgings, that irritable misanthropic temperament with which all the readers of his works are familiar displaying itself even in these early times so habitually that his cheerful, easy-going mother could not tolerate him under her roof. It was a fortunate circumstance that he had for a fellow-lodger Franz Passow, afterwards celebrated as a Greek lexicographer, who greatly assisted him in his classical studies.

In 1809, on the completion of his twenty-first year, Arthur Schopenhauer matriculated in the medical faculty at the University of Göttingen, where, with unwearying energy, he studied everything, noting down in manuscript all that he heard, and adding comments of his own, in which his instructors were often severely criticized. The fame of Fichte attracted him in 1811 from Göttingen to Berlin, and with the disappointment occasioned by the celebrated Professor's lectures began that contempt for the post-Kantian philosophers of Germany the expression of which has so largely contributed to the popularity of his works. At Berlin he also heard Schleiermacher and H. A. Wolf. For the latter, the great philologist, he had the profoundest reverence; with the former it was otherwise. With respect to his abhorrence of Fichte, Mme. Zimmern rightly observes that, whatever views he held with respect to the "Wissenschaftslehre," he might have accorded a word of praise to the unflinching patriotism displayed in the address which Fichte delivered in 1808. But to Schopenhauer, as to Göthe, political enthusiasm was unknown, and the former had a special dislike for his own countrymen, as is well illustrated by the following anecdote, relating to an outburst which occurred during a sojourn in Italy:—

"The German Fatherland has reared no patriot in me," he once said; and he often repeated both to his own countrymen and to French and English, that he was ashamed to be a German, they were so stupid a people. "If I thought so of my nation," said a Frenchman in reply, "I should at least hold my tongue about it."

Schopenhauer did not long remain at Berlin, and his first work, the short treatise entitled "Die Vierfache Wurzel des Satzes vom Zureichenden Grunde," which is by no means unimportant, and which was published in 1813, obtained for him the degree of Doctor of Philosophy, bestowed by the University of Jena. His mother and he were never on good terms, and when, on his return to Weimar to reside there, he presented his mother with his treatise, she sneeringly pretended to infer from the title, the "Fourfold Root," that it must be a book for apothecaries, and was undutifully told in reply that the treatise would be read when her works would not even find a place in a lumber-room. Johanna was not to be set down. "The whole edition of yours will be still on hand," was the retort. Unlike Peacham and Lockitt, both mother and son were in the right. Arthur sold scarcely a copy of his first edition of the treatise, and Johanna's works, eagerly read at the time, are now, if they are ever mentioned at all, merely remembered as some very old English novel-readers remember the "Minerva Press." We should not, however, forget that it is to the mother we are really indebted for all we know of the earlier portion of the son's life.

There was a practical cause for the estrangement between Arthur Schopenhauer and his mother which perhaps had more to do with it than difference of taste or temperament. While he hated commerce, he abhorred the notion of gaining a livelihood by means of literature or philosophy. This feeling is prominently revealed in all his attacks on the University professors of his day. The men who live *for* science and those who live *by* science are as wide apart, intellectually and morally, as heaven and earth, and he who would teach truth should be in the enjoyment of a worldly competence not at all dependent on his teaching. Johanna was extravagant, and Arthur feared, not without reason, that she was squandering his patrimony. If left without it, what would he do? He might become as base as Fichte or Hegel. His mother's faults were in some measure compensated by her *salon*, which made him acquainted with many celebrated men, above all, with Göthe, who was highly pleased with the "Fourfold Root," and hoped to find a convert to his beloved theory of colour. Schopenhauer did not prove so subservient a disciple as had been hoped, and though the young man and the veteran much admired each other, there was no great sympathy between them. Those who know how frequently Schopenhauer appears in print as a declared misogynist may be especially amused by the fact that he was consumed by a passion for Caroline Jägemann, the chief actress at the Court Theatre of Weimar, and the recognized mistress of the Duke; but the circumstance is more important that about this time he was first introduced by Friedrich Mayer to that Indian lore which afterwards had so much influence on his thoughts.

Four years spent at Dresden, whither Schopenhauer removed in the spring of 1814, were chiefly occupied by the composition of his *opus maximum*, *Die Welt als Wille und Vorstellung*, published in 1818 by Brockhaus of Leipzig. This was in one volume, the second not having been added till many years afterwards. A brief exposition of the theory which it inculcates we have given so recently that anything like a repetition here would be superfluous. Its completion was followed by the visit to Italy to which we have referred above, and under the Southern sky he led a life by no means corresponding to the asceticism which he so strongly inculcates in his writings. While he taught as a Buddhist, he lived as a European *bon vivant*, and, like Kant, was a hearty eater to the end of his days. Still, far from being a hypocrite, he honestly avowed his inability to act up to his own ideal. He expressed to his friend Dr. Gwinner his fears that he would never attain Nirvana, and once, after looking at the portrait of the Abbé de Rancé, the virtuous founder of La Trappe, an order which he regarded with profound reverence, he turned away with a mournful air, saying, "That is a matter of grace." He was suddenly brought back from Italy by the news that the mercantile establishment at Dantzic, in which a great part of his own and all his mother's fortune was invested, was threatened with bankruptcy. His genius as a speculative philosopher had by no means affected his character as a shrewd man of business, and while his mother, who would not listen to his advice, was left almost penniless, he, by anticipating the crash which ensued, saved the bulk of his property.

The most miserable part of his life was spent at Berlin, whither he removed in 1820, hoping to make a position as a lecturer on his own philosophy. Never were hopes more vain. His great work, on the fame of which he had reckoned as an introduction, had received even less attention than the luckless "Fourfold Root." He had no chance of rivalling Hegel and Schleiermacher, and every day his lecture-room became emptier. In 1831 he was driven from Berlin by the cholera, and it is a notable trait in his character that he was terribly subject to panics, which could with equal facility be produced by epidemic maladies and popular tumults. His extreme Conservatism in politics, his dislike to popular rule, which extended even to a condemnation of trial by jury, could be traced to natural timidity. At the same time his nervous irritability could make him on occasion even ferocious. While he was at Berlin, the discovery that his landlady was in the habit of allowing an acquaintance to hold coffee-parties in his ante-room so moved him to wrath that he threw her out of his door, and so severely injured her arm that he was sentenced by a court of law to maintain her for life. The annuity thus awarded proved a long one, and when the good lady died at last, he wrote on the certificate of her death, "*Obit anus, abit onus.*" Generally, however, he seems to have been a beneficent man, and to have done what he could for his poor relations. In 1833, after a few more migrations, he settled at Frankfort. With this ancient city, in which he passed the remainder of a life ending in 1860, his name is chiefly associated. Here at last he learned what celebrity was, and though his secluded misanthropic life first led people to style him the "Whimsical Fellow of Frankfort," he was ultimately recognised as the "Sage"; he was regarded as one of the lions of the place as he strode along the street, and the landlord of the Hôtel d'Angleterre, where he dined every day, replied, when asked if he had any royal visitors, "Yes, Dr. Schopenhauer.

His first gleam of prosperity was his successful competition in 1839 for a prize offered by the Royal Norwegian Academy of Drontheim for the best essay on the Freedom of the Will. With the Royal Danish Academy, which in the following year offered a prize for the best inquiry into the grounds of moral obligation, he was, indeed, unsuccessful; nor did the publication in 1844 of a new edition of his principal work, with an addition, attract much attention. But the collection of miscellaneous essays which he published in 1851 with the title *Parerga and Paralipomena* was received with decided favour, and its success brought into more general notice his earlier productions. An article on his philosophy generally, in the *Westminster Review* for April 1853, was speedily translated into German by one of his disciples, and this helped to diffuse the knowledge of the long-overlooked "Sage" among his own countrymen. The third edition of *Die Welt als Wille und Vorstellung* actually turned out a profitable speculation, and when, at the age of seventy-two, the great Pessimist peacefully, though somewhat suddenly, shook off his mortal coil, he was already a man of renown, with declared partisans and admirers.

If this book reaches, as it merits, a second edition, we would recommend a careful revision of proofs. No one can be more perfectly aware than the writer that whereas, in naming the author of *Faust*, every free-born Briton has a choice between "Göthe" and "Goethe," and, by way of a frolic, may write "Gœthe," "Goëthe" is a thing of naught.

UNDER THE NORTHERN LIGHTS.*

THE officers and crews of the North Polar Expedition have passed the winter in utter sequestration from mankind, beneath the sunless sky that bends over that region of our globe, which only becomes accessible by the yearly discharge of its ice-drift through Smith Sound into Baffin's Bay. They were last heard of at the Carey Isles, near the entrance to Smith Sound, by the finding of letters which Captain Nares on the 28th of July deposited in a cairn of heaped stones upon the summit of a hill in the south-eastern island of that group. It was Captain Allen Young, in his own vessel, the *Pandora*, who ran up twice, on the 18th of August and on the 10th of September, to call at the Carey Isles, several degrees north of his appointed course, that he might fetch any correspondence left at that *poste restante* by the *Alert* and *Discovery* some weeks before. We have to thank the *Pandora* for the assurance given us by their parting message that the North Polar squadron had also happily evaded the troublesome navigation of Melville Bay towards the close of the season. But the proper errand of the *Pandora* lay in quite another direction; not at all to the north, but rather west by south from Baffin's Bay, which is the common gateway of the Arctic regions in that hemisphere.

The ancient problem of geographical speculation and nautical experiment concerning the feasibility of a passage by water along the northern coasts of America, from the Atlantic to the Pacific Ocean, has not ceased to invite the adventurous mind. The geographical question of the existence of a chain of water-basins, gulfs, sounds, straits, or other channels, all the way between the two oceans, has long been settled. But the feat of nautical skill is yet to be performed. It seems to be generally acknowledged that no sailor could have been more competent to try it again last year than Captain Allen Young. He served under Sir Leopold M'Clintock in 1859, when three detached parties, journeying across the ice with sledges, explored the shores of Prince of Wales Island and King William's Island, around the closed southern end of M'Clintock Channel, or Franklin Sound. The obstacle to what is still inappropriately called the North-west Passage has been proved to lie in that piece of water alone. It is simply the accumulation and retention of drift-ice in summer, by the conformation of the mainland opposite those large islands and Victoria Land. The ice comes down M'Clintock Channel, which is funnel-shaped; but it is here stopped by the promontory of Boothia Felix from passing off either into Hudson's or Baffin's Bay. Let this one land-locked basin, at the suitable time of the year, be once crossed by a vessel equipped for such navigation, and the remainder of the voyage to Behring's Straits would not be difficult, as it lies through Simpson and Dease Straits and other channels, which are sheltered by Victoria Land from the northern drift of ice. The real difficulty is to get a ship round the southern end of Prince of Wales Island, whether approaching it through Peel Sound or through Bellot Strait, out of Prince Regent Inlet, from the eastward side. Captain Allen Young, indeed, should know more than any other man of the coast-line of Prince of Wales Island. He intends to try again this year, having been stopped last year by the ice, which covered all the width of Peel Sound below the La Roquette Isles, near the outlet of Bellot Strait. We shall be pleased to hear of his ultimate success.

These voyages have been undertaken at Captain Young's private cost, but he accepted the pecuniary aid of two partners towards the late expedition. One was Lady Franklin, who cherished a hope of the finding of some memorials of her lost husband where the survivors of the *Erebus* and *Terror* ship-wrecked company must have perished in 1848. The other contributor was Mr James Gordon Bennett, in whose service one travelling reporter met Dr. Livingstone on the shore of Lake Tanganyika, while another joined the Russian army at the capture of Khiva. Arctic scenery, and Arctic adventure in general, if not exactly the North-west Passage and the fate of Sir John Franklin, had become once more a topic of interesting newspaper discussion. As Mr. Stanley had once more plunged into Equatorial Africa, it was Mr. MacGahan who had to embark in the *Pandora* for a voyage to Peel Sound, and possibly that way to the Pacific Ocean. The *Daily Telegraph*, by an arrangement similar to that made in the case of Mr. Stanley's present African mission, shared with the *New York Herald* the current publication of Mr. MacGahan's letters. They are collected in the volume with which we have now to deal, and of which, from a literary point of view, there is not much more to be said. It is augmented by several chapters made up of tolerably pertinent information extracted from other books. These describe the migratory life of the Innuits or Eskimos, apart from their scanty settlements in Greenland, with their traditions of romance and mythology preserved by Dr. Rink. There is also some account of M'Clintock's efforts, and those of his lieutenants, Hobson and Allen Young, who went in search of the traces of Franklin sixteen or seventeen years ago. These matters need not here detain us further than to offer one or two remarks.

It seems, after all, not unreasonable, since we know there were a hundred men under Captain Crozier's command in April 1848 marching towards the mouth of the Great Fish River, to presume that they somewhere deposited the final records of that unlucky expedition, before the last man of them died on their dreadful journey. The probability of their having made such careful provision for the safety of those documents is rather greater from the fact of the Eskimo people being found in possession of a variety of trivial relics which our countrymen may have kept about their persons to the last. It is true that Lieutenant Hobson in 1859, after finding the latest written account of them at Point Victory, and the two skeletons further along that shore lying in a stranded boat, with the other tokens of their desperate condition and its end, looked in vain for the customary monument of a deposit, a conspicuous heap of stones. M'Clintock himself also went across Simpson Strait, and examined Montreal Island, near the mouth of Great Fish River, as well as the mainland coast and that of King William's Island, without seeing the cairn that might have been expected to mark a spot chosen for leaving the papers which we should have read with mournful satisfaction. But still there is a chance of their discovery, as there is much more than a mere chance of their existence; and the widow of Sir John Franklin was therefore justified in a hope, which she has not lived to realize, that something beyond the bare fact and date of his death, June 11, 1847, may yet be ascertained. It is doubtful, however, with a view to the interests of geographical science, whether the complete records of Franklin's expedition, sent out above thirty years ago, would prove of any great value at the present time. The enterprise of the North-west Passage, in which Captain Young perseveres with so much determination, has rather become a simple problem of dodging the ice-drifts, as we have explained, in sailing through waters now comparatively well known. It is an exploit of bold and adroit navigation, which may be worthy of ambition on the part of a seaman who loves his noble profession, and of which all Englishmen would feel in some degree proud. But it can hardly be said that the cause of science imperatively demands its speedy performance. From that point of view, one would think, it seems more desirable for our exploring ships to approach as near as may be to the North Pole. The incidental knowledge, too, which may be gained by the Polar Expedition concerning the ocean currents and the ice-drifts that so much affect the temperature of our Atlantic shores is likely to be of great practical utility. On the other hand, few persons would now dream of using the North-west Passage as a commercial route, though it was originally designed for access to the fabulous wealth of the Indies. Nor is there any temptation to colonize those vacant provinces of the British Empire in which not even the Eskimo can make a dwelling-place, and which the Arctic explorer visits scarcely once in ten years.

But where the conductors of popular journalism lead the way it is conceivable that the metropolitan caterers of excursion trips by contract may at some future time attempt a new field of operations. The successors to Messrs. Cook and Gaze will perhaps be enabled to issue return tickets from London, available within the season, ice permitting, for a summer voyage to the scene of Sir John Franklin's disasters, there and back, or even through Behring's Straits and round Alaska, to get home by San Francisco. Steam has almost rendered it possible to traverse the lesser of those distances and return to London between July and October, but for the obvious risk of being caught by the ice. The *Pandora*, which left Portsmouth on June 27th, was opposed in her outward voyage across the Atlantic by violent contrary winds; but twenty days would in ordinary circumstances suffice to reach Disco, the whalers' port of Baffin's Bay, and ten days more should bring the steamer, with a fresh supply of coal from Kudliset, well into Lancaster Sound. It is there, after proceeding further west through Barrow Strait to Peel Sound, or after turning directly south by Prince Regent Inlet, that the vessel incurs a danger of being prevented by the ice from getting out again two or three weeks later. The *Pandora* herself, in the first week of September, returning through Barrow Strait, had some difficulty with the ice blockade off Cape Rennell, the promontory of North Somerset fronting Wellington Channel to the north. In Prince Regent Inlet, east of North

* *Under the Northern Lights.* By J. A. MacGahan, Correspondent of the "New York Herald," Author of "Campaigning on the Oxus, and the Fall of Khiva." London: Sampson Low & Co. 1876.

Somerset, there is not so much fear of obstruction as in Peel Sound on its western side; but the only way from the bottom of Prince Regent Inlet to the westward is through Bellot Strait, which divides North Somerset from the Boothia mainland. Whether Bellot Strait or Peel Sound be the more difficult passage to get into Franklin Sound is a question not yet positively decided. Each has been stopped up at the particular times when a passage has been sought; but a future attempt either way is perhaps destined to be successful. It cannot, however, be effected, with the present means and appliances, in the Arctic sailing season of every year, but only in the most favourable years; for the expedients of boring and cutting a way through packed ice are limited to a thin crust of it, and a short distance to be traversed. When the *Pandora*, on the last day of August, having run down Peel Sound to La Roquette Isle, within sight of the mouth of Bellot Strait, encountered a field of consolidated ice-floes, from five to thirty feet thick, which extended fifty miles and filled the whole space from shore to shore, nothing more could be done. After waiting three days for the chance of an opening by some change of wind, Captain Young resolved to turn back, and he was but just in time to escape being shut in at the upper or north end of Peel Sound. This should be a warning to the mere summer excursionists of the future, who might else be tempted by advertisements of the wondrous enjoyments of an Arctic voyage.

The better part of those enjoyments, to judge from Mr. MacGahan's report of them, can be obtained without going further than the Greenland coasts of Baffin's Bay. Icebergs of exquisite hues and a fantastic variety of forms, assuming different aspects from hour to hour by the magical power of transformation which there is in the low sunlight and softened atmosphere of a Northern summer day, are constantly met with in that grand vestibule of the Arctic seas. The land presents to view a broken line of high rugged mountains, rising abruptly out of the water, above three thousand feet, to the sharp peaks and pinnacles behind which lies the measureless expanse of an elevated glacier, stretching far away with a continual upward slope into the unknown interior of Greenland. That vast country, in size a continent, and belonging neither to Europe nor to America, but itself a distinct section of the earth's surface, lies hidden under a massive plate of ice which fills up its deepest valleys to a height not much below its mountain tops. It is in the condition even now through which our own and other European countries have passed in former geological epochs, being continually planed down, and hewn or filed into shape, by the sliding and grinding or cutting action of the glaciers as they slowly descend to the ocean. The iceberg is well known to be merely a broken-off fragment of mountain glacier, formed probably in some elevated recess of the Alpine region far inland by the congealed snows and rains of many years. It is often found to contain pools of fresh water, an acceptable supply to the crews of passing ships. Mr. MacGahan has an eye for the beauty of these superb works of nature, and feels an intelligent interest, though his scientific studies are not very profound, in the mighty processes of which such tokens may be seen where he went last year. He makes himself still more at home with the merry and hospitable settlers of the Greenland shore. They were visited by the *Pandora's* company at Ivigtut, a station for the mines of kryolite worked by a Danish Company; at the little seaport town or hamlet of Lievely, in Godhavn, the harbour of Disco Island; and at Yuyarsusuk, in the Waigat Strait, near the place where coal is got without any price but the labour of digging it from the face of a cliff above the sea-beach. The Eskimo people in these simple villages, with whom are a very few Danes or half-bred persons employed in Government office or in mercantile business, seem to be a kindly and gentle race. But Mr. MacGahan and his comrades, of whom Lieutenant Pirie, R.N., and the Dutch naval lieutenant, nicknamed Van Tromp, are most frequently mentioned, saw those friendly Eskimo people at a favourable time. The men were all gone away seal-hunting, so that the frolicsome women and girls, being left to amuse themselves and to entertain their English or foreign visitors as they pleased, were in a very agreeable mood of innocent freedom. The dress of an Eskimo fashionable young lady, consisting of a short jacket, a pair of seal-skin knee-breeches, pretty red leather boots with tops of white linen, and some trimmings of fur, with the hair in a top-knot on the crown of her head, would have a certain piquancy of effect at a fancy ball in Europe. Mr. De Wilde, the artist of the *Pandora* expedition, has lent the aid of his pencil to Mr. MacGahan in representing some of those queer native figures with whom the officers and sailors joined in a feast and dance to beguile their short delay in the port of Disco. These parts of the narrative contain an admixture of humorous anecdote and banter which may perhaps be appreciated more readily by Mr. MacGahan's travelling companions than by readers of his book not personally acquainted with "Tromp" or any of the party. One person on board is so described that we should have been pleased to have made his acquaintance when he was to be met walking in Fleet Street, as Mr. De Wilde has drawn him, with his umbrella held for the sake of dignity over his honest old head. This person is "Eskimo Joe," the brave and faithful servant of Captain Hall's *Polaris* expedition, by whose unselfish labours, after the death of Captain Hall, some of that party were fed and sheltered and kept alive through a whole winter. It appears, from what Mr. MacGahan says, that Joe has been very ungratefully and unfairly treated. He really seems to be one of those good fellows, simple heroes of a despised tribe, whose example has now and then proved a capacity for the virtues of true manhood in every race of mankind. As Joe and his wife Hannah are now residing at New York, it is to be hoped that Mr. MacGahan's testimony on his behalf may serve to win some kind of modest provision for his old age.

NEW CLASSICAL POETRY.*

IT is natural that the favourable reception given to the *Songs of Two Worlds* should have led the author to continue his poetical exercises; and it is no doubt a true instinct which has led him to "tread the classic paths of song," of a special aptitude for which he had given evidence in a sketch, "From Hades," in his third series. Not that he loaded the language of his blank verse with idioms or expressions closely imitated from the classics, as is the wont of some modern poets, or sought the ear of scholars by echoing, with little difference save of tongue, the words of Homer or the dramatists. It was rather the spirit than the letter of Greek poetry which was reproduced. In the *Epic of Hades*, now before us, we have an expansion of the little piece which we have just mentioned, and it deserves to be commended to the attention of all who take an interest in the problem how to turn classic models to good account. We have coupled with the *Epic of Hades* a volume of mixed pieces by the author of a neo-classic drama of some eight or ten years ago, *The Sorrows of Hypsipyle*, because those among them which are on classical themes have the merit of simplicity and directness, and so far belong to what one may hope is a new or a reviving school.

The form of the *Epic of Hades* is a dream of a visit to ghost-land by the author, a singer of our younger day. His handling of this theme cannot be called wholly subjective or wholly objective. He brings the various ghosts clearly before us in such a way that we can recognize them at once without the help of labels. In his choice of subjects the author has not shrunk from venturing on ground already occupied by at least two Victorian poets, those associated with the names of Marsyas and Andromeda. But in neither case need he shrink from comparison. His Marsyas is full of fine fancy and of vivid description; a blending of new and old in what a fabulist would call the myth and the after-myth. The finding of the flute, the contest with Apollo, the arbitrament of the Muses suspended for a time by the question of superiority betwixt breathed or hand-wrought—auletic or citharædic—music, the turn of the scale when the sun-god throws his voice into the balance, all these furnish passages of fine conception and execution; whilst the vindication of a noble strife for fame, even if its end be

> To fall upon the icy ledge, and fall,
> Where other footsteps dare not,

is a worthy tribute to the more modern shades which inspire this portion of the strain:—

> Him
> Whose sad young eyes grow on us from the page
> Of his own verse: who did himself to death:
> Or whom the dullard slew: or whom the sea
> Rapt from us.

But as the vision of Marsyas deserves study as a whole, we shall quote only a fragment of it, to show the author's nicety of description of nature's aspects. It is where the shepherd amid the summer stillness catches the goddess's flute-notes:—

> The time when a deep silence comes
> Upon the summer earth; and all the birds
> Have ceased from singing, and the world is still
> As midnight, and if any life there move—
> Some fur-clad creature, or cool gliding snake—
> Within the pipy overgrowth of weeds,
> The ear can catch the rustle, and the trees
> And earth and air are listening.

The Andromeda has to us one recommendation denied to Kingsley's—a more congenial metre; another is its unstrained and natural narrative, whether the heroine is rising within her palace home to a sense of destined self-sacrifice, or, as the strains of priest and procession fade in the far distance above, listening on the rock-ledge for the coming of the sea-monster, till the catastrophe

> At the dead dark hour before the dawn,
> When sick men die.

Both in this picture and in the kindred one of Medusa, later in the volume, sufferings for the salvation of a people, directly or indirectly, and the

> strange chain of sacrifice
> That binds an innocent life, and from its blood
> And sorrow works out joy,

are dwelt upon and interwoven with the myth. Andromeda dates her insight into the real meaning of her life and deeds from the time when the eternal calm of the tomb was broken for a brief space by

> One who was divine
> Not as our gods, joyous and breathing strength
> And careless life, but crowned with a new crown
> Of suffering.

In glancing at some of the other tenants of Hades who are mad to figure in this poem, we must be content just to mention the touching presentment of Laocoon and his sons, a group interpreted into new life by intensely natural treatment, and to confine ourselves to the portraitures of Helen and Heracles, the latter is wrought in the myth of Deianeira. The author has endeavoure

---

* *The Epic of Hades.* By the Author of "Songs of Two Worlds." London: Henry S. King & Co. 1876.

Songs Now and Then. By J. Ashe. London: Bell & Sons. 1876.

to give consistency to the riddle of the resistless beauty who was "the Hell of men and fleets and ships," and to win for her the reader's condonation, as well as that of Menelaus and the Trojan elders. His clue to her fickle frailness, her quick wearying of the court and love which it is her curse to inspire, and

> A weary look no other than the gaze
> Which ofttimes as the rapid chariot whirls,
> And ofttimes by the glaring midnight streets,
> Gleams out and chills our thought—

is the secret of a shepherd first-love "in a little landlock'd bay, whose banks sloped gently downward to the yellow sand," on whom were expended her first-fruits of passion, and after whom Theseus, Menelaus, and Paris, were only so many successive pastimes, fraught with fate and ruin to nations. Looking back upon the scene of her love's young dream, her saddened spirit quickens to enthusiasm, and she fondly asks—

> Break they then still,
> Those azure circles on a golden shore?
> Is there a spot upon the older earth
> Where spite of all, gray wisdom and new gods,
> Young lovers dream within each other's arms
> Silent, by shadowy grove, or sunlit sea?

The key to the whole after-career is furnished in the following lines:—

> Love like a flower,
> Love springing up too tall in a young heart,
> The growth of morning, Life's too scorching sun
> Had wither'd long ere noon. Love like a flame
> On his own altar offering up my heart
> Had burnt my being to ashes.

Remembrances of the Greek chiefs of divers dates, of the false Paris and the nobler Hector, of the sack of Troy, the death of Priam, the carrying-home to Greece, the Rhodian episode, and her fate after others reigned at Sparta in place of Menelaus, are inwoven in the tale with considerable dexterity, and the "fairest woman of the poet's dream" attributes her escapades to the gods having marred "her life with too much beauty."

A key is also found for the tale of Heracles and his tragic death, worked out, by the way, with much force in Mr. Warren's Philoctetes. Our poet sets in prominence the weak side of the hero, as pleading excuse for the often-left helpmate's jealousy. In the course of a few pages we recognize scenes and thoughts borrowed from the *Trachiniæ*, though the loan is skilful and legitimate. But the gist of the whole tragedy as it is here epitomized is Deianeira's description of her hero, as

> Mighty in war, mighty in love; now bent
> To more than human tasks, now lapp'd in ease,
> Now suffering, now enjoying;

or, as Heracles's own interpretation of his life puts it:—

> I have lived
> As he lives who through perilous paths must pass
> And life-long trials, striving to keep down
> The devil within him; born of too much strength,
> And sloth, and vacuous days; by difficult toil,
> Labour endured, and hard-fought fights with ill.
> Now vanquished, now triumphant, and sometimes,
> In intervals of too long labour, finding
> His nature grown too strong for him, falls prone
> Awhile a helpless prey, then once again
> Rises and spurns his chains, and fares anew
> Along the perilous paths.

"Quo semel est imbuta recens servabit odorem Testa diu." It is satisfactory to find Mr. Ashe, like the writer with whom we have coupled him, drinking still at the old sources, and displaying in his verse a kindred spirit and flavour. He, too, lays himself out rather to catch the spirit of classic models and to expand hints from ancient epics, such as the "Gift of Here," or the promise made by that goddess to Æolus on condition of his "listening to her hard behest" about the ships of Æneas. We are introduced to Deiopeia, fairest of Here's attendant nymphs, awaiting her destined bridegroom "on the windy top of old Pelorus," and the picture and soliloquy are equally classical. At first the nymph bemoans the lot that has withdrawn her from the splendours and glories of Olympus, now exchanged for the contemplation of her bridegroom's

> Stormy isles,
> Goat-feeding Lipara with heart of fire,
> Didyme, Ericusa, and the rest.

But anon the calming down of the elements is made to synchronize with her lord's coming. The waking up of the maiden, whose eyes had closed in fear and terror—

> when the dizzy whirl
> Of windswept motion numbed her brain to sleep—

to a morning of hope and contentment, is very pretty:—

> Gradually
> A sense of things grew out of troubled dreams;
> And she was lying on soft grass, beside
> The green marge of a fountain; but the sun,
> Bright on it, only shed stray beams on her,
> For shade of graceful poplars hung o'erhead,
> Whose leaves the breeze show'd silver, twinkling, made
> A pleasant pattering sound, like summer rain.
> Two streams, which took their sources from the fount,
> Ran near, reflecting many-coloured flowers.

Another like sketch, entitled "Psamathe," takes its warranty from a hint in Catullus's Nuptials of Peleus and Thetis (lxiv. 11-8), and follows the fortunes of a stray Nereid who, like the Muriels of romantic poetry, had a mind to visit the haunts of earth, "to hear the music of men's speech and clasp their hands in love." Her earth-dream ends in disenchantment, and we are permitted in the sequel of the poem to strain our eyes after her as she slips beneath green waves, and we

> Can see no more the snowy arm
> And pearl-white shoulders glancing mid the foam.

The story is prettily told, and the chief drawback to Mr. Ashe's poetry is a little mannerism, such as the tacking of the initial "a," which we find in "akin" or "afloat," to any number of words. We count three in as many pages, "aroll," "aroar," and "aglow," and we doubt whether the number might not be multiplied by a closer survey. Another poem, called "Acede," is indebted somewhat to classical fancies; and yet another, called "A New Alexis," which is graceful and tender, though the topic is, we cannot help thinking, of doubtful taste. Truer, and more to our fancy, is a blank-verse presentment of Cleobis and Bito, from the account of them in Herodotus (p. 85-7). But it would be wrong to leave our readers under the impression that the author of *Songs Now and Then* at all confines himself to classic themes. He is far from unsuccessful in modern love songs; he records passing thoughts and memories in short pieces that are sonnets in all but form. Still we like best the lyrics which tell a tale of his first love amongst the muses; and in closing our necessarily brief notice of his new volume we shall recommend it to the reader by quoting his "May Day" (p. 57):—

> O day, divine as love or dreams!
> The wizard sun
> Works such enchantment with his beams,
> As would have won
> The heart of Pluto to set free,
> Nor snatch to Hell,
> Ceres's fair child, Persephone,
> In Enna's dell.
>
> O splendid flashing of his eyes!
> The locks of gold!
> O revelry of youth, that lies
> Round brows, as old
> As death the phantom, as the glow
> Of dawn dew-pearled;
> As time, as passion, as the woe
> That galls the world!
>
> O day, divine as love or dreams!
> The hills are glad!
> I hear the laughter of the streams,
> Of Oread,
> And Fawn! O day! a Danae
> To this gold shower,
> The earth burns like a rose for thee,
> A virgin flower.

PEARLS OF THE PACIFIC.*

LET no one in search of information regarding pearls and pearl fishing turn to Mr. Boddam-Whetham's pages. The alliterative title which he has prefixed to them has no reference to real gems, but is an example of one of those devices to which bookmakers have recourse who are uneasily conscious that their literary wares stand in need of some adventitious allurement. Why Mr. Boddam-Whetham could not have contented himself with a plain title we cannot understand. His book is an account of travels in the Hawaiian, Samoan, and Fijian islands. A title which should say so simply would prove quite as taking, we should think, as one which admits of a double interpretation. But then it might seem to lack ingenuity, and accordingly it was rejected in favour of a grandiose but meaningless jingle of words. Moreover, on what grounds the islands above mentioned are dubbed pearls of the Pacific is not at all clear, unless it be that the figurative epithet is supposed to be poetical. But even in poetry we expect epithets to be suitable. When the Spaniards boastfully styled Cuba the Pearl of the Antilles, they were so far justified that the island is beyond all doubt the largest, richest, and most beautiful in the West Indies. But the superiority of the three groups visited by Mr. Boddam-Whetham over all others in the Pacific Ocean is an assumption for which there is no warrant. Want of taste and literary judgment are not displayed in the selection of the title alone, but constantly reappear, though most glaringly at the beginning of the book. Nor are the merits of the author such as make us readily forget his defects. Mr. Boddam-Whetham encountered no stirring adventures, and saw little out of the beaten track; his descriptive powers, too, do not enable him to throw the charm of novelty over an oft-told tale. Still the islands which he visited lie so far out of the course of all but a few English tourists that his narrative may for some people not be without a certain interest.

When Mr. Boddam-Whetham reached Honolulu, he found the Hawaiians in all the excitement of a most important contested election. The royal line of the Kamehamahas had become extinct in 1872, and the successor who had then been chosen to found a new dynasty had also died childless and without naming an heir. It devolved therefore upon the Legislature of the kingdom to elect a new sovereign. It speaks much for the political progress made by a people who were naked savages at the time of Captain Cook's visit, that a disputed succession gave rise to no civil war or disturbance of any kind outside the capital. The only riot that

* *Pearls of the Pacific.* By J. W. Boddam-Whetham. London: Hurst & Blackett.

occurred was a less serious affair than often might be witnessed a few years ago on the occasion of a Parliamentary election in a third-rate country town here at home; while in the rest of the kingdom the choice of the Legislature seems to have been at once acquiesced in. There were two candidates for the throne. Queen Emma, whose visit to this country some years ago may be remembered, was the popular favourite, at least in Honolulu. She was the widow of Kamehamaha IV., a former king, and was granddaughter of an Englishman who married the daughter of a native chief. Her competitor was a native chief. It would seem, if the scandal of Honolulu is to be trusted, that the Hawaiians have made progress in the less desirable practices of representative government, as well as in obedience to the decision of the constituted authorities. For the members of the Legislature are accused of having taken bribes. The Ministry then in office desired the election of Kalakaua, the rival of Queen Emma, and they carried their point. If Mr. Boddam-Whetham correctly understands the working of the Hawaiian Constitution, there were at the time two Legislatures in existence. The term of that elected in 1872 had not come to a close, while the term of that elected in 1874 had not begun. It would seem therefore that it was the old Legislature which ought to have assembled to choose a new sovereign. But, as a matter of fact, it was that of 1874 which came together. Of course, Queen Emma's partisans accused the Ministry of having summoned this body for its own purposes. As the election of a King, even in the South Seas, is not an everyday occurrence, our readers may desire to have the description of the scene before them:—

> The Legislative Hall was on the second story of the building, and on entering we found three-quarters of it occupied by the Assembly, the remaining quarter overflowing with anxious spectators, whites and browns. The desks of the nobles and representatives were arranged in a semi-circle around that portion of the hall assigned to them, the upper part being occupied by the throne, draped in black, and the dais of the President. On the right of the dais were the seats reserved for the Ministers, Consular representatives, &c. The roll of the nobles and representatives was called at twelve o'clock precisely, and all responded except one member, who was absent from the country, there being thirty-four representatives and eleven nobles. . . After the Prime Minister had read the announcement of the death of Lunalilo, the balloting for his successor commenced; Kalakaua, who had occupied his seat among the nobles, having previously left the hall. The whole proceedings were carried on both in English and Hawaiian, and in a most orderly and parliamentary manner; but the shouting and cheering which were heard going on outside betokened that those who were holding forth to the mob indulged in a more fiery and inflammatory mode of address than was considered proper in the Hall of Assembly. The result of the ballot was the election of Kalakaua by a vote of thirty nine to six for Queen Emma.

A Committee was at once appointed to wait upon the newly-chosen King to announce to him his election to the throne. But no sooner had the Committee issued from the building than it was assailed by the mob, the carriage in which its members had seated themselves was speedily wrecked, and the members were dragged out and severely beaten. It was with difficulty that they regained the shelter of the Court-house. The Ministers had made no preparations to quell a riot, possibly because they knew the native forces could not be depended upon, and shrank from suing for protection from the foreign Consuls. The mob soon learnt that it was master of the situation, and proceeded to break open the doors, to ransack the building, and to maltreat the representatives. Eventually, however, a party of marines from a British and an American man-of-war in the harbour restored order. During the remainder of Mr. Boddam-Whetham's stay in King Kalakaua's dominions, he encountered no adventure equally exciting. He saw the hula-hula, a native dance not unlike that of the Nautch girls of India; and of course he visited all the sights of the island, especially the volcanoes, extinct and sleeping. But in his descriptions there is nothing striking or novel. Of the natives he brought away a kindly opinion, having found them uniformly courteous and obliging. But they are slowly dying out. They pass their time chiefly in amusement, working as little as possible. Trade at the time of his visit was stagnant, the cotton industry was depressed, and altogether the future prospects were not bright.

The next group visited was the Samoan. The people are still in the naked savage state. The men tattoo almost the entire body, so that at a distance they appear to be dressed in blue; and they are as fond of idleness as the Hawaiians. But they are fine, stalwart, and well built. Their chiefs are especially fine-looking and tall, and they wield almost unlimited authority over their tribesmen. They have a dialect of their own, and a large number of words are used only in application to them. The Samoans are described as gentle in disposition and easily managed. A considerable number of Europeans have settled among them, and exercise great influence. They have introduced cotton-planting, which here has proved a profitable industry. And the islands are the centres of a brisk trade. It is a remarkable proof of the enterprise and commercial aptitude developed by the present generation of Germans that almost the whole carrying trade of these regions has passed into German hands. It was in a German sailing vessel that Mr. Boddam-Whetham made the voyage from Honolulu to Apia, the chief town in the Samoan group, and although at the time of his visit the harbour of Apia was crowded with shipping, only one vessel hoisted the Union Jack. But, although commerce seemed so much more flourishing than in King Kalakaua's kingdom, the Samoan islands have this great drawback, that the climate is very trying, being both hot and moist. A trip to the latest addition to the British Empire—Fiji—was the utmost limit of Mr. Boddam-Whetham's travels. He strongly approves of the policy of annexation, and is sanguine in his expectations of the benefits that will accrue from it. But we need not follow him in his history of the quarrels between the white settlers and the Ministry of the native King, which preceded annexation, and render it necessary. The scenery of the islands he describes as very fine, and their resources great. But cotton-planting there, as in the Hawaiian group, has proved a failure, and is being superseded by sugar-growing. The Fijians are described as powerful and well made, but, like the natives of the preceding groups, they are indisposed to work. Consequently the plantation hands are mostly brought from other islands. In the interior of the islands, the tribes, as we have all heard, are man-eating savages. And Mr. Boddam-Whetham quotes in full the report of a native of rank, who had been sent on a mission to one of these cannibal tribes, of his experiences amongst them, which gives a very vivid impression of the savagery of these interesting fellow-subjects of ours. Since annexation the hill-tribe chiefs have been persuaded to acknowledge British authority. It is to be hoped the acknowledgment is not merely formal. On the sea-coasts the people are orderly and have embraced Christianity; but an anecdote told by Mr. Boddam-Whetham (though, we are afraid, not a new one) suggests doubts as to the reality of the conversion as well as concerning the wisdom of the missionaries. One of the chiefs, we are told, asked to be baptized, but was refused on the ground that he had a number of wives. He went away with a very dejected countenance, but some time afterwards returned, and joyfully told the missionary that he had got over the wife difficulty. The good clergyman was profoundly pleased by the proof thus given him of the chief's sincerity, and bestowed many encomiums upon his convert. At last, however, he bethought himself to inquire how the convert had disposed of his surplus wives. "I have eaten them," was the triumphant reply.

THE DEMOCRACY.*

THE author of *The Democracy* has chosen a motive which has been pretty frequently used in poetry, but is rather less common in prose fiction. He tells the story of a man of ability and character, almost of genius, who, rising from the lowest class, and animated by a passionate devotion to the cause of the people, ultimately yields to the seductions of the world, forgets his aspirations, and with them loses everything that gave him importance and interest. It is obvious that success in the conduct of a plot so ambitious as this cannot be obtained without an unusual knowledge of the extremes of society. If the tale is to have any reality at all, the gutters and the gilded saloons must be described with much more tact and sympathy than are commonly given to novelists. Tact and sympathy are not wanting to the author of *The Democracy*, but he has not got them in sufficient measure to avoid an air of unreality, which is the chief fault of a very careful, and in many respects very praiseworthy, story.

Besides the general difficulty of which we have spoken, there is another to be overcome, in the delineation of the character of the hero. If he is to be made more interesting than the successful or unsuccessful agitator of everyday life, he must have a somewhat refined cast of talent, developed out of rather extraordinary circumstances. Mr. Kingsley, in a novel which *The Democracy* in some places resembles, made his Alton Locke a poet. Poets, of course, can go everywhere, and their native sensibility is fine enough for anything. It has proved more difficult to bring Paul Nethersole, the hero of *The Democracy*, within range of the temptations that were too much for the Republican virtue of Alton Locke. The writer has been obliged to bridge over the gulf between Clerkenwell Green and Grosvenor Square in a rough-and-ready way. On the other hand, there is much ingenuity in the development of Paul Nethersole's character out of surroundings and antecedents carefully disposed so as to produce an interesting "irreconcilable" of good taste and not ungentle manners. Everything is so arranged as to beget in him a kind of personal grudge against society, property, and authority, and, at the same time, a distrust of mere vulgar fanaticism and the rhetoric of Trafalgar Square.

Paul Nethersole was the son of a small tradesman who displayed in humble life qualities which, had he only been a king, would have endeared him to Mr. Carlyle. Lucius Nethersole was a miser, not absolutely from love of money in itself, but because he had his eye on an ever-receding future of ease and respectable good-fellowship. He was a fierce martinet in the matter of neatness, perpetually flicking particles of dust off his furniture, and arranging chairs and tables with mathematical precision. "On the rare occasions on which he was false to avarice the passion for domestic symmetry had led him astray." To the "veracity" and "thrift" thus indicated in his pleasing character, Mr. Lucius Nethersole added a violent and dangerous temper. Not very long after his marriage he had driven his wife and her infant child Paul from his house, and when the story opens he was living alone with his elder son Peter. Peter was a genius in his way. "At ten he announced a discovery to his father—how to tilt the scale and save a quarter of an ounce." In spite of Peter's congenial qualities, Lucius was beginning to think it would be respectable to bring his wife and her boy back again, and he acceded without much

* *The Democracy.* By Wyvis Thorne. London: Chatto & Windus 1876.

difficulty in getting them to return. Mrs. Nethersole had made a living while separated from her husband by her skill as a dressmaker, and had been aided by the patronage of a certain Lady Fermor. She had given Paul, now a lad of twelve, the best education within her reach; he was head boy of a Classical and Commercial Academy which had turned out many pupils afterwards distinguished in retail trade. When the young scholar and his mother answered the appeal of Lucius and went back to his house, their misfortunes began in earnest. There was no more education for Paul; it was proposed to make him a page in Lady Fermor's household, and, after resisting as long as he dared, he ran away from his ferocious father. Paul had only lately learned "that there were tribes of the English, and that he was one of the lower." The discovery was made more bitter by a kind of childish passion for Lady Fermor's daughter Henrietta. To be her servant, and that in buttons, seemed intolerable, so he fled away on a snowy night, fell asleep on the parapet of Waterloo Bridge, was rescued by a casual passer-by, and in his company made the acquaintance of some typical members of the "Democracy."

Paul's preserver was a working-man named Berdoe, whose object and aim in life was to do no manner of work. His delight was in conversation and contemplation of the spectacle of life. Here is his statement of the Cyrenaic philosophy:—

> Enjoy! Not to do that is the unpardonable sin. The one thing I think terrible is to grow old without having *tasted*. For my part, every dinner I eat, every pipe I smoke, every pretty woman or fine picture I look upon, every strain of sweet music I hear, I consider as one sensation of pleasure of which I have made sure. The thing is thenceforth and for ever beyond the power of fortune—nothing, not even Omnipotence, can take it away. Miss your opportunity; put it off, as so many people do their joys, to a more convenient season, and a thousand accidents may happen. It may never come in your way again, or, if it should, age may have taken away your relish for the feast of life.

This clever nonsense, with its scraps of Scripture misapplied, is much more what might be expected from the idlest of "idle fellows" than from a speculative working-man, however indolent. Berdoe's philosophy is meant to balance that of old Nethersole, always putting off enjoyment, till age has taken away his relish, or till it has ceased to be possible. Perhaps there is too much of this sort of reflection in *The Democracy*, and there is certainly too much about old Nethersole, who takes up the space that is sadly needed at the end of the story, where the incidents are crowded together with little art. This fault of inappropriate tone and incongruous language rather spoils the humour of all the characters drawn from low life. To take another instance, when Paul, after some queer adventures, gets a place as shopboy to an atheistic and Republican bookseller, he meets a certain "Robespierre Pegler." Pegler is meant to be the common agitator of Clerkenwell Green. He is the author of "The Secret History of the Royal Families of Europe"; he lives in a garret in a court off Drury Lane, where his furniture mainly consists of a gin-bottle, a dagger, and a list of persons whose heads are to fall in the next revolution. He describes himself to Paul as "not a man, but a cause. I am '89. I am the Revolution. I am the proletariat in arms. I am death to tyrants—do you mark the word, boy?—tyrants." This fustian is not inconsistent with the fact that Mr. Pegler used to earn a supper by taking the Tory side in the discussion forums of taprooms. But it does seem inconsistent with the fact that Pegler was a man a good deal trusted by the promoters of demonstrations, and by all the small political people of the book. Indeed none of them are very much better than Pegler, and the pity of the hero for the degradation and wretchedness of the proletariat is meant to be enhanced by the fact that he does not find in that class any leaders except foolish fanatics and interested sneaks. Paul passed two or three years with Frere, the atheistic bookseller, and with his pretty and religious daughter Lucy. Just as Berdoe talks too much like an æsthetic essayist, so does Lucy speak too much in the more serious tone of Mr. Matthew Arnold's theological criticisms. She has a vague spiritual orthodoxy of her own, expressed in choice language which she could hardly have learned from the literature in her father's shop. Her influence counteracted that of the Peglers and of Frere; and if Paul had been disposed to buy a dagger and to sneer at Noah's Ark, Lucy would have brought him back to common sense and decency. The natural result was that she fell in love with him, though the explosion of her passion was deferred by circumstances.

It chanced that a certain "swell," named George Chilver, was anxious to see something of the people. His philanthropy was at once "exploited" by a dirty little politician named Washington Bee. Bee, with Pegler and others, got up a "demonstration" *apropos* of nothing in particular, Chilver supplying the funds. There is an amusing scene in the Committee-room:—

> "There's banners," suggested a Committee-man.
> "Liberty, Fraternity, and Equality!" said Mr. Pegler.
> "And Free Thought," added Frere; "that's worth all the rest."
> "Citizens," said Mr. Pegler, glaring revengefully on Frere, and rising with all the indications of a great oratorical effort, "I have an amendment against the words 'And Free Thought.' I do not oppose them as a sentiment, but as an expense. It will cost us an extra yard for every banner, not to speak of gold fringe."

The absurd demonstration ended in a puny riot. Pegler stopped a carriage, Lady Fermor's of course, and insulted her daughter. Frere was hit on the head, and died; his death-bed scene is very well described. Paul went on living in the same house with Lucy, and becoming more and more convinced that gold fringe and banners would never win the people's battle. Meanwhile, his father again drove his mother from his house, and, not being able to live on the twopence a day which she earned by sewing braces, she died of starvation. Recognizing in her death, and in his wretched old father's prosperity, an instance and a result of the institutions of property and of authority, Paul became a convert to socialism. To get knowledge, which he could not but see was absolutely wanting among his comrades, he studied at a working-man's college, where Chilver happened to be lecturing. The plot now moves pretty swiftly. Paul became the friend of Chilver, he took to literature, made money, and occupied himself much in deeds of charity. It struck Chilver that Paul would be a good man to have in Parliament, and as he himself was not Chilver at all, but Lord Fermor in disguise, he easily put his *protégé* into a Radical pocket borough which he happened to possess. Few things, in a mild way, can be much more improbable than that a man of title, living as a rule in ordinary society, should have kept his identity concealed for years from the people with whom he associated; but this rather clumsy device is necessary to bring Paul at once into connexion with public life, and with Chilver's, now Fermor's, sister, Lady Henrietta. At first Paul took the House of Commons by storm, and was cheered when he made speeches about the "Condition of England question," and brought forward motions for "an Inquiry into the State of the Nation." In its laxer moments the opinion of the House associated him with working-men's tea-parties and plum-cake. Unluckily, Fermor once asked his friend to his house, where the tea-party was of a more distinguished sort, and from that moment it was all over with Paul. He fell hopelessly in love with Lady Henrietta, felt much more pain at the thought of his own social awkwardness than of any other social difficulty, and tried to win Lady Henrietta's heart by learning to ride, taking rooms in May Fair, buying a gold latch-key, and toning down his political opinions. The end of it was that his partisans who had hailed him as the "hope of the human race," hooted him off the platform. Lady Henrietta, who was entirely indifferent to the fascinations of his seat on horseback, and probably ignorant of the existence of his gold latch-key, rejected him when he had the audacity to propose to her. From the day of her marriage to another Paul was no more seen, not at least by Lucy, who had showed him with extreme plainness that she loved him, nor by his father, nor by Berdoe, who became a parish beadle, and contemplated existence from the serene and lofty height of that office. *Pacem summa tenent.*

There is something inartistic in Paul's disappearance, like "a burst bubble on the waters of life." Probably we are meant to suppose that he committed suicide, which would have been a natural termination to his infatuated folly about Lady Henrietta. But the whole of the conclusion of the story, with Paul's wonderfully sudden lapse from virtue into second-rate dandyism, is rather hurried and unnatural. If the change had been confined to his opinions, it would only have been usual; but Paul has not been represented as a vulgar nature likely to be fascinated by "dressing-gowns cut and finished with almost as much nicety as a walking coat." Altogether, there is a want of distinctness in the conception of Paul, in spite of all the trouble that has been lavished on him, and there is a want of proportion in the various parts of *The Democracy*. An impression of melancholy is left, on the whole, and there is too much questioning of life. In spite of these blemishes, however, it is quite in a different class from the ordinary stories of the day. *The Democracy* has plenty of humorous scenes which are amusing enough, and would be even more so if one could be sure that they were true to life in Clerkenwell as well as in the House of Commons. The reader is tempted perhaps to wish that the book had been recast before publication, but he feels justified in hoping for satisfactory later work from the author.

GERMAN LITERATURE.

THE centenary of American independence has called forth a review of some of the most remarkable aspects, past and present, of American social and political life, from the pen of an intelligent foreign resident of long standing. Herr Kapp *, already favourably known as the author of a work on the employment of German mercenaries in America during the colonial connexion with England, has brought together some of the results of his American experience in two good-sized volumes. Most of these essays, indeed, have appeared before, but they were well worth collection. A considerable part of the book relates to a subject on which a German emigrant should be qualified to speak with especial authority—namely, the character of the immigration from Germany and the circumstances under which it takes place. The author sensibly dissuades his countrymen from entertaining any expectation of the permanence of the German nationality in America, or of the ultimate constitution of a Republic parcelled out among English, Irish, Germans, and Americans, as Switzerland is shared by German, French, and Italian Swiss. The circumstances are totally dissimilar, and the utmost that can be expected is that the German element may exert an appreciable influence on the national character. A large part of the essay is occupied with exposing the infamous frauds practised upon the immigrants, including details of the particular hardships and misadventures of certain vessels. There is also a very interesting account of the early struggles of the now flourish-

---

* *Aus und über Amerika. Thatsachen und Erlebnisse.* Von Friedrich Kapp. 2 Bde. Berlin: Springer. London: Asher & Co.

ing German communities in Western Texas. The author's German feeling comes out strongly in the reprint of his correspondence during the Civil War. The Germans, it will be remembered, were far more uncompromising opponents of slavery from an abstract point of view than the native Americans; and accordingly Herr Kapp has scant patience with the prudent hesitations of President Lincoln, and does not enter at all into the feeling of American statesmen that the question was one to be considered in the light of its bearing on the preservation of the Union. Though living in the midst of Americans, he appears to have been as little able to appreciate the intense determination of the people as the majority of observers at a distance, and hence he is full of doubts, misgivings, and mistrusts which are shown by the event to have been wholly gratuitous. It is also significant to find him so influenced by national feeling as to prefer the incompetent Sigel to General Howard, who was regarded by Sherman as one of his ablest officers. With all these drawbacks, the letters are a lively record of the impressions of a thoughtful mind, placed at the centre of stirring events. An historical sketch of the slavery conflict preceding the Civil War, and a sound exposition of the Monroe doctrine as originally promulgated, are also among the more valuable constituents of these volumes. The Monroe doctrine, it is not always recollected, was elicited by the proceedings of the Holy Alliance on the continent of Europe, and was originally designed to obstruct any forcible interference in the contest between Spain and her revolted colonies. The more questionable denial of the right of a European Power to acquire territory on the American continent is believed to have been interpolated into the original draft by the Secretary of State, John Quincy Adams.

Herr Constantin Rössler * is a very wordy writer, whose handsome and substantial volume may be described as imposing in more senses than one. Any interest attaching to it arises from the author's honest belief in the Prussian State Church, not as a Church, but as a State Church. He disapproves most particularly of Strauss, Schopenhauer, and *id genus omne* on the one hand; he has so little affection for the Romish Church, on the other, as to hint, not obscurely, that the time will sooner or later arrive when it will have to be persecuted out of existence; but he seems somehow to have attained the conviction that nothing more is required than "the centralization of religion" as a department of State for the edification of the nation, the education of youth, and the reformation of manners. Starting from the basis of the most extreme Erastianism, he has reached nearly the same practical conclusions as those developed in Mr. Gladstone's early work on Church and State from the contrary point of view.

Count Baudissin's contribution to the history of Semitic religion † are acceptable reviews of the present state of our knowledge on a subject which is as yet very obscure from the poverty of material. It is indeed a question how soon the influx of information from Assyrian sources may render this observation inapplicable; at present, however, it is difficult to get much beyond the particulars of the polytheistic phases of Semitism incidentally imparted in the Scriptures. The clearness and copiousness of Count Baudissin's dissertation on the only strictly Biblical subject treated in his volume contrast forcibly with the inevitably meagre and speculative character of the remainder of his essays. This disquisition treats of the conception of the heathen divinities entertained in the Old Testament, very carefully, and with a great affluence of quotation, tracing the progress from the original conception of these deities as national tutelary genii endowed with an actual sphere of authority, to their subsequent subordination to Jehovah, and their ultimate resolution into mere figments of the imagination. Count Baudissin's views as a Biblical critic are moderate and conservative; he does not believe in the original identity of the Jewish Deity with any local Semitic divinity. A portion of his essay is devoted to an examination of the traces in the Old Testament Scriptures of the later view by which a substantial existence was accorded to the gods of the heathen, while they were at the same time regarded as evil spirits. Other essays discuss kindred topics, such as the traces of serpent-worship among the Semites, which Count Baudissin regards as purely indigenous, and the origin of the Sibylline and Gnostic sacred name Iao, which he considers as undoubtedly identical with the Hebrew Jehovah. Another investigation of great interest discusses the genuineness of the fragments of Sanchoniathon's Phœnician history, professedly preserved by Philo of Byblus. Count Baudissin does not believe in their authenticity, and considers that they were probably fabricated by Philo himself, or some other advocate of the Euhemeristic theory of mythology which they express, but to which a genuine Phœnician document would have afforded no countenance. A second volume is announced as in preparation.

Albrecht Weber's lectures on the literary history of India reappear in a second edition with the addition of so many notes and comments as to render them almost a new work.‡ The extremely unsettled condition of most Indian literary problems necessitates frequent modification either in the maintenance of the writer's own views or in his attitude towards the opinions of others, while his sturdy honesty suffers him to leave no difficulty unacknowledged. A more thorough and intrepid love of truth could not be desired, and the author's intellectual characteristics are reflected in the simple, straightforward, but at the same time rugged and arid, character of his exposition. The lectures are designed to afford a general view of the literary history of India from the time of the Vedas, including of necessity the religious development of the Indian mind, and to some extent the scientific also. The general tendency of his criticism is to bring down the dates of the masterpieces of Indian literature. The great epics, he thinks, may have been written about the commencement of the Christian era; Kalidasa may have flourished about the fourth century, and Bhavabhuti as late as the seventh or eighth. He points out the influence of the Greeks on Indian astronomy, and suspects that the author of the Ramayana may have been acquainted with the Iliad.

A curious and learned essay by F. Kittel * discusses a subordinate point of Indian mythology, the origin of the veneration of the Linga as a religious symbol, principally in the worship of Siva. The practice is usually supposed to have been adopted by the Aryan conquerors from the indigenous population. Herr Kittel, however, maintains the contrary view, and seems to assign strong reasons for his opinion.

Dr. Gilow's essay † on the relation of Greek philosophy to the national religion insists forcibly on the peculiarities which tended to mitigate the conflict between tradition and the spirit of inquiry, more particularly the indefinite condition of dogma among the Greeks, and the absence of a hierarchical caste and a body of sacred writings. He then proceeds to investigate the opinions of the philosophers prior to Socrates, classifying them according to their relation to the popular creed.

A work on the philosophy of the present epoch, by Karl Grün ‡, the biographer of Feuerbach, ought to have been interesting, its professed design being to trace the progress of speculation from the culminating point of Feuerbach's philosophical activity, some thirty years since, to this day, thus including the rise of the pessimistic systems of Schopenhauer and Von Hartmann, and the development of scientific materialism. Unfortunately, although Herr Grün's language is not ill adapted to serve as the vehicle of thought, the thought itself is usually imperfectly conceived in his own mind, and the course of his reasoning is impeded by all manner of sallies and digressions. He is more felicitous in citing the ideas of others, which fortunately constitute a large portion of the substance of his book.

The Munich Library § possesses twenty-four detached leaves taken from the covers of MSS. formerly in the Freising Library, and containing fragments of the Itala or primitive Latin version of the Epistles of St. Paul and St. John. The latter is particularly interesting from containing the verse of the Three Heavenly Witnesses, the MS. being apparently of the seventh century. The fragments have been very carefully edited by Herr Ziegler, with a photographic facsimile.

The Masora ‖, Professor Frensdorff remarks, has been greatly employed in the correction of the Hebrew text of the Old Testament, but has virtually been only once edited itself, subsequent editions being only repetitions of the *editio princeps* of 1525. It is his ambition to produce a new and thoroughly critical edition, to which the present volume, containing the references of the Masora arranged in alphabetical order, and thus forming a Masoretic dictionary, is designed as a precursor.

Dr. A. Stadler ¶ remarks that philosophical controversialists in Germany are more and more grouping themselves around Kant, to the neglect of those successors who were at one time thought to have advanced beyond him. He has accordingly endeavoured to provide a concise exposition of Kant's doctrine of the Pure Reason, lest the actual teaching of the philosopher should be lost sight of amid the various glosses of his commentators, of which he seems to think there is some danger.

K. G. Andersen's ** essay on German etymology explains a great number of familiar terms, and contains a number of amusing examples of corruptions arising from misunderstandings and inaccurate pronunciations, which have given rise to false and misleading etymologies in their turn.

F. Becker has written an exceedingly interesting monograph on the employment of the fish as an emblem of Christ in early Christian art.†† A great number of examples, chiefly from the Roman catacombs, are brought together, and in many cases illustrated with woodcuts, some of which are extremely curious. The earliest example,

Herr Becker thinks, is one in the mausoleum of Domitilla, about the end of the first century, but here the symbolic character of the representation hardly seems adequately made out. He observes that the enigmatic character of the delineation rendered it a secret symbol, which accounts for its disuse after the general prevalence of Christianity.

Herr Conrad Fiedler's rules for the appreciation of works of art* appear in the main reducible to one, that the critic should possess as much æsthetic and philosophical culture as he can contrive to acquire.

It is a good idea of Herr E. Engel's to bring together the passages of Byron's journals and letters relating specifically to himself†, and by an arrangement of these in chronological order to frame a virtual, though in many respects defective, autobiography. The frequency of the egotistic poet's references to himself insures a sufficiency of material, and, as Byron always wrote well on the subject that mainly interested him, the literary attractions of the volume are very considerable. The weak point consists in the editor's own introduction and notes, which savour far too strongly of hero-worship.

Not more than three or four of Lessing's plays‡ have retained possession of the stage, and his European reputation as a dramatist is founded on two only. It will be a surprise to most people to learn that he left behind him no fewer than fifty-four plans for dramas, in some of which the outline is to a considerable extent filled up. As might be expected, these sketches mostly belong to an early period of his career, ere he had discovered his more genuine vocation as a critic. Some have been printed before, but the whole now make their appearance for the first time in a separate volume, and in a collective form. The most complete is a comedy on the story of the Ephesian Matron; the most interesting, perhaps, is a tragedy, unfortunately composed in Alexandrine couplets, on a contemporary event, the conspiracy of Samuel Henzi and other citizens of Bern to effect a revolution in the government. Fragments of tragedies on the stories of Codrus, Spartacus, and Cleonnis, also possess much interest, and characteristically evince Lessing's sympathy with the antique spirit of political liberty, and classical life in general. *Tarantula* is an amusing burlesque on the Italian opera, and *Fatima* is a very curious burlesque indeed. The fragments of an intended *Faust* are insignificant in compass, but would have been very considerable but for the loss of the greater part of the MS. The piece was undertaken in direct competition with Goethe, and would apparently have been modelled upon the precedents of the old English drama. It would hardly have added to Lessing's reputation, if we may judge by the few specimens preserved. Most of the other fragments are [illegible] æsthetic and drafts for comedies or domestic dramas, some borrowed from the French. It is interesting to find a translation of Calderon's "Life is a Dream" among them; and the idea of this piece seems to have formed the groundwork of another of Lessing's sketches, "The Horoscope," the plot of which is apparently his own invention. These glimpses into the workshop of a busy dramatist undoubtedly merit preservation, even though their strictly poetical merit is commonly inconsiderable, and their form too incomplete to allow much scope for constructive skill or the delineation of character. The editor has displayed the most laudable assiduity in exploring every corner of literary or historical reference that appeared capable of throwing a ray of light upon his subject. His view of the importance of the fragments published by him is naturally exaggerated; but we cannot regret an error which has so largely stimulated his exertions.

The last number of the *Russian Review*§ contains a valuable account of the literature on the emancipation of the serfs, the continuation of Professor Brückner's history of didactic literature in Russia during the eighteenth century, and a paper by M. Wesseloffsky on the affinities between Russian and Indian popular tales.

ADVERTISEMENTS.

MUSICAL UNION.—BREITNER, Pianist, Pupil of Rubinstein, on Tuesday, May 23, with Papini, Lasserre, &c. Quartet in G, No. 81, Haydn; Piano Quartet, B minor, Mendelssohn; Quartet, D minor, Schubert; Solos, Chopin, &c. Pianoforte. Tickets, 7s. 6d., to be had of Lucas & Oliviers, Bond street, and Austin, St. James's Hall, at the Regent Street Entrance. Visitors can pay at the Door. No Free Admissions will be granted. May 30, last performance this season of Rubinstein.—Director, Prof. ELLA, 9 Victoria Square, S.W.

PHILHARMONIC SOCIETY.—*Conductor,* Mr. W. G. CUSINS. FIRST MORNING CONCERT, at 3.30 P.M., on Monday, May 22, St. James's Hall. Overture, Naiades (Bennett); Serenade and Allegro Giulioso, Pianoforte, Mr. Charles Halle (Mendelssohn); Pastoral Symphony (Beethoven); Wellenstein's Camp (Rheinberger). Vocalist, Mme. Trebelli-Bettini. Stalls, 10s. 6d.; Balcony, Reserved, 7s.; Unreserved, 5s. Admission, 2s. 6d. Stanley Lucas, Weber, & Co., 84 New Bond street; at the Musicsellers', and at Austin's Ticket Office, St. James's Hall.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Dream of Pilate's Wife," "The Night of the Crucifixion," "La Vigne," "Soldiers of the Cross," "Christian Martyrs," "Gaming Table," &c.—DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1s.

THE SOCIETY of PAINTERS in WATER COLOURS.—The EIGHTY-SIXTH EXHIBITION is now OPEN. 5 Pall Mall East. From 9 till 7. Admittance, 1s. Catalogue, 6d.

ALFRED D. FRIPP, *Secretary.*

GAINSBOROUGH.—The BEAUTIFUL DUCHESS of DEVONSHIRE. Mr. SAMUEL COUSINS, R.A., has undertaken to ENGRAVE this magnificent PICTURE.

The Artist's Proofs will be issued at Ten Guineas each.

Subscribers' Names are now received by Messrs. THOS. AGNEW & SONS, the Publishers and Proprietors of the Picture, at 9 Waterloo Place, Pall Mall; Exchange Street, Manchester; and Liverpool and London Chambers, Liverpool.

ARTISTS' BENEVOLENT FUND. Incorporated by Royal Charter, for the Relief of the Widows and Orphans of British Artists.

Patron—HER MAJESTY THE QUEEN.

The SIXTY-SEVENTH ANNIVERSARY DINNER of the Corporation will be held at the Freemasons' Tavern, Great Queen Street, on Saturday, June 17, 1876,

Sir WILLIAM FRASER, Bart, M.A., M.P., in the Chair.

Since the foundation of the Society, the sum of £37,077 10s. has been distributed in relieving widows and orphans of British Artists, and during the past year fifty-three widows and sixteen orphans have received annuities amounting to £1,123. The institution is entirely supported by the voluntary donations and subscriptions of artists and patrons of the fine arts.

Gentlemen's Tickets, £1 1s.; Ladies, 12s. 6d., may be obtained of the Stewards; at the Bar of the Freemasons' Tavern; and of the Secretary, L. YOUNG, Esq., 6 Trafalgar Square, W.C.

QUEEN'S COLLEGE, 43 and 45 Harley Street, W. Incorporated by Royal Charter, 1853, for the General Education of Ladies and for granting Certificates of Knowledge.

The HALF TERM for the College and School will begin on Monday, the 22nd inst. Prospectuses may be obtained on application to Miss GROVE, at the College Office.

E. H. PLUMPTRE, D.D., *President.*

WELLINGTON COLLEGE.—JUNIOR SCHOLARSHIPS. There will be an ELECTION to SIX in June next. They are open to all BOYS who on June 1 are between Twelve and Fourteen years of age. The Examination begins on Tuesday, June 20.—For further particulars apply to the Rev. the BURSAR, Wellington College, Wokingham.

CLIFTON COLLEGE SCHOLARSHIPS.—EIGHT or more will be open to COMPETITION at Midsummer, 1876, value from £20 to £60 each, which may be increased from a special fund to £80 a year in cases of Sons of Clergymen. Further particulars may be obtained of the SECRETARY, the College, Clifton, Bristol.

FETTES COLLEGE.—SCHOLARSHIPS.—Four of £40 per annum. Competition in July.—Apply for particulars to HEAD-MASTER, Fettes College, Edinburgh.

HIGHGATE SCHOOL.—There will be an EXAMINATION for FOUR ENTRANCE SCHOLARSHIPS of £50, £40, £30, and £20 per annum, to be held on the 27th inst. and following days. Application to be made to the Rev. the Head-Master, School House, Highgate, N.

GROVE HOUSE SCHOOL, Tottenham.—Head-Master, ARTHUR R. ABBOTT, B.A., Oxford. Terms [illegible] guineas per annum. Next Examination in July.—For Prospectus apply to the Head-Master.

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,074, Vol. 41. May 27, 1876. [Registered for Transmission abroad.] Price 6d.

TURKEY AND THE GREAT POWERS.

THE refusal of the English Government to concur in the resolutions adopted by the three Imperial Courts appears to be definitive and final. Until the nature of the Berlin proposal is accurately known, it is impossible for non-official politicians to judge whether it is compatible with the fixed policy of England. Mr. DISRAELI and Lord DERBY might have merely declined to take an active part in an intervention which they might nevertheless have admitted to be expedient or justifiable; but there can now be little doubt that their refusal implies a total divergence of policy. The English Government is still not willing to precipitate the fall of the Turkish Empire. The appointment of an International Commission to superintend the administration of Turkish provinces would be inevitably followed by armed occupation. The three Powers will not ultimately entrust the execution of their decrees to Turkish troops, especially while the Porte is unable to suppress the insurrection. The English Government has no forces to spare for the pacification of Herzegovina or Bosnia; and it would not be inclined to assume responsibility for the acts of an Austrian commander. Still less would it be possible to follow Russian policy in dealing with the petty States which support the insurrection. Both Servia and Montenegro have hitherto been assured of impunity while, in a state of nominal peace, they carry on a ruinous war with Turkey. Sooner or later they may find that they have to deal with a more formidable Power; but as long as Austria ostensibly co-operates with Russia, the intrigues of the Governments of the Principalities will not be abated. The most significant circumstance in the refusal of England to adopt the Berlin resolutions is the comment which is furnished on the policy of the three allied Courts. It is not likely that a new and more stringent version of the ANDRASSY Note would have been rejected as unnecessarily urgent. The Turkish Government accepted the peremptory demands of the Note; and perhaps it would have redeemed its pledges of administrative reform if the insurgents had adopted the compromise. As in fact nothing has been done, it may be plausibly contended that want of power on the part of the Porte is equivalent to want of will. The concessions which were thought sufficient two months ago are no longer deemed satisfactory; and it has become necessary to suggest terms which may be imposed on the insurgents by force if they decline negotiation.

The whole nature of the controversy has been changed by the prolonged inability of the Porte to reduce the insurgent province to submission. When the rebellion began in the summer of 1875, its continuance was deprecated by dispassionate observers, not because it was thought desirable that Christians should be governed by Turks, but in the belief that, like former insurrections in Turkey, the revolt would be crushed after much fruitless suffering and bloodshed. It was also known that all European statesmen, except in Russia, regarded with uneasiness the possible commencement of a general war in the East. The danger has since not become less imminent; but with a change of circumstances the precautions which are required have become subject to modification. It has now become evident that, if the civil war proceeds, it will be both the right and the duty of the SULTAN'S Government to declare war against Servia and Montenegro; and yet it is a hopeless enterprise to retaliate on petty States which cannot be conquered or occupied. The Ottoman Government will never again be allowed by the Christian Powers to extend its dominion over countries which have once become practically independent; and the Porte is aware that a Russian general officer is now the military adviser of the Servian Government. The detachment of additional provinces from the Empire is likely to result from a continuance of the struggle. Both Governments and speculative politicians must be content to learn from experience, which is always repugnant to the feelings of angry partisans. The treason which prospers is no longer, in a political sense, treason; and the insurgents, by their own pertinacity, and through the aid of friendly neighbours and astute patrons, have so far succeeded as to keep their enemies at bay. It is impossible to decide between conflicting accounts of recent military operations; but it is evident from the most favourable statements that the Turkish Commissioner in Herzegovina has attained no decisive success. The contest is wearing out the financial resources of Turkey, although there may perhaps be no difficulty in sending reinforcements to the disturbed provinces. The hopes which even at a distance appear to be plausible are probably regarded by the insurgents as certain.

Incredulity, or rather habitual suspension of belief, is the ordinary mental condition of persons who take an intelligent interest in Eastern politics. Recent rumours of disturbances in Bulgaria may probably be more or less false; but, on the other hand, they may possibly be true. If the civil war which began in Herzegovina extends throughout European Turkey, the contest will soon pass beyond the sphere of diplomacy. In default of foreign intervention, a general rising of the Christian population would perhaps simplify the task of the Ottoman Government. It may not be practicable to provide troops for the pacification of all the disturbed districts; but the indigenous Mussulmans, whatever may be their faults, are a warlike race, and in defending their own property and homes they will need neither provisions nor pay from the Government. If the ordinary estimate that the Mahometans form a third of the European population of Turkey is well founded, it is by no means certain that they may not prove themselves a match for their miscellaneous adversaries. The worst of all civil wars is a struggle, not of hostile countries or districts, but among neighbours of hostile religions and races. In such a contest the atrocities which would be committed on both sides might perhaps seem to justify foreign interference; and an army of occupation would be practically engaged in a territorial conquest which could scarcely fail to provoke dangerous jealousies. The scheme of breaking up European Turkey into principalities either independent or nominally subject to the Porte would not solve the difficulty. The cheap device of expelling from Europe a race which is rhetorically described as an invading horde is simply impracticable. The wanton and wholesale deportation of three or four millions of inhabitants from their homes is a measure which has no precedent since the barbarous expulsion of the Moors from Andalusia and Granada. FERDINAND and ISABELLA were at least national sovereigns, disposing of the forces of Spain for the accomplishment of their cruel and fanatical purpose. The philanthropic pedants of the present day must appeal to foreign States, or, in other words, to Russia, to provide means for the extermination of the Turks with the object of establishing the absolute sovereignty of the conqueror.

In the present as in the past, English statesmen who have to deal with the Eastern question are principally concerned to prevent the acquisition by Russia of the countries which, under the Government of the Porte, are friendly, or at least neutral. The possession of Constantinople by Russia would be equivalent to the exclusion of English commerce from the shores of the Black Sea and from the Danube. In Central Asia it is impossible to protest with

effect against the constant extension of the commercial monopoly of Russia; but it is not expedient to acquiesce tamely in a repetition of the same process in Europe. It fortunately happens that on this point the interests of Austria are identical with those of England; nor is it improbable that Germany might resist the acquisition by Russia of the mouths of the Danube and of the outlet from the Black Sea to the Mediterranean. There is no reason to suppose that the English Government has abandoned the policy of its predecessors, although, like Lord STRATFORD DE REDCLIFFE, the Ministers may pursue the same objects by different methods. It might perhaps be prudent to connive at the gradual dissolution of the Turkish Empire, if there were any prospect that it could be peaceably effected; but as the Christian subjects of the SULTAN become more aggressive, the Mahometans will be more vigilant in defence of their lives and property. There was no difficulty in detaching the Danubian Principalities from the Empire, because the Porte had observed the ancient conventions which prohibited the settlement of Mahometans in Moldavia and Wallachia. The population of Servia also was homogeneous, with the exception of the Turkish garrisons in a few fortresses and towns. Montenegro had never acknowledged a dependence which was not enforced, and there are no Mahometans resident within its borders. In Bosnia and Herzegovina the difficulty arises from a mixture of religions and races, and it extends throughout the provinces which are subject to the direct authority of the SULTAN. A foreign ruler might, by means of military power, enforce on both parties order and peace; but there is no reason to suppose that Austria will undertake the duty, or that Russia would perform it from disinterested motives.

AMNESTIES.

IN France the long discussion on the proposed amnesty of the Communists has ended with an appropriate declamation from VICTOR HUGO. There never had been much reality in the discussion, for it was evident that the proposed amnesty could not be accorded, and it seemed probable that many of those who supported the proposal would have been very much disappointed if they had been too successful. Here too there has been some little stir over a proposal to celebrate the return of the PRINCE OF WALES by the release of the Fenian prisoners; but such interest as was awakened by it was chiefly excited by the language and conduct of those whose business it was to dwell on the wrongs and sufferings of Irishmen. It was equally impossible in both cases that the Government should consent to set free those who are still suffering punishment. The Fenians are few, and their release would not be attended by any direct danger to society, but they are suffering for crimes which it is especially necessary to visit with severe retribution. Those who merely took part in the Fenian conspiracy have long ago been pardoned or have come to the end of the lenient sentences with which they were visited. Those who are still undergoing punishment are not pardoned, because they committed murder or broke their military faith. Many of the Communists have been condemned for similar crimes; but a large proportion are no doubt confined in French prisons or kept in penal settlements for no other reason than that they took a leading part in the doings of the Commune. Moreover, the French proposal was for an amnesty, not for a pardon; and if a sponge had been passed over all that was done in 1871 there would have been thousands free to come back who have since sheltered themselves in exile. France, and above all Paris, cannot afford to have these men back. They are too dangerous to French society. A French Government, and above all a Republican French Government, cannot take the risk of having large bands of determined and dangerous men return who would plot either against or disgrace it according as it might provoke the equal dangers of displeasing or of pleasing them. In all cases where conspiracies or revolutions have taken place it is impossible to say what a wise and just Government should do with the offenders, unless the particular circumstances of the outbreak are carefully considered. After a civil war an amnesty is often, not only the most merciful, but the most prudent and the only possible, course. The Government of the King of SPAIN could not treat the defeated Carlists as rebels and punish the thousands of private soldiers who took part in the enterprise. After sufficient time has elapsed a strong Government is generally ready to grant an amnesty to conspirators who have ceased to be dangerous. Of the Communist convicts, or of the Communist exiles who would be convicted if they could be caught, a very large number have not been guilty of any acts beyond what have been repeatedly pardoned in France and every civilized country. They took part in an unsuccessful insurrection; and, if there was any reason to suppose that they had done with insurrections for ever, they might be allowed to come back to their homes on the plea that, on other occasions, other men who have done just what they have done have been allowed to come back. The reason why the bulk of the Communists are kept out of France, or imprisoned in it, is that the whole course of their lives, or at least of the lives of the classes to which they belong, shows that to import so dangerous an element into French society as it now exists would be to subject the country to a risk from which it has a right to be guarded.

Those who admire, as well as those who do not admire, VICTOR HUGO's compositions, must have been equally prepared to find that he did not for a moment address himself to the real question on which the wisdom of an amnesty depended. He had got to make a declamation, and he made it. He had got to use his own peculiar style, and he used it freely. He began by saying that, as it was a very special occasion, and every word he used was of the utmost importance, he had taken the precaution to write his speech; and he read it out exactly as if it had been a chapter from one of his novels. It was in point of fact exactly like a chapter in one of his novels, only that it was neither very extravagant nor very brilliant. There were, however, passages in it of much merit in point of style, and inspired by a feeling which no one could doubt was genuine. He drew a picture which had no other fault than that of irrelevance, showing how he had wandered up dismal staircases, knocked at humble doors, and been admitted into the bosom of famine-stricken families. What, he asked, was the cause of all the distress he witnessed? Why was the wife weeping? Her husband was away. Why were the children fainting with hunger? Their father, who should have given them bread, was in New Caledonia. The simple remedy in the poet's eyes was to bring the man back, and then VICTOR HUGO would go up the staircases again and find every one beaming with happiness and blessing the name of the Assembly. He also invited his hearers to remember that the faults of the Communists were committed under very extraordinary circumstances. They had been made nervous by the long fever of the siege; they had gallantly defended their beloved Paris, and then they were told it was no longer to be the capital. It would remain the capital of the world as a matter of course; but it was to be degraded from the superior position of being the capital of France. It was enough to drive Parisians a little mad, and that they had been a little mad their poetical advocate candidly admitted. He was too sensible, even in the height of his raptures, to contend that they had not done wrong. But then what were their crimes to those of the late EMPEROR? And thus VICTOR HUGO secured an easy transition to his favourite theme. He revelled in denunciations of NAPOLEON the Little; and, in fact, the greater part of his declamation was an echo of the different works he has published in the last twenty years. It was a piece of poetical prose altogether disconnected from current politics, and it was treated as such. It was made to be heard, not criticized. It was received in perfect silence. No one replied to it, or attacked or complimented the speaker. The only possible answer would have been to offer the aged poet a wreath of laurels. As the forms of a decorous Assembly did not permit this, the Senate quietly rejected the proposal and passed to other business.

The scene in the House of Commons presented an entire contrast to that in the French Senate. Mr. DISRAELI, with great moderation of language and a studied absence of everything that could justify the slightest irritation, explained that most of the convicts were in Western Australia, with very slight restrictions imposed on their liberty, and that those detained in England had either been convicted of murder, or had added some peculiar aggravation to the crime for which they had been condemned. But the Irish members were not going to let slip a fine opportunity of relieving their feelings and pleasing their constituents. Mr. O'CONNOR POWER protested against the policy, as he termed it, of vengeance and trampling mercilessly on a fallen foe, and he thought that more atte-

tion should have been paid by Mr. DISRAELI to a memorial signed by 138 members of the House, stating that the time seemed to them to have come when mercy might properly be shown. This gave rise to a very animated discussion, for many of those who had signed it alleged that they had been tricked into signing it. Great pressure, as Mr. ANDERSON explained, had been put upon them, and they had not understood that they were asking for the pardon of murderers, and some of them had received positive assurance that this was not the effect of the memorial. If any unfair means were used to procure signatures, those guilty of such conduct deserve the chief blame. But it is not very creditable to their victims that they should have yielded to pressure in such a matter, and that they should not have taken the trouble to examine for themselves the exact bearing of the document they were asked to sign. Anyhow, the controversy as to the mode in which the signatures to the memorial had been obtained entirely destroyed any effect which the memorial could have produced. But this was not all. The Irishmen soon took to quarrelling among themselves, and Mr. BIGGAR made a speech so wild and violent that Mr. BROOKS, the late Lord Mayor of Dublin, who had started the discussion, owned that he regretted what he had done now that he had heard Mr. BIGGAR. Another Irish member suggested that one of the convicts had got double the term of penal servitude allotted to another simply because he was an Irishman, while his accomplice was an Englishman; and as to the guilt of the convicts, he could state that another Irish member, who unfortunately was not present, "believed in his heart" that one of them was perfectly innocent. Mr. BUTT did his best to cover the follies of his followers and to give the discussion a general tone. He suggested that even those to whom the death of Sergeant BRETT was to be attributed were not guilty, except in a technical sense, of murder, as they did not go to the scene of their crime with an intention of committing it, and that, if political considerations had not intervened, they would have been released before this. The question, as stated by Mr. BUTT, would therefore be this. Persons engaged in an intended rising against the Government of their country, kill, in the execution of a special part of their design, an agent of the law engaged in the discharge of his duty. Is penal servitude for life too severe a punishment for them? On the contrary, it seems a mild punishment. It is essential for the safety of society that the Government should jealously guard the lives of those who are merely doing their duty as servants of the Crown; and a Government would be justified in regarding the crime of murdering a sergeant of police, merely because his death was necessary in order to effect a traitorous object, as a peculiarly dangerous one. It is satisfactory to know that the few Fenian prisoners who are still detained have been treated with as much leniency as the nature of their crimes permitted; and that, so far from there having been any merciless trampling on a fallen foe, the greatest disposition has been shown to consider how far, consistently with the first duties of a Government to the country, the punishment of the offenders could be mitigated.

THE EXTRADITION DEAD-LOCK.

THE appointment of Mr. PIERREPOINT, who has a reputation as a sound lawyer, to be Minister of the United States in England, may possibly tend to an amicable solution of the dispute which has arisen on extradition. The legal question, indeed, is simple and easy; but perhaps Mr. PIERREPOINT may understand better than the SECRETARY of STATE the inability of the English Government to accede to the American demand. Mr. HAMILTON FISH can scarcely be blamed for making the most of an argumentative triumph. It must be pleasant to reiterate in various forms the undeniable proposition that a municipal law cannot overrule a treaty. Lord DERBY, on the other hand, unavoidably answers "*non possumus*" to conclusive demonstrations that he ought to act in direct violation of law. Even if the Government were to yield to Mr. FISH's logic, the Judges of the High Court would undoubtedly discharge WINSLOW on the return to a writ of *habeas corpus*, if it were shown that he was kept in custody for purposes of extradition in contravention of the direct provisions of an Act of Parliament. It is impossible to deny that the Government of the United States has an excellent excuse for putting an end to the treaty, if, indeed, any justification were needed for the exercise of an undoubted right. There is no reason why any irritation should be felt either in England or America, and the SECRETARY of STATE has the less reason to be angry because he has the best of the controversy. It may be hoped that, after a short interval, both Governments will see their way to the conclusion of a new treaty which may be so constructed as not to lead to a hopeless dead-lock. The only weak point in Mr. FISH's contention is that he proves too much. If the treaty is to be literally interpreted, it provides for the surrender of political refugees who may be charged on sufficient evidence with the commission of one of the extradition crimes. The prohibition of surrender in the English Act of 1870 is unnecessarily comprehensive. There is no reason why a criminal who is surrendered on a charge of obtaining money under false pretences should not be tried in his own country for forgery or murder. The perpetration of several offences is not more commendable than the commission of a single crime. The framers of the Act of 1870 were thinking too exclusively of political refugees, when they ought to have devoted their principal attention to the case of ordinary criminals. In a future treaty both Governments might properly reserve to themselves the power of refusing extradition in any case which in their judgment might involve a confusion between ordinary crimes and political offences. In one sense the American argument is open to another objection. There is no practical use in proving that the Legislature of an independent nation has made a mistake. Parliament is supreme; and its decisions cannot be questioned by the Ministers of the Crown. A foreign Government may reasonably ask for a change in the law which has operated to its disadvantage; but it is useless to contend that the law, while it exists, should be disobeyed.

The correspondence, when it is published, will probably show that the discussion has not been confined to the simple issue of a conflict between the treaty and the statute. In the recent case of LAWRENCE, who was tried in Massachusetts on a different charge from that on which extradition had been granted, the PRESIDENT directed the representative of the ATTORNEY-GENERAL not to proceed with the prosecution. The Court determined that the PRESIDENT had no power to interfere with the course of justice; but the incident seems to show that the American Government was not indisposed to the kind of arrangement which is indicated in the English Act. The peremptory demand of the surrender of WINSLOW may perhaps have been immediately suggested by the decision of the Court in the case of LAWRENCE. If it should appear that the two Governments have been in the habit of acting on a friendly understanding, it would not be surprising that a change of American policy or practice should create a difficulty which has for the last six years been in some way evaded. If WINSLOW is guilty, he may think himself lucky in the difference or misunderstanding of which he seems to be the first occasion. There is no reason to suppose that he was in danger of prosecution for any offence except that on which the demand for extradition was founded. Lord DERBY has thought it necessary to pay literal obedience to the law; and Mr. FISH not unreasonably directs the American Chargé d'Affaires to give no assurance or promise for the purpose of meeting the objections of the English Government. If Parliament had passed an Act prohibiting payment of the damages under the *Alabama* award, the offence offered to the United States might perhaps have justified the declaration of war which would certainly have ensued; but, however great or evident might be the international wrong, the Minister of the day would have had no choice but to obey the law of his own country. Those who passed, or neglected to repeal, the law are answerable for the consequences.

It may be collected from some passages which purport to be extracts from Mr. FISH's despatches, that the Act of 1870 immediately attracted the notice of the American Government. Sir EDWARD THORNTON seems to have been instructed to propose a modification of the treaty in accordance with the English law; but the overture was rejected by Mr. FISH, who professed to be satisfied with the ambiguous language of the Act. The SECRETARY of STATE is perhaps entitled to the credit of having devised the far-fetched interpretation which has been with good reason rejected by the Law Officers of the Crown. Notwithstanding the distinct prohibition of unconditional surrender, Mr. FISH and the advocates of his cause in England contend

that, by a subsequent section, the entire Act, or rather every part of it which might seem to interfere with the American claim, is once more consistent with the provisions of the treaty. But even a Parliamentary draftsman is incapable of repealing in the same statute a distinct enactment by a vague exception of portions of the Act which may be thought inconsistent with a certain treaty. All previous Acts by which extradition was authorized are in the first instance repealed; and if the section ended with the repeal, there would be no law of extradition. It is further provided that the Act shall be applied to the case of certain enumerated treaties, with the exception of any part of the Act which may be inconsistent with the treaty. Mr. FISH must have been reduced to argue that the prohibition of surrender except on the specified conditions must have been in the first instance deliberately inserted with the knowledge that it was inconsistent with the treaty; and further, that the precautions which had been thought so indispensable as to justify a violation of treaty rights were afterwards indirectly but effectually abolished. The Law Officers will have little difficulty in maintaining the soundness of an opinion which scarcely admits of dissent.

Even if the American Government persists in its intention of abrogating the treaty, the Government would do well to amend the Extradition Act in the next Session. Although European Powers may perhaps be less punctilious than the United States, it is not improbable that the difficulty which has now arisen may occur in relation to other treaties. A Secretary of State who is compelled by Act of Parliament to refuse to a foreign Government the discharge of an undisputed liability, though he may have no choice as to his own course, must feel that he scarcely occupies a dignified position. Mr. FISH has, with the characteristic candour of his nation, spared no pains to illustrate the awkward position of a Government which is unluckily incapable of refuting his criticism. The principle of facilitating the course of justice in foreign countries may properly receive a liberal interpretation. The only excepted case is that of political refugees who may happen to be charged with ordinary crimes. It is possible that their immunity might give rise to serious embarrassment. Popular feeling in England would be opposed to the surrender of some fugitives who might nevertheless have been guilty of the gravest crimes. If ORSINI or his accomplices had escaped to England after their attempt on the life of the Emperor NAPOLEON, they would properly have been regarded as murderers, not as political offenders; but the Government, if it had given them up, would have been exposed to troublesome clamour; and cases might be imagined in which violations of law might admit of a doubtful interpretation. It was fortunate that the good sense and moderation of a later French Government prevented it from demanding the extradition of refugees who might have been charged with complicity in the atrocities of the Paris Commune. It would be expedient to throw on the Government which might receive a demand of extradition the responsibility of deciding in each particular case whether immunity should be allowed on political grounds. The American Government ought not to object to a mode of avoiding the disputes which might otherwise arise.

SIR SALAR JUNG.

AN unfortunate accident has detained Sir SALAR JUNG at Paris beyond the time when he was expected to arrive in London; but when he comes he will meet with the reception he deserves from all who know how immense are the services he has rendered to England. He has made the power of the NIZAM that of a cordial instead of a doubtful ally; he did more, perhaps, than any other man to help England in the crisis of the Mutiny; and he has set a brilliant example of what may be done in a protected State when the State is administered in accordance with English ideas. For a century the history of the Nizams of Hyderabad has been the history of princes who have been forced into an alliance which they have very much disliked, and by which they have very much profited. They were inclined to an alliance with the French, and we made them abandon that alliance. They sided with HYDER ALI, and we made them change sides and come over to us. They disliked fighting TIPPOO, and we made them fight TIPPOO. They were driven by a perverse good fortune into being always on the conquering side, they were paid handsomely for choosing the lucky cause against their will, and the present infant prince owes a large part of his territories to the munificence of a Government which shared the spoils of its victories with his predecessors. In the internal concerns of Hyderabad the British Government has interfered from time to time, being always desirous that the military power should be completely under British control, and occasionally shocked at glaring instances of misgovernment and oppression. After the fall of the French power in India, the Nizam of the day got together a small army, well drilled and organized, and commanded by RAYMOND, one of the most brilliant of the French adventurers of his day. Lord WELLESLEY thought this far too dangerous a weapon in the hands of an ally whom he thoroughly distrusted. He insisted that the French officers should be sent away and the troops they had trained disbanded; and this was effected nominally by the orders of the NIZAM, but really by the troops being forced to submit when they found English guns in command of their cantonments. Soon after an arrangement was effected which, with slight changes, has lasted to the present day. The NIZAM handed over a portion of his territory to be administered by the British Government, who undertook out of the revenues to provide a safe little army for him. The last treaty on this head was made in 1853; but the territories then ceded for that purpose made such rapid progress under British rule that the revenue was much in excess of what was needed to support the contingent. Accordingly, Lord DALHOUSIE gave back a part of the ceded territory, and Lord CANNING gave back all of it except Berar. It is reported that to get back Berar also is one of the aims of Sir SALAR JUNG in his present visit to England. The excuse for requiring territory was that the affairs of the NIZAM were so badly managed that the British Government, without a material guarantee, could not be sure of getting enough to support the contingent it undertook to provide; and now that Sir SALAR JUNG has put the revenues of the NIZAM into a state of great prosperity, he not unnaturally thinks that the British Government does not need any territory as a guarantee for payment. The use made of the contingent gave rise to the only direct act of interference on a large scale in the administration of the internal affairs of the NIZAM to which the superior Power has found itself driven. The revenue of several districts had been farmed to middlemen; the oppression was extreme, and British officers had to be employed in putting down the resistance of despair. To avoid the scandal, Sir CHARLES METCALFE was sent as Resident, and he established a land settlement which gave peace and prosperity to the country, and has subsequently had the advantage of teaching capable natives, like Sir SALAR JUNG, what is the meaning and what are the conditions of good government.

The lesson set by Sir CHARLES METCALFE in 1820 survived only in the memory and traditions of a few when, in 1853, Sir SALAR JUNG was called as a lad of nineteen to fill the post, previously occupied by his uncle, of chief adviser to the NIZAM. He found everything in confusion; the system of farming the revenue had again been introduced, and payment was enforced by the employment of mercenaries who sucked the life-blood out of the people. Sir SALAR JUNG set himself with unflinching resolution to bring in a new state of things, and he had already done much when the terrible crisis of the Mutiny came to try his courage, and to give him the opportunity of deciding the momentous question whether the great Mahometan State of Hyderabad should side with or against the insurgents. If Hyderabad revolted, it was beyond doubt that all Southern India would revolt too; and when Delhi fell, the Governor of Bombay telegraphed to the Resident of Hyderabad that, if the NIZAM went, all was over. But the NIZAM remained faithful, and that he so remained, in opposition to the earnest wishes of a powerful body of his subjects, was due to Sir SALAR JUNG. General HILL, who, as having commanded the Hyderabad contingent, is well acquainted with the facts, has stated, in his interesting letter to the *Times*, that when the Resident informed Sir SALAR JUNG of the fall of Delhi, he was told that the news had been already known three days in Hyderabad, and if Sir SALAR JUNG had ever thought of seizing an opportunity to desert the English Government, he had ample means of using his earlier information for the purpose. But he never wavered. He had made up his mind that the cause of England was the cause of good government. He knew that the success of the rebellion

would only make universal the state of things from which he had been for four years endeavouring to rescue the territories of his master. Those who surrounded him took a very different view, and could not bear to throw away a golden occasion of winning a triumph for their religion, and letting plunder and oppression run riot. He was exposed to constant menaces and much danger, but he showed himself thoroughly equal to the task he had undertaken. When the Residency was attacked, he saved the lives of those who were threatened. He stationed Arabs on whom he could depend at the gates of Hyderabad, and bade them shoot any one who incited the people to revolt against the English. He had such control over the Hyderabad contingent that the English Government found it safe to employ it, and derived considerable benefit from its services. In a word, our new guest is the man who, when Delhi had fallen and our power was for the moment tottering in the balance, saved Southern India for England. Even if Southern India had revolted, it is possible that by a profuse expenditure of men and money we might have conquered it back again and all the rest of India as well. But Sir SALAR JUNG spared us the expenditure of countless lives and countless millions; and if ever there was a clear occasion for acknowledging in a fitting manner an inestimable service, such an occasion is presented by the arrival in England of the Prime Minister of the NIZAM.

Sir SALAR JUNG has rendered a less striking, but still very considerable, service to England by his administration of the dominions of the NIZAM in recent years. He has made good order everywhere prevail. Roads, tanks, wells, irrigation works, a good police and schools, are among the benefits he has conferred on his country; and gradually he has achieved the most difficult success of all, and has made his fellow-natives see that he has been throughout in the right, and that in the pursuance of the policy which he started lie all their best hopes for the future. Naturally, like every one who tries to do good in a semi-barbarous country, he has provoked bitter personal hostility; and in 1868 an attempt was made to assassinate him. But the attempt only brought into relief the estimation in which he was generally held; and his escape was welcomed with delight by people of all classes. Nor is it only that he has made the Deccan one of the most flourishing parts of India. He has helped us to solve the difficult problem of how we are to treat the independent principalities of which we have lately heard so much. Mr. HUNTER records, in his Life of Lord MAYO, the anxiety which this problem caused to the new Governor-General. He determined that from the outset of his rule he would deal with the independent princes on fixed and definite principles. After long consideration, Lord MAYO came to the conclusion that there were three principles on which the Government ought consistently and resolutely to act. The first of these was non-annexation, the misrule of a native chief not being used as a weapon for aggrandizing the power of England. The second was that the Government should always acknowledge its responsibility for any serious misrule in a native State, and should be ready to interfere by displacing the offending chief, and administering the territory through British officers, or a native regency, in the interest of the lawful heir. The third principle was that all those who ruled well should be in every way honoured and encouraged. Lord MAYO had the strongest possible sense of the personal side of government, and he laid down as one of the duties of a Viceroy that he should be the friend and not merely the patron of good men. The English were to do their best to govern well in their own dominions, not only directly for the sake of those they governed, but indirectly for the sake of those governed by native chiefs. When it was seen that an honest endeavour was being made in a native State to copy the pattern set by England, then the highest honours were to be offered and the most cordial friendship was to be shown to those who had been paying England the most welcome of tributes—the tribute of imitation. The one road to favour was to lie through good works. What Lord MAYO wished to see done for the improvement of all native States has been done in the amplest manner by Sir SALAR JUNG for the territories of the NIZAM. He has abundantly earned the respect, the friendship, and the honour which Lord MAYO proposed should be the reward of the wise administration of native States; and Englishmen, who give Sir SALAR JUNG the reception he has merited will have the satisfaction of at once welcoming a benefactor and of knowing that they are helping to carry out a leading principle of Imperial policy.

THE CITY COMPANIES.

THE short discussion in the House of Commons on the City Companies, though neither profound nor exhaustive, was indirectly not wanting in amusement and instruction. According to the political doctrines which prevail in Parliament, the Companies have not much to say in their own defence; and the prospect of re-adjusting property to the amount of many hundred thousands a year is attractive to theorists and reformers; but both parties were fully aware that there was much to lose, and nothing for the moment to gain, by provoking formidable opponents. Behind the Companies is the City, and at the back of the City are, for many purposes, the provincial Corporations. Only a few years ago the City of London habitually returned four Liberal members; but in the last Parliament the number was reduced to two. In 1874 Mr. GOSCHEN, who has strong personal claims to the confidence of merchants and men of business, barely found his way into the House of Commons at the bottom of the poll. Some time before, Mr. GLADSTONE had unnecessarily threatened the Corporation with an investigation of its affairs; and, by a natural result, his party fell into disfavour in the City. The Companies are chiefly governed by members of the Corporation, and they consist almost exclusively of citizens of London. Their genial festivities, their quaint customs, and their easy munificence are regarded by their members, and by the civic community in general, with a grave attachment which is scarcely appreciated by critical strangers. The same forms have been observed and the same phrases have been used on ceremonial occasions for hundreds of years; and consequently those who belong to the Companies have something of the reverence for antiquity which is not conspicuously exhibited by ordinary Englishmen. Mr. JAMES and his constituents at Gateshead have nothing to fear from the offence which his speech and motion may have caused to the citizens of London. Mr. GLADSTONE, on the other hand, has made up his mind to disregard the hostility which he had previously provoked. Other leading members of both parties know by experience the power of the City; and Mr. CROSS, who is not extravagantly devoted to institutions merely because they are ancient, was eager to profit by the excuse, suggested by Mr. GLADSTONE, that an Address to the Crown for a Commission of Inquiry was not the proper form of proceeding.

The Companies rely more securely on their Parliamentary influence than on the arguments of their defenders. They contend indeed that their large estates were never public property, having been in many instances purchased by their predecessors from needy Sovereigns. The LORD MAYOR reminded the House that the charitable funds of the Companies, to the amount of 100,000*l.* a year, are administered under the control of the Charity Commissioners; and Sir G. BOWYER declared that the rest of their estates was strictly private property. Although external considerations prevented the House from adopting Mr. JAMES'S proposal, there is no reason to believe that the claim of the Companies to absence of responsibility is admitted by Parliament. There is a general conviction or prejudice that all property held in common by corporate bodies must be saddled with a trust. The ordinary imagination scarcely comprehends any middle form of possession between simple ownership and administration of public funds. It happens that on this question the most Conservative classes share or exaggerate the doctrines of modern Liberalism. To the great English landowner the principle of hereditary succession seems ultimate and almost divine; and his sense of the fitness of things is offended by the spectacle of any other mode of devolution of property. In the discussion on the pending University Bills the House of Lords has unanimously declined to listen to any suggestion that vested rights in College property could supersede supposed considerations of utility. By general consent Commissioners are appointed to redistribute at their pleasure the revenues of the Colleges; nor is any fear entertained of the future application in revolutionary times of the same system to great private estates. There is something respectable in the aristocratic security which allows privileged legislators deliberately to

raze the outworks of private ownership which exist in the form of corporate property. On the other hand, the strength of the Companies lies in the fact that their members are seldom of a station to provoke social or democratic jealousy. The tradesman sympathizes with fellow-tradesmen who are associated with wealthy and even splendid institutions. A festival in a splendid hall seems to put the guests who are entitled to be present on a level with the dispensers of private hospitality.

The condemnation of idle fellowships involves the principle of appropriating to public uses the much idler endowments of the City Companies; but their fate will probably be delayed both by reasons of party convenience and because their members are more uniformly loyal than College Fellows to the institutions by which they profit. Clever young men at Oxford and Cambridge have during the last twenty years published innumerable pamphlets to prove that various devices of the writers would be preferable to the actual distribution of College endowments. The residents have always cherished a disinterested desire for a monopoly of the College revenues, while the absentees have for the most part been too well contented or too busily employed to vindicate their own position. Members of the governing bodies of the City Companies are seldom given to the composition of pamphlets, and they never tamper with their trust by inviting Parliament to undertake a readjustment which, as they well know, would result in spoliation. Their boldest innovations consist in occasional proposals for reverting to the discharge of obsolete duties which once appertained to the Guilds. As the Companies can scarcely undertake in the days of strikes and Trade-Unions to supervise the industry of mechanics and artisans, some of them make more or less judicious attempts to encourage by prizes or by technical instruction the handicrafts with which they are traditionally associated. The Turners' Company, which has less to lose than some other bodies of the same kind, lately invited Mr. GLADSTONE to deliver a discourse on wood-carving, which included an undesired digression into the responsibilities of corporate property. If the Goldsmiths are well advised, they will scarcely ask so formidable a guest to compare their services to the industry of the precious metals with their gorgeous displays of plate and with the income which is partly applied to purposes of splendid hospitality. Their revenues are probably as well spent as if they belonged to a Duke, but still they might be diverted to more obvious purposes of utility.

The Companies show their wisdom in resisting preliminary inquiry, instead of reserving themselves for a defence of their evidence on the merits of the case. They are much too rich to oppose with effect confiscation of their property if they once admit that it is subject to the disposition of Parliament. When the Roman Empire was in its decline, it was with good reason thought imprudent to allow barbarian envoys to inspect the accumulated wealth of Rome or Constantinople. Commissioners and Liberal members of Parliament, instructed by the statistics of Blue-books, would be as dangerous as Goths or Huns. It seems that the rental received by different Companies from property in the City amounts to half a million, and it would be difficult to account, to the satisfaction of severe economists, for the expenditure of a fifth part of the amount. There would be no difficulty in devising useful modes of application for the superfluous revenues which would be discovered. The City and the metropolis still need public works of use and ornament; and even the opening to free passage of the toll-bridges would be more generally useful than a series of luxurious dinners. Only a few cautious politicians foresee the danger of enforcing the principle that all property should be deemed to be held in trust for the benefit of the community. Still rarer are the sceptics who doubt whether it may not be worth while to maintain some ornamental excrescences merely because they are old and picturesque. Neither class will afford the Companies any active aid when their establishments are seriously attacked. Things which cannot be defended on plausible and popular grounds are in modern England doomed to destruction. Unfortunately the City Companies have no reason for existing which can be intelligibly explained to an irreverent multitude. The present members will do well, in a figurative sense, to eat and drink, for to-morrow the Companies will inevitably die.

REVISION OF THE FRENCH CONSTITUTION.

THE French Senate is justifying the hopes of its creators in an unexpected way. It was meant to be the specially Conservative element in the Constitution, and it is apparently of opinion that there is nothing so Conservative as to do nothing. The consequence is that discussions which in the Chamber of Deputies would hardly rise to the level of an "incident" are clothed in the Senate with all the dignity of an "event." In his last Circular the late Minister of the Interior declared the Republic to be the definitive Government of France, and set up a distinction between the legitimate hopes entertained by the Monarchists previously to the voting of the Constitution and the factious hopes that they entertained now. M. DE FRANCLIEU, who feels that he is in all respects the same man since the Constitution was voted that he was before that date, and suspects moreover that at his age he is not likely to change, took offence at this distinction; and his own, or somebody else's, constitutional studies suggested to him that M. RICARD had not even a legal right to make it. The 8th Article of the Constitution reserves a right of revision; and, according to M. DE FRANCLIEU, nothing that admits of being revised can be called definitive. In the year 1880 the Constitution may be altered, if the representatives of the nation desire it. A special outpouring of Divine grace may by that time have convinced the French people that in the restoration of the BOURBONS lies their only hope of salvation. M. DE FRANCLIEU hopes that this moral miracle will be wrought, and he maintains that the 8th Article of the Constitution gives him the right to hope it. He admits that he must defer the realization of his hopes till 1880, but so long as they are expressed in no less future a tense than this, they are not factious. On the contrary, they are essentially constitutional hopes. One day last week M. DE FRANCLIEU confided his indignation at M. RICARD'S Circular to his brother Senators, and it fell to the new MINISTER of the INTERIOR to defend his predecessor's statement. M. DE MARCÈRE argued that the 8th Article of the Constitution must be interpreted with a proper regard to facts, common sense, and convenience. A general election has proved that the country accepts the Republic as the definitive Government of France. It cannot be supposed that the framers of the Constitution meant to undo their own work in advance, and, as it happens, the very article to which the Legitimists appeal was proposed by a Republican, M. CASIMIR PÉRIER. The object of the reservation was not to provide for the destruction of the Constitution, but simply for its modification. It is a safety-valve which will enable the nation to meet any unforeseen difficulties by revision instead of by revolution.

Of course M. DE FRANCLIEU was not satisfied with this explanation, and it was natural, therefore, that he should give notice of an interpellation. It is not quite so clear why M. PARIS, who belongs to the Moderate Right, if not to the Right Centre, should shortly afterwards make this interpellation his own. The friends of the Ministry which was overturned by the elections know perfectly well that M. DE FRANCLIEU'S hopes are vain, and that, so long as they remain vain, their own hopes must be equally impracticable. If the revision of the Constitution in a Legitimist sense is improbable, its revision in an Orleanist sense is still more improbable. Why then should they care to associate themselves with a mere quibble of this kind? Perhaps they had some notion that Marshal MACMAHON might be irritated by the limitation of the right of revision involved in M. DE MARCÈRE'S interpretation of the 8th Article. Down to 1880 the MARSHAL has the sole right of proposing that the Constitution shall be revised, and M. PARIS and his allies may have thought that, by presenting themselves as the champions of revision in its more unrestricted sense, they would show the MARSHAL how much more careful they were of his prerogative than the false friends who have superseded them. Perhaps they had ground for thinking that M. DUFAURE was not altogether in agreement with M. DE MARCÈRE as to the latitude allowed by the 8th Article. In that case it might seem worth while to bring this disagreement into clearer light. The partisans of the late Ministry cannot afford to despise trifles. As there is not the slightest chance that the country will come round to their way of thinking if it is left to itself, it must be helped towards a better mind by any instrument that presents itself. Now no instrument is on the whole so likely to be serviceable

for this purpose as the fostering of dissension in the Cabinet. If the Marshal can be made to see that there is an unmistakable gulf between M. Dufaure and M. de Marcère, he may be led to think of the terrible position in which M. Dufaure's death would leave him, and may thus be led to insist on the gradual reconstruction of the Cabinet in a more Conservative sense. At all events, the interpellation originally put forward by the Extreme Right became in the end the interpellation of the Right Centre, and was discussed in the Senate on Wednesday.

M. Dufaure's speech gives some indications that there were two opinions in the Cabinet as to the manner in which the interpellation ought to be met. M. de Marcère's speech had suggested the idea that the Ministers rather courted an opportunity of impressing alike on Royalists and Imperialists the uselessness of attempting to upset the Republic. M. Dufaure, on the contrary, began his reply to M. Paris by asking the Senate to give no vote on the question. If the Senate were to state their own construction of the 8th Article, it would not be binding on the united Chambers, with whom will rest the right of revision in 1880; and if it should prove that the Senate's construction of the Article is even now different from that which the Chamber of Deputies puts on it, a conflict might be provoked which it was their duty so far as possible to avoid. A Second Chamber which is told by a Conservative Minister that action must be useless and may be mischievous is not likely to do much. The Senate shrank from incurring the risk depicted by M. Dufaure. M. Paris proposed the order of the day pure and simple, thereby in effect withdrawing the interpellation, and M. de Franclieu declared himself satisfied with the explanation that had been given. There can be no question that M. Dufaure's reading of the 8th Article differs in some respects from M. de Marcère's. It does not appear, however, that the discrepancy is wide enough to have any political importance. According to M. Dufaure, the only hopes with which the Government is concerned are the hopes entertained by public functionaries. It has no intention of probing men's hearts or of censuring opinions which are not manifested in such a way as to disturb the public peace. But since the Republic has become the definitive Government of France, its representatives must no longer connive at the setting up of any other Government in its place. So long as there was no Constitution, official persons were the servants of a Government on which no special character had been impressed, and they were at liberty, within reasonable limits, to strive to impress upon it the character which they wished it permanently to bear. Now that there is a Constitution, the Government has become Republican, and official persons must know it in that character and in no other. Those who hope for a Restoration must no longer expect to obtain Government appointments, or to be left undisturbed in them if they have already obtained them, or to be allowed to make use of those who hold them for the advancement of their political ends. As to the limits within which revision will be possible, it is a question which cannot be debated to any purpose. There are those who hold that under the 8th Article France may be declared a Monarchy. There are those who hold that under this same Article France may be declared a Convention. There are those who hold that nothing will be permissible except modifications which do not affect the substance of the Constitution. Let the decision as to which of these interpretations is the correct one be left to 1880, and to the Assembly which will then have the power, if it has the will, of entering on the business of revision.

M. Dufaure's speech was marked both by good sense and by ingenuity. There is no getting over the fact that, whatever Ministers or Chambers may say to the contrary, the Assembly which will have the power to revise the Constitution in 1880 will also have the power to say in what sense and to what extent it shall be revised. If a majority in the united Chambers have by that time come round to M. de Franclieu's way of thinking, the Constitution will most certainly be revised in a monarchical sense. If, by that time, the Irreconcilable Left are the undisputed masters of the situation, the Constitution will certainly be purged of any elements which may have been found to work unfavourably for the development of Radical ideas. M. Dufaure's reminder that extreme interpretations of the right of revision may be put forward on one side as well as on the other may have helped to cool the ardour of the Right. After all, it is but poor comfort to M. de Franclieu to be allowed to retain his hopes if the Communists are to be allowed to retain theirs also. Yet even he must see that the more widely the door is thrown open under the 8th Article, the more motley will be the crowd that will come in under it. If in 1880 France may lawfully be declared a legitimate Monarchy, she may as lawfully be declared a federation of Communes. The strength of the existing Constitution lies in the fact that the majority of Frenchmen are content with it. So long as that is the case nothing can overthrow it; so soon as an extreme party on one side or the other can succeed in making the majority of Frenchmen prefer the substitute which it offers them, nothing can keep it alive.

CRUELTY TO ANIMALS.

THE evidence collected by the Royal Commission on Vivisection, while it vindicated the humanity of English men of science, as a body, from aspersions which had been most unjustly cast upon them, at the same time showed clearly enough that a fashion of carelessness and indifference in regard to the sufferings of animals was gradually growing up in certain quarters under foreign influence, and was very likely, if left unchecked, to spread in a dangerous manner. The Commissioners did not venture to lay down the principle that vivisection was under no circumstances justifiable, for they admitted its valuable results in certain cases; but they held that the abuses of the system had reached a point which demanded some kind of regulation, so that "the progress of medical knowledge might be made "compatible with the just requirements of humanity." The Commissioners also came to the conclusion that, whatever opinion might be entertained as to the morality of vivisection, the only result of an attempt to put down the practice altogether would be either a general evasion of the law, or the flight of medical and physiological investigators and students to other countries, where they would be at liberty to make any experiments they pleased. The Government has now taken up the problem thus presented for legislative solution, and in the main has adopted the recommendation of the Commissioners, even going, at least on one point, somewhat beyond them. It is proposed that, as a rule, painful experiments on animals shall be allowed only when they are performed by a specially licensed operator in a registered laboratory, and on the strength of a certificate that the experiment is made with a view to the advancement of new discovery of knowledge which will be useful for saving or prolonging human life or alleviating human suffering, or for the purpose of testing a former discovery of this nature; and that in such cases the animals must be first of all rendered unconscious of pain, and, if seriously injured, killed immediately afterwards. An exceptional permission is, however, given to make experiments without anæsthetics, if it can be shown that insensibility would frustrate the object of the investigation, and to keep in life animals so treated, if that is absolutely necessary for the purpose in view. And in every case a report of the form and result of such experiments is to be made to the Home Secretary. Where it is shown to be necessary, experiments on animals under anæsthetics will be permitted as illustrations to professional teaching; but an absolute prohibition is imposed on any exhibition of painful experiments on animals to the general public, and also on the use of urari; and dogs and cats are to receive a special immunity from painful experiments. It is provided that penalties for offences under this law may be enforced by summary process, with an appeal to Quarter Sessions.

It is obvious that this measure is, in substance, a declaration of general principles which will afterwards have to be interpreted in particular cases, and it may be presumed that the working of the Act will not be altogether smooth and easy, at least at first. Cases will occur in which it will be difficult to say exactly what is "new "discovery," what is "useful for saving or prolonging "human life or alleviating misery," whether there is really a necessity for vivisectional experiments in teaching, and so on. There will also be some difficulty in getting evidence against offenders; and, if the law is harshly or vexatiously put in force, it may provoke concerted resistance on the part of scientific men. All this may be foreseen, and it will therefore be prudent not to expect too much from the direct operation

of the measure. Its chief value will perhaps lie in the fact that it is a grave public declaration of the right of animals to protection, and a protest against anything like wanton cruelty. But this in itself is very important, and its effect will be enhanced by the arrangements for Government inspection, the reports of experiments, and other means of ascertaining what is actually being done, and bringing the light of public opinion to bear on it. The higher professional authorities will no doubt be enlisted on the side of the law, and a more wholesome professional tone on this subject will be established, while at the same time there will be a general rise, as Lord CARNARVON said, in the standard of public thought and feeling. The fact that a stigma is thus thrown on cruelty when wantonly practised can hardly fail to have a deep influence, and it may also be presumed that these restrictions will have an effect in preventing the spread of the habit of reckless investigation by inexperienced or incompetent performers which has apparently been lately coming in. Lord CARDWELL observed very justly that at present the system was in its infancy, and might be dealt with more advantageously than if allowed to develop and harden. Custom is the familiar excuse for all cruelty, and it is well to check it at the beginning. Under such an Act as that proposed the area of lawful vivisection will be very much reduced, and the "convenience" of experimentalists will no doubt be found to be on the side of avoiding operations which may entail unpleasant consequences on themselves. The better class of them will also feel that they are put on their honour, and are bound to do all they can to inflict as little pain as possible. On the whole, it may be believed that this measure, which is framed in a spirit of moral suasion rather than of harsh penal correction, will do much good; and it is to be hoped that the professional support which may be looked for will not be alienated by an injudicious use of the law. It will be time enough when the new system has had a fair trial to determine whether it requires to be made more absolute in any direction.

It was of course not to be expected that this compromise of the consideration due to animals would satisfy the extreme party on either side, and they have naturally lifted their voices against it on opposite grounds. A conference of delegates has been held on the invitation of the Royal Society for the Prevention of Cruelty to Animals, to consider the Bill, and resolutions have been passed approving of the general restrictions contained in it, but protesting against the exceptions allowed, and demanding that the provision in regard to dogs and cats should be extended to horses, asses, and mules. On the other hand, the Duke of SOMERSET has come forward as the champion of freedom for vivisectors. It is quite true, as he says, that pain is daily inflicted on animals for the purposes of amusement, curiosity, and vanity; and that clumsy sportsmen and ladies who have a weakness for sealskins and birds' feathers are responsible for an enormous amount of misery in this way. There can be no doubt that he was justified in calling attention to this side of the question; but it does not follow that scientific men are to be allowed to be cruel without adequate reasons merely because there is a vast amount of promiscuous cruelty constantly perpetrated in private society. Obviously the argument points the other way—that the measures applied to science should be extended in other directions. It is of course easy to remark on the inconsistency of limiting the amendment of the law relating to cruelty to animals to just that class of cases in which, whatever may be the amount of pain inflicted, there is at any rate a plausible excuse for it. Nobody supposes that, as a rule, scientific inquirers are merely engaged in selfish sport; they are working for others, for animals as well as men, and, if they err, it is from mistaken zeal in an intrinsically beneficent pursuit. On the other hand, people who inflict pain purely for their own amusement and the indulgence of the meanest tastes are let alone. We are aware that usage blunts the sense of incongruity, and that an old custom, however bad in itself, is different from a new one. But, if we take our stand on logic, it is evident that not only this one part of the law relating to the ill-treatment of animals, but the whole of it, requires revision and enlargement. WINDHAM used to say that no one who condemned the noble and manly sport of bull-baiting could consistently defend fox-hunting; and nothing can be more flagrantly illogical than that a man should be fined for setting a dog at a cat, and should have full liberty to set a pack of dogs to run down a hare or fox and eat it. Working-men are constantly punished for getting up cock-fights, but there is no more cruelty in cock-fights or in dog-fights than in combats between dogs and other animals.

The truth is that humanity to animals is of modern date, and has kept pace with the growth of sympathetic perception. In other days people never thought of animals having feelings like themselves; but gradually this has dawned on them. Up to the passing of MARTIN'S Act there had been no legislation for the protection of animals; but since then there has been a continuous movement in this direction, and bear-baiting, bull-baiting, badger-drawing, cock-fighting, ratting, and dog-fighting have been made illegal. Yet other sports are still tolerated which in some of their incidents are equally brutal and disgusting. Otter-hunting, for instance, is especially of this character. It is quite right that otters should be killed as vermin, but the sport which brings out a whole country-side to gloat over the struggles of the wretched brute and to assist in its execution is surely as bad as anything of that sort can be. Again, it is usually pleaded on behalf of coursing and hunting that all that sportsmen care about is the exercise and exhilaration of the chase, and we should be the last to deny that this is a healthy element in English life. But it is impossible to be blind to the fact that other considerations enter into the enjoyment of the sport. Any one who reads the hunting reports even in so respectable a paper as the *Field* will find very unpleasant evidence of the sort of bloodthirsty delight with which the more brutal incidents of the chase are relished by a certain class of sportsmen. It is impossible to imagine anything more sickening than descriptions of wretched hares and exhausted foxes being torn into bits and eaten by the hounds. In one case we read of a fox being pursued into the cellar of a country house, and killed in the presence of an "excited crowd"; and in another the worrying of a couple of foxes is spoken of as "the cream of the day." The sight of an old hare plucked from its seat by furious dogs, and, as it is gracefully put, "allied to currant [illegible]," fills the mind of the chronicler with "a feeling "of [illegible] for an opportunity of sharing the sport "of such a pack." Again: "They ran into and killed "this fox on a window-sill in the middle of the main "street (of a village) to the delight of the whole "population, who, to judge by the crowd, turned out to a "man." In another case a fine old dog fox was killed in the shrubbery of a house and "eaten on the lawn," and the writer thinks "the hounds well deserved their fox"—a common phrase in these reports. It appears that foxes are also sometimes dug out of a hole for the mere purpose of being gobbled up by the hounds. There is really no necessity for hunting being associated with such stupid brutalities; but it is to be feared that custom has too strong a hold as yet to admit of any effectual treatment of such abuses until public opinion has ripened a little more. It is well, however, that people should face the fact that the kind of cruelty which is dealt with in the present Bill is only a small part of a far larger evil, and that the logic of the case requires uniform treatment all round.

THE MERCHANT SHIPPING BILL.

THE consideration of the Merchant Shipping Bill as amended in Committee was a less revolutionary process than it at one time promised to be. There proved to be a limit to the capacity of the Government for learning wisdom by experience, and instead of the Bill being entirely remodelled with Sir STAFFORD NORTHCOTE'S consent, it was only amended in one important point and that against his will. How the detaining clauses of the Bill are likely to be received by shipowners may be guessed from a speech of Mr. MACIVER'S on Monday. The gist of his complaint was that the operation of these clauses had of necessity to be confined to British ships, because no foreign State would tolerate the Board of Trade espionage to which British shipping is to be subjected. It may be suspected that any system of detention which is really effective will come under Mr. MACIVER'S condemnation. Indeed without espionage it is hard to see how a detaining officer is to ascertain that there is reasonable cause to think a vessel unsafe. He is ordered to use his powers in all cases where a British ship is "by reason of the defective condition of her hull, equipments, or machinery, or by reason of overloading or improper loading, unfit to proceed to sea. But defects of this kind are not usually apparent

on the surface. A ship's hull may be very rotten, but the paint on it will be all right. There may be no visible shortcomings in her equipments or machinery, but if no ship is to be detained unless all the world can see the reason before they have been told it, the officials will have an easy time. Even as regards overloading, a ship may easily pass unnoticed just at the moment she is getting out of dock, and if the detaining officer is to make sure of his prey in all cases, he must form his ideas of the amount and stowage of the cargo from his own investigations. Sir CHARLES ADDERLEY cheerfully answered that Mr. MACIVER appeared to know the intentions of the Government on this subject better than they did themselves—a retort which was probably truer than Sir CHARLES ADDERLEY intended it to be. There is good reason to fear that the Government know very little about their intentions on this subject. If the consequences of giving these large powers to the detaining officer had been seriously weighed, it is not likely that the 4th Clause would ever have been inserted in the Bill. The Government may be acquitted of intending to make this part of the Bill a scarecrow, but they will probably find that the attempt to make it a reality will excite a much more formidable opposition than they have dreamed of. That well-worn fiction, the responsibility of the shipowner, was again paraded under the orders of Sir CHARLES ADDERLEY on Monday; but responsibility, if it means anything, means that the person on whom it devolves is left to do or omit to do certain acts in the knowledge that, if any harm comes of his conduct, he will be liable to punishment. Under the 6th Clause of the Merchant Shipping Bill the responsibility of the shipowner appears to be tantamount to his chance of escaping detection supposing that he sends an unseaworthy ship to sea. The shipowner is called responsible, and under the 4th Clause he is really made so. But then Sir CHARLES ADDERLEY was too genuinely anxious to protect the lives of seamen to rest content with this provision. He first shifts the responsibility on to the shoulders of the detaining officer, and then frankly confesses that he has no very clear idea of what the Government means by the transfer. We question whether the Government have ever asked themselves whether there will be many or few detentions under the 6th Clause. Yet upon the efficiency of this clause, considered as a deterrent, the safety of seamen in a great measure depends. If the detaining officer is active, and keeps his eyes and ears open, if he listens to every report he hears about a vessel, and then goes and verifies it by personal examination, very few unseaworthy ships will get to sea. But this end will have been attained at the greatest possible cost, both of inconvenience and ill-feeling; and the temptation to the officers to avoid the local unpopularity, and to the Board of Trade to avoid the cost and discredit, of unsustained detentions, will be very great. All this has been wilfully incurred by the Government rather than assent to the simple provision that the seaworthiness of a ship shall be ascertained by previous survey, undertaken at the most convenient time for the owner and the most effective time for the surveyor.

In one important respect the Bill was amended on Monday, but on this point also the Government resisted improvement as doggedly, though not as successfully, as on the principle of compulsory survey. They had been warned by the dwindling of their majority to eight on a previous night that they could not count on the support of their friends on the question of deck cargoes of timber, and the discussion of Monday showed that there was no weight of shipowning opinion arrayed against Mr. PLIMSOLL'S proposal to prohibit them altogether. Sir STAFFORD NORTHCOTE said very truly that the clause imposing a penalty on deck cargoes of timber carried in winter dealt with a very delicate question, in that it would refer not only to the condition in which ships reached this country, but also to the condition in which they sailed from the port of loading. This argument might have had some force if it had been used against subjecting foreign as well as British ships to the penalty; but there seems no reason why the House of Commons should be more scrupulous about prohibiting deck cargoes of deals not more than three feet in height than about prohibiting deck cargoes of timber generally. There seems to be a pretty general consent among shipowners that the exception which the Government were so anxious to retain would be a frequent source of danger, and a majority of nineteen reversed the previous decision, and forbade the carrying of any timber on deck during the winter months.

A contemporary has remarked that the Merchant Shipping Bill has greatly suffered from the circumstance that the President of the Board of Trade is not a Cabinet Minister. It is convenient no doubt to have only twelve contending opinions to bring into harmony instead of fifteen; but this advantage is dearly purchased at the cost of leaving the most important legislation of the Session to be prepared by a subordinate Minister, and discussed in its relation to the general policy of the Government in the absence of its author. If to reduce the number of the Cabinet is thought so important, it might have been obtained by the excision of the Lord Privy Seal and the Postmaster-General, instead of by that of the Presidents of the Board of Trade and the Local Government Board. The value of the Lord Privy Seal as the handy man of the Ministry has often been enlarged upon; and if the British Constitution had allowed Lord MALMESBURY to come to Sir CHARLES ADDERLEY'S aid, the plea might have been accepted as valid. But, as a matter of fact, it is the CHANCELLOR of the EXCHEQUER who has been the handy man of the Ministry during the present Session; and so far as legislation goes, the Lord Privy Seal would hardly have been missed. So long as Mr. SCUDAMORE was in the Post Office, it might have been contended that no one short of a Cabinet Minister would have the power needed to restrain so wayward and so capable a subordinate. But now that Mr. SCUDAMORE has gone, more important questions are likely to arise in connexion with trade and commerce, and with local taxation and public health, than any that can possibly present themselves in connexion with the receipt and despatch of letters or telegrams. The Merchant Shipping Bill will go to the House of Lords with a very curious uncertainty hanging over its operation on Canadian ships. We need not now attempt to decide between the *Times* on the one side and the CHANCELLOR of the EXCHEQUER and the PRESIDENT of the BOARD of TRADE on the other. It is enough for our present purpose to point out that, if the *Times* is right, the Bill would have been greatly improved if it had come under Lord CARNARVON'S notice during the period of its preparation. In theory, no doubt, the Cabinet are as responsible for the Bills prepared by Ministers not of their number as for their own measures. But, though the responsibility may be the same in the two cases, the acquaintance with the contents of the Bill is not the same; and it has been reserved for the Merchant Shipping Bill to show that responsibility and knowledge cannot be safely kept apart.

THE POPE AND THE ENGLISH CONSTITUTION.

A SIGNIFICANT "whisper of the throne" pontifical has lately been communicated to the outer world through the faithful columns of the *Osservatore Romano*, and has naturally attracted attention in this country, to which it pointedly refers. The object of the article is to show, for the shame and confusion of Italian and Catholic statesmen, how much of genuine Christian principle has been preserved in the Constitution of heretical England, which they profess their desire to emulate, and which in fact contains all that is requisite for the quiet, safety, and prosperity of a country. It remains, we are told, in substance what it was before the Reformation, in common with the ancient Christian Constitutions of mediæval Europe:—

> In the first place, then, it is to be observed that the English Constitution, under which denomination is comprised all that regards customs, institutions, laws, and English forms of government, has carefully preserved and incorporated into itself all that heresy has left of Christian belief and practice. England is religious, and her intimate union with religion has preserved for her the blessings of peace and prosperity. In fact, the English nation stopped short at the ruins of the Reformation. Separated from the Church and from the Vicar of Christ, she has, however, retained all the remainder of Christianity, and, above all, the Ten Commandments. These she has always maintained in her customs, her laws, and her government.

There is undoubtedly a certain amount of truth in this commendation. A country whose constitutional history "has broadened down from precedent to precedent" does present striking contrasts to the wholesale revolutions and equally wholesale reconstructions which, unlike Topsy, have not "growed," but have been made to order, severing, as by a sharp line of demarcation, the past and present of so many nations of the Continent. Let us take one outward sign which is by no means devoid of significance to an intelligent observer. There is probably no country in Europe, certainly no Protestant country, so rich in the remains of Christian architecture as our own. Not only have our cathedrals survived almost intact the double ordeal of the Reformation and the Puritan Revolution, to be restored in our own days to much of their pristine splendour, but we possess a wealth of ruined abbeys which the most Catholic and most c

foreign nations cannot match. The richly endowed and still influential convents of Austria, regarded as buildings, are the creation of yesterday compared to Tintern or Rievaulx or Valle Crucis. True, our abbeys are in ruins, but the very ruins have been religiously preserved, while cathedrals and parish churches of equal age still resound with solemn chant throughout the length and breadth of England. It may be said that these are external accidents, but at all events they are accidents characteristic of a nation careful of its Christian traditions, and which, to adopt the language of the *Osservatore Romano*, retains its respect for the Decalogue, "the Divinity of Christ, the Holy Trinity, and the principal dogmas," and has even "jealously preserved its ecclesiastical hierarchy, maintaining it in honour." There is indeed, paradoxical as it may sound to some persons to say so, much of the better elements of mediæval Christianity, social, moral, and political, which has been lost elsewhere, so deeply ingrained into the Constitution and national life of England, that nothing short of a revolution of the Continental type, of which happily we have had no experience hitherto, could eradicate it. Is there, for instance, another country in Europe where the most advanced school of theorists in the matter of higher education would gravely appeal—whether rightly or not, we do not here inquire—to the directions of the founders of our mediæval colleges as prescribing substantially just what is demanded by modern requirements? So far, then, the praise of the Papal organ, though it comes from an unexpected quarter, rests on a solid basis of fact.

But immediately after the passage already quoted follows one which sounds so strangely in the midst of an elaborate and evidently sincere panegyric as to suggest at first sight the idea of a veiled sarcasm. Our readers may recollect that we noticed some months ago a paper on Church and State by Sir George Bowyer which had appeared in the *Contemporary Review*.* Of a good deal of its contents we were able to speak favourably, but we ventured to intimate a doubt as to how far his exceedingly "minimizing" views of Papal infallibility, the authority of the Syllabus, and some other cognate points of controversy would pass muster in orthodox Roman circles. Our suspicions have now been confirmed with a directness and weight of authority which may perhaps be considered more flattering to our sagacity than to Sir G. Bowyer's soundness in the faith. Sir George, in the article in question, expressed his "abhorrence of the persecutors of former days, whether Catholic or Protestant," in the most unequivocal terms, and it is usual in the present day for religionists of all classes to profess, whether honestly or not, a similar estimate of persecution. We remarked at the time that such sentiments could not easily be reconciled with the Syllabus—which indeed Sir George Bowyer puts aside somewhat contemptuously as a notoriously fallible document—or with other and more venerable Papal pronouncements on the subject. But we had scarcely expected to find the extremest champions of Papal claims selecting its persecution of heretics as the crowning glory of a Christian State. Such, however, is the laudatory estimate of the *Osservatore Romano*:—

> England is not to be looked upon as having only persecuted the Catholics; she persecuted the heretics also, those who aimed at the foundations of Christianity. The Anabaptists were burnt alive by Elizabeth, the Arians were burnt under Edward VI., and the cry "*De Hæretico comburendo*" lasted a long time, and, after this, apostasy and heresy always drew down corporal punishment and civil disqualification.

On this theory it will be a redeeming feature in Cranmer's character that, in spite of his own frequent tergiversations, he had the grace, in his worst period of heresy, to burn some fanatical preachers, one of them a woman, who were probably not much more heterodox, and were certainly much more honest, than himself. We do not say that laws for repressing blasphemy or ensuring the observance of Sunday, to which our panegyrist also refers, are never defensible or expedient; but, when our pious continuance in the burning of heretics after the Reformation is cited as a signal evidence that English "customs are in perfect accord with the spirit of Christianity," it is difficult to know whether to smile or to sigh. At the same time we are by no means prepared to dispute the claim of the *Osservatore* to represent more accurately than Sir G. Bowyer the doctrines of the Vatican, as might be inferred from the unexceptionable but mournful testimony of the late Cardinal Vitelleschi, in his very remarkable volume on the Œcumenical Council lately reviewed in our columns.

The *Dublin Review* does not hold quite so high a place as the journal which is, in fact, the *Moniteur* of the Papal Court. But still it has received the most abundant *imprimaturs* and benedictions of Rome, and its editor must be considered in a peculiar sense the authorized, though unofficial, spokesman of the Holy See in this country. We looked, therefore, with some curiosity to see what he would have to say of Sir G. Bowyer's version of Liberal Catholicism, and were not at all surprised to find that it had anticipated the edifying teaching of the *Osservatore* on the persecution of heretics. After quoting Sir G. Bowyer's vigorous denunciation of persecutors, and observing that it will certainly be understood to denote "those who have co-operated in inflicting punishment—at all events capital punishment—on heretics, as such," the Reviewer adds, diplomatically, that he cannot really have meant this. We can only say that, if he did not mean it, he is either ignorant of his mother-tongue or culpably reckless in his use of it. But the reason why he cannot have meant it is, from the Reviewer's point of view, no doubt a very forcible one. "He cannot have forgotten what excited much attention at the time—namely, Pius IX.'s canonization of S. Peter Arbues, who in his time exercised the office of Inquisitor, and doubtless condemned more than one heretic to capital punishment." This is rather a mild way of putting it. Peter Arbues was so notoriously cruel a persecutor and condemned so many heretics to the flames, that at length, in sheer desperation, the relations of some of his murdered victims rose against him and put him to death. If Sir G. Bowyer has forgotten his canonization as a martyr at the instigation of the Jesuits in 1867—which is very improbable—we have not forgotten it, or the outburst of startled disgust which it elicited among Catholics as well as Protestants on the Continent, the more so as the process of canonization then revived by Pius IX. had been wisely suffered to drop for more than two centuries. The Reviewer adds, very truly, that many other canonized saints have taken part in the capital punishment of heretics; and he accordingly assumes that Sir G. Bowyer can only have meant to condemn those persecutors who have acted in a cruel temper or with undue severity. But it is quite clear that he does not speak in any such restricted sense; and moreover he expressly and by name condemns the Inquisition, of which "S. Peter Arbues," as well as S. Pius V., was an exceptionally cruel and severe, though perhaps a strictly conscientious, official, and which was an institution established and carried on for centuries under the fullest Papal sanction. It is not our business to reconcile Sir G. Bowyer's frankly avowed abhorrence of persecution with a belief in Papal infallibility, but we are glad to recognize in it an indication of that Christian spirit which the *Osservatore Romano* is kind enough to attribute to our countrymen. We shall not follow the Reviewer into his comments on the *ex cathedrâ* authority of the Syllabus, which Sir G. Bowyer summarily dismisses, as well as "the *personal* infallibility of the Pope," as "a figment and absurdity," further than to observe that, in spite of the high authority of Dr. Newman, it has always puzzled us to understand how, if the Pope is infallible at all, the Syllabus can possibly be anything short of an infallible document; which indeed His Holiness appears, from what the Reviewer says, to have himself officially declared it to be. Meanwhile it is noteworthy that Cardinal Vitelleschi, who ought to know, invariably speaks of "the personal infallibility" as the point at issue and eventually defined, throughout his able and interesting volume on the Vatican Council. Notwithstanding the lavish commendation bestowed by our Roman panegyrist on the English Constitution, we cannot help being afraid that Sir G. Bowyer's English feeling is more unimpeachably manifested than his orthodoxy in his treatment of Vaticanism and its results.

* *Saturday Review*, February 5, 1876.

HONEYMOONS.

In almost all countries, Christian and heathen, a certain amount of horseplay and roughness, amounting even in some cases to cruelty, is the portion of newly-married couples. But in England alone does fashion tyrannize so harshly as to prescribe the wedding tour. At a time when most people would seek quiet and seclusion, publicity is forced upon them, and they are made conspicuous even by the way in which they are hurried on their travels. Woes enough are in store for them without the additional inflictions of society. They are likely enough to make each other miserable without being tortured with specially invented troubles. But their feelings are never thought of in the ordering of the wedding festivities. By long custom we condemn the bride and bridegroom to many petty annoyances which might easily be avoided. They would, no doubt, be avoided did people take the famous advice to "marry early, yes, marry early—and marry often." But others will not learn by our experience; and, for the present at least, there is little reason to hope that any reform is contemplated. We condemn the unfortunate couple to a penance which would try the deepest affection and irritate the sweetest temper. When Hodge and his sweetheart crown their pastoral loves in the quiet old country church, they enjoy a walk in their finery and white cotton gloves, and then take possession of the cot beside the wood, and settle down at once to connubial comfort. But they have chances of happiness denied to their richer neighbours. It is a matter almost of moral duty, certainly of superstitious strictness, that when the squire marries the rector's daughter, or my lord marries my lady, the first month of married life must be passed in the discomfort of foreign hotels, or the still less endurable desolation of English inns, as if to strain to the utmost the strength of their newly-made bonds. Now and then, it is true, a bridegroom may know better. He has perhaps been married before, and does not forget his old experiences. When the carriage comes round, and his bride and he, amid showers of slippers and rice and other senseless manifestations of the inanity of the wedding guests, step in and are whirled away, he drives out by one gate and, after a short excursion over the hills, returns by the other, treading on the heels of the departing. But such a contrivance requires considerable forethought. Papa and mamma must be persuaded to wink at it. There must be no evening ball, and the junior branches of the family must be despatched elsewhere under various excuses. Most men contemplate some such escape from the tyranny of usage, but few there be that can accomplish the fulfilment of their scheme. My lord sometimes borrows a friend's house, and exchanges the prying glances of watchful friends for those of private domestics; but his fate is little different from that of his less distinguished neighbours; and while modern method grumbles at the

decline of matrimony among eligible young men, they forget that many a man who would walk coolly to the cannon's mouth, or even undergo the amount of ceremonial required by the social usages of a village, cannot, even if he would, face the long and bitter agony of a fashionable wedding—the preparations, the bridesmaids' lockets, the settlements, the bishop and three other clergymen, the sexton of St. George's, the dreary mirth of the breakfast, the speeches, the presents, and finally the four white horses, the down-drawn blinds, the railway station, the luggage, the horrors of the middle passage, and the yawning desolation of the wedding tour.

The foreign tour has, on the whole, its advantages in comparison with Killarney or the Isle of Wight. The newly-married are not so easily recognized abroad. There is some chance therefore of escaping from the curious gaze of people for whom everything connected with matrimony has a strange attraction, and who would go out of their way at any time to stare at a newly-married couple. A happy delusion is sometimes nursed to the effect that the recent nuptials are a profound secret to the outer crowd, among whom the victims would conceal themselves. But there are too many experienced eyes at the accustomed resorts; the young people labouring under such a delusion are sometimes tempted to the imprudence of an evening stroll along the Dover pier on their way to France, and fancy that the loungers may disregard them or think they are Darby and Joan of many years' standing. The bridal satin and the blue frock-coat have been laid aside; a quiet travelling costume has been assumed, but the disguise is not sufficient. The relative position of the young lady in the new Ulster and the tight boots to the young gentleman who looks so uneasily conscious in his shooting suit is manifest to all that infest the pier; and our unfortunate couple are only too glad to escape from the staring eyes outside to the scarcely repressed congratulations of the landlord within, and the obsequious but significant attentions of the smiling waiters. Unpleasant as is their brief sojourn in their native land, their next step is still more unpleasant. The crossing has somehow to be performed. They may wait a day, or even two, for favourable winds; but sooner or later they must go; and a shower of small troubles attends their start. The bridegroom is distracted by his new responsibilities. He may have travelled in other days with his sisters, but always found somebody only too willing to assist him in dispositions for their comfort. His new wife and her maid are wholly dependent on him, and while he feels that he could provide for the former, he fears and hates the maid. In his hurry to catch the early boat he leaves his cigars on his dressing-table; shall he be able to smoke those he can get at Calais? The hotel bill has extended to fancy dimensions, and he is foolishly conscious of having had to pay for his peculiar and novel position. He has an idea, confirmed by the subsequent inspection of his purse, that in the dim twilight of the morning he has dealt out sovereigns instead of shillings to the boots and porter. The new maid, too, racked with concern for the safety of all their lives in crossing the sea, of whose raging billows she has so often heard with awe, has forgotten the chlorodyne. No remedy is provided for the inevitable sea-sickness, and she is uncertain whether her mistress's new travelling bag with the gilt fittings has been left in the hotel or stowed away to take its rough chance with heavier luggage. But the troubles of the shore are soon forgotten, as the steamer bounds merrily "on a breeze from the northward free"; the bridegroom points to the white cliffs, and quotes Scott to the bride. She looks exceedingly pretty; and, standing with his arm round her, the proud husband shows his high spirits by wishing the recipients of his sovereigns joy of their windfall, and by facetious remarks on the appearance of the other passengers, interspersed with timely exhibitions of aquatic knowledge and the use of yachting and naval terms. Before long, however, certain white-crested waves appear upon the sparkling waters; and very soon the gay looks and sprightly conversation flag. A more taciturn period succeeds, and a snug corner amidships is gladly secured and made comfortable with rugs and wraps. But the steamer is now in mid-channel, and begins to perform such evolutions as materially diminish the happiness of our couple. The poor little bride experiences those gradual risings to unexpected altitudes, that sliding along the surface when a descent was expected, and finally, that awful sinking to remote depths, accompanied by an extra groan from the funnel, which thrills through her frame, and finally overcomes her. Long time, however, she battles bravely with the inclemency of the elements. So much the greater her ultimate breakdown. The husband holds out longer, but only to add another to the horrors of his position. His feelings are put to a severe test as he sees that his dearest one is suffering and that he cannot relieve her; but his affection itself is tried when he observes, as he cannot help observing, before the hand of sickness is laid upon him also, that the bloom of her cheek has been replaced by an ashy paleness, her rosy lips have turned blue-grey, her charming hat is cocked recklessly at an unbecoming angle, and he recalls with uneasy conscience the words he has so often sung in the days of devotion, the vows of constancy to endearing young charms, now that they seem indeed to fleet in his arms like fairy gifts fading away. If five minutes of sea-sickness can work such a change, what will be the case after years and misfortunes have made the present appearances permanent? But he feels that on this occasion the sufferings of his beloved demand from him at least a show of tenderness in the inverse proportion to his diminishing admiration, and he ventures to offer such comfort as she may derive from being asked "how she feels." All the reply is a melancholy shake of the head, for speech is dangerous, not to say impossible. After the first paroxysm is over he remembers that they have come provided with a domestic. To her care he will confide his suffering bride, and, betaking himself to the comparative retirement of the forecastle, will try to think of happier scenes. But where is the maid? Helpless though he feels as respects his wife, and queer as respects himself, he searches in vain, till the object of his quest is at last discovered in the noisome recesses of the ladies' cabin in a state of total collapse.

Such are the ordinary conditions under which a newly-married couple now-a-days begin matrimonial life; and during those early weeks sad memories are laid up of provoking mistakes, of trunks which will not pack, of trains which will not wait, of bonnets which cannot be tied under half an hour, of tiresome sight-seeing, of broiling sun, of headache, and, alas, sooner or later, of ill temper, and even a quarrel. The maid who was to be a comfort has proved only a trouble. Her knowledge of foreign tongues turns out to be a myth, and her nerves have required quite as much care as those of her mistress. She has left something behind at every stopping-place, and is herself abandoned on a Paris platform when the young couple start for Geneva. By telegraphy and the police she is eventually recovered alive, and she has, perhaps, once or twice been of use as a buffer. But, on the whole, the experiences of a honeymoon abroad are not of an encouraging kind. Differences of opinion, incompatibilities of temper, fretfulness, and above all weariness of each other, which, if they ever sprang into being, might easily have been hidden under better conditions, have come forward into the full light of day, and the honeymoon is the prelude to a married life in which indifference will rank almost as a virtue. Indifference may be attained by various means; it visits the cottage as well as the castle; but too often the honeymoon calls it into existence, and many a bridegroom but just returned from a "delightful tour on the Continent" will be able to sympathize with the remark of the country farmer to a companion in the train as he went to town to buy hay:—"Yes, it's been a bad winter for some folk. Old Smith's dead, and so is Jones, and my wife died yesterday. And how be the hay, master?"

COTTAGE PROPERTY.

THERE are several subjects in the treatment of which a writer is rather assisted than hindered by his own ignorance, and among these may be numbered questions relating to the occupation of lands and houses and the position of the occupants. Habits and customs differ so widely all over England, the agricultural labourer has so little in common with the mechanic, special prejudices remain so closely wedded to particular districts, that any attempt to generalize from any given locality can throw but little light upon the subject. No question, however, is more discussed or excites more interest, and it is impossible to expect that, in order to qualify himself for writing upon agricultural topics, a writer should be required to possess a freehold estate of at least a hundred acres. The present generation is bent on improvement, and is determined to see the effects of all its labour and expenditure during its own lifetime, and to feel certain that it has not spent its money and its advice in vain. In a few years houses can be built, railways made, School Boards elected, model schools set in operation; and it is expected that, after the study of Mr. Green's *Short History of the English People*, and when "the importance of cheerful obedience to duty, of consideration and respect for others, and of honour and truthfulness in word and act" (we quote from a memorandum issued by the Education Department) has been generally impressed upon the school children of the age, some marked change will take place in the condition of the working classes to correspond with the efforts made in their behalf. When the results are small or none at all, fault must be found with some one, and the Government and the landlord suffer alternately. Half-a-dozen critics run to the plant which was planted the day before, and, having pulled it up, are surprised to find that it has neither grown nor rooted itself in the night. Yet there is no royal road to civilization, and the adoption of a new code of morals requires almost as long a period of time as the introduction of physical changes by the selection of breeds. If we are to draw any lessons from the alterations made in the habits of thought and life among the upper classes during the last hundred years, several generations must pass away before a love of cleanliness or refinement can become common among the labouring portion of the population.

Suppose some one had gone to Mr. Western in the year 1750 and said, "Sir, I represent the spirit of the next century, and beg you to live more in accordance with it. Your mode of life is not that of a pious and well-conducted person. You use expressions both unnecessary and indecent, nor have you that reverence for the presence of your maiden sister which could be desired. Many of your cottages consist only of one room, there is no school in your village, and the clergyman has sadly neglected the spiritual wants of the parish. I request you to amend your ways by avoiding expletives, going to bed sober, and reading a chapter aloud from Mr. Doddridge's *Family Expositor*, which I have brought with me, every morning and evening to your household." Mr. Western would have used the most hideous language, thrown Mr. Doddridge out of the window, and sent Sophia into hysterics. Education is a very gradual process, and old customs die a very hard death. The manners of our upper classes improved with the roads. There is

an interesting passage in Tate Wilkinson's Memoirs, published in 1790, about the difficulty of travelling in the middle of the last century, which ends with the following anti-climax:—"Scotland was then imagined by the Cockney as a dreary place, distant almost as the West Indies; now an agreeable party may with the utmost ease dine early in the week in Grosvenor Square, and without discomposure sit down at table on Saturday or Sunday in the New Town of Edinburgh." If the Squire had had no opportunity of leaving his country house, but, like the labourer, had been tied down to his native parish from birth to death, his language and manners would have remained the same. It is only by substitution of other pursuits that the sports of the upper classes have been more humanized. Were there no covert-side there would be a bull-ring. By giving colliers a hunter and a grouse moor, dog-fighting and cock-fighting would become extinct; but until a paternal government can provide the former, savage instincts will find a vent in the only direction open to them. Meantime society has not been idle, and, were it possible, we should much like to see an estimate of the expenditure on cottage property during this century, an expenditure which has probably been in most cases unremunerative. We cannot conceive a better occupation for the philanthropist who theorizes about the duties attaching to landed property than that of buying ten cottages every year and transforming their occupants into cultivated beings. He would of course not confine his attention to a single district, but would form small Utopias in the centres of all the trades of the country. Each cottage would contain a kitchen and scullery, three bedrooms, a back-yard, suitable offices, a porch overhung by roses, and a garden bright with the flowers recommended by the writers of the seventeenth century. The tenant would defer his marriage from prudential motives, and regulate the number of his children subsequently according to the fluctuations in wages; and, if he pulled his head down by his forelock, or, as is the habit in manufacturing districts, gave a side nod to his landlord, he would carefully explain that this act of courtesy was in no way to prejudice his right of making a claim to his unexhausted improvements in the scullery at the end of his tenancy, when the Small Tenements Act came into operation. The philanthropist would probably die after a hopeless failure to draw the mean between despotism and self-government, [illegible] himself into the character of the ap[illegible] ages, "at once turning out any who betrayed distinct ved even the moral leprosy which it was his design to extirpate"; which we take to be a fine way of describing drunkenness. Where a landlord has his property in the neighbourhood of his own house, a gentle despotism produces pleasant enough results. The proprietor with his thirty or fifty cottages on the outskirts of his park, where no disturbing element enters into the life of the village and the same occupations have absorbed the youth and the age of successive generations, who regulates the number of public-houses, and, it may be, banishes them altogether to a distance of three or four miles, can make the whole of his estate one idyllic picture. His tenants' gardens may be as neat as his own, and he will be contented to receive two per cent. upon the gabled dwellings which he has built to harmonize with the lines of his lodge and school. He supplements the working of the Education Act, centres the compulsory powers in himself, and refuses to allow the introduction of lodgers, except perhaps in one or two licensed instances. This, however, charming as is the scene, is, after all, a forced condition of human life; and were the landlord to present each tenant with the fee simple of his holding, the Arcadia would crumble away in a couple of years. No squalor is greater than that which is to be found in the village of small freeholders or squatters, where there is no one to originate any scheme for the benefit of his neighbours, no one with any money to spare, no one to set an example to the others. As long as the walls will hold together, as long as the thatch does not drop through the roof, no repair will be dreamt of by the owner, on whom the blame is never laid. The well-informed Correspondent of some daily paper credits the neighbouring landlords with the wretched hovels, which some day, if they do not tumble to pieces of their own accord, are bought to be pulled down.

In speaking of the dwellings of the poor, it is not to the agricultural village which is at the doors of the great landowner that attention is to be turned. There are few men who have not some outlying property, and in many of the manufacturing districts there are no men of leisure, nor indeed any one who is not compelled to live there by his business or for his livelihood. In most cases the control is completely in the hands of the agent, who is not given to unproductive expense, and is not inclined to look from an æsthetic point of view upon the restoration or alteration of houses which pay from 4*l.* to 6*l.* a year. Where the original value of the property consisted in the political power it gave, and where that value was swept away, as it often was by the Reform Bill of 1867, it requires some philanthropy on the part of the possessor not to get rid of his responsibility and throw the decaying rows of houses into the market. If, on the other hand, he is determined to raise the condition of his tenants, he must possess patience, tact, and decision of character, be a rich man, and also have plenty of spare time to give to the question. If he has views about the separation of the sexes, he will be met at the outset by the existence of a wholly different code from his own, which he must be prepared to recognize. On one side is the exquisite delicacy of the Government, for whose sake the mud heaps on the banks of the Serpentine have been raised. When little boys can no longer be seen bathing after eight o'clock on a summer evening we shall become a moral and exemplary people. "Prenez-moi ce mouchoir (or mud heap), par de pareils objets les âmes sont blessées," the First Commissioner of Works cries with Tartuffe. "Society must not know that anybody is naked underneath his clothes." As to our language, it is Yes and No. Since Charles Lamb explained to Coleridge that by d—d he meant deuced, we have steadily improved, until no doubt half the House of Lords, including Lord Forester, do not know the meaning of even this latter word. But this state of things is not that in the midst of which the lower classes live. Their language is still rich in expletives, and they cannot see any object in the separation of the sexes. If the grown-up sons and daughters and grandsons and granddaughters prefer the same bedroom, the landlord, short of exercising Lord Hadda's power, is helpless. He cannot compel his tenants to use rooms which they dislike; all he can do is to provide sufficient accommodation. In a small village rules respecting lodgers can be enforced; but where life is more hurried, the population more migratory, and the demand for labour keener, no agent can, without exercising excessive inquisitorial authority, prevent overcrowding. The temptation to take in lodgers is no doubt great when the rent of the cottage is 6*l.* a year, and a man can be found who will pay 2*s.* 6*d.* a week for one room. There is, however, just the same difficulty even when the spare rooms are not wanted for lodgers. In the long, low bedchambers which run along the whole of the first story in a Lancashire farmhouse, all opening into one another, the first is often the only one used, the other two serving as storehouses or hen-houses. "It is more comfortable," is the reply to the agent, when, an alteration having been made at a great expense, the chickens are discovered in the new [illegible]. In one case, where two small cottages had been given [illegible] family in order that they might separate the [illegible], the mother explained that they preferred sleeping [illegible] two large beds touching one another. The family consisted of a mother, a son of nineteen, another of fourteen, a girl of twelve and another of eleven. Every additional room creates [illegible] trouble, and one great bed, with its sordid [illegible], requires [illegible]. Owns nothing more miserable with [illegible] than in some of the mining districts. The absence of herbs and flowers, the dirt with which the air and water are charged, all add to the desolation of the ill-fitting door patched with dirty cloths, the uneven floor with here and there a flag missing, and hardly an article of furniture downstairs or upstairs. Yet the tenants very likely earn good wages, and might surround themselves with comfort. What may be earned can be gathered from the fact that not long ago a father and his three sons were paid 20*l.* on a Friday and had spent it all before Monday morning. No doubt there is a desire for better houses on the part of some of the working classes; but the majority would prefer a hovel at 3*l.* to a good house at 7*l.*

If the difficulty is great of inducing a man to live in new rooms, it is still greater to persuade him to change his cottage. Even when no mason's art can avail to prop up the walls, and the wind and rain beat through the crevices of the latticed windows, it is with the greatest reluctance that the tenant will leave it. His father and grandfather lived there, and he wishes to die there, an event which is always looked upon with great satisfaction. To die in your house is a compliment to it and to you, and it is far more important that a house should offer facilities for this act than for any other. In cases of this kind no complaint will ever be heard by the agent. The tenant's only object is to show that there never was so model a cottage; the rain is like the rain at Marly and does not wet, and though the wind is high there is very little of it. We know of one case where a farmer pulled off part of the roof in order to dislodge his tenant, who, in no way discomposed, remained there until his landlord in despair put it on again. Altogether the question of accommodation for the working classes is one of extreme difficulty. As long as the cost of building remains so great, it will be a temptation to the small freeholder to patch up any collection of hovels he may own. Until a higher standard prevails, the wages will be spent in the old way. There is nothing to make any one hopeful at present. The history of the savings banks shows how small a proportion has been laid aside by those who have benefited by the great increase of wages, and competent judges say that in Lancashire the workingman is no better off now than he was ten years ago. Public zeal and private enterprise will go on doing what they can, but after all their efforts there will be a residuum left whose civilization will tax for many years the energies of our descendants.

SOUTH PEMBROKESHIRE CASTLES.

THE Flemish district of Pembrokeshire—in what sense Flemish we have already explained—is as rich in castles as Northumberland itself, and for exactly the same reason. The inhabitants were settlers in a conquered land, with dangerous neighbours on their borders; they held a small isolated territory which lay open to attack from the whole of a large district. Each town therefore needed its fortress to guard it; each dwelling of a considerable lord became a fortress itself. Yet perhaps castles are not so thick on the ground here as they are in some other districts. They are hardly so thick on the ground as they are in Glamorganshire.

Perhaps the difference is in some measure owing to the different nature of the settlement. The settlement of Glamorgan was essentially a settlement of lords with their followers. The Flemish colony can hardly fail to have been of a more popular character. Every parish church seems to have had its tower designed as a stronghold in time of need, and, as we have said, a military touch may be seen in the ordinary houses. And the churches as well as the houses are well worth studying. That they have less of ornamental detail than the ancient churches of almost any other part of the island is in no way surprising, nor is it in any way blameworthy. And what they lack in ornamental detail they make up in picturesqueness and complexity of outline. They add, too, the almost universal presence, though certainly in the simplest of forms, of the stone vault, so rare in all other parts of Britain, except in churches of a far greater size. In South Pembrokeshire, contrary to the rule of the rest of the world, a wooden roof in a church is a sign of finer work. It is a sign that the building is not a specimen of the local style of the district, but that it has been built after the pattern of churches of a richer type elsewhere. Where we see, as we now and then do, elaborate windows and other work of the fourteenth century, the plain local barrel vault would be felt to be out of place. So it is at Carew, so it is at Hodgeston, where a modern architect has ruthlessly mutilated the most graceful feature of the building; and, lastly, in the most characteristic of the greater churches of the district, the priory of Monkton, close to Pembroke.

From the churchyard of Monkton the view is one which is eminently characteristic of the district. Nowhere do we more thoroughly feel where we are than in Little England beyond Wales. The great physical feature of the district is brought strongly home to the mind of the traveller who passes from the town of Pembroke to its suburb Monkton. South Pembrokeshire is, before all things, a land of inland seas, of peninsulas, and of islands. It is not a land of mountains, but it is pre-eminently a land of hills. The English district is largely made up of two peninsulas, the northern of which is separated from Dewisland, the immediate patrimony of St. David's, by the noble bay of St. Bride, curving round like the bay of Penzance, or even of Naples, and with the islands off either horn suggesting memories of Ischia and Capri. This northern peninsula, itself made up to a considerable extent of smaller peninsulas, is cut off from its fellow to the south by the haven of Milford. Here again we seem to see a Scandinavian trace. The *ford* here is surely neither an English *ford*, nor a Welsh *fordd*, but a Scandinavian *fiord*, like Waterford and Wexford. And a *fiord* of very truth it is; a fiord with endless creeks running far up the country, so that points far inland stand on the salt water. We are here on a fiord of the ocean, subject to the law of tides, so that the look of one of these inland creeks varies greatly from one hour to another. But, at a favourable moment, the great fiord of Pembrokeshire may suggest the noblest gulf of the Hadriatic; and, on the bosom of the haven of Milford, we are tempted to say that we only lack the mountains to feel ourselves on the *mouths* of Cattaro. The creeks which run thus far inland wash the bases of three of the chief castles of the districts. At Haverfordwest, the most northern point of the haven—the spot where the traveller leaves the iron road of modern times to betake himself how he can to the ancient city of St. David's—the border stronghold of the Englishry—castle and town rise proudly over the low ground at their feet, low ground where, at the favourable moment, the inland sea shows itself. But the castle, noble in its position and its outline, is degraded and disfigured by its modern use as a gaol. At Haverfordwest the objects of greatest attraction are ecclesiastical). There is the church of St. Mary, of an uncouth outline enough outside, but sheltering within pillars and arches of the thirteenth century which might stand part of the richest minster. And there is the ruined priory by the water, with the shell of its aisleless cruciform church, once seemingly, with its long lancets, the fellow of the little cathedral at Killaloe. From Haverfordwest the railway will lead us to its most distant point at Neyland, or New Milford, with Pater or Pembroke Dock opposite to it. Here we are in the thick of the works of modern times. But we have only to cross the hill between the main haven and one of its creeks, and we come in sight of the opposite heights crowned by the castle of Pembroke and the priory of Monkton. The narrow inlet of the ocean, dwindled to the size of a small stream, ebbs and flows between the two hills, and the proud fortress into which the wooden structure of Arnulf of Montgomery grew rises straight from the rocks which form one of its coasts. A cave, the *Wogan*—the British name surviving for a natural object—not quite of the size of Wookey Hole—perhaps its namesake—in Mendip or of the Devil's Hole in the Peakland, but big enough to be striking and solemn, burrows, as it were, under the hall of the castle, and is itself taken into the line of the defences. The walls with their towers, the huge round tower—not quite the rival of Coucy, but the nearest surviving approach to it in Britain—the stately hall itself with its late thirteenth-century windows, the gateway, the whole circuit of the castle, all join to form a group worthy to be the head of the Flemish land, worthy to be the home of the great Earls of whom the one gained his fame by sheltering the youth of Henry of Winchester and the other by withstanding his miarule.

The castle stands nobly, whether as seen immediately from below or from the opposite side. But the Monkton view, though it brings out the architecture of the castle itself less perfectly, is perhaps the most characteristic of all. The priory stands on its height, one of the type of double churches whose arrangements seem at best to be beginning to be understood—a church without transepts, with a graceful choir and lady chapel of the fourteenth century, now in ruins, attached to a ruder nave of the native type. In its churchyard—so it is said on the spot—not so long ago stone seats still remained for the hearers of the out-door sermon preached from the churchyard cross. Below it stands, not exactly a castle, but a fortified house, a "domus defensabilis," thoroughly characteristic of the district. On the opposite side are the castle, the town wall, the massive tower of St. Mary's Church, contrasting with the slender one of the priory itself, but both such as could be found nowhere else. In mere extent the town of Pembroke does not rank above an English market-town; but, just as in the small towns of Germany, its position gave it importance. The capital of the conquered land, the seat of the local chief and of the burgesses gathered under the shade of his fortress, a town of this class really ranked rather with Exeter and Lincoln than with the petty places on whose level its mere physical size would place it.

As one horn of the haven reaches to Haverfordwest, and another to Pembroke, each washing a fortress which protects a considerable town, a third horn washes a third fortress, which stands all alone, the stronghold of a lord, but not the shelter of a civic settlement. This is Carew, a place whose name calls for a short lecture on its pronunciation. The name is British *caerau*, camps, a name handed on from some encampment of the race who were driven out. But the received English spelling is Carew, keeping in its last syllable a survival of the British plural; and its received English sound is exactly the same as *Carey*, not deviating very much from the sound of the Welsh original. From the place a family took its name, and, till within a generation or two, the pa- of both place and family was always sounded *Cárey*. But ith becomes Smythe and Smijth, so *Carów* was thought to have a finer sound, and the barbarous pronunciation is actually making its way from the family to the castle. The castle itself is in some points a contrast to that of Pembroke. While at Pembroke we have a purely military castle, mainly of the thirteenth century, at Carew we can trace the steps by which the mere fortress gradually changed into the great house. The gates and towers are there after the old pattern, but the great hall was thoroughly recast in the days of Henry the Seventh by Sir Rhys ap Thomas, a person who plays some part in general history, and who holds a very great place indeed in local imagination. Joining on to his work, built on by a most violent contrast against one of the original towers with its vast spur buttresses, is a range of large rooms of the confirmed domestic architecture of the Elizabethan age. The whole is forsaken and roofless; but, as often happens, the latest part of the building is the most ruinous. Huge square windows, with their mullions and transoms, are not so well fitted to weather storms without protection as the massive walls of a Norman keep.

The castle of Carew then is not only striking in its general outline and worth studying in many of its details, but it is specially instructing from its combination of military and domestic architecture. But on the road from Pembroke to Carew the traveller will do well to turn aside to take such a view as is allowed him of another forsaken and roofless building of the ecclesiastical-domestic class, the once episcopal manor of Lamphey. While the traveller is allowed an uninterrupted study of Pembroke and Carew, the sight of Lamphey is put under churlish restrictions; but the main features can be made out. The building, once a favourite residence of the Bishops of St. David's, is well worth the attention of the special student of domestic architecture; but in a more general aspect it is chiefly remarkable for the question which has been raised, whether its peculiar arcaded parapet, which bears a faint likeness to the beautiful parapets of the palace of St. David's and the castle of Swansea, is the work of the same architect, the famous Bishop Henry Gower of the fourteenth century. But, compared with the work in the other building, the Lamphey parapet is so very poor that it must surely be a weak imitation of later times. We may with more confidence look for the hand of Gower in the neighbouring church of Carew, one of the best of those in the district which do not conform to the local type.

From Carew, castle and church, the wayfarer will naturally make his way to Tenby, but he will do well to turn aside to give a glance to the church of Gumfreston on its slope, with a singular mineral well at the bottom of the dell in which either the natural philosopher or the physician may find some interest. The church itself has no detail of any kind, but no better specimen can be found of the strange, wild, picturesque character of the local type. At Tenby itself, the huge church has nothing local but the tower; but the process by which it has swelled to its present form is worth comparing with Grantham and Great Yarmouth. The most really interesting thing at Tenby is the town wall, which remains very nearly perfect throughout the whole of one side. Of the castle only fragments are left; but the peninsular hill stands nobly, looking over the sea two ways, to the island of Caldy on the one side and to the Worm's Head, the western promontory of Gower, on the other side. From Tenby the favourite excursion is, not without reason, to the castle of Manorbeer, the birthplace of Giraldus. Five-and-twenty years back there was not much to be made out here beyond a picturesque outline of walls and round towers. But the chief features have lately been brought clearly to light, a hall and a chapel whose changes are well worth study, and among which are parts of Giraldus' own day or earlier. The castle stands well on the south coast, looking down on a small bay, and with the wildest and

strangest even of Pembrokeshire churches on the side of an opposite hill. As to the origin of the name of this place many strange guesses have been made. It may be well to preserve the strangest. At some unrecorded time the land was laid waste by a huge and savage bear. For a while no means were found of killing, trapping, or otherwise getting rid of the enemy. At last a stout knight of those parts met the terrible beast in single combat. At last he slew him, but not till after so long and hard a struggle that it was for a while doubtful to which victory would fall, "man or bear." Wherefore the name of the place was called Manorbeer.

MAY MEETINGS.

THE speeches at Exeter Hall and its dependencies during the season of the Evangelical parliament may be divided into the sensible, the autobiographical, and the funny. We shall say nothing about the first class; we only mention its existence in order that whatever we say of the two other classes may not be misunderstood. The aim of a May Meeting is the gaining of additional sympathy and subscriptions for a number of "Evangelical" institutions, some of which are useful, some indifferent, and some mischievous. It is evident enough to the cooler bystander that the managers of these meetings, in whatever higher light they may regard them, certainly look upon them as entertainments, and that, in the arrangement of their annual company of movers and seconders, they take pains to provide a number of speakers who know the trick of raising a laugh. The fun during the present May seems to have been faster and more furious than in any previous year; and the Committees who cater for the Puritan pleasure-seeker may congratulate themselves upon having secured a considerable accession of comic talent. The railways have brought up to London a number of ministers of all Evangelical denominations from remote parts of our island. Some of these gentlemen are distressingly autobiographical; they seem to think that London not only wishes to know every meditation which occurred to their wise minds upon their journeys, but also wishes to have these valuable meditations reproduced and moralized upon in public. Thus the Rev. Dr. Brown, who came all the way from Cheltenham, told his audience that he was much struck by seeing a drop of dew upon every blade and leaf. The Rev. Mr. Evans, who came from Carnarvon, began his speech by informing the hearers that on his railway journey he "passed a very extensive nursery-garden"; and then, lest Londoners should not know what a nursery-garden is, he kindly defined it, and explained the use of it at considerable length. Of course the dew-drops and the nursery-ground were incontinently "improved"; and we find that the improvement of an insipid story invariably leads to the kind of noise which the reporters call "applause," and earns the speaker time to get his breath, wipe his brow, and collect himself for his next point. "Applause," however, is not the highest prize which the pious and pleasure-seeking audience has to bestow. Most of these fresh speakers from the country appear to have employed the tedious hours of their long journeys in the diligent preparation of themselves for their first public appearance in London by the study of a handbook of comic anecdotes. We do not know the title of this volume; we can only conjecture that it may be called "The Converted Joe Miller," or "Sanctified Sprightliness," or "Merriment for Methodists," or "The Playful Puritan," or "Saints at Sport," or "The Presbyterian Punster," or "Banter for Baptists." If either of these titles should be unappropriated, the Religious Tract Society is free to use them; we have no wish to claim the copyright. A May Meeting, if we may judge by the reporter's continuous parentheses of "laughter," "much laughter," "renewed laughter," "loud and long-continued laughter," has now become a sort of tournament of jokers. Mr. Evans of Carnarvon is a perfect Tannhäuser at this kind of contest. During the course of his appeal for the Home Missionary Society he was interrupted no less than sixteen times by expressions of the satisfaction of his gamesome and gleeful audience. There must be something inexpressibly comical in the act of carrying the Independent gospel into the rural parishes of England. The maintenance of a supply of farcical orators being a matter of such concern to the managers of the May Meetings, we take the liberty of throwing out a hint which may be of some service to them. Suppose that Lord Shaftesbury, assisted by a jury of newspaper reporters, should be asked to close the jocund season of the religious world by a solemn public coronation in Exeter Hall of the ablest joker of the year. The crown might be adjudicated in each alternate season to the broadest farce and to the best bit of unconscious humour. In the former instance it would become the prize of the speaker who had been most frequently interrupted by "bursts of laughter." In the latter instance Lord Shaftesbury, like the King of Prussia, would simply have to crown himself. No one would be startled at the latter proceeding. Exeter Hall is not only the earthly paradise of the self-conscious, but its frequenters already regard the noble lord as the human mainstay and crown of Christianity.

At the meeting of the Young Men's Christian Association, Mr. Maguire told the audience that he had heard some friends who sat near him "concur in thinking and saying that there is no man to take Lord Shaftesbury's place when God takes him from us." This eloquent Irish clergyman, as if he were anxious to outdo Mr. Matthew Arnold's notorious "Three Lord Shaftesburys," amidst loud applause proclaimed it to be his belief that Lord Shaftesbury's death would "produce a dozen Lord Shaftesburys, perhaps even a thousand." The audience did not seem to perceive that it is the very singularity, the rare oddity, of this popular aristocratic humourist that makes him so precious. If they could multiply him, he would cease to be the treasure and the wonder that he is. We do not know how it may be with other hearers, but we ourselves find more fun in the quaint movements of Lord Shaftesbury's heavy-dragoon solemnity than in the sparkling jokes and puns of the light cavalry of the pious parade-ground. At the beginning of his speeches the Earl begins to chaff his hearers. He tells them that he has to be in "another place," whereupon the awed country listeners poke one another and whisper "the House of Lords." He implies that his presence is needed in that "other place" at that very hour, in order that he may make a speech or record a vote which will save Protestant Christendom from extinction. He next tells them that, in consequence of this urgent demand for his oratory or his vote elsewhere, he can only give them "five minutes," and thereupon he pours out his soul in passionate wails or sugared flatteries for twenty minutes or half-an-hour, or even longer. He has twice repeated this favourite performance during the present season, once for the London City Mission, and once for the Home Missionary Society. There is not a little humour in this performer's choice of platforms. He is proud of calling himself a defender of the Established Church; but he prefers to speak at those meetings in which an intolerant onslaught upon the largest section of the English clergy is expected to be a part of the programme. Thus he likes the London City Mission; the apostles of this Society, according to Lord Shaftesbury, have wrought a miracle of which most Londoners remain ignorant. "They have prevented London from becoming a city of devils." These apostles certainly are no St. Pauls; they are said to be for the most part under-educated men, who have failed as [illegible] or as small shopkeepers, and are ambitious to wear [illegible] taken for somebodies. We cannot discover any [illegible] Exeter Hall clique with whom they are popular; workmen notoriously make game of them, and many a clergyman who is labouring for the culture and enlightenment of his parish speaks of them as a standing vexation. Lord Shaftesbury said that all such clergymen were Ritualists or Rationalists; he scolded the former behind their backs at the London City Mission meeting, and the latter at the Home Missionary meeting, an entertainment got up by the Independents. Any other man who boasted of being a defender of the Established Church would lack the humour to perceive that the sending into hundreds of parishes of uncultivated rivals who measure their success by the number of men and women they can persuade to leave church and go to meeting is a cunning method of upholding the Church. Lord Shaftesbury says that he has such unbounded confidence in the apostles who derive their mission, orders, and jurisdictions from these two Companies (limited), that he is certain that they will never interfere with the clergyman of the parish, unless he is a Rationalist or a Ritualist. The managers of both Societies must smile at his agreeable innocence. They do not think it worth their while to remind him that the term "Ritualism," as employed by the foes of the Church of England, has a far wider range of meaning than that given to the same term by controversialists within the Church. As used at present within the Church, it describes a section of the High Church party; but as used by the managers of the Independent and Baptist Home Missionary Societies it covers the entirety of the historical doctrine and discipline of the English Church. The Bishop of Lincoln is as much a Ritualist in their view as Mr. Mackonochie, and Dean Burgon's doctrine is not much less anti-Christian than Mr. Orby Shipley's. Nay, the young apostles of the Dissenting Home Mission Societies know very well that their friends Canon Miller and Mr. Maguire are called "priests" in the Book of Common Prayer, and that whatever a person described as "the priest" in that book is bidden to do or to say is said and done by these Evangelical clergymen, who would soon lose place and pay if they declared that their consciences did not allow them to accept this designation. The Home Missionary Society very naturally concludes that, whenever a person is doing and saying that which a "priest" is ordered to do and say, "the sacerdotal virus is at work," and that its agents ought to be at work against it, calling as many English people as they can to forsake "Common Prayer," or religious fellowship with the majority of their neighbours.

Nothing perhaps is so conspicuously comical in the Evangelical May-monarch as his total incapacity to perceive the humour of his own funny stories. Messrs. Moody and Sankey have been much talked about during the May meetings, especially Mr. Sankey, his "sung gospel" having left a more reverberating echo behind it than his partner's preached gospel. Lord Shaftesbury told his hearers that he had lately "concluded an address in the very depths of Whitechapel" by quoting from Mr. Sankey's hymn—

Hold the fort, for I am coming.

"It was taken up," he said, "by the whole of that degraded and miserable population. They sang it with intense force"—evidently preferring it to the Earl's sermon. "They sang it while I went out of the room; and I am told they insisted on singing it several times afterwards." If Lord Shaftesbury had visited London Bridge Station on Easter Monday, and accompanied a train-load of costermongers and their lasses to Greenwich Park, he would have heard them singing "Hold the Fort," and other tunes of Mr. Sankey's book, with persistent gusto. He would probably have rejoiced in this evidence

of the great evangelical work going on in the hearts of the masses; he would not have taken pains to listen very accurately to the words which they had fitted to the tunes—words which it would be impossible to quote in a meeting of respectable men and women. He might have produced a similar result by closing his discourse with the words, "Tommy, make room for your uncle." Lord Shaftesbury has often proved that he is an enemy to all coarseness and vulgarity, and he has always shown a genuine anxiety for the refinement of the poor. We wonder that he has not made use of his almost dictatorial authority to attempt something for the refinement of the more disagreeable vulgarity of the jokers at Exeter Hall. The chairman of "The United Methodist Free Churches Home and Foreign Missions" (we trust that we have placed the three qualifying adjectives in their right order) at their field-day was a Mr. Butler, who had come from Bristol. One gentleman bedaubed the chairman to his face with whole pailfuls of superlative praise; he was "not like Pharaoh's Butler," who forgot the United Free Methodists in the day of his exaltation. He was "a prince in our Israel," and "he stood on a platform with the merchant princes of the ancient city of Bristol"; he had raised himself by a host of virtues and accomplishments, duly catalogued by the orator, from a William Butler to a "William Butler, Esq." The joke about Pharaoh's butler was thought to be so brilliant that more than one speaker played it off. The Rev. Joseph Kirsop, President of the Annual Assembly, on being called upon to speak, uttered, amid approving laughter, the paltry pun—"I respond with pleasure to the call of the chief Butler who remembers Joseph, and does not forget him." Will Lord Shaftesbury think it a triumph of the Gospel when bishops chaff like merry-andrews, and the Houses of Convocation ring with bursts of laughter? Adulation to the face is not enough for these orators; some of them are not ashamed to add a canonization of the living. "A Roman Catholic lady told a friend of mine," said Dr. M'Ewan, at the meeting of the Sunday School Union, "that he had no saints, and she cited St. Francis as the specimen of a saint of her own Church. My friend replied, 'We have such saints as St. Guthrie, St. Müller, and St. Barnardo; your saint found honest men and made them beggars, our saints find beggars and turn them into honest men.'" An appeal to history and an exhibition of the immediate effects of the Franciscan mission would be thrown away upon a speaker whose aim is applause for himself rather than the enlightenment of his hearers. We are not surprised that one of his saints should be a Scotchman, but he must have been ashamed when he recollected that two of them were still living. If the characters produced by St. Barnardo and St. Müller are copies of the persons who shout applause and scream with laughter at the May Meetings, we must express our conviction that the honest persons whom Francis of Assisi turned into beggars—for instance, Roger Bacon, William Occam, Alexander of Hales, and their scholars—were a very preferable human production. We have come across one good story amongst the hundred paltry ones related during the present jocund season, although we have some fancy that this, like its wretched companions, is an old acquaintance. "A vocalist" (which is the United Free Methodist periphrasis for a singer) "was singing 'There's a Good Time Coming.' One of his audience rose, and said, 'Would you kindly fix the date?'" A few men possessing this dry kind of common sense are much wanted at the May Meetings; they might be able to recall the speakers from their floundering historical, autobiographical, and anecdotical expatiations to the real business in hand.

AUTHOR AND REVIEWER.

IT is difficult to see what object the author of *Bishops and Deans* could have in bringing an action of libel against the *Record* for reviewing his book. The Rev. F. Arnold had commented with much frankness on the lives and labours of the leaders of various parties in the Church, and the *Record* naturally took under its protection those of its own peculiar favourites whom he had criticized. It seems that the late Mr. Joseph Payne, sometime Deputy Assistant Judge at the Middlesex Sessions, had, as many lawyers have, his hobby, and it was writing verses. The *Record* said that

> good taste and good feeling would have omitted the paltry sneer at what he (Mr. Arnold) calls the "doggrel" poetry with which that pious and self-devoted man (Mr. Payne) used to cheer the crowded evening anniversaries of the teachers and supporters of the Ragged Schools and Reformatory Unions, drawn together to enjoy a meeting with their noble President, and hear of the good effected in the alleys and slums of London and Westminster.

We quote this passage from one of the articles of the *Record* which were read in Court, and, as Mr. Arnold complained of it as libellous, it deserves attention. We have not been able to find the passage in Mr. Arnold's book which is referred to, but Mr. Arnold informed the Court that he did not use the word "doggrel"; and this, so far as we can make out, is his complaint against the *Record*, viz. that that journal said that he said that Mr. Payne's poetry was "doggrel," whereas he did not say so. But the *Record* itself admits, a few lines further on, that the "tail-pieces" of the "cheery annual addresses" of the learned judge were impromptus, and "no doubt often contained doggrel poetry." So that the *Record* admits that Mr. Payne wrote "doggrel," but thinks that Mr. Arnold should not have uttered a "paltry sneer" against it. The pious and worthy persons who enjoyed an annual meeting with their noble President, and heard all about his "movements on behalf of the City Arabs," and were cheered by Mr. Payne's addresses with "tail-pieces," had the faculty of being contented with harmless and cheap amusement. As the *Record* adds, these addresses served their purpose, and "they were emanations of deep feeling which is the soul of poetry," but nevertheless it is admitted that they contained "doggrel." The American who crossed the Atlantic to behold Mr. Payne as the author of certain "thrilling lines" perhaps considered that the soul of poetry was more important than the body, although it is generally expected that a poet should express what ordinary people can only feel. It may be feared that some of the "City Arabs" who were "gathered in" from the streets by the police did not appreciate the privilege of beholding the Assistant-Judge, whom they would have irreverently called a "beak," so highly as the enthusiastic gentleman from America. Mr. Arnold, we should remark, has not only stated his case to a jury, but has moved the Queen's Bench Division for a new trial. The Judges of that Division probably regarded the question of the quality of Mr. Payne's poetry as beyond the issue in the case. The reviewer said that "good taste and good feeling would have omitted the paltry sneer" at Mr. Payne's poetry, and this was part of the alleged libel. The self-sacrifice which the *Record* ascribes to Mr. Payne would, in our view, have been exercised rather by those who listened to his poetry; but this is by the way. It seems wonderful that an author should think it worth while to complain to a Court and jury that a reviewer imputed to him want of taste and feeling, and characterised his remark on Mr. Payne's poetry as a "paltry sneer."

The next subject of complaint is rather more important, although here also it only comes to this, that the *Record* warmly controverts Mr. Arnold's description of the Bishop of Durham as "the Bishop of a party rather than of a diocese." The *Record* admits that Bishop Baring is a "party man" in the same sense in which St. Paul and the other Apostles were party men, but not in the sense in which Mr. Arnold calls him a party man; and this seems very like saying, as they do in the House of Commons, that the other side is factious, but we are patriotic. But Mr. Arnold further stated that the diocese of Durham was "perturbed," and that its Bishop had aimed at the expansion of the "tyrannical power" possessed by Bishops generally over curates. The *Record* insists that there has been no special perturbation in the diocese, although it mentions with satisfaction that the Bishop's proceedings have "quelled the litigious designs of ultra-Ritualistic mutineers," and that "the diocese has not since been disturbed." The question who it is that troubles Israel has from old time received diverse answers, and perhaps the spectacle of laymen subscribing to provide their Bishop with a "guarantee fund" for litigation with his clergy might at first sight appear to justify Mr. Arnold's description of this diocese as fast becoming "the most perturbed" in the country. But if it be admitted that there must be parties in the Church, and that these parties must have what are called "organs," it follows that Mr. Arnold and his reviewer in the *Record* will disagree in everything connected with Dr. Baring except in classing him as a "Low Church bishop." It is, however, a droll result of our administration of the law of libel that this necessarily interminable question should be submitted to a jury. Speaking roughly, we should say that it is give and take on both sides. The Bishop is used by Mr. Arnold much as Mr. Arnold is used by the *Record*, and this view was adopted by the Judges, after hearing all that Mr. Arnold could urge against it.

The strongest point made by Mr. Arnold against his reviewer was upon the words, "On almost all crucial theological questions the book is stamped both with uncertainty and inconsistency." But here again the *Record* has a right to express its opinion in moderate language, and it applies to all such matters the maxim, "He that is not with us is against us." Mr. Arnold, in commenting on this passage, assured the Court that he had avoided entering into such questions; but one of the Judges hereupon remarked that men might differ as to what were crucial questions, and we can clearly see that the author and reviewer do differ on this point. As regards "uncertainty and inconsistency," the same Judge observed that any man who wrote two volumes on such a subject could hardly be so fortunate as to escape such imputations. The *Record* regrets "that Mr. Arnold's own views are very indistinctly shadowed forth," whereas Mr. Arnold's notion seems to be that, as an historian, he is not bound to have "views," at least not on "crucial questions"; and if his book was intended as a mere collection of clerical gossip, we should be inclined to agree with him. There seems to be some mistake about the words "unbelieving Positivist," which (in the passage to which, as we understand, Mr. Arnold in his argument referred) are not applied to Mr. Arnold, but to a person with whom it is suggested that Mr. Arnold has some sympathy. In reference to the late Professor Maurice, Mr. Arnold said that he succeeded "perhaps a sounder thinker, the late Professor Grote"; and the *Record*, in commenting on this passage, confounded Professor Grote with Mr. Grote the historian, and intended to call the latter an "unbelieving Positivist." This error was corrected in an early number, and it was an error that only slightly affected Mr. Arnold. There is another passage, in which the *Record* says that Mr. Grote "avowed his sceptical positivism to the last"; and Dean Stanley admired Mr. Grote, and Mr. Arnold admires Dean Stanley. This, briefly, is the substance of a passage to which we suppose Mr. Arnold to have re-

ferred, and it falls far short of imputing to him "unbelieving positivism." The treatment of Dean Stanley in the book is said, indeed, to be illustrative of the "uncertain sound" of the author's trumpet, and in the same connexion it is said that on a certain great question "the author fails himself to speak out distinctly." It is manifest that such matters as these could be only very slightly and imperfectly considered by either Court or jury. It may be said that, instead of going to a jury, the plaintiff might have had his case tried by a judge, and perhaps by a judge of theological attainments, with or without skilled assessors. But the defendant would probably have been unwilling to surrender his right to have the question of "libel or no libel" submitted to a jury; and if, on the whole, a jury cannot be got in such a case to see libel, it is well to assume that it does not exist. Our own impression would be that Dean Stanley, notwithstanding the author's supposed sympathy with him, is treated pretty much like Bishop Baring. To call the Dean's funeral sermons in the Abbey "orations for the English Valhalla," and to distinguish between the way to Heaven and the way to Palestine, is not a usual mode of expressing excessive admiration. The author has a chapter on "Palmerstonian or Low Church Bishops," which is criticized by the *Record* in its characteristic style. The popular belief that those Bishops were really appointed by Lord Shaftesbury does not quite satisfy the *Record*. We are informed that there was a gradual improvement in Prime Ministers, which culminated in Lord Palmerston. There had been a tendency in the right direction, and "Lord Melbourne also indicated a sense of the importance of good Bishops by avowing that nothing so much disturbed him" as an episcopal vacancy. Liberals may be glad to learn on such high authority that their former leaders have been the Church's best friends. Somewhere about the same time an eccentric Evangelical clergyman remarked that "the Devil had had too much to do with choosing Bishops"; but from 1855 to 1865 "Lord Palmerston acted so as to raise the standard of the Episcopate." He had been, says the *Record*, in early life "a man of fashion and of pleasure," but he never adopted the "sceptical notions" of the Whigs of Holland House, and the Rector of Romsey, Canon Carus, the friend of Simeon, has testified to his demeanour at church. The *Record* therefore believes that Lord Palmerston sincerely desired to exercise his patronage for the good of the Church, and the best proof of this desire is to be seen in the fact that he availed himself of the advice of Lord Shaftesbury.

This sort of discussion, partly historical, partly theological, and largely personal, fills nearly eighteen columns of the *Record*, and we can imagine the bewilderment of the jury when the whole was read to them right through. It seems to us that the *Record* on this occasion was thoroughly itself. Mr. Arnold tells us that the present Dean of Carlisle annoyed Bishop Monk of Gloucester by speaking of the clergy of Cheltenham as "my clergy," and the *Record* defends the speech. This, we think, ought to console Mr. Arnold for falling under the *Record's* censure in matters of good taste. Bishop Monk's perception of the propriety of language was probably not confined to Greek, and if Dean Close did use the words imputed, we should have thought that even this reviewer would have had some sense of their absurdity. But perhaps his mind has been too long imbued with the "doggrel" poetry of pious and worthy Mr. Payne.

LIABILITY OF EMPLOYERS.

THE question which is raised by Mr. Macdonald's Bill with regard to the liability of employers for injuries negligently caused to persons in their employment is not altogether so abstruse and difficult as some of the speakers who took part in the debate tried to make out, but the Home Secretary showed his characteristic good sense in proposing that it should be sent to a Select Committee. It is evident that the question has excited much feeling among working-men, especially miners, and that a decision of the House of Lords has produced in Scotland something very like a reversal of local law. There are always two sides to a controversy of this kind, and it is well that each should have a fair hearing, and that no ground should be afforded for saying that proper caution and pains have not been taken in adjusting the points of difference. Even if an inquiry does not throw any new light on the matter, it will at least ensure that the facts of the case will be fairly sifted. It is not enough that a question of this kind should be settled in the way which justice may require; but the justice of it must be made manifest, so that both parties may understand the grounds of any decision that may be come to. As the law stands, an employer is liable for the consequences of any act of a servant which injures a person not in his employment, but is not responsible for an injury to one of his own men, if it is occasioned by the negligence of a fellow-workman. It may be, as the Attorney-General suggested, that there is some risk of the liability in the first of these cases amounting to absolute injustice; but the case he put does not quite bear out this view. It was that of a greengrocer in a small way of business, whose servant happened to drive his master's cart over, and thus to injure, a person holding a lucrative office, the unfortunate greengrocer being thereupon mulcted in damages which would utterly ruin him. It is obvious that in such a case the penalty which may fall on the greengrocer is likely to have the effect of making him very careful as to the sort of drivers whom he employs; and that such a check is needed is shown by the number of accidents of this kind which are constantly occurring, and which have, in fact, recently called forth a strong circular from the police. No doubt, if the accident is due to some casual and unforeseen fault on the part of a servant whose employer has taken every reasonable precaution to ascertain his fitness for his duties, it is very hard on the employer to make him pay for it; but, on the other hand, people in the street have a right to protection, and if the greengrocer were not made personally responsible for the acts of his servants, he would be probably much less particular in selecting them. It can hardly be denied that a tradesman who employs drivers who are drunken or incompetent, knowing them to be so, or without taking the trouble to look into their characters, very properly suffers if any mischief is thereby caused to other people, and that this liability is a great security to the public.

Next comes the question why this rule should not equally apply to injuries done by fellow-servants to each other. It is true, as Mr. Burt frankly admitted, that there are cases in which it would be most unjust that employers should be liable for accidents to their workmen; that is to say, cases in which it is the workmen's own fault that an accident happens, or in which it is a part of the natural risk which is inseparable from the business. It would be preposterous to punish employers in this way for things with which they have nothing to do, and which they cannot guard against; and in every case the test should be, whether there has been any neglect or insufficiency of precaution on the employer's part which led to the accident. It is quite clear at least that "common employment" is not in itself a sufficient answer in such a case. There is no reason why an employer should be responsible to his own people as much as to the public for any injury which is brought about by his keeping incompetent or careless servants. If an employer uses a dangerous boiler which blows up, he has no right to plead that it was only his own servant who was killed and maimed, and that it was part of the bargain that he should not be liable for compensation in such a case. And what is the difference between a weak boiler and a blundering or careless workman who endangers his neighbours' limbs or lives? An employer is bound to see that his works, including both the human and the inanimate machinery, are kept in such a condition as shall give reasonable security to all persons concerned, whether in or out of his service; and this, it seems to us, is the principle which ought to be insisted on. How far this rule should be held to apply in particular cases must of course be often a difficult question to decide, and must turn on the facts in each case; but as a general principle it is surely indisputable. It would appear, then, that, whatever else may be done in this matter, the confusing and misleading plea of "common employment" ought to be got rid of; and that the responsibility of employers for the safety of their servants, as well as of the general public, ought to be distinctly proclaimed. Nothing can be more dangerous than to allow people to contract themselves out of their rights as ordinary citizens. There are some occupations which in the nature of things are notoriously dangerous, and the men who engage in them are well aware of this, and on this account obtain compensation in higher wages than they could expect if the element of danger were wanting. Still there is a limit to the fair risks to be run, and it is well that an employer should have it kept before his eyes that, if he does not keep down these risks to the lowest practicable point, he must bear the consequences. One member who spoke in the debate, and who is a large coal-owner, seemed to think he was a very ill-used man because he had to pay 100,000*l.* for an accident in one of his collieries which killed a large number of men. He said that "he knew it was a fiery mine, and he worked it as such, providing five times the ventilation absolutely required." It is obvious, however, from the fact that an explosion occurred, that his estimate of the sufficiency of the ventilation of the colliery was too sanguine; and most people will think it a very good thing that speculators who experiment with men's lives in "fiery mines" should be made to give compensation for their miscalculations, as a lesson both to themselves and others. Mr. Macdonald made a very unjustifiable assertion when he said that all mine explosions were crimes; but it was equally foolish for the Attorney-General to argue that miners, because they get good wages and are said to carouse on champagne, had no right to compensation if they are exposed to unnecessary risks. It would be absurd to say that in every case of an explosion or other accident the employer should be held responsible; but, on the other hand, there is an obvious danger in relieving him of responsibility by the use of such a plea as "common employment," which does not touch the merits of the question in any way. Mr. Forsyth argued that every person entering on employment must be understood to accept the risk of accident through the default of a fellow-servant; but then there is the counter proposition, which must not be left out of account, that the employer is responsible for the capacity of those whom he employs and for any precautions which may be required for the safety of the workers. And it is difficult to see why this principle should be affected by the fact of the injured person being under the same employer as the person who inflicts it. Mr. Serjeant Simon put as another illustrative case that of a chamber-maid who put her fellow-servant into damp sheets, whereby the latter caught cold and fever ensued, and the employer was made liable for damages. This, of course, is a fanciful case, and it is easy to make things appear ridiculous by such means. Every one

will admit that it is impossible to carry a principle of this kind into every detail of private life, and that, before an employer can be made liable, negligence or other failure of duty must be traced to him. All we contend for is, not that compensation should, as a matter of course, be extracted from employers, but only that the question should be argued on its merits, and not barred by an empty plea of "common employment." In such a case as that cited by Mr. Dodson—that of a guard killed by the neglect of a platelayer or foreman of the permanent way—the connexion is purely nominal; and the Attorney-General also admitted as much in regard to placing managers of mines on a level with the working miners as fellow-servants.

The Home Secretary fully acknowledged that the law, as it stands, is wrong, but he also pointed out that the proposed Bill, though it might set the law right in one way, would throw it off its balance on the other side. The effect of getting rid of an irrelevant and perplexing legal phrase ought not to be to place employers in a false position, but to enable the questions which arise to be fairly tried, and it may be hoped that the Government will find the means of doing so. There is one aspect of the question which especially deserves consideration, and that is the probable effect of a change in the law on the men themselves. Apart from the justice which is due to employers, it may be asked whether it is for the benefit of the men that facilities should be given for interminable litigation on all sorts of petty questions, involving law expenses and tending to keep up a feverish irritation between employer and employed. Mr. Pease pointed out that the effect of such a system might in more ways than one be injurious to the workmen, as, for instance, in making them less cautious and careful among themselves, and also in leading to a reduction of wages, which are at present higher than they otherwise would be because something is added as a kind of insurance for accidents. These are points which will require to be dealt with very cautiously, and the possibility that any attempt to deal too hardly with employers may react on the interest of the labouring class ought not to be lost sight of.

THE ART OF DRESSING.

IT is a pity that in a series of so-called "Useful Books" any should be included which are clearly useless; and a shilling manual now before us on the Art of Dressing (Warne and Co.) certainly comes under this category. The writer, who calls himself "a Lounger at the Clubs," is possessed with an unfounded notion that he is bound to be funny; but, if his book should reach a second edition, he will do well to strike out all the jokes, and replace them by a few additional facts and figures, if he has any at command. The mischievous influence of the Special Correspondent's style of writing appears strongly in this author, who, having nothing to say, says it in as many words as possible. He wishes to make a suggestion, by no means abstruse, that, before condemning a lot of old clothes, his reader should look them over, and pick out any that may possibly be capable of further service. "Separate the sheep from the goats," he says, intending to convey a plain precept in what he thinks a graceful metaphor. He might have remembered that in this age of shoddy neither sheep nor goats have much to do with human clothing. It might be thought, too, that his advice as to beating, brushing, and scouring old clothes supposes a tenacity of substance which is seldom found in them. Some of his precepts are certainly economical, but whether they are practicable may be doubted. Thus he says that a man must wear gloves at garden parties and other resorts of ladies, but if he only frequents clubs he may do without them. Tight-fitting gloves look "elegant," but they afford more satisfaction to the wearer than to the outside world. It is satisfactory to be told on such high authority that, if we dislike the trouble or cost of wearing gloves, the happiness of mankind will not be sensibly affected by our discarding them. "One can please oneself whether to wear them or not," even in Piccadilly. The author disapproves of cleaning gloves, but the process would seem to be more hopeful than beating old clothes, rubbing them with spirit of turpentine and benzoline, and expecting that after being hung up in the air for a week they will lose their smell. He advises that one umbrella should be kept for fine days and another for wet days, and he thinks that gaiters, although sometimes worn "in high quarters," cannot be relied on to give an air of fashion; and here he is probably correct, because at one time the notion rather prevailed of connecting gaiters with respectability and responsibility. For a tie he recommends plain black silk, and in summer "a chaste effect" may be produced by wearing a French crape handkerchief passed through an ebony ring. The practice of describing articles of ladies' dress as "very chaste" has, we believe, been abandoned, as liable to injurious misconstruction, but the epithet is perhaps unobjectionable as regards gentlemen. But we should adopt with less confidence his commendation of "a made-up sailor's knot" as substitute for a necktie. All "make-ups" betray themselves at a glance, and whether or not ease be desirable, the affectation of it is certainly unpleasant. As regards pocket handkerchiefs, after calling them "nasal attendants," he has little to say except that cheap ones are good enough to lose in washing. As to white hats being cooler than black hats, he tells us that "this is a fancy on the wearer's part," although he had stated a few pages back that "dark-coloured clothes are warmest in summer," and had given the familiar explanation of this tolerably well-known fact.

The comparison between present and former fashions in dress which this manual suggests is, on the whole, favourable to the common sense of the men of our time, although it must be allowed that the women still sacrifice health, comfort, beauty, and even decency, at the bidding of that capricious and unseen divinity which regulates their appearance. The American ladies who are now clamouring for liberty might at least emancipate themselves and others from the tyranny of fashion. They have been holding indignation meetings to complain of the inferior place awarded to them at the opening of the Philadelphia Exhibition, and they also object to the gigantic figure which is about to be erected by French subscription at the entrance to New York Harbour. A female figure, they say, has been chosen to symbolize freedom, when the female sex are slaves. Perhaps the propriety of the model might be enhanced by placing on the figure's head a Parisian bonnet to indicate that women, under whatever country or form of government, obey the same universal laws of dress. It would be true, although not complimentary, to apply to men and women as regards dress the distinction between progressive and stationary societies. Men have made a clear advance, and they are not likely to recede from their preference for comfort and utility over show. But there is no fashion of bygone times which women would not resume if only it be credibly reported that "they" are wearing it. We doubt whether even "H. R. H." could persuade members of Parliament nowadays to wear trousers made with straps of the same material to go under the feet, as Sir Robert Peel may be seen wearing in some of H. B.'s sketches. Such trousers could only be put on after pulling on one's boots, and they must have been not very nice on dry days, and detestable on wet days. The fashion of wearing moveable straps, or even chains, for the same purpose was probably founded on the notion that no gentleman ever walked; and we have even heard that a nobleman who led fashion in his day had his trousers made to look well as he sat in his phaeton, and was seriously incommoded when an accident compelled him to dismount in the Park. With us military fashions have usually been an exaggeration of the follies of civil life, and it is remarkable how the notion that soldiers were to be looked at rather than to march or fight gained influence during the reign of stocks, straps, stays, and lemon-tinted under-waistcoats. The trousers were, as this writer says, strapped closely down and tightly hauled up, "to the total preclusion of all sedentary occupation." But it was perhaps a compensation that in those days gentlemen were not supposed either by their tailors or anybody else to be generally devoted to the desk, and they did not universally write books as they do now. As regards the stock of those days, it was nothing when you were used to it, and an elderly gentleman of the period would have been uneasy if he had not felt a stiff collar sawing him under the ears. A pair of "Wellington" boots required, not "pulleys," but hooks, to pull them on and a bootjack to pull them off; but it is a mistake to suppose that they were not useful as well as ornamental. In a new and rough country at this moment there is nothing like them, and we forget, in quizzing the fashion of fifty years ago, that at that time there were not railways everywhere. The coat of many capes, which Lord Albemarle describes as one of the fashions of his youth, was a comfort, and almost a necessity, on a stage-coach journey in winter. The laced cravat called by the French a "Steinkirk" was an easy as well as graceful fashion, and it prevailed, as Lord Albemarle also tells us, until high stocks and stick-up collars superseded it. This change of fashion is well shown in the portraits of the Dukes of Gloucester and York, successive Colonels of the Grenadier Guards, engraved in General Hamilton's History of that corps. The coat cut away to allow the waistcoat to show below it when buttoned was another fashion of the Duke of York's time, which was absurd in civil, and mischievous in military, life. It may almost be said that for more than fifty years after 1750 all changes in dress were for the worse.

We must confess that our courage would be hardly equal to adopting some of the suggestions of this manual. We are advised to get one pair of trousers made by a first-rate tailor to our entire satisfaction, and, when they are nearly worn out, to use them as a pattern from which our own cloth may be made into other trousers by an inferior artist. The author confesses to some difficulty in finding even in a back street a tailor who will condescend to be a mere copyist. But even if we could trust the tailor, could we trust ourselves? for we also have our part to do in producing the beautiful and economical result of three pairs of new trousers for 66s. "The stuff bought must now be soaked in a bucket of water in which is put a handful of salt, which will effectually prevent the colours running." You must see this done yourself, and then the cloth must be hung up to dry thoroughly, and afterwards sent to the tailor to be cut, made up, and hot-pressed. We cannot help thinking that the fortunate possessor of stuff of well-selected patterns sufficient for three pairs of trousers would act wisely in letting well alone. The salt-and-water method of treatment might answer, and it might not, just as cutting up an old man and boiling him to restore his youth would certainly kill him, and might possibly fail to bring him back to life. The process of finishing cloth is probably better performed by the manufacturer than it would be by the combined skill of the purchaser and his jobbing tailor; and, on the whole, we should prefer not to "insure our materials against shrinking" by this hazardous experiment. It resembles rather too closely the author's treatment of old clothes with "benzoline and turps," and then allowing a week to elapse "before

they lose their smell," which perhaps they might retain. To keep trousers in shape, he says, you should damp them with a sponge, fold them in brown paper, and put them under a weight. "How do soldiers, with their limited stock of trousers, manage to turn out so well?" The author's answer to this question is perhaps less satisfactory than he thinks. "They damp their overalls, roll them up, and place them under their bed or pillow." Here again is a process which we should like to see tried by somebody else before adopting it ourselves. The management of soldiers' uniforms is one of the most occult branches of military science. As long as white trousers were worn by the Guards it was possible to maintain unlimited faith in pipeclay, but what answers to pipeclay in the treatment of dark trousers? Then, again, the process by which a pair of leather breeches is restored to something like its pristine splendour after a hard day's duty in drenching rain is intelligible, particularly when the soldier has ample time to perform that part of his duty properly. Any shoeblack or kitchenmaid could clean a cuirass, but the scarlet or blue coat under it presents a more serious problem, and this author does not help towards its solution. As regards clothes generally his advice is to fold them up the moment you take them off, because "while "the cloth has the warmth of the body in it, it is more plastic and impressionable than when cold." We should have thought that clothes "having the warmth of the body in them" had better be allowed, for the sake of health and comfort, to lose it by hanging in the air; but we live and learn.

We may almost say that the only practical suggestion contained in this book is to pay ready money for our clothes, and it did not need a manual to tell us that. Such a book might have been made useful, which this is not; or it might have been a clever and not too obtrusive puff of some particular tailor, which this is not. But we fully believe that it was written by a "lounger" at Clubs or elsewhere. When a man calls himself a "lounger at the Clubs" it seems to imply that he has, like the London Correspondent of a country newspaper, access to every Club and every social circle in London. This author quotes the saying that Eve sinned that she might dress, and we may remark that not the least of the blessings of Paradise was that Adam did not need a manual on "the Art of Dressing with Economy."

THE ROYAL ACADEMY.

IV.

IT is a distinctive merit of modern art that it deals closely and faithfully with human life and the outward aspects of nature. Moreover, in the Northern nations of Europe—Great Britain, Scandinavia, Denmark, and North Germany, forming a geographical and in some degree also an ethnological group—man is thrown by an uncongenial climate and an almost hostile nature back upon himself; he is forced into moods of melancholy which by reaction break out fitfully and even tumultuously into merriment; the battle of life, too, may become so hard that endurance takes the place of enjoyment. These severe conditions mould the art of Northern Europe, and we accordingly find in English pictures a seriousness and earnestness which nevertheless, as in the dramas of Shakspeare, find relief in the play of humour and the flash of wit. The Academy, which, notwithstanding its shortcomings, reflects pretty faithfully the outer world, often a "chaos of mingled purposes and casualties," would appear in some degree to illustrate Dr. Johnson's famous "Preface," wherein he insists that

> Shakspeare's plays are not in the rigorous and critical sense either tragedies or comedies, but compositions of a distinct kind, exhibiting the real state of a sublunary nature which partakes of good and evil, joy and sorrow, mingled with endless variety of proportion and innumerable modes of combination, and expressing the course of the world, in which the loss of the one is the gain of the other; in which, at the same time, the reveller is hastening to his wine and the mourner is burying his friend. . . . . Upon the whole, all pleasure consists in variety.

English artists are often at their best when they take inspiration from English or French authors; they do not succeed so well with Italian classics, and they but seldom hold converse with German literature. Certainly Mr. Frith makes a step in the right direction when he passes from a railway station or a gambling table to the "Vicar of Wakefield" (250) and Molière's "L'Amour Médecin" (132). The manner is sufficiently smart, and yet it does not, as is too often the case, degenerate into flashiness. Mr. Marcus Stone has somewhat in common with Mr. Frith, and occasionally he seems on the point of surpassing himself, and yet he never quite succeeds. "An Appeal for Mercy, 1793" (1326) scarcely rises above the genre of history; a serio-comic composition, "Rejected" (42), has more colour and better surface texture. One fault of the men of this class is that the pigments lie on the canvas thin and smooth, so that, instead of depth and richness, they have a poverty-stricken aspect; this defect always stood in the way of Mr. Frank Stone, the father. The son, Mr. Marcus Stone, is felicitous in narrative; his situations speak out dramatically, his incidents sparkle with point. Here, in the "Rejected," a graceful girl, in coquettish hat and with tearful eyes, makes an exit by aid of a curtain; a painful interview has ended in the defeat of an elderly but well-preserved country squire, who, though sustained by high black boots and a red coat, seems ready to sink utterly, either from wounded love or mortified pride. Mr. Marcus Stone thus wins his way towards an Associateship in the Academy. Another possible candidate may be Mr. Pott, who has long done good work, and assuredly he now adds to his position by an extremely clever and well-conceived scene, "His Highness in Disgrace" (936). The little fellow writhes in his chair under the chastisement of a keen-eyed cardinal, who would appear to be the caretaker of his small conscience and the keeper of his large conceit. The execution and colour are worthy of the conception. Also to be commended is a well-painted picture, "For the King and the Cause" (1333), by Mr. Lucas. Our artists find themselves specially at home in compositions where, in accordance with the before quoted passage from Johnson, tragedy forebodes a shadow and comedy thrusts a sting.

The little colony of clever painters known as "the St. John's Wood school" does not confer distinguished honour on the Academy. Mr. Calderon has failed of late to nerve himself to arduous effort; a priest bowing to pretty girls on a flight of steps (1346) may be said to be making fun on canvas—a habit much now in vogue. Mr. Yeames also plays off a good joke in "The Last Bit of Scandal" (233). Two sedan-chairs meet—let us suppose, in the streets of Bath—and two flunkies raise the roofs in order that a lady of a certain age and an old gentleman, evidently an inveterate gossip-monger, may exchange a few words about the last new scandal. We are sometimes surprised that so few of our painters follow, even at a distance, in the steps of Hogarth. Mr. Wyntield, with congenial innocence, depicts (101) "The New Curate" sharing in an afternoon tea; the daughters look upon him sweetly, but the mother seats herself as a full stop between them. The artist, mindful of the delicacy of the occasion, has fitly kept down his colours, and an oversmooth brush shows his sympathy with the situation. Mr. Storey does little to sustain his recent election as Associate by "The Dancing Lesson" (121). Mr. Leslie must indeed have been rather hard up for a theme and a title when he indited "My Duty towards my Neighbour" (169). It might lead to more deliberate results if our artists would fall into the practice of jotting specific subjects in a book kept for the purpose. The mind, thus buckled down, would [illegible] consistency almost unconsciously, and the themes, if [illegible] owed a cant phrase, might assume a more crystal[illegible]e-books of topics are kept by authors, and Jo[illegible]e was accustomed to jot down on the spur of the moment [illegible]y thoughts and passing incidents ready for use. But it cannot at all events be laid to the charge of Mr. Marks that he did not mature "The Apothecary" (156). He has not only matured his conception, but has repeated himself; the skeletons and bottles come as old acquaintances. The labour thrown into these realistic details is almost unexampled since the time of the Dutchmen. Yet perhaps the painter might afford us a little more variety, say, perhaps in the direction of "The Temptations of St. Anthony." Mr. Marks and Teniers have much in common. We have already found occasion to commend "Following the Plough" (301), by Mr. Hodgson, also one of the St. John's Wood brotherhood.

Italy once again favours the painter's art. Mr. Henry Wallis, in a well-conceived composition, "Outside a Prison in Southern Italy" (322), becomes poetic. A pretty child, violin in hand, is made to charm prisoners peering from behind an iron grating. Mr. James is also to be commended for intention in a picture of students in the famed "Gardens of the Medici" (33). Likewise clever in the delineation of local character, and impressive from its religious devotion, is "Worship in the North of Italy—Cadore" (73), by Mr. Benson. Not less devout, though removed far away in geographic latitude, is Mr. Clausen's picturesque group kneeling on the bare earth at "High Mass in a Fishing Village on the Zuyder Zee" (141). The artist falls into Frère-like moods of sentiment and simplicity, and a congregation of people kneeling in one accord under the sway of a common faith can scarcely fail to be impressive, especially when painted with this earnestness.

Eastern climates and costumes do not glow in the present Exhibition with their accustomed character and colour. "A Cairo Bazaar" (222), by Mr. Lewis, is wholly incoherent. We owe so much to this artist that our regret is all the greater when he becomes garrulous. Mr. Goodall is almost more than Eastern. His progressive endeavours after perfection culminate in "Sheep-Washing near the Pyramids" (585); but the flood of light and the romance of colour are not much in keeping with "sheep-washing"; and the forms are throughout feebly pronounced. We congratulate Mr. Frank Dillon on his "Courtyard in Cairo." This faithful study from the spot, crowded out last year, now justly obtains a place on the line.

Naturalism and realism, though certainly not on the increase, at least in their lower phases, still abound in divers varieties. Mr. Thomas Faed is sure to fall into moods of rustic melancholy in "She never told her Love" (219). More rudely realistic are Mr. Nicol in "A Storm at Sea" (152) and Mr. Small in "The Wreck" (13); the latter deserved a better place than at the ceiling. Mr. Fildes scarcely escapes coarseness in "The Widower" (476). The subject here forced up into one of the principal pictures of the year is overdone. To accumulate all imaginable circumstances of grief, to load on a widower dirty clothes, to surround him with desolate motherless children, to pitch the whole painting in direst tones and colours, is an art within the reach of most penny-a-liners, either on paper or on canvas. "The little more and the little less" used to be a golden rule, and in this case we desire a little less of claptrap, and a little more of art. Mr. Fildes has confessedly so much talent, and is so near to a distinguished success, that he will do well to become the severest of critics on himself. Mr. E. W. Macbeth, in "A Lincolnshire Gang" (46), has brought to light a painful social condition of things, if we may trust the Catalogue

and his picture. Here is a farmyard, with little children of the age of five years and upwards, hired to a gang-master to do eight or nine hours' agricultural work in the Fens. They walk to their labour, "sometimes eight miles a day," "and during the last hour they are at work they will ask," said an old gang-master, "forty times what o'clock it is." The artist throws himself into the scene with pathos; the composition is rather distracted and scattered, the local colour and the texture are also a little obtrusive, but all this is to be ascribed to the mannerism of the school of Messrs. Walker, Pinwell, and North. To a cognate style also belongs "Death's Door" (412), by Mr. Herkomer. The spectator, supposed to be on an elevated plateau, looks upon a company of "peasants of the Bavarian Alps in prayer, awaiting the arrival of the priest who is to administer the last rites of the Church to a member of the family." The colour has the disadvantage of being over-crude and red, but the general conception is carried out with singleness of motive; the peasants are weather-beaten, and they meet in the presence of death in the silence of the upper mountains.

As usual, a few miscellanies which defy classification have to be thrown in promiscuously. It would appear that small cabinet canvases, after the manner of the old Dutch panels, are on the decrease. The only names that we have to mention are Mr. Thomas Webster (193) and Mr. J. Clark (56). Mr. Horsley (209), Mr. G. Smith (917), Mr. John Faed (867), and Mr. C. Calthrop (870) are in accordance with their accepted antecedents. Mr. Jerry Barrett, who passes incontinently from grave to gay, appears to advantage in the latter mood, "Where the Bee Sucks" (65). Mr. F. W. W. Topham is again overflashy in "A Bridal Welcome—Florence, 1565" (879); while Mr. Holl, of whom much was hoped, at last degenerates to mawkishness in "Her Firstborn" (286). Mr. Tissot also, who began with sunny prospects, ends in "The Thames" (113), with umbrellas and steam funnels belching out smoke. The picture is washed out, yet dirty in colour, and, as to the choice of subject, it will be felt by most people that what happens to be disagreeable in nature needs no repetition in art. Mr. Fahey, in a monologue, "He Never Came" (388), cannot be quite dismissed with faint praise. Somewhat after the manner of Mr. Leslie when most sentimental, here is a solitary love-lorn maiden casting tearful eyes over a waste of stagnant waters, while her lover is nowhere to be found within the four corners of the canvas. The tranquil lines, the subdued lights, and the monotone of colours secure the unity which gives expression.

Lady artists, we are happy to say, distinguish themselves, perhaps because only a select few obtain entrance. The two sisters, the Misses Mutrie, retain, as they deserve, their prescriptive position on the line for their truthful and tasteful flower pictures—a sphere of art specially congenial to the female mind. Mrs. Staples, *née* Edwards, known also by her book illustrations, is scarcely at her best in almsgiving on a snowy night (1340). One of the recipients is so daintily dressed that he might be mistaken for a dandy young gentleman. This forced-up and false kind of sentiment has long been a fatal infirmity among female artists. They are prone to be lachrymose, as if in the act of painting they were shedding tears over the sentimentalities of Mrs. Hemans's "Songs of the Affections." What they should aim at is a strength not less than masculine, with a sensitiveness and refinement wholly feminine. It has often been said that genius in man in certain moods becomes womanly; antique art and Renaissance works in Italy, especially under Raffaelle, owe much to the divinely ordained allegiance between the two sexes; and if in our day women will work as thoroughly as men, there is a possible Renaissance in painting, and even in sculpture, analogous to, though different from, the new birth due to womanhood in poetry and in prose romance. To some small degree these conditions are foreshadowed in a picture deservedly on the line; "They Homeward Wend their Weary Way" (551), by Miss Havers. The sentiment is here sustained by sound technique. Also good, after its kind, is "Alsace" (149), by Mrs. Jopling. We must regret the absence of Miss Thompson. "Balaclava," the best picture she has painted, failed, it is said, to be finished in time for the Academy. Another statement is that dealers in the copyright made it a condition that the work should be exhibited only where subscriptions could be received for the engraving. The absence of this masterpiece is to be deplored, chiefly in the interest of the artist herself. Miss Thompson made her reputation within the Royal Academy, and she owes much, we will not say quite everything, to the applause which has in consequence been generously and universally accorded. We have usually observed that when an artist passes from the Academy into the hands of dealers, the birthright of genius becomes bartered away.

THE OPERAS.

THE company at Covent Garden has been strengthened by the return of Mme. Patti, and that at Drury Lane by the first appearance at that house of M. Faure. One could wish that Mme. Patti's marvellous flexibility and certainty of execution were heard in parts less well known than those which she has been singing. *Aida* is promised, and Mme. Patti is to appear next week in the well-worn *Traviata*, but there are many parts less well known than Rosina, Violetta, Dinorah, or even Giulietta, in which Mme. Patti has formerly appeared, and there seems no reason why she should not appear in them again. Mlle. Zaré Thalberg has sung Lady Enrichetta in *Marta*; her singing possesses its old charm of freshness, and has improved since last year, but it would undoubtedly have been better that she should have studied more before appearing at Covent Garden, instead of turning the stage, as is too frequently done now, into a practising ground. She might thus also have gained some notion of the art of acting, which for such a part as Lady Enrichetta is especially desirable. The spinning quartet loses half its meaning when Lady Enrichetta is a lifeless figure, and the following scene between her and Lionello, which clumsily enough introduces the air "Qui sola vergin rosa," demands some attempt at least at representing varying emotions on the part of Enrichetta. Signor Graziani, who sang Plunkett, appeared in the early part of the opera to have lost, not only his voice, but all control over his intonation; for this he made up by his spirited and admirably finished singing of the beer song in the third act. Signor Marini's performance of Lionello was steady, and his singing in the interview with Marta in the second act was charged with true passion; but the delivery of "M' appari tutt' amor" was far from satisfactory. The singer announced his intention of dying with a robustness which removed all apprehension for his well-being.

Among the performances that Mlle. Titiens has given since her return from her visit to America, which seems, if anything, to have improved her splendid voice, perhaps that of Norma is the most striking, inasmuch as the singer has here to produce a tragic effect with music which has but little dramatic quality. Mlle. Titiens has a singular power of indicating, so to speak, the surrounding atmosphere of every part which she undertakes. The grandeur and dignity with which she first appears on the stage as Norma seem to have in them a different quality from those displayed in *Lucrezia Borgia*; they carry the imagination back to the savage majesty of the Sacred Forest. The music following Norma's entrance was grandly sung, and Mlle. Titiens's acting during the prelude to "Casta Diva," when she looked upwards in a kind of ecstasy, and, gradually folding her hands together, assumed a look of deep prayerfulness, had in it a commanding and awful effect. The feeling and execution of "Casta Diva" were admirable, as was the case also with "Deh con te" in the second act, where the struggle in Norma's soul when she is advancing to kill the children was rendered with a wonderful depth of emotion. Signor Fancelli sang well as Pollione, though there was a tendency, especially in the first air, to force his voice. This air is, by the by, a most ludicrous instance of that incongruity of words and music in Italian opera which set Herr Wagner's soul aflame. It describes a bad dream, and is introduced by the words "In rammentarlo io tremo," repeated four times in an ascending passage. Mlle. Bauermeister's performance as Adalgisa was, like all her performances, highly creditable; the singing indeed was excellent, but the acting would have been better if the singer had not, whenever it was possible, turned her back to the person she was addressing. It is difficult to speak as to the merit of the chorus on account of the overpowering din of the orchestra, which has, if anything, increased in loudness since last year.

M. Faure's first appearance at Drury Lane was the occasion of a combination, not too common, of three great singers and players—M. Faure, Mme. Trebelli, and Mme. Nilsson. Each of these singers, besides vocal excellence, possesses the faculty, expressed by them in various ways, which, as we have said, belongs also to Mlle. Titiens, of giving a distinct personality to every assumption of character. Mme. Trebelli gives to Siebel in *Faust* the same boyish grace and petulance that she does to Urbano in the *Huguenots*; but the two personages are made different by the study which mimics nature. Siebel is invested with the tenderness of a boyish love which avoids weak sentimentality; and this is relieved by touches of the gaiety natural to Siebel's age. Mme. Trebelli's byplay, which is always careful without being obtrusive, brings this quality out with special skill while Siebel, leaning on Valentine's arm, listens to Mephistopheles singing the "Dio dell' Or." The mixture of petulance and horror at Mephistopheles's interference in the following part of the market scene, and the expression of the despair and hope that belong to early years in the garden scene, when the flowers, drooping first at Siebel's touch, regain their natural bloom under the spell of holy water, are alike admirable. Mme. Trebelli's acting in the scene with Marguerite after she has been mocked by her companions at the well conveys the very essence of unselfish devotion, and her singing at this point of "Quando a te lieta" is as perfect in feeling and style as anything can be. Mme. Nilsson's Marguerite, of which we gave last year a detailed description, seems to have gained yet more in force and delicacy. The *piano* delivery of the repeated laughing expression in the jewel song appears particularly to be given with even more art and insight than before. In this one passage Mme. Nilsson, by her acting and her singing, which, with all its skill, seems as natural as the song of a thrush, gives the whole meaning of Marguerite's character. M. Faure's Mephistopheles certainly does not lose by being transferred to a narrower stage than that of Covent Garden. The part is filled with an appalling power of mockery assumed for immediate purposes, which at moments, and through the whole of the Cathedral scene, gives place to a native and diabolical majesty. The arrangement of this scene is in one point better at Drury Lane than at the other house. At Covent Garden Mephistopheles disappears almost as he utters his last sentence of damnation; at Drury Lane Marguerite advances to the niche where he stands, shrieks, and falls back as he watches his prey with a devilish curiosity and sense of command. As

rendered by Mme. Nilsson and M. Faure, the situation is overpowering, and is made instinct with the tragic power of Goethe's drama. Signor del Puente's singing of Valentine was correct and dramatic, but a little rough, and the violence of his death throes was excessive. The choruses were, on the whole, good; and Sir Michael Costa's conducting was of course admirable, but for the matter to which we have more than once taken exception. The noise of the "Soldiers' Chorus" was stunning, and gave vulgarity to the most commonplace piece of music in the opera. A fashion, which we could wish to see followed, of combating the senseless habit of *encores* seems to have arisen at Drury Lane, and, on the occasion of M. Faure's first appearance, was only once broken through, when he was compelled to yield to the demand for a repetition of the serenade. Signor Stagno was less successful as Faust, in which part he constantly forced his voice and made too violent transitions from a soft to a loud tone, than as Roberto in *Roberto il Diavolo*, not the least melodious, nor, in spite of its marvellously incoherent plot, the least dramatic, of Meyerbeer's operas. His dress was better chosen in this than in Faust, and he displayed a force both in acting and singing which he missed in Gounod's opera. He gave the air in the gambling scene with great spirit and with skilful modulation; and he got through the trying temptation scene, where Roberto has first to refuse and then to succumb to the wiles of a dancer in dumb show, with considerable success. In this opera Mme. Nilsson, who sang with admirable power and correctness, gave a representation of a peasant girl entirely different from that which she gives in Marguerite; the rusticity of Alice was marked with a most delicate touch, and preserved even through the excitement of the scene where she suspects and opposes Bertramo. This character was performed by Herr Behrens, whose deep and resonant voice is well suited to Bertramo's dark deeds. The singer's intonation was more correct than it sometimes has been, and his large presence gave a good notion of Bertramo until he was called upon to express emotion, when his efforts at acting were painfully praiseworthy. Mlle. von Elsner, who appeared as Isabella, displayed considerable dexterity of execution, but unfortunately this was not always employed upon the true notes. The dancing of Mlle. Katti Lanner (Elena) had agility and grace, a combination which is not too frequent, and, more than this, it had the full meaning of the scene. The unaccompanied chorus of men in the second act was well given, but some of the others were hopelessly out, and for this there is less excuse at Drury Lane than at Covent Garden, where the chorus is harder worked.

If the noise of the orchestra were modified and the chorus were more certain at Drury Lane, there would be little fault to find; and as things are, if the season there goes on as it has begun, it may well fulfil its promise of being brilliant. It seems a pity that, with M. Faure for Pietro and Mme. Nilsson for Cattarina, Mr. Mapleson should not mount *L'Étoile du Nord;* but perhaps we may hope for this, as for other things, when the new opera house is opened.

REVIEWS.

CEYLON.*

BEFORE Indian railways had transferred from Calcutta to Bombay a considerable part of the passenger traffic of what is called the "Overland Route," Ceylon used to be a resting-place for two sets of travellers, by whom it was regarded with very different feelings. The outward-bound merchant or civilian, who had almost welcomed the aridity of Aden after the heat and glare of the Red Sea, and who in mid-ocean had caught a glimpse of the not very attractive coast of Socotra, gazed with rapture on the splendid vegetation fringed with white surf, that met his eyes as he was piloted by a boatman in an outrigger-canoe into the harbour of Galle. It was a doubt whether India could offer any picture so inviting as the dense groves of cocoa-nut trees, the lines of hills clothed with perennial verdure, and the salient features of Adam's Peak or the Haycock in the background. To the Anglo-Indian, homeward bound after ten or fifteen years' residence in Madras or Bengal, the cinnamon island appeared simply odious. The sea breezes could not atone for the even monotony of the temperature. The numerous comforts and appliances of India were wanting. The houses were ill constructed, with small verandahs, and the rooms wanted punkahs. Beef was unknown; fowls dear; mutton stringy and tasteless, and unlike the "gram-fed Patna sheep." Add to this that the openings for administrative talent and commercial energy were few. Coffee had been ruinous and unremunerative, and official salaries were fixed at an absurdly inadequate scale. What could possibly be the delights of a colony where there were no hill-forts to storm and no fine provinces to annex, and the revenue was not equal to that of a couple of good-sized Bengal Commissionerships? Yet the appearance of the work now before us by an unknown author was not necessary to prove the existence of many features which afford a fine field for the talents of the scholar, the administrator, the sportsman, the naturalist, and the merchant. Ceylon is the Taprobane of Ptolemy, the Singhala Dwipa of Hindu literature, the Lanka of modern Hindus, the Serendib of the Arabian Nights. The introduction of a purer faith by the Buddhists who were forced to flee from India has formed the subject of much scientific inquiry. The degree of intercourse which the Singhalese had with Roman galleys, Arabian *ghurrabs*, and Chinese junks is discussed by authorities summed up in several chapters in the volume before us. There are long strings of Kandyan kings, and there are histories which tell how the Portuguese acquired the sovereignty of the island, and had to succumb to the Dutch, while the latter, in their turn, were compelled to yield to the British. Within the last sixty years Ceylon has been the scene of two insurrections. It has an increasing revenue, considerable natural advantages, and one splendid harbour; and though no longer a rest-house for nearly every passenger connected with two out of three Presidencies of India, it commands attention as lying directly in the track of steamers bound to Australian or Chinese waters, and it can be reached in less time than Jamaica, Trinidad, or any other of our dependencies in the West Indies.

The island is comprised within less than four degrees of latitude and about two degrees of longitude. It is not quite 300 miles in length, and nowhere 150 in breadth. The greater part of it may be described as a series of undulating plains, unlike the wide flats of Behar or Hindostan. Here and there are spurs or offshoots from the ranges of mountains which cover the remaining portion, and which, in the southern provinces, attain to an altitude of 6,000 to 8,000 feet. The exuberant vegetation is at first suggestive of the fertility of Lower Bengal. But somehow the geology of the country is not favourable to cereals, nor, except in places, to the cultivation of coffee. On the eastern coast there is a series of lagoons or salt-marshes. In parts of the island are tracts for which the European can find no better names than the native terms *Paténas* and *Talawas*. The former are open spaces on the sides of hills or on the bottoms of valleys, varying from a few yards to several thousand acres in extent, and covered with a natural lemon-grass of coarse texture and overpowering smell. *Talawas* occur on the eastern side of the island and in the tract watered by the Mahavilli-Ganga and other streams. They are picturesque glades, studded with fine timber, like a chase in England, and frequented by herds of wild deer. We have all heard of the variety of precious stones which the island conceals, and it has small amounts of gold and iron, but there is nothing to lead us to expect large returns from mines or metals, unless it may be from a peculiar kind of iron ore. Only one river in Ceylon has a course of more than a hundred miles, though several pass the half hundred. The fault of the climate is, perhaps, its uniformity and the want of that dry and exhilarating cold weather which enables Anglo-Indians to live in hope through the damp of one province and the hot winds of another. Cyclones or hurricanes are rare. There are of course great atmospheric changes and violent storms of thunder and lightning, and a wind called the "along shore" wind comes down unpleasantly from India, divested of every particle of its original coolness, and warms up March and the latter end of April into the decent semblance of a hot season. But what with sea breezes and a rainfall of less than a hundred inches in the year, the thermometer in the plains appears to have a range of six or eight or ten degrees, between 76 and 85, and gives a mean, in the twenty-four hours, of 75 or 76. Of course there are exceptions, as at Jaffna; and at Trincomalee the temperature more resembles that of the Madras Presidency, while at Nowara Ellia, in the hills, the invalid may enjoy a climate equal in some respects to that of the Nilgiris or the Himalayas.

So much for the general aspect and conditions of the dependency which these two volumes describe. The author has several qualifications for the discharge of his task. He has resided a long time in the island, though, as we gather from some expressions, not within the last few years. He is entitled to the praise of great industry and research, and he has laid under contribution historians, travellers, classical authors, Portuguese and Dutchmen, geologists and naturalists, Sir E. Tennent and quaint old Captain Knox. Unluckily, he has not arranged his voluminous materials to the best advantage. He seems to be nothing of a sportsman; he tells us little about the reforms of the executive administration, the progress of government, the repression of crime, or the education of the people. A sporting contemporary has pointed out several errors in his chapters on birds and reptiles, as well as the want of recent information on other topics. It is easy to pounce on several mistakes in Oriental terms and phrases, some of which may be misprints; but Sir E. Tennent is made responsible for the following original reading of a passage in the Æneid:—

> Ægyptus et Indi,
> Omnis Arabes vertebant terga Sabæi.

Pestis serica may very easily be a mistake for *vestis*, and *semmar* for *janeo*, the sacrificial thread worn by Brahmans to this day. But Tumlook is not on the river Hooghly, but on one of its affluents. Hindoo mendicants are not in the habit of disporting themselves in the streets of London, though Mahommedans may sweep our crossings occasionally; and the liquid called *tari*, corrupted into our "toddy," is in India usually obtained, not from the cocoa palm, but from the *tál* tree, or the *Borassus flabelliformis* of botany. However, in a work so crammed with facts and so full of the discoveries and conclusions of a host of writers, these errors might be easily condoned. The serious defect of the work is that it is a laboured compilation, and nothing more. We

* *Ceylon: a General Description of the Island, Historical, Physical, Statistical.* By an Officer, late of the Ceylon Rifles. 2 vols. London: Chapman & Hall. 1876.

have too much of ancient disquisition and too little of recent observation and adventure. As a storehouse of opinions, and as a signpost showing the way to original sources, the work may be useful, but for a general view of the Singhalese dependency we much prefer the volumes of Sir E. Tennent, or the "Eleven Years" of Major Forbes. This is the more to be lamented because, in the inevitable progress of a Crown colony with natural resources not fully developed, there is always room, after the lapse of ten or twenty years, for a fresh work bringing down events to date. It may be very creditable to an officer of a local regiment that he should have spent his time in rummaging old libraries in preference to consuming tobacco and cursing the climate; but something beyond plodding diligence is requisite to produce a good standard work which shall either throw previous authors into the shade, or at least take rank on the shelves with them.

We must leave to our readers to select for themselves such topics of this "historical, physical, and statistical" work as they may fancy. The range is so wide from Buddhism to crustacea and mollusca, and from mediæval accounts to reptiles and botany, that every fancy can be indulged. We shall select three or four subjects characteristic of the island, which are not unskilfully handled. The pearl fishery, vaguely renowned even in the days of Pliny, is carried on principally at Aripo, on the west of the island, a little south of Mannar and Adam's Bridge. Few places, from the description, can be more dreary than the shore at this spot. A sandy beach, a few cocoa palms, some thorn bushes, and enormous mounds of shells which have accumulated for centuries, do not sound attractive or picturesque. From March to May this spot is thronged by some hundreds of thousands of people interested in the catch, and houses are hastily run up of mats and palm leaves, while boats of all sorts and sizes crowd the beach. The divers mainly come from the Malabar coast, and their operations begin at sunrise. The plunge to the bottom is facilitated by a stone weighing thirty pounds attached to a rope, in a loop of which the diver places his foot, and drops perpendicularly. As soon as he reaches the ground the stone is drawn up, and the process of filling a basket with shells commences. Experts remain under the water not quite sixty seconds, though the Government Inspector had known one man who could stay eighty-seven seconds. They can go down nine fathoms, but work has been done in thirteen. Danger from sharks is only apprehended, and not felt. A professional "shark charmer" is, however, always in attendance, who recites a formula, and supplies charms and amulets for the divers. The immunity from attack probably arises from the noise and disturbance of the waters by so many hundred boats. Some divers can bring up 3,000 or 4,000 shells a day, and earn nearly 4*l.* in eight days' work. Failures in the fishery are not uncommon. During the occupation of the Dutch, which lasted 140 years, sixty years were unproductive, and there were only four really good seasons. In our time there was a failure from 1820 to 1828, and another from 1837 to 1859. It is not very easy to estimate the financial return of this branch of the revenue, which is usually farmed out to a speculator. In 1814 seventy-six millions of shells were brought up; and in 1798 the farmer paid the Government 140,000*l.*, and realized about 50,000*l.* of profit. There is still some doubt, it would seem, whether the pearl itself is the result of disease, or of an "independent natural concretion." One naturalist ascribes the origin to parasites. Even greater uncertainty exists as to the possibility of facilitating the growth of pearls by systematic treatment. But we should say that there can be no doubt as to the careless and unscientific way in which the shells are buried in the sand, and the valuable part either extracted after decomposition or forcibly torn out. The stench, by the way, which arises from the putrefaction of such vast numbers of shell-fish is horrible, and yet Aripo is not converted into a huge hospital. The sea breezes and the short time of the fishery may perhaps account for this immunity from epidemics.

It is well known that we do not look to Ceylon alone for a supply of cinnamon. It has been cultivated in Java and Malacca; but some hold the opinion that cinnamon is really indigenous to Ceylon, or, if introduced there from some other country centuries back, it has been developed by a combination of climatic influences to an extent elsewhere unrivalled. Cinnamon gardens formed by the Dutch in the neighbourhood of Colombo were kept up by the colonial Government, and were one of the sights of the island, until the year 1840, when the competition of Java, China, and some of the West Indian islands extinguished monopoly. These celebrated gardens were sold, neglected, and either turned to wildernesses or displaced by villas. There are, however, some good plantations still at Negumbo, not many miles north of Colombo, and at Galle, where the growth of the plant and the curious process of peeling may be watched. Cinnamon requires shade and manure. The tree naturally would grow to twenty or thirty feet in height, but the larger branches are pruned in order to produce a crop of shoots. In the sixth season, when about five feet high, the bark may be peeled, but a good crop is not obtained till the ninth year. When the shoots are cut after heavy rains, they are tied in bundles till the sap ferments, and then the bark is skilfully removed. These operations are entrusted to a particular caste termed Chalias. The exquisite aroma of the bark soon vanishes, or is exhaled during a sea voyage. A kind of oil is also obtained from the leaves and bark, and the berries and young shoots used to give a substance called "Colombo wax," used by the Portuguese as candles for their altars. The only revenue derived by Government from this source consisted in the export duty, which was reduced many years ago from three shillings in the pound to one, and finally abolished. Cassia, which resembles the cinnamon plant, but is not found in Ceylon, competes with this product in the European market, though our author declares it to be more rough to the palate.

The account of coffee-planting is good as far as it goes, but more might have been made of such an unworked field. The sale of lands and the growth of coffee-plantations commenced in 1837 and culminated in 1845, when there came a crash. Protection was withdrawn; credit collapsed; and many estates were either sold for nothing or returned to their original jungle. We are told that two estates worth 10,000*l.* each were bought for 300*l.* and 500*l.*, and that ninety per cent. of the planters lost everything. But the lowering of the differential duties in 1845 was not the sole cause of these disasters. Some men did not understand how to manage natives, or entrusted their properties to dishonest or incompetent agents. Others selected places with a wrong aspect, and either too high or too low, and sometimes forgot that you must have land or water carriage to convey your produce to port. Some plantations were damaged by elephants, monkeys, and storms. Then labour was dear, which added greatly to the cost of production, and coolies had to be imported from the Malabar coast, as the Singhalese from the low country or the Kandyans from the hills would not or could not work. We believe, however, that coffee-planting may now lead to independence, if not to absolute wealth; and for a young fellow who is hesitating between Assam tea and Australian sheep-farming we would suggest a visit to the Rambodde district. There and near Pusilava a planter's bungalow, 3,000 or 4,000 feet above the sea level, would give a cool climate, and (subject to the drawback of loneliness) pleasant occupation, health, and opportunities for sport.

The chapters on Buddhism do not differ much from other accounts of that remarkable religion. A more condensed account of a faith whose author inculcated some excellent moral precepts with the dreary prospect of final extinction may be found in the *Indian Wisdom* of Professor Monier Williams. We could have wished that the author of the work before us had given us his opinion of the practical effect of this creed on the morals and manners of the Singhalese. But though the last chapter contains several particulars as to the dress, physical appearance, amusements, and social customs of the races that people the island, we have no attempt to show how far the precepts of Sakya Muni have been modified or abandoned in the practice of 2,400 years. An appendix gives some slight particulars of the Maldives, but the author never landed at those extraordinary coral formations. Any account of Ceylon would be incomplete without a notice of the aboriginal Veddahs. Sir E. Tennent and our author seem to have divided these jungly creatures into more sections than necessary. An excellent paper in the March number of the *Fortnightly Review* shows clearly that the tribe consists of only two divisions—the Kelè or Rock Veddahs and the Gan or Village Veddahs. The former are the pure type of the noble savage. They never smoke, or weep, or laugh, or chew betel, or, except in rare instances, use any shelter but rocks, trees, and holes. They live in the forests of the North-Eastern provinces, and carry bows and arrows, and no other weapon than a small axe. They are adepts at killing wild animals with arrows, though not always proficient in shooting at a mark; and, besides roots, fish, and honey, they will eat deer, monkeys, and wild boars. The Village Veddahs submit to live in huts, and will occasionally employ themselves in fishing and making mats. Their intellectual faculties are on the lowest scale, and though they speak truth and are quiet, affectionate, and submissive, some of them have given way to revengeful passions. Efforts are made to civilize them by some excellent missionaries, and we cannot avoid the conclusion that the pure Veddah must soon be extinguished. Sir E. Tennent estimated their number at 8,000. In 1858, if that estimate were correct, they had dwindled down to 380.

Ceylon has not the historic renown nor the wonderful architectural remains of India, nor the political problems with which that empire amazes, repels, and captivates us by turns. Like India, it never can become the home of successive generations of Englishmen. Colonists will not find "nuggets" there nor "fleece a thousand flocks." But the religious system, the geographical situation, the picturesque scenery, the coffee, cinnamon, pearls, and other products, must raise it to a high rank amidst our most prosperous colonies. By a freak of nature its only good harbour lies out of the shipping track, in the East of the island, and whether a breakwater at Galle or Colombo ought to be erected out of Imperial as well as local revenue, is a question which, however seductive, cannot be discussed at the close of a review.

SIXTY-NINE YEARS AT THE COURT OF PRUSSIA.*

In a literary point of view the Diary is not an attractive form of composition. Nobody cares to be neat and happy in the terms in which he addresses his future self; and history piecemeal, whether of a period or of a single life, is fatiguing unless the disjointed, fragmentary nature of the narrative is corrected by some qualities in the writer's character and circumstances which are rarely met with. The conduct of human affairs is seldom

* *Sixty-nine Years at the Court of Prussia: the Recollections of Countess von Voss.* Translated by Emily and Agnes Stephenson. London: Richard Bentley & Son. 1876.

satisfactory to the reader in the position of looker-on; blunders, incongruities, unfitnesses disturb the effect of what possesses permanent interest; the journalist and his business in life seem constantly at odds. He is not satisfied with his work and place in the world, or else we are not satisfied for him or with him. There must be a growing confidence in the writer, or we soon tire. Of course there are some diaries dressed up for publication, to which our remarks need not apply. In the diary simple we require to take an interest in the leading character and to be supported by a sense of stability and reality resulting in success. It is this success which carries it over all drawbacks in the journal of Countess von Voss. We see a piece of the world's work well done; and a character of exceptional force and vigour placed exactly in the position best fitted to bring it out. Sixty-nine years spent at the Court of Prussia, beginning at the age of thirteen, when she was appointed lady-in-waiting to the Queen of Frederick I., and ending at eighty-five, when she still held office as Mistress of the Household under Frederick William III., carried the writer through times of wonderful change and trial. But it not seldom strikes one that the happiness of a life depends very little upon the times in which it is lived. Misfortune and tragedy in their acute form, such as take hold of the reader or observer of a life or a period, are short in actual endurance; and if the character exposed to them or living in them is equal to emergencies as they arise, there is some satisfaction, at any rate some bracing, to be got out of them. Nobody is utterly miserable who is equal to the occasion and plays his part well. In proportion as a life is passed in always knowing what to do and always doing it, it is a happy life; and this felicity, we may say, always attended Sophie Marie von Voss, from the date when, as a child, more womanly than her years, "beautiful as an angel, but resolute as she was charming," she gave Mr. Carlyle's hero, Frederick William I., a hearty box on the ear for attempting to kiss her, down to extreme old age, when she was still able to carry out to the letter the very sensible rules she laid down to herself on being appointed, at the age of sixty-three, mistress of the household to the interesting and unfortunate Louisa, Queen of Frederick William III. Her conscience was sound and serviceable rather than scrupulous—that is, she accepted the ideas of her age in their best sense. The virtue which predominated was loyalty. From infancy she lived in the Prussian Court, and the claims of the Royal Family took with her the lead of all others.

Beauty, which thus far in the history of the world has had so much to do in fostering the great qualities of women and developing their intellectual powers, gave her early an opportunity of manifesting this devotion. Her attractions had inspired the Prince of Prussia, heir-apparent of Frederick the Great, with an absorbing passion. As Thiebault, in his *Souvenirs de vingt ans*, writes:—

> The lady who has inspired the Prince of Prussia with so warm an attachment was Fräulein von Pannewitz, and the world must at least confess that she was fully worthy of being the object of so passionate and unconquerable a love. Tall and slight, with the form of the huntress Diana, and yet fair and lovely as Venus, she was as charming, as innocent, and as amiable as she was beautiful. The Prince had set his mind upon obtaining a divorce from his wife, that he might offer his hand to her, and the highest authority was obliged to interfere in the matter. At last, overpowered by a storm of remonstrances and admonitions, her high spirit was so worked upon that she voluntarily sacrificed herself, and that with a courage and self-denial which all noble and feeling hearts must understand and admire. To make all future hope impossible to the Prince, she suddenly and most unexpectedly resolved upon marrying.

Her cousin, Count von Voss, was made fully acquainted with the truth that she could not love him—in fact, her own affections had been so touched by the Prince's devotion that no similar sentiment was again awakened in her—but he too was in love. The marriage was not a happy one. He was jealous without cause, as she devoted herself to her children and to his wishes and interests. But the Prince's devotion and sad and early death were lasting influences, and infused a melancholy and romance into her character which probably added to its interest and dignity. And doubtless her conduct on this occasion inspired the Royal Family with a regard and affectionate respect which made her one of themselves to the end of her life. Her marriage took place in 1751, at the age of two-and-twenty. More than thirty years after we find the same drama performed in the same Court, with a different ending. Frederick William II., the son of her princely admirer, falls in love with Julie von Voss, her husband's niece and the Queen's Lady-in-waiting. The entries of each day note the King's growing attentions with anxious disapproval; "it must be put a stop to." But Julie would lend herself to no measures that should stop it. Julie's beauty as well as character was of another type, "in the style of Titian, a beautiful form, and delicate features dazzlingly fair, but entirely without colour, her marble paleness relieved by rich reddish yellow hair"—this luxuriant golden hair getting her the name of Ceres. The affair ends in the great historical scandal of a left-handed marriage. Julie has scruples of conscience, and demands conditions, which are granted:—

> The conditions put before the King by Fräulein von Voss, as mentioned by the Mistress of the Household, were as follow:—That the Queen should give her written consent to their union, that the King should wed her solemnly by the left hand, and that Frau von Rietz and her children should leave Berlin for ever. The King was willing to concede the two first points, but the third he would not give in to. And yet many influential persons, notably the Minister Finkenstein, her brother's father-in-law, urged her compliance, advised her to sacrifice herself for the happiness of the country and the true welfare of the King, by banishing from his neighbourhood the influence of interested, dangerous people; even the Queen herself did so, in the hope of setting aside through her the dreaded Frau von Rietz. She had always had an affection for Fräulein von Voss, and now sent her word "she was glad to know the King was in such noble, good hands." . . . And so at last it appears the left-handed marriage was performed by the Court preacher Zöllner, in the Royal Chapel at Charlottenburg. The Consistorium declared this to be an allowable proceeding, on the precedent of the permission given by Melancthon for the double marriage of Philip the Magnanimous of Hesse.

The aunt, however, was not in the secret; and it is observable that, in spite of this clerical sanction, nobody was in the least taken in by the proceeding, or regarded the marriage as anything but a sham. "It grieves me sorely," we read; "with the best will I cannot avoid a feeling of disgust and abhorrence at a thing so unlawful. They may give what seeming reason for it they will; her conscience will tell her so soon enough, and will never be at rest again." Kings, however, were certainly privileged persons. Nobody liked to say them nay; and the old Queen invited "the Countess Ingenheim" to dinner; and, when she was ill, Princess Frederica and the Princess of Brunswick, with the King, dined in her room at her bedside. "It is too strong!" writes the correct Mistress of the Household; but even she pronounces the King "the best Prince that can be found in the whole world. What a pity that he is so weak, so devoid of energy, and sometimes so impetuous!" Julie did the best thing that was left for her. She went into a galloping consumption, and died quite suddenly.

We get into a purer air when the Queen Louisa comes on the scene, and Napoleon brings the world to its senses; though the part the King played in the great tragic action of his day was so far beneath the occasion. There is something touching in the clearness with which these two women, the poor Queen and her devoted servant, saw all things go wrong, and often knew what ought to be done, and yet were too loyal to husband and sovereign to betray by a word their real feelings and convictions; except, indeed, by whispered comments in this journal. Religion was a real influence with both, though it came to them in courtly garb, and the same pastor, Zöllner, whose subservience in the left-handed marriage we have just recorded, held office in the new Court. "Pastor Zöllner," we read, "who is our director and confessor, came and remained a long time with the Crown Princess." We find curious entries. Thus the first child and heir, born in 1797, was baptized one day in the Audience Chamber by Sach, the Lutheran pastor, and next day was carried to "the Radziwills, where the little new-born Prince received Catholic baptism." Nothing of this sort excites remark. Sermons are always praised; it was not the day of criticism in such matters, but of docile submission. Yet, where there is this docility, there may be error of another kind, and there is a compunctious notice on one occasion, soon after the accession, that on Sunday nobody had thought of going to church.

We cannot wonder that Napoleon figures as a monster in these pages. There is a sort of suppressed grudge against Providence for permitting this scourge to her country and her Queen to live—"and this scourge, this vile man, is permitted to crush and torment us"—even interfering, as it were, with the course of events in his favour. At one time rumours reached them that he had nearly been drowned in the Elbe, when a "miserable sailor" saved him from a fate that would have done such a good turn to all the world. Her portrait of him is not flattering. She accompanied the Queen in July 1807 when she joined the King at Tilsit:—

> A quarter of an hour later came Napoleon. I received him with Countess Tauenzien at the foot of the staircase. He is excessively ugly, with a flat, swollen, sallow face; he is very corpulent besides, short, and entirely without figure; his great round eyes roll gloomily about; the expression of his features is severe, he looks like the incarnation of fate. Only his mouth is well shaped, and his teeth are good also.

Yet this was an occasion on which the Queen's action promised some advantage to the cause:—

> He was extremely polite, talked to the Queen for a long time alone, and then went away. Towards eight o'clock we went to him, as, out of consideration for the Queen, he had dined earlier than usual. At table he was in very good humour, and talked a great deal to me. After dinner he had a long conversation with the Queen, who seemed pretty well satisfied with the result.

But the next day they heard that he recalled everything he had promised the Queen. "He avoided her, and when they did meet looked malicious and spiteful. On taking leave she said to him that she went away feeling deeply that he should have deceived her. My poor Queen, she is quite in despair." At this time the Countess von Voss was seventy-seven; but nothing either in her own tone or in the conduct of others towards her reminds us of age. The feeling towards "My Queen" has youthful enthusiasm in its mode of expression. Her sense, judgment, courage, resource, show all her powers in full exercise. Probably such a character might have wearied of the formalities of etiquette if they had not had to be enforced under difficulties; but she could not endure to relax in observances when to do so would imply admission of defeat. Duty and care for others prevented personal fears. Wherever there was hurry and risk she accepted the post of danger. When the Queen had to fly from Königsberg to Memel, the Mistress of the Household followed with an aide-de-camp, General Köckritz, and they were detained at a post-house for want of horses. The General's courage failed with the French in pursuit. They had wished to cut off the King, and they would hasten after him, would find them out, would massacre them, or at best would take them prisoners. "Not that they would take two old women prisoners," said the Countess, quietly, and the General was silenced. We are struck by the absence of any parade of personal danger. More

and then we read entries like "As usual, every one comes to me," but more naturally her pen runs into pity of her poor Queen struggling with such feminine sweetness, endurance, and good sense under the adversities that eventually broke her heart. "Her language was wonderfully beautiful and touching," "My poor Queen cries too much," "there is no one like her." But our space fails. In spite of the public troubles that harassed this life at its close, troubles so keenly entered into and shared, in spite of wounded patriotism and outraged public spirit, the book leaves a cheerful impression. Existence is in itself enjoyment whenever there is a part to play, with the power to play it well; and, after all, in the stormiest periods there is an under-current in every life which does not take its flow from the course of outward events.

ANTONIO DE TRUEBA.*

AT the present moment, when Spain has just brought her latest Carlist war to a successful end, and when the Basque provinces which maintained the struggle are on the point of losing, perhaps irrevocably, their cherished and long fought-for *fueros*, the English reader may find not a little to interest and enlighten him in the stories of the Basque novelist and chronicler, Antonio de Trueba. Fernan Caballeros, the Spanish counterpart of George Sand and George Eliot, has made the orange groves, the peasants, and the legends of Andalusia familiar to a large public all over Europe. Several of her most striking stories have been translated into English, and their genius and freshness have invested even the fierce Ultramontanism of their author with something charming and piquant to English eyes. What Fernan Caballeros has done for Andalusia, Trueba has done with equal freshness, though with less genius, for the Basque provinces. His subjects are much akin to those of Caballeros; to both the pious, laborious Spanish peasant is the ideal of humanity, and Spain, when all deductions have been made, the ideal country. Both are passionately attached to local scenery and local traditions, and the pencil of Caballeros is not truer to the glowing skies, the bare, sun-scorched hills and tropical plains of Andalusia than is Trueba's to the white farm-houses, the cherry-orchards, the ravines, the streams, and the northern sea of Biscay. Thus far Trueba seems to be little known in England. He has attracted some attention in France, and a pleasant edition of his works has been published in Germany. In Spain, especially in his native province, he enjoys, or did enjoy till the recent war broke out, an extraordinary popularity, which was at its height in 1862, when the representatives of the ancient seigneury of Biscay, assembled "under the oak of Guernica," appointed Antonio de Trueba archivist and chronicler to the Basque provinces. Trueba, however, is not a pure Basque. He was born in the small district of Las Encartaciones, lying between Bilbao and Santander, a tract of country where the peasants speak, not Basque, but Spanish, and which, both in race and traditions, is more nearly assimilated to Castile than any other part of Biscay. His parents were superior labourers living by agriculture, and Trueba, born in 1821, spent fifteen peaceful years in a corner of country famous for its natural beauty, its fertility, and the fine physique of its peasantry. Here he learnt to sow and reap, to shake orchards and tend goats; and here, while quite a child, he made a name for himself at the country festivals by his gift for verse-making. Here he first fell in love with a beautiful maiden, seen once, and only once, on the high road; and here too, like Wordsworth at Hawkshead, he gathered in a harvest of natural and simple impressions, the reproduction of which was afterwards to give value and poetry to all he wrote. He was just fifteen when the Carlist war of 1836 broke out. The whole of Northern Spain, then the most flourishing part of the Peninsula, woke to war and the horrors of war. The Basque provinces had very little to gain and everything to lose; but a cause backed by the Church and pledged to the *fueros* appealed to them irresistibly, and soon along the whole line of the Ebro the country was in arms. Levies of the population began, and the parents of Trueba, in their home at Sopuerta, foresaw military service for their son as a peril close at hand. He was of a delicate and nervous temperament, and they resolved at all risks to send him safely out of the way. Accordingly, they wrote to some relations in trade at Madrid, and before the war was fairly on foot Trueba was established in the capital as an assistant in his uncle's shop in the Calle de Toledo. He was past thirty before he saw his native country again.

During the sixteen or seventeen years which elapsed between the arrival of the penniless, broken-hearted boy at Madrid, and the return of the successful author to the home of his childhood, Trueba was first occupied in learning and then in writing. His education in the village school of Sopuerta had naturally been of the scantiest. The keener life of the capital roused in him a desire for knowledge, which he set to work to feed as he best could, spending his time after business hours in incessant reading, varied with attempts at writing. But though Trueba read many books during these years, he never attained to anything like general cultivation. His lack of education, of that rudimentary apparatus of general knowledge which the reading public of France and England demands from an author as a matter of course, has remained throughout his greatest drawback. Those of his stories the scenes of which are laid outside Spain are full of the most laughable mistakes, and there is no European country of which Trueba has such hopeless notions as of England. His serious account of a Sunday service in an English country church is one of the most comical things in modern fiction. To his want of higher cultivation the greater part of his most glaring faults may be traced—his childish self-conceit, his lack of literary proportion, and the over-sentimentalism which spoils so many of his best stories. In this he is a strong contrast to another contemporary Spanish novelist, Galdos, a writer of great natural gifts and an artist of the first rank to boot. Trueba as an artist is nowhere near the first rank. He would be the first to tell the reader that art has little or nothing to do with his work, and his contempt for "philosophers"—for people, that is to say, who limit and sift and make reservations—is always candidly expressed. He is not a novelist as Europe understands the word, but he is one of the first of story-tellers. In the combination of simple types, in the description of country life as he knows it and has seen it, in the reproduction of popular beliefs, popular malice, popular sentiment, he is second only to Fernan Caballeros in Spain, and—*longo intervallo*—to George Sand among her Berry peasants.

His first successful appearance as a writer, however, was as a poet. The *Libro de Cantares*, published in 1852, when he had been for several years struggling to maintain himself by literature with very small success, was followed by one of those bursts of popular applause which are peculiarly Southern, perhaps peculiarly Spanish. The freshness, the vivacity, the genuine popular tone of the *Cantares* delighted the Madrid public, and their glorification of Biscay won them an eager welcome in the North. The book ran quickly through five editions. The Duke of Montpensier paid the expenses of the fourth edition, and Queen Isabella herself defrayed those of the fifth. Trueba's name was made, and a journalistic appointment secured him daily bread till he should do something better still. Luckily he soon found out where his real strength lay, and gave up poetry for prose. Five volumes of *Cuentos*, or tales, followed one another in quick succession, and still the public bought and praised his books with unabated relish. Trueba married; he saw once more the white houses and the orchards of Las Encartaciones; he had the delight of finding his name a household word in the beloved Northern valleys, and his poems on the lips of countrywomen who did not know their author. In 1862 came the appointment of chronicler to the seigneury of Biscay, and a fresh and rather odd phase in Trueba's life began.

To justify his position the new chronicler must needs think it incumbent upon him to write a history of the Basque provinces. It was as if Burns had set to work to rival Gibbon. The natural result followed. Trueba dived with interest into numberless old documents preserved in the archives of the various Biscayan towns, delighted himself with picturesque anecdotes and bits of striking biography, and was finally seized with a great curiosity to trace the history of his own family—a curiosity which some papers in the municipal collection at Bilbao enabled him to a great extent to gratify. But the history of the "very noble and very loyal seigneury of Biscay" has not yet been written, nor is it much to be desired that Trueba should ever write it. Some fragments indeed, the results of his studies, he has given to the world under the title of *Capitulos de un Libro*. The *Capitulos* has gaiety, discursiveness, *naïveté*, all the characteristic qualities in fact of Trueba; but, as a French critic too politely says of it, "peut-être cependant sentirait-on parfois chez l'auteur l'absence de savoir et d'instruction générale nécessaires à ce genre d'études; le sujet n'est pas toujours suffisamment pris de haut." When the recent Carlist war broke out, Trueba was living with his family at Bilbao. He was known politically as an ardent supporter of the *fueros*, and seems to have been suspected of Carlism in general by the Liberal party; so that, in spite of his boyish flight from Carlism, no sooner was Don Carlos the younger up in arms for legitimacy and the *fueros* than Trueba became a marked man in Bilbao. An informal meeting of the citizens revoked his appointment and its emoluments, and Trueba once more took the exile's road to Madrid, burdened this time with a wife and family. Since 1873 he has courageously resumed his career as an author, and has produced a second series of books, of a very different tone and style, however, from his early ones. It can scarcely be doubted that the abolition or modification of the *fueros*, whenever it comes, will be a severe blow to what has been at least a cherished sentiment of Trueba's whole life.

The subjects of his stories are as various as the merit of them. They are for the most part slight, and owe their attractiveness, not to any skill of plot or elaboration of character, but to the ease and sparkle of the conversations, the humour brought to bear on common things, on children and childish mischiefs, on household cares, on the ways and whims of domestic animals—always a favourite subject with Trueba—and on the gossip and merry-makings of village life. There is, in general, a moral of some sort—the superiority of country to town life, the advantages which flow from industry and family love, the harm of family discords and of foolish ambitions; these, and similar maxims, lie at the root of all Trueba's work. But he handles his moral lightly, and seasons it with so much humour and so much grace that the reader is always ready to forgive him the monotony of his themes. A story called *Las Siembras y Cosechas*, "Sowings and Reapings," in the *Cuentos Campesinos*, is a fair illustration of his prevailing manner. The plot is of the slightest—is, in fact, nothing more than an amplification of the proposition that, if a man sows seed in November, he will reap wheat in June, and that, if his wife sows harmony and thrift in the household while he is away from-

it, she will reap a harvest of loving and industrious children; but the various domestic scenes—the waking of the children, the feeding of the fowls, above all, the harvest and the harvest supper—are given with delightful zest and freshness. In any short account of an unknown author it is impossible to make an extract or two represent the writer fairly; but we cannot refrain from translating a passage from the children's talk in this story as a specimen of the crispness and simplicity of Trueba's manner:—

Canute is eight, Periquito six, and Hermengilda four, and they all sleep in one bed.

Here is the conversation which the children keep up while the little girl feeds and rocks her doll, which has lain warm in her arms all night:—

"I'm going to sow wheat in my garden." "So will I in mine! And shall we get much corn?" "Yes, a great deal." "And what shall we do with it when we've got it?" "Sow it again in the garden and get ever so much more." "And then?" "Then we'll sow lots and lots down in the field." "And more after that?" "Yes, we'll go on sowing and sowing!" "And when we have got heaps and heaps?" "Why, then we shall be rich!" "Rich! what does that mean?" "Why, it means having an india-rubber ball, like the mayor's Tommaso." "How jolly! Does it cost much to sow?" "Ask father if it costs him anything!" "And we shall really get an india-rubber ball?" "Really and truly."

Hermengilda, Merigilda, or Minigilda, for she owns to all these names, has been busy feeding her doll while her brothers have been sinking deeper and deeper in economics. Presently she hugs and kisses it, and begins to sing:—

Sleep, my little one, sleep,
For the cuckoo is coming this way,
And he eats up the children who cry,
And are cross to their mothers all day.

"Good-for-nothing chit! Won't you go to sleep now that I've filled you as full as you can hold? Well, then you shall be whipped. There!—

For the child who is good
Gets a blessing;
But the child who is naughty
A dressing!

There, there," she went on, "now the child's asleep! Bless its little heart! It's worth more pennies than all the world. Oh, *my* child is sure to be good, because her mother's so good! . . . She'll be rich and live many years, and then she'll die happy and go straight to Heaven!"

The only objection the reader is inclined to make here is that Hermengilda's remarks to her doll are a little too old for her supposed age of four years; but the practical agriculture of the boys is delightful. Or, to take a graver passage, could there be a more suggestive description of a girl's grief and longing when fate separates her from the playfellow of her childhood whom she is just beginning to love than the following, taken from an earlier volume of tales?—

Santiago set out with his father.

Quica and Catalina remained behind disconsolate, following them with their eyes till they disappeared over the top of a neighbouring hill.

Then the girl made an almost superhuman effort to calm her grief and said,

"Señora Madre, I will go and take the sheep to the mountain."

"Do what you will, daughter," replied Quica, mechanically.

It was Catalina's office every morning to open the doors of the sheepfold, and to lead the sheep to a pasture a stone's throw from the farm, where they might be left for the day. But on this day she took them on to the hill which Ramon and Santiago had just passed, and from that hill she walked to the next, and on still further to another and another, keeping the road to Bilbao perpetually in sight, till at last, sinking with fatigue, and half dead with sorrow, she bowed her beautiful head and turned her backward steps, not to the farmhouse of Ipenza, but to the church in the valley, and to the sheltering altar of the Virgin of Consolation.

A girl's yearning after a lost playmate could hardly be better given, though the sentences are so few and simple. As an illustration of Trueba's powers of pure description we will give a passage or two, premising that it is impossible to do justice to them by a couple of extracts. The Biscayan landscape in Trueba is not relegated to a stray paragraph here and there. It lives perpetually behind his characters, and the reader is never allowed to forget its heaths and gorges, its chattering streams and yellowing maize-fields. His happiest sketches of it are sometimes the effect of a chance phrase or sentence. But the following description of a Biscayan spring, with its mixture of realism and fancy, is full of charm:—

The spring had just dowered Las Encartaciones with a rich mantle of green worked with cherry and apple blossom, and was now doing homage to it every morning with a miraculous bird-concert—a thing to hear, so magical and wonderful was the labour of the musicians, inspired with the prospect of the rich breakfast of wild cherries which the spring had promised them for a fee.

In the fields at the bottom of the valley, as well as in those girdling the scattered upland farms, life and merriment reigned. All the land was joyful—not so much because of the coming of the leaves and the flowers and the birds, as because hope had come with them, golden hope, just risen like a butterfly from its chrysalis, out of the spike of maize already showing its reddish head in the ground turned and sown a fortnight before, out of the blade of corn swelling with pride to feel the ear in its bosom, or out of the fruit-blossom which, like a happy mother, lives to see her children in their turn parents. In the walnut and chestnut woods, boys are cutting whistles from the bark, or hunting for nests in the hazel groves by the river, while the oxen pasture in the rising meadows, and men and women are weeding among the forward crops or breaking the clods round the backward ones. The men have their pipes, the women are singing and laughing noisily, and all alike, children and men and women, are overflowing with a gaiety and contentment unknown to us choked by the harmful air of cities.

The lively opening of one of his least successful stories, as such, *Desde la Patria al Cielo*, is worth quoting as a specimen of the indirect satirical tone which is very common with him, and sometimes extremely effective. He is describing to his favourite bugbear, the "philosophical reader"—that is to say, the typical town-bred scoffer at rustic life and family joys—a certain village in Biscay which is to form a background for perhaps the most violently improbable and sentimental of all his stories. The village, he admits, has been so cruelly neglected by the geographers as to be found with difficulty on any map; its church, architecturally speaking, is contemptible, and its houses are mere mean cottages, beneath the notice of an educated eye; still, for all that, its inhabitants are benighted enough to cherish an absurd and proud affection for their native place, and

when the deep-toned festival bells ring from the white church tower, and when the people coming in find the altars heaped with rose-boughs and lilies, and the pavement strewn with thyme and bulrushes, these idiots weep for joy, and imagine themselves happy in their poverty, their church, and their village, which you can scarcely find on the map!

O philosophical reader! is it not true what the French say, when they tell us that Africa begins in the Pyrenees?

S—— has its river, but that too the maps have forgotten, neither have the poets ever called it *Father* So-and-so, nor have any of these gentlemen said of it that it draws the heart out of your breast, or that it talks in this way or that way, or the other way; in fact, it is a river so stupid that it contents itself with being always clear and fresh, and with breeding trout and dace to fatten the barbarians we have been speaking of, with setting in motion the mill which grinds flour for these savages, or the iron-works which provide employment for these Hottentots when the weather does not allow them to work on their farms, and with keeping perpetually gay and verdant the fields and gardens which yield grains and fruits, vegetables and flowers, for the use of these animals!

But the best is still to come.

The historical and monumental curiosities of the parish of S—— are the following:—

A rose-tree which Teresa planted when her son was ill, offering to give to the Virgin all the roses it might bear thenceforward if her son should get well, as in fact he did.

An inscription on the bridge recording how on such a day of such a year So-and-so plunged into the river at the risk of his own life to save Such-an-one.

And a hermitage of San Roque older than Methusalem, which these fanatics hold in great respect because the Saint revered in it freed the parish from the plague in the days of Maria-Castaña.

But you my philosophical reader will say—

That Teresa's urchin got well because good-for-nothings take a long time dying.

That So-and-so plunged into the river because the day was warm.

And that the parish got rid of the plague because the weather changed.

Well, I grant you,—so it must have been. Only these rustics are such superstitious dolts!

Even in his latest work Trueba is never tired of reproducing this Northern life and landscape. His Madrid public has begun to find it a little monotonous, and to weary of its perpetual white-walled farms and blossoming cherry-orchards. But Trueba writes of what he knows, and, however limited his circle of experience, he is right in thinking that nothing else makes good work. The English reader who cares to get a lively picture of Northern Spain and of Biscayan life, and who knows Spanish enough to enjoy them, cannot do better than while away a few summer afternoons with the *Cuentos Campesinos* or the *Cuentos Color de Rosa*. He will find them often foolish, still oftener sentimental, but very seldom dull; and in these days of far-fetched griefs and out-of-the-way passions their unfailing sunshine, and their unpretending reflection of the simpler elemental aspects of human life, have a peculiar charm. Unlike Fernan Caballeros, who likes nothing so well as to bring half her characters to a violent end, there is very little tragedy in Trueba. The griefs he describes are mostly simple and cured by simple means. The lost lover comes back, or the prodigal repents, or, if Death steps in, religion and the Church offer unfailing consolations. So that the reader is never harrowed, while it is always in his author's power to make the slightest theme sparkling and attractive, by the use not only of abundant natural gifts, but of rare stores of impression and observation.

FIVE WEEKS IN GREECE.*

MR. YOUNG calls his little volume "this trifling book of travel, containing nothing of original interest to the scholar or archæologist." Nor can we say that he is wrong in so calling it. It is a trifling book, and it does not contain anything of original interest. Yet Mr. Young can add with truth that he has not been "guilty of mere scribbling." One does not exactly see why he took what must in many ways have been a very disagreeable journey through the interior of Greece; but it is in some points well that he did take it. He does not seem to have made a single important observation of any kind; but he has seen what Greek travelling is like, and he reports both its good and its bad side for the benefit of others. The first thought that will come into most minds on the mention of travelling in Greece is whether the thing is possible at all, whether the attempt would not lead to being at once snapped up by brigands. Now we have for some time heard it whispered by Englishmen who ought to know, that there has always been a good deal of exaggeration on this head, that in the worst times the danger lay largely in the precautions taken, and that a traveller who drew no attention to himself might get about pretty safely. But Mr. Young is able to report a better time. By his account, Peloponnesos is absolutely safe; Northern Greece is safe as long as the Greek and Turkish authorities continue to act zealously and in concert along the frontier. Without such concert neither side is safe, as in that case the brigands escape from one country into the other. The state of things is somewhat pre-

* *Five Weeks in Greece.* By James Foster Young. London: Sampson Low & Co. 1876.

carious; the removal of a single energetic officer on either side may jeopard the safety of the whole border. Still it has been shown that the peace can be kept, and at the time of Mr. Young's visit last year it was kept. In saying this Mr. Young is not simply repeating what he has heard from Greeks or what has been said in Greek official reports. He relies on cautiously worded English official testimony, that of Mr. Malet, who allowed that brigandage had stopped, though he was clearly afraid that, if a particular Turkish officer were removed, it would begin again. This however refers only to Greece north of the Isthmus; Peloponnesos certainly seems from Mr. Young's account to be safe enough. He himself went through both parts of the country, and saw and heard nothing of brigands, save only that he fell in with a sergeant in the Greek army who had once shot one. This exploit, it seems, was performed by firing when the brigand's back was turned. This was near Parnassos, where the brigands once had it all their own way, but which seems to have been as clear from them as Peloponnesos when Mr. Young was there. We are here of course only dealing with Mr. Young, and repeating what he says. His visit was in 1875. The last accounts in the daily papers, especially since the departure of the King, tell another and a worse story than all. The doers of mischief now are said to be not brigands, but soldiers.

But, however safe Mr. Young found his journey, his record of travel does not describe a journey in the interior of Greece as at all inviting, except to those who either enjoy hardships for their own sake, or are willing to go through a large share of them for the sake of knowledge. No roads, no inns, filthy quarters, chance food, the journey to be made on wretched horses at a snail's pace—such is Mr. Young's picture of travelling in Greece as soon as the traveller gets away from Athens and a few other chief towns. That is to say, the civilization of the country is topheavy; the head has developed too fast for the members; it would be better for Athens to be a little less civilized, and for the land in general to be a little less barbarous. When we say "barbarous" we mean merely in the lack of those artificial comforts which Western Europe has learned to look on as necessaries. No people can be less barbarous in any other sense than the Greeks of the districts visited by Mr. Young, as far at least as their treatment of strangers is concerned. The appearance of strangers sometimes awakened a degree of curiosity which was inconvenient to its objects; but Mr. Young and his companion everywhere met with the kindest treatment from all classes, rich and poor, official and non-official. Once only did they meet with the least approach to incivility from an official prig, but even this was mere incivility of manner which did no real harm. The Greeks, as seen by Mr. Young, if they have their vices, have also their virtues; and in both they present a contrast to Northern nations in general, and to Englishmen in particular. They are thoroughly sober, as indeed Southern nations are commonly; and one would think that this was an acquired virtue of later times, for the word μεθύειν and its cognates fill a greater place in old Greek talk than we should fancy that they would in a state of things described by Mr. Young. The Greek is easily excited; Mr. Young several times saw men draw knives on one another on slight provocations; but they are easily appeased and do not bear malice. All that he saw of their domestic and private relations was in every way amiable.

Mr. Young's witness as to all these things is valuable as describing a part of the country which is not often traversed by English travellers; and, if he had kept himself simply to setting down what he himself saw of the country and its people, we should not have found any fault with his book, or have confirmed his own unfavourable judgment of it. A book which discharges its own purpose, if that purpose be at all a rational one, is not to be found fault with because it does not answer some other purpose. So far as Mr. Young's book describes modern Greece, and the modern Greeks as he saw them, so far well and good. But he had better have stopped there, and not have said anything about ancient Greece at all. Of Byzantine and mediæval Greece he seems never to have thought at all; nor are we disposed to find fault with him on that score; for travellers or writers to care about such matters is so rare that we are more inclined to rejoice in any one who shows any knowledge of them than to complain when they do otherwise. But Mr. Young thought it necessary to put in something about the earlier days of Greece. As we gather from one or two passages, he put it in as an afterthought. Mr. Young describes himself on his title-page as "Of Brasenose College, Oxford," and in one place he speaks of Oxford undergraduates as if they were a class to which he did not himself belong. We must infer, then, that he has gone through at least as much study of the Greek language and Greek writers as is needed for an ordinary Oxford degree. Whether his name is to be found in any class list we have not taken the trouble to look. But one might have thought that even so much study as this would have awakened some little interest in old Greek matters, especially in one who for some reason or other felt a call to go to Greece. Yet seemingly Mr. Young did not care for these things, but he thought it needful to put in something about them, and also thought it needful to be funny in the process of putting it in. Now it is wonderful that a man should go and look at the Harbour of Pylos without thinking either of its ancient or modern associations; yet such, by his own showing, is the case of Mr. Young. But, such being his case, he would have done much better to have said nothing at all about either. It is intolerable that a man should write two meagre paragraphs, partly made up of extracts and figures, about the exploits of Demosthenes and the exploits of Codrington, and then add this kind of thing:—

> It is perhaps needless to say that, like Thackeray's celebrated answer, which was utterly to annihilate his opponent in an argument, I did not really recall all these associations till afterwards (and then with the help of Messrs. Thucydides and Finlay), too late to be of any use! However, it is a pious fraud, and I believe a writer's licence, to pretend one *did* recall it all on the spot!

Mr. Young is fond of telling us over and over again that he is not a scholar, but that his companion "B." was. And his notion of Mr. Finlay seems odd:—

> Another afternoon we were so fortunate as to be able, through an introduction, to visit the house of the late Mr. Finlay, who lived thirty years in Greece, sometime as Consul and correspondent of the *Times*. He appears to have been a man of extraordinary industry; for, in addition to his duties as Consul and Correspondent, which must have been considerable, he found time to write his works on Greece (ancient, mediæval, modern), which are standard books and much read. He came out, in the first instance, like his contemporaries, Lord Byron, General Gordon, Sir R. Church, &c., to assist in the cause of Independence, and for a short time (so we were told) held a commission in the Greek army.

We do not remember to have ever heard of Mr. Finlay in the character of a consul; but it is hard to prove a negative, and we would not swear that he never was one. But Mr. Young clearly thinks that the letters to the *Times* which Mr. Finlay wrote in the later years of his life, after the *Times* had at last found out that he was something more than "a gentleman of Scotch extraction," were the main work of his life, and his great Histories something quite by the way. So it is throughout; when Mr. Young comes to any place of historic fame, sometimes he makes a dry summary of history, sometimes he merely jests about his own lack of scholarship and the superior knowledge of "B." Mr. Young makes the complaint, true but not new, that our way of pronouncing Greek in England simply makes it harder for an Englishman to have any dealings with a Greek. But one might almost think that he found out this fact in the country; for he tells us, as if it were a piece of news, that the Greeks pronounce by accent, and that with them ἄνθρωπος is sounded as ἄνθρωπος, and not as ἀνθρῶπος. But he seems to have hardly made any attempt to speak or understand the language. He is still in the state of thinking the thing funny. He does tell us how a Greek boy wrote down the word for a flea as ψηλός, but he seems to have no notion what word was meant, and how much was implied in the spelling. Mr. Young will perhaps be surprised if we tell him that he has been playing Liudprand of Cremona without knowing it. In modern Greece the Corinthians and the δήμαρχος ἐκ τῶν στρωμάτων are as vigorous as when they assaulted Strepsiades; and the little animal which leapt from the head of Socrates to that of Chairephón is still called by his old name ψυλλός. But the change which has come over the sound of the letter υ leaves hardly any perceptible difference between ψυλλός and ψηλός. The misspelling is therefore of exactly the same kind as the misspellings of Liudprand, which teach us so much more than he could have taught us if he had spelled right.

Mr. Young has thus done himself damage. We have to thank him for some useful information as to the present state of things in a country of which we know at once so much and so little. But he has in a great measure spoiled it by talk about "Messrs. Thucydides and Finlay" and the like; still he has made one good observation even with regard to ancient remains. He remarks on the rarity of fragments of antiquity in Greece as compared with their frequency in Italy. There must be plenty below the ground. The modern Greek plough is so feeble an instrument that it does not even turn them up. With regard to matters of art, as well as in regard to many other matters, we may say "From Pope and Turk defend us both." But the Turk is, after all, the more dangerous enemy of the two, and Italy has never seen the Turk on her shores save for one moment at Otranto.

FOX BOURNE'S LIFE OF LOCKE.*

IT certainly seems remarkable that we should have had to wait so long for a complete biography of Locke; but, as it is, there is perhaps little reason to regret the delay. One important part at least of the materials has lately become more accessible than it ever was before; and it is satisfactory to find that a task so long neglected, or but partially touched, has been at last taken up by good and careful hands. Mr. Fox Bourne has put much honest work of his own into the fulfilment of his task, and of course has now and then to call specific attention to the results of his own inquiries; but he never forgets that the first duty of a biographer is to put his subject before himself. The result is a book which, without making any special pretension to literary finish or graces of composition, is clear and interesting to read, and will be of permanent value to the students of Locke's work and times.

The feature of Locke's career of which ordinary readers will perhaps most need to be reminded is his almost constant activity in public affairs. A very common opinion has been entertained among mankind, from Plato downwards, that there is some necessary antagonism between philosophy and the practical commerce of life; so that a philosophic turn of mind is hardly compatible, for example, with fitness for political undertakings. Among the

* *The Life of John Locke.* By H. R. Fox Bourne. 2 vols. London: Henry S. King & Co. 1876.

many proofs of the injustice of this notion there can be none more signal than is furnished by Locke. Not only had his philosophy distinct political bearings—as indeed is sufficiently manifest by some of his best-known writings—but the greater part of his action in life was determined by political motives, and the leisure that enabled him to put his great work into the form in which it was at last published was none of the philosopher's own seeking. The *Essay on the Human Understanding*, such as we now have it, is due to the compulsory seclusion of a time of political exile. This, indeed, might have been the case with one who had no further connexion with affairs of State than as a holder and open maintainer of opinions then counted dangerous. But Locke's part in such matters was at all times more weighty and intimate than that of an advocate or pamphleteer. His relations to the first Lord Shaftesbury gave him abundance of active work, mostly quite apart from the duties of his nominal office, and much of it of such a confidential kind that as little record as possible was kept of it; but quite enough evidence remains to show its extent and importance. For the production of this evidence, and still more for the setting of it in its proper light, we are in a great measure indebted to Mr. Fox Bourne. At a later time there is good reason to believe that Locke had a considerable share in the preparations made in Holland for the action of the Whig leaders which ended in the Revolution of 1688. Very soon after William III.'s accession he had the offer of being sent as ambassador to the Elector of Brandenburg, which he declined on the score of his health and strength being insufficient for the post, and with the special observation, which throws a curious light on the diplomatic manners of the time, that, as on the one hand "their warm drinking" in Brandenburg would not suit his constitution, and on the other hand there was "no such rack in the world to draw out men's thoughts as a well-managed bottle," he "should think it more for the King's interest to send a man of equal parts, that could drink his share, than the soberest man in the kingdom." After this Locke held for some years an office of no ostensible importance, but was in fact consulted on important matters, and on more than one occasion the public expression of his opinions had considerable—it is hardly too much to say decisive—weight. He did as much as any one man to save England at a critical season from embarking on the downward course of a debasement of the currency. His views on this subject are as clear and sound as those of any modern economist. Only the other day he was cited by M. Michel Chevalier as laying down the true principles needed for the decision of the question, now much agitated in France and elsewhere, of adopting the single or the double standard. Lord Campbell even spoke of Locke (in a passing remark in the Life of Lord King) as the founder of Free Trade; this, however, was an unlucky piece of hyperbole, for the record of Locke's subsequent work in the Council of Trade leaves no doubt that he fully shared or at any rate acquiesced in the protectionist assumptions on which the commercial policy of the time was founded. The wonder is that on the currency question he had so thoroughly emancipated himself from prejudices whose prevalence and strength are shown by the fact that his conclusions, the truth of which now seems elementary, made their way but slowly. The tract on the liberty of the press which he issued a few years later had an immediate and absolute success. Here, indeed, he had a partial foreshadowing of Free-trade doctrine, when he pointed out in strong and homely language the ill effects of the protected monopoly of publishing the classics then enjoyed by the Stationers' Company.

In 1696 Locke was at last induced to accept a more adequate public recognition of his abilities—involving, however, a burden of new and severe work which taxed his failing health to the utmost—in his appointment as one of the original members of the Council of Trade and Plantations. While he held this post, he was not only active in its duties, but the "chief director and controller" of the business of the Council. They had not been long at work before "Mr. Locke was desired to draw up a scheme of some method of determining differences between merchants by referees that might be decisive without appeal." The draft prepared under his instructions became the first of the series of Acts by which arbitration has taken a most useful and important place in the administration of justice. In the following year the Council produced an exceedingly curious scheme for suppressing the woollen manufacture in Ireland—as being, on the economic suppositions then current, of "very ill consequence to this kingdom"—and by way of compensation establishing and protecting that of linen. Still more remarkable is an elaborate proposal for the reform of the Poor-law submitted by Locke in 1697, and in substance, it seems, adopted by the Council; but it had no practical result. Among other means of diminishing pauperism, Locke demanded "the suppression of superfluous brandy-shops and unnecessary ale-houses," probably not seeing, as later experience has forced modern statesmen to see, how much easier such things are said than done. A little after this he had a special summons from the King on business whose exact nature is not known. Mr. Fox Bourne conjectures, with much plausibility, that the King had chosen him as the best person to accompany the Earl of Portland on the special mission to France which followed the Peace of Ryswick. What is certain is that some important public employment was at this time proposed to him and declined, as the embassy to Brandenburg had been, on the ground partly of health, partly of "want of experience for such business."

Turning to another aspect of Locke's life, the reader will find much to please and interest him in the course of the friendships and domestic relations which are now for the first time fully brought out. It is not a little curious to see the bachelor philosopher more than once called upon to act as a match-maker, or to give advice in the critical conjunctures of a suit, though it does not always appear what success attended him in the business, or even who the principal parties were. His last appearance in company was at a feast in honour of the wedding of his "cousin King"—Peter King, afterwards Lord King and Chancellor, to whose descendant we owe the publication of a great part of Locke's correspondence and papers. The friendship with King was one of those attachments which some rare temperaments like Locke's can form in the evening of life, renewing in them all the warmth and happiness of earlier hours. A devoted follower acquired by him still later, indeed in the very last years of his life, was Anthony Collins, a name now little remembered, and to whom scant justice is done by English biographers, but obviously a man of no common abilities. But all Locke's friendships are full of interest, and to dwell on them separately would almost be to tell his life over again. Every one of them is interwoven in some important way with the very substance and fabric of the work of his life; for he was no solitary thinker, indulging in society as a recreation or luxury, but was social and human in all his ways, and not least in his favourite pursuits. There was William Molyneux of Dublin, who became Locke's fast and intimate friend, through a correspondence arising out of the famous Essay; their meeting was long put off, and when it at last came their fellowship was very near its end, for Molyneux's death followed a few months after. There were Continental men of letters with whom Locke, having once known them in their homes, for many years corresponded on terms of half-romantic affection. Limborch and Le Clerc he took to himself, or rather took shelter with them, in his days of troublesome and sometimes dangerous exile in the Low Countries. Nicholas Thoynard was some years their senior in Locke's acquaintance; they met in Paris in the course of a journey, the reports of which are among the most interesting parts of Locke's earlier correspondence. And Lady Masham, Locke's admirable disciple and host, is to be remembered chief of all; but here we can only add that the praise of her and hers is worthily given in these volumes.

Mr. Fox Bourne has rightly withstood the temptation—and it is easy to see that it was a grave one—of dwelling at any length on the philosophical part of his theme. It is perhaps a question whether he might not have retrenched even more to make room for the results of his own special work; an abridged account of the contents of the Essay, for instance, seems either too much or too little for the occasion. One cannot help reflecting, when one is fresh from the record of Locke's extensive culture and acquaintance, on the curiously insular character of his philosophy. The slighting allusions to "Messieurs les Cartésiens," in letters belonging to the time when he was conceiving the Essay, would alone show that he never appreciated Descartes. To Spinoza, his exact contemporary by birth, he paid no attention whatever, whether he was in this instance biassed by the prejudiced reports which are known to have been afloat, or took it for granted that there was nothing to be found in Spinoza but a peculiar development of Cartesian principles which his own judgment had finally rejected. However, this did not prevent one or two coincidences from happening. When he laid it down in his tract on Error that "the sincere and steady purpose of a good life" is the only rule of orthodoxy men are entitled to impose on their neighbours, he stood on precisely the same ground as the much-denounced author of the *Tractatus Theologico-politicus*. But we are far from feeling any regret for the perfect independence of Locke's philosophical work; it was just this independence which fixed its commanding position in European thought, and marked it as the starting-point of a new line of advance.

SHAKSPEARE'S PLUTARCH.*

IN this handy and interesting volume we fancy we see the fruits of the Archbishop of Dublin's very suggestive Lectures on Plutarch which were noticed in our columns some three years ago. In discussing the Lives Dr. Trench touched on the probability that, had Plutarch never written—nay, perhaps, had Sir Thomas North never translated from the French version of Amyot the lives of Coriolanus, Julius Cæsar, Marcus Brutus, Marcus Antonius, and others—"Shakspeare's three great Roman plays would never have existed, or would have existed in forms altogether different from those in which they appear." Owing to the cumbrousness of the folios of North it was difficult to give sufficient extracts from them in an edition of Shakspeare; and it has been a happy thought of Mr. Skeat's to reproduce in a separate volume, either wholly or in part, seven of Plutarch's Roman and Greek Lives from which Shakspeare has drawn plot and matter and incidents, adding some critical remarks with a view to afford an insight into Elizabethan and Bible English, and also to serve as a test of our great dramatist's indebtedness to indirect historic sources. Here we see that not

* *Shakespeare's Plutarch; being a Selection from the Lives in North's Plutarch which illustrate Shakespeare's Plays.* Edited, with a Preface, Notes, Index of Names, and Glossarial Index, by the Rev. Walter W. Skeat, M.A., formerly Fellow of Christ's, Cambridge. London: Macmillan & Co.

even his "little Latin" was taxed, much less his "less Greek"; whilst it is perhaps matter of congratulation that in North's racy and vigorous old English version he found his material in the clearest and handiest form. Mr. Skeat does not mention the volumes of select parallel Lives of Plutarch edited by Mr. George Long, though he attributes to the appearance of the Langhornes' translation, and, later still, of Mr. Clough's modification and improvement thereof, the comparative oblivion into which till recently North's version had fallen. This neglect was undeserved, for the "various hands" for whom Dryden wrote a preface were a sorry lot; and the editions which succeeded do not combine the interest and spirit of North's *Plutarch*. The Lives which are now published present the text of 1612 (the date of the fourth edition) collated with that of 1631 (the fifth) with a few readings from that of 1609. The first edition was published in 1579. A special interest attaches to Mr. Skeat's choice of the fourth edition from the fact that a copy of this edition, presented in 1870 to the Greenock Library, which was once Shakspeare's own, bears his initials on its title-page, and seems, from a note, to have been purchased by "W. S." for eighteen shillings. It appears, however, that Shakspeare was acquainted with one of the two earlier editions, though he may have bought that of 1612 for his own use.

Mr. Skeat's twofold object in editing the volume before us is such as to commend itself to all who have a wholesome interest in our literature. He seeks not only to furnish in a handy form biographies written in a graphic and lively style which makes them still a standard model, but also to enable the general reader to examine for himself the use made of them by Shakspeare for his Roman plays. It is to be hoped that in the first respect this work may do good, for of late years biography has outrun its normal limits, and has consisted rather of an unlimited quotation of letters than of the essence of correspondence, anecdotes, facts, and collateral history. So that any one who takes us back to a Plutarchian model of biography, fresh and lively, brisk and portrait-like, will deserve the thanks of an oppressed section of the reading public. Of course Plutarch had faults which it would be well to eschew, and there might be danger in letting biography owe its attraction to "curious myths"; but let any one read Julius Cæsar, Marcus Antonius, or the extracts from Plutarch's Alcibiades in North's version, as here set before us, and say whether a spice of Plutarch's antidote to weariness might not be a boon to his English successors in this branch of literature.

In truth it is this vital essence of biography which, being at hand in Plutarch, has made so many vivid pictures for Shakspeare's Roman plays. He laid hold of the anecdotes which kept historic narrative from becoming wearisome, and shaped them to his purpose. A parallelistic study shows us how independently and with what true genius he did this. Nothing escapes him in his authorities, though his use of the matter they supplied is the very reverse of servile. In Plutarch's Marcus Antonius, p. 207 of this edition, with regard to the battle of Actium it is set down "that the Admiral Galley of Cleopatra was called 'Antoniad,' in the which there chanced a marvellous ill sign: swallows had bred under the poop of her ship, and there came others after them that drove away the first, and plucked down their nests." At the parallel place in Shakspeare's *Antony and Cleopatra*, as he had plenty of matter to fill his scene, all the reference he makes to this is barely to name "the Antoniad, the Egyptian Admiral" (Act iii. sc. 10). But later on, in Act iv. sc. 12, where we are transported to the last battle and final crash of Antony's fortunes off Alexandria, Shakspeare shows that he has held this omen in reserve for use on a fit occasion, where he makes Scarus croak to his leader,

> Swallows have built
> In Cleopatra's sails their nests: the augurers
> Say they know not, they cannot tell, look grimly,
> And dare not speak their knowledge.

Just in the same way the dramatist seems to have noted for use on occasion a remark of Julius Cæsar cited by Plutarch in his Marcus Antonius, p. 163, c. 6, when "some accused Antonius and Dolabella unto him for some matter of conspiracy: 'Tush,' said he, 'they be not those fat and fine-combed men that I fear, but I mistrust rather these pale and lean men, meaning by (*i.e.* referring to) Brutus and Cassius.'" Shakspeare did not find a place for this shrewd remark of Cæsar's in the play which had its substratum in Plutarch's Mark Antony; but in *Julius Cæsar*, Act i. sc. 2, when the conspiracy is a-brewing, and Julius Cæsar chances on Antony and others in a public place, he is made to say to Antony:—

> Let me have men about me that are fat,
> Sleek-headed men, and such as sleep o' nights.
> Yond Cassius has a lean and hungry look;
> He thinks too much; such men are dangerous.

It is from Plutarch's Mark Antony, too, in the very same chapter on the ceremonial at the Lupercalian Games in which Antony was figuring, that Shakspeare took the materials for the famous speech in *Julius Cæsar* attesting that "on the Lupercal" the future triumvir "thrice presented him a kingly crown, which he did thrice refuse"—facts which he used more in detail in the 1st Act and 2nd Scene of the same play. And towards the close of *Antony and Cleopatra* two slight instances show further, were it needful to produce further evidence, how closely our dramatist had mastered and digested the pages of Plutarch with a view to his immediate object. When Antony's death is announced to Octavius Cæsar, c. 41, after bursting into tears, "he called," so we read in North's Plutarch, "for all his friends, and showed them the letters Antonius had written to him and his answers also sent him again, during their quarrel and strife; and how fiercely and proudly the other answered him to all just and reasonable matters he wrote unto him." Now let us see how Shakspeare makes use of this. Octavius, at the close of Act v. sc. 1, is sending Gallus and Dolabella to Cleopatra, but bids the rest of his council of war

> Go with me to my tent; where you shall see
> How hardly I was drawn into this war;
> How calm and gentle I proceeded still
> In all my writings; go with me and see
> What I can show in this.

Both biographer and dramatist trace the same identical lines. At the very close of the play, also, we find Shakspeare making Octavius Cæsar, on receiving the news and learning the attendant circumstances of Cleopatra's death, conclude—

> Most probable
> That so she died; for her physician tells me
> She hath pursued conclusions infinite
> Of easy ways to die.

Turn we hence to Plutarch, M. Antonius, p. 217, c. 39, and we find that, as his fortunes failed amidst the rioting of Alexandria, Antony and his Cleopatra "did break up their first order, which they called Amimetobion (as much as to say 'no life comparable'), and did set up another, which they called Synapothanumenôn, signifying the order and agreement of those that will die together." In connexion with this order, the biographer goes on to tell us that the Egyptian Queen was very busy in testing the force and action and relative painfulness of various poisons, and that she found "none so fit as the biting of an aspick." Here is the basis of Octavius's hearsay.

No passage in *Antony and Cleopatra* is more famous as a piece of word-painting than Enobarbus's description (Act ii. sc. 2) of the Queen going forth in her barge to take Antony captive by the dazzle of her charms and splendour. But, though it is a passage which commentators and illustrators have often traced in a cursory way to Plutarch, it needs word-for-word comparison to arrive at a full appreciation of Shakspeare's debt. Sir Thomas North's whole passage describing what the Alexandrians said was "the Goddess Venus come to play with the God Bacchus for the general good of Asia" is a piece of rich and graphic English. Thus runs a fragment of it:—"Her ladies and gentlewomen also, the fairest of them, were apparelled like the nymphs Nereides (which are the mermaids of the waters) and like the Graces; some steering the helm, *others tending the tackle and ropes of the barge, out of the which there came a wondrous passing sweet savour of perfumes, that perfumed the wharf's side*, pestered with innumerable multitudes of people" (M. Antony, c. 13, pp. 174-5). Now for our poet:—

> Her gentlewomen, like the Nereides,
> So many mermaids, tended her i' the eyes,
> And made their bends adornings: at the helm
> A seeming mermaid steers: the silken tackle
> Swell with the touches of those flower-soft hands
> That *yarely* frame the office. *From the barge*
> *A strange invisible perfume hits the sense*
> *Of the adjacent wharfs.*

But it would be unfair to deprive the reader of the pleasure of comparing the two for himself. It is just, however, to Mr. Skeat to illustrate the usefulness of his glossary by a single word in both the copy and its model. In the one the curious old English word "pestered" is duly explained as "crowded," with minute reference to this passage. The equally archaic adverb "yarely" in the other has all needful light thrown on it in the glossarial index under the head *yaraje*, where we read as follows:—

> Yarage. s. management, 208, 5, 211, 4. From the adj. *yare* nimble, active. Shakspeare has *yarely*, Tempest, i. 1.

Mr. Skeat might have added A. and C. iv. 2; but his glossary shows that the word means "nimbly." But we must not dwell longer on the comparison of Shakspeare and Plutarch (for which the life of Marcus Antonius seems to afford the richest field) than just to enumerate a few passages in *Antony and Cleopatra* which have their original in Plutarch, or rather in North's version of the French translator. The story told by Philotas, the physician to Plutarch's grandsire, about Antony's cook roasting eight wild boars whole for twelve guests "because we do not dress one supper only, but many suppers, being uncertain of the hour he will sup in" (p. 176, M.A.), reappears in the scene of Shakspeare from which we last quoted, where Enobarbus tells Mæcenas how they did "sleep day out of countenance and made the night light with drinking." In both we find mention of Antony and Cleopatra's custom of traversing Alexandria by night in strange disguise; in both we find the pirate Menas's overture to Sextus Pompeius off C. Misenum to cut the cables of the vessel in which he is feasting those who have robbed him of his father's house, and so to place in his power his rivals Octavius and Antony. Shakspeare makes much capital out of Octavia's strait between her husband and brother, and the soothsayer's valuation of the relative luck of Antony and Octavius, whether the battle be between cocks and quails, or consuls and triumvirs. In both he follows close on Plutarch. To Plutarch towards the catastrophe Shakspeare is indebted for Antony's challenge of Octavius to single combat, and Octavius's reply. "Cæsar answered him that he had many other ways to die than so" (M. A., p. 219). "Let the old ruffian know" (thus Shakspeare puts it) "I have many other ways to die; meantime laugh at his challenge" (*A. and C.* iv. 1.) So again

the dramatist takes from the biographer the tradition of the strange noises heard, though nothing was seen, in the night before the final battle off Alexandria, which men interpreted "that it was the god, unto whom Antonius bare singular devotion to counterfeit and resemble him, that did forsake them." Eros's suicide to escape killing his master, and Antony's dying advice to Cleopatra to confide only in Proculeius, are among innumerable minor borrowings of Shakspeare from Plutarch's translator for the material of this play.

Enough perhaps has been said to indicate an attractive field of literary comparison; and with Archbishop Trench's Lectures on Plutarch, and Mr. Skeat's suggestive preface, excellent indices, and capital editing of the text, a pleasanter occupation or recreation could scarcely be conceived. The insight it would give into Shakspeare's materials and his mode of using them would be found ever increasing. For instance, Mr. Skeat, in pp. xvii.-xviii., shows some colour for the conjecture that various names of characters in the *Winter's Tale*, *Hamlet*, *Timon of Athens*, *Midsummer Night's Dream*, and several allusions to Roman history and biography, are drawn from the folio of North, either that for which "W. S." paid "18s." or an earlier edition. Doubtless there are some incidents in the Roman plays not to be found in these folios, *e.g.* the episode of Enobarbus's treachery to Antony and his speedy repentance (*Ant. and Cleop.* iv. 6); and as to such Mr. Skeat might have given a prefatory paragraph. Too high praise can scarcely be awarded to the glossarial index or to that of proper names, whilst the brief textual notes are all that is wanted. Apart from the dramas and the history a certain interest attaches to a chronicle in which we read of legions being "billed" (*i.e.* enrolled) and paid, probably through a *cofferer*, *i.e.* a treasurer; of Antony at one conjuncture "causing his tents and fardels to be trussed up; and at another disposing the *rereward* and the *coward* of his army." We find ourselves here in the very midst of Bible English, at the same time that we learn that in North's day *huswives* and *hussies* were synonymous, and dancing women were called "tumbling gillots." In whatever light we regard Mr. Skeat's *Shakespeare's Plutarch*, it is entitled to rank as a timely and useful addition to English literature.

SPORT IN ABYSSINIA.*

LORD MAYO'S book shows that there is excellent big-game shooting [illegible] ing to be had in Africa within comparatively easy reach of Mediterranean steam communications. The Cape at best is a long way off, and it is a serious matter spanning up for a tedious journey to the remote interior with teams of sluggish oxen who may fall victims to the bite of the *tsetsche*. Sir Samuel Baker made magnificent bags of everything, from elephants and giraffes downwards, on the Upper Nile tributaries of Abyssinia; but it is not every one who has the enterprise to undertake expeditions inland from remote back settlements, like Khartoum, among warlike tribes in a state of chronic hostility. Lord Mayo and his companion simply took shipping at Suez for Massowah; they carried with them a very moderate amount of stores, which they had laid in in the Egyptian bazaars; and they would probably have met with few difficulties on their way up country had they conducted their march with a little more discretion. They were not very many weeks absent, yet they came across almost every variety of game. Near the coast they found birds in abundance—guinea-fowl, partridges, snipes, sand-grouse, &c.—besides the smaller deer and antelopes. Further on, they came on such larger species as the hartebeeste; there was the wild boar in the jungles and the hippopotamus in the rivers; there were lions, tigers, leopards, and other ferocious creatures to enliven their beats with the element of danger; and, finally, they too came upon troops of giraffes, and apparently might have enjoyed elephant-hunting to their hearts' content, had they had somewhat more experience. In point of fact they were seldom successful, and for Lord Mayo at least the expedition ended unfortunately. Just as he reached the best shooting ground, an imprudent bivouac under exposure to the night damp struck him down with a severe attack of dysentery. He had separated from his companion, who had gone on ahead, and had to beat a precipitate retreat to the coast, having a very solitary and miserable time of it.

We cannot say that the party seem to have managed matters well, nor are their proceedings likely to have smoothed the way for any of their countrymen who may follow in their footsteps. Lord Mayo seems to have been somewhat in the habit of treating natives as "niggers." He and his friend were exceptionally fortunate in being accompanied through many of their stages by the well-known General Kirkham, the English commander-in-chief of the Abyssinian forces. Yet they would have been perpetually in difficulties about obtaining supplies had they not gone on the principle of requisitioning the country. It appears that the farmers and villagers were quite open to bargains; but if they hung back or seemed disposed to take advantage of the white strangers, the latter simply helped themselves. It sounds strange to hear an English gentleman mention incidentally that, as his coolies generally had their hands pretty full of an evening with pitching the camp and other indispensable duties, they found it saved trouble to waylay the women coming from the wells, and empty their water jars forcibly. If the women came to see it as a joke after their first alarm, it says much for the amiability of the native temper. Another time we are told with much gusto how the Englishmen's followers made a rush at a party of funeral guests who were returning laden with fragments of the feast. These spoils they appropriated to their own use, to the equal astonishment and disgust of the jovial Abyssinians. No wonder that three or four villagers who came by said, "You have been robbing our people; you will see what they will do to you to-morrow!" But when they went on, with what appears to us to have been a very mild and natural remonstrance, "You are a Rass" (which means a lord in Abyssinia), "and ought to know better than let your servants do this," Lord Mayo found that they "got a little too cheeky," and "was rather annoyed." So he jumped across the stream, snatched one of their sticks, and "gave them two or three cuts across the back, as hard as he could," explaining that that was how a Rass was accustomed to treat people who were insolent; and we can only hope these ignorant Abyssinians have laid his moral lessons to heart. We might multiply instances of the kind, opening the pages at random; and even when Lord Mayo was being carried back to the coast sick in a litter, and felt a sick man's inclination for some little delicacy, he found strength to rise and shoot a kid in a passing flock, refusing afterwards to indemnify the owner. His only explanation is that the man "had been ordered to supply him with food, and a young kid was very little out of a large flock." We are aware that necessity has no law, and that, once beyond the limits of civilization, a man may be excused for resorting to violence rather than resign himself to starvation. What we object to in Lord Mayo's proceedings is that, by his own admission, the party sometimes did wanton damage simply in order to save themselves trouble, as when they emptied water-jars in the neighbourhood of a spring, and tore down hedges to feed their fires when there was no lack of wood for the fetching. Nor do we understand that they were by any means in the habit of insisting on the natives receiving adequate recompense for these arbitrary exactions; and, indeed, Lord Mayo accomplished many long stages towards the coast carrying only five or six dollars for pocket-money. Yet, when they saw him prostrate and suffering, many of these poor people treated him with extreme kindness. Frequently he was indebted to them, as he is ready to confess, for tolerable night-quarters and more comfortable transport; and repeatedly they came to the invalid's bivouac with milk, eggs, and other little luxuries, and that without any expectation of repayment.

Although rough diet and exposure brought on dysentery, Lord Mayo pronounces the country to be very healthy on the whole. There was abundance of wood and water, and the scenery generally was extremely picturesque. Indeed he seems to have advanced over the ground that was traversed subsequently by the ill-fated Egyptian expedition; and, speaking of the chances of an invasion of the kind, he predicts what would be the probable result. Access to the interior from Massowah lies through a succession of narrow gorges, completely commanded by the surrounding hills. Roads, properly speaking, there are none; and although King Johannes is fully alive to the indirect profit of opening up easier communications, he is too chary of his considerable treasure to part with any of it for the purpose. But even as things are at present, there is a good deal of desultory trade with the coast, and the sportsmen came across more than one caravan, besides single merchants with mules laden with gold dust and other valuable produce. It does not seem likely that Abyssinia will ever do much in ivory, for the tusks of the Abyssinian elephants are small. But Lord Mayo was greatly impressed with the agricultural capabilities of these districts, and repeatedly regrets that English speculators have not been turning their attention in that direction. In the meantime the best land seems to be cheap enough. The King had generously made General Kirkham a grant of a large tract in one of the most fertile valleys, and the General presented Lord Mayo with a sunny selection from it, in return for which he is to receive a box of English seeds. Of General Kirkham we necessarily hear a good deal, as he passed so much time in the society of the travellers. He began life in the service of the Peninsular and Oriental Company, and appears not only to be a resolute and intelligent man, but what we should call "a good fellow." It says something for the mild and liberal administration of Abyssinia, as contrasted with the system in Egypt and Turkey, that even the General, although his sovereign's right-hand man and commander-in-chief of all the forces of the kingdom, hesitated about laying hands on articles he stood in need of, and occasionally ventured a remonstrance against the fashions of his English companions. The sport, as we have said, was less successful than it should have been. To be sure, Lord Mayo was unfortunate in having to make his start without the better part of his battery, and by the time he was overtaken by the missing guns his failing health had crippled him for the field. But he appears to have been unlucky too in not finding native experts to direct his arrangements, and we know that even an experienced sportsman left to himself in an unfamiliar country is practically helpless. The party were, indeed, continually following up fresh elephant trail; the animals showed themselves so tame and fearless that once they came routing round the camp in the night-time; and not unfrequently the sportsmen were face to face with them. But some untimely shot or other *contretemps* came off at the critical moment, and after many wild-goose chases not a single animal was bagged. Apparently they were in the habit of neglecting the elementary rule of the sport, which is never to fire at meaner game when there is any suspicion of elephants in the vicinity. On one occasion when they were out after

* *Sport in Abyssinia; or, the March and Tackazzee.* By the Earl of Mayo, Lieutenant Grenadier Guards. London: John Murray. 1876.

elephants, and "burning" in the pursuit as the children say, a lion crossed their path and the temptation was too strong to be resisted. They fired and missed, and had to regret the hasty impulse too late, when they heard a band of the huge animals they were in search of crashing away through the branches of the forest. As their native followers remarked, very sensibly, if they had only disposed of the elephants first, they would have had lions in plenty coming prowling round the carcases. Unambitious sportsmen might make satisfactory mixed bags almost anywhere with very little trouble, and could eke out such preserved meats as they might carry with them with an ample variety of fresh game. The covers swarmed with red partridges, but the birds were hard to flush, and unluckily Lord Mayo and his friend had taken no dogs with them. But there were geese, ducks, and snipes in the streams; the sand-grouse repaired to their drinking-places at stated seasons, and sometimes came actually circling round the tents; while the deer let themselves be approached easily enough, and without any very scientific stalking. Indeed, from the general tameness of the animals which are usually the wildest it would seem that the natives in those parts are no great hunters, and leave their preserves very much undisturbed for the benefit of strangers.

It will be seen that the book contains a good deal of useful information on its special subject, but the author does not often travel beyond that. We only hear incidentally of Abyssinian politics, and we learn little in detail of the condition and resources of the country, although we might have imagined that conversations with General Kirkham over the camp-fires might have supplied many facts worth repeating. But as the author is never in the least reticent, either as to his failures with the rifle or the questionable relations he established with the natives, we feel throughout that he is thoroughly trustworthy. And the impression he leaves on us as to the native population is decidedly favourable. Their nominal Christianity may not go for very much in practice. They have some singularly unpleasant habits, such as that of fortifying their courage by gorging themselves with raw flesh, and devouring as choice delicacies the uncleansed intestines of newly-killed animals. Although easily excited, they are by no means very warlike; they are disposed to take life easily, and have a sharp enough perception of their personal interests. But they are good-humoured, and even kindly, if taken in the right way, and possess a very fair share of intelligence. On the whole, we think that Englishmen who are fond of wild shooting might do worse than follow in Lord Mayo's route, although we fear that the local recollections of his visit will scarcely secure a welcome for his travelling countrymen.

TURNER'S BIBLICAL AND ORIENTAL STUDIES.*

THE practice of pouring out on the public the contents of writing-desks and note-books has become so general that we must submit to the infliction with the best grace we can. Mr. Turner has thought it right to put forth as a volume a number of papers, some of which have appeared in the *Journal of Sacred Literature*, while the others were lying beside him in a more or less unfinished state. They may be divided into two classes—the one dealing with subjects illustrating the course which, in his belief, Divine Revelation must follow; the other handling questions which, in strictness of speech, are purely historical. Of the former we have nothing to say. On the "History of Job and its place in the scheme of revelation" so many theories have been held, and, so far as we see, may be entertained legitimately, that we do not care to enter into an argument which concludes with the assertion that "the narrative describes real events" (p. 170), and that these events and the composition of the book belong to præ-Mosaic times (pp. 173–5), although we are warned that "we know nothing at all as to the origin of the book or the history of its composition" (p. 177). The views taken by Mr. Turner of the Israelitish economy, or of the tenses of the Hebrew verb, may be both sound and instructive; and to his examination of these subjects no objection can be taken except such as may be concerned with his competence for dealing with them. This we have not the least wish to call in question. But when a writer, in his anxiety for the maintenance of that which he regards as truth, makes the acceptance of certain conclusions relating to alleged facts a matter not of history but of theology, we are bound to ascertain, if it be possible, whether the claim is to be admitted, and whether the data on which it rests have been fairly established. It is unjust to excite prejudices against the methods of Egyptologists and Assyriologists, and then to leave those prejudices to work without making an attempt to show that they have any justification in fact. It is absurd to shut our eyes to conclusive proofs of the satisfactory decipherment of ancient inscriptions, nor will the impartial historian hesitate to accord to these documents their proper authority, as soon as he has sufficient grounds for regarding them as put up by men who recorded events belonging to their own time, and did so with good faith. But the historian will signally fail of his duty if he allows the acceptance or the rejection of such records to be reckoned to him either as a religious merit or as a heresy, more or less seriously affecting his soul's health.

Against such theories all who have the interests of historical truth at heart are bound to protest; but Mr. Turner goes even further. He looks on the discoveries made under Assyrian or other mounds and ruins as an earnest of still more important discoveries to be made hereafter. In this he may be right, and we hope that his expectations may be realised; but we are very sure that he is not right when he tells us that these records have been buried by the special providence of God, to be doled out in portions as they may be needed to furnish an answer to certain persons called gainsayers and infidels. Mr. Turner seems to have come across a set of critics, to us wholly unknown, who profess to reject in a lump the whole mass of Jewish tradition as a "void and formless chaos"—that is, who will receive no single event in Jewish history preceding the notices given of it in Roman or Greek writers. He is also able to inform us that thirty or forty years ago the idea that any records of Mesopotamian history would ever be recovered and deciphered would have been scouted as a wild and ridiculous dream. We are not aware that even Sir Cornewall Lewis went to such lengths; and even his incredulity on the subject of decipherment was quite subordinate to his reluctance to regard either chronology without history, or history without chronology, as of any intrinsic value. We know that many Jewish traditions, not only of the Exodus, but even of later times, have been disputed; but it is a new thing to learn that there are not wanting men who disbelieve every event in Jewish history prior to the time of Alexander the Great. Certainly Ewald is not among the number, although he may have ventured to call in question some statements respecting times so comparatively recent as the reigns of David and Solomon. But Mr. Turner seems to exult in the discovery of slabs or cylinders telling us that "Samaria was depopulated, Jerusalem invested, Lachish stormed and pillaged," just as though these facts had been seriously and generally disputed. With an enthusiasm not easily to be understood he exclaims, "So much, at least, of the strictly historical in the Old Testament is now secure as the rock upon the sea-shore against the surgings of unbelief." This unbelief, it seems, is to grow more formidable; and then we are to have a fresh supply of Assyrian or Babylonian inscriptions corroborating the Jewish accounts of events belonging to the reigns of Cyrus, Darius, Nebuchadnezzar, and Artaxerxes. "Who knows," he asks, "what testimonies of a like kind are yet hidden in those mysterious mounds, kept in reserve against the fit time for their production, when the spiritual conflict between faith and infidelity shall have waxed yet more fierce?"

We would only ask, Against whom are these shafts directed? There are some persons who have never for a moment been tempted to question the great verities of the Christian faith, but who nevertheless feel quite unable to resist the evidence which led Sir Cornewall Lewis to the conclusion that the Roman traditions of events preceding the war with Pyrrhus are very little to be trusted. There are others who have no objection to believe the story of Romulus and Remus, or Hector, or Aristomenes, or even Sindbad, but who yet hold that thought is a function of matter, that the idea of will as a power or cause acting freely is a delusion, and that this life is the be-all and end-all of man. The latter are quite ready to believe anything they may be told about Ismidagon, or Sargon, or Asshur-bani-pal. The former may possibly reject the statements about them as unproved, or inconsistent, or self-contradictory. Yet these are to be treated as heretics and infidels, although it is hard to see how the digging up of bricks and cylinders in Mesopotamia is to change their convictions of the nature of historical evidence, or to rescue the speculative unbeliever in God and a life to come from the slough of materialism. It is a pitiable policy which insists on seeing enemies where there are none, and leaves the real adversary unmolested.

This dread of an opposition which is all but imaginary has led to the writing of the first three essays in this volume, which treat of the decipherment of the Cuneiform inscriptions as a well-established fact. We certainly have not been unwilling to make this admission, although, in examining M. Lenormant's Manual of the Ancient History of the East, we regretted the necessity for changing the names of Assyrian or other kings, sometimes partially, sometimes wholly. It is no hard matter to understand that Durrigalazu may be the same as Kurgalazu, Purnapuryas as Burnaburyash, and Gurguna as Gunguna; but by the light of nature it is impossible to recognize our old friend Ivalush under the new styles of Hu-likh-khus, Binlikhish, or Binnirari. The matter of importance, however, is not names, but things; and we turn with some eagerness to the essays which are to tell us, not that the inscriptions have been read, but that they add substantially to our historical knowledge. All history beyond doubt has its value; but there are also records on which time spent brings weariness both to the flesh and to the spirit. It may be well worth while to study the chronicles of despotism or cannibal savagery; but the task is not inviting, and the harvest is scarcely so precious as to tempt us to linger over it long. How then is it with the monuments of the Mesopotamian kings? Not only, it seems, must different phonetic equivalents be assigned to the signs, or some of the signs, which indicate their names, but in some instances, by no means unimportant, the order of their dynasties must be changed. Not many years ago Mr. Rawlinson told us that, if the scheme of Berosus might be regarded as sufficiently established, the reign of Nimrod, who, as being deified by the name Bilu-Nipru, became the Belus of Ovid, began with B.C. 2237. If we are to follow Mr. Turner, he is to be brought down to the period which closed the fourth Berosian dynasty of forty-nine Chaldeans, according to Mr. Rawlinson in B.C. 1518. In Mr. Turner's essay the date becomes 1550. It can scarcely be said that the reasons urged for this

* *Studies Biblical and Oriental.* By the Rev. William Turner. Edinburgh: Adam and Charles Black. 1876.

change are without force. On the whole, they hang well together, and seem to be supported by the narrative of the wars of the confederate Kings of Shinar and Elam, with their allies the chiefs of the cities of the plain, in the days of Abraham. If the empire of Nimrod, he argues, was already an established fact, how is it that we have nothing said of it here, while a confederacy exists which seems to leave for it no room whatever? The plea that God could not have allowed so mighty a dominion as that of Nimrod to be established immediately after the confusion of tongues at Babel is less intelligible and convincing. But when we are told that there is no space for Nimrod until after the reign of Ismidagon, who was by no means the last of his dynasty, and that the date of Ismidagon is "certainly determined to about B.C. 1860" (p. 94), we are brought back to the old device against which we have already protested in the case of M. Lenormant *, who assigned a certain date to Kedorlaomer, King of Elam, because Asshur-bani-pal places his capture of Susa 1635 years after that monarch. We know nothing of the grounds on which Asshur-bani-pal made this statement; we have as yet no reason for supposing that he had before him continuous registers for the whole of that long period; and the date thus assigned is some seventy years earlier than that of Mr. Rawlinson. So with Ismidagon, the certainty about whom is, Mr. Rawlinson informs us, got at thus. The inscription at Bavian relates that Sennacherib recovered from Babylon certain images carried thither 418 years previously by the Babylonian King after his victory over Tiglath-pileser; and, again, Tiglath-pileser speaks of himself as having rebuilt a temple which had been taken down sixty years before, after having lasted 641 years from its foundation by Shamas-vul, son of Ismidagon, who is thus driven back to the middle of the nineteenth century B.C. Mr. Turner insists that the Assyrian kings were truth-loving men, who would not without adequate reason speak of an event as a fact of history. But we in our turn must insist that we in no way question the veracity of Sennacherib when we decline to accept his alleged conviction as sufficient evidence of the age and the existence of Ismidagon. Before we can do so we must simply assume the fact of contemporary registration, between the days of Sennacherib and Tiglath-pileser, and from the monuments we have not even continuous information of the monarchs who reigned in the interval. But, in truth, it seems impossible for Assyriologists, as for Egyptologists, to escape from the charmed circle of ingenious conjecture and devices for the reconstruction of lost annals, if ever those annals were written. We have [illegible] the [illegible] still to build "on the most reliable reconstruction of the chronological scheme" of Berosus (p. 103); and this plan is that of Herr Gutschmid, which comes briefly to this, that the duration assigned by Berosus to a certain dynasty, added to that of the mythical dynasty which precedes it, gives a period of 36,000 years—in other words, a Babylonish *sar:* therefore the later dynasty is historical. On similar grounds Niebuhr thought that the period assigned to the reign of the second Tarquin at Rome may perhaps have been historical, because to this reign alone he could not apply the arithmetical scheme of the artificial chronology of Rome before the burning of the city by the Gauls. But in spite of this Niebuhr had the honesty and the courage to dismiss the whole scheme as a forgery and a fiction; and that of Herr Gutschmid has no higher value. Mr. Turner, it is true, devotes an essay to Berosus, whom with Josephus he delights to honour as an entirely capable and trustworthy writer. We cannot say that the evidence adduced in it justifies us in reversing the verdict given against him by Sir Cornewall Lewis.

LADY SILVERDALE'S SWEETHEART.†

MR. BLACK'S last volume of short stories was welcome, in the first place, for its merits, and also as an infraction of the senseless custom which forbids the writer of fiction to put anything before the public within the compass of a solitary volume. We may presume that publishers imagine they serve their own immediate interests by fighting shy of one-volume books; and there are of course certain obvious trade advantages possessed at present by the three-volume system. A publisher who resolved persistently to oppose prejudice in this respect would no doubt have to encounter difficulties at the outset; but, supposing that he was prepared for this, there seems no reason why he should not find fiction in one volume as good a speculation in London as it is in Paris. On the appearance of Mr. Black's *Maid of Killeena* we dwelt upon this matter, and expressed a hope that the author would repeat the experiment he then made. It would be well for many writers, as well as for readers, if this form of fiction became more popular. A bad novel would be more tolerable in one volume than in three; and there are many clever authors who would produce better work if they found it possible or advisable to compress their productions into a less space. To some writers it would be a relief to escape from the necessity of filling up the inevitable third volume; to others the exercise of art required to compose a satisfactory story within close limits might be a useful lesson. Mr. Black's charm of style and light touch appear peculiarly well fitted to deal with this kind of work, and the stories he tells seem to illustrate the adage "As easy as lying"; but it must be remembered that this ease is the result of labour and practice.

We could wish that Mr. Black in his present volume had given us more new matter. "The Marriage of Moira Fergus," which is one of the longest tales in this collection, does not seem to us one of its author's happiest efforts. Both in this and in "The Strange Horse of Loch Susinabhal" the representation of the Gaelic pronunciation of English, which he made familiar in the *Princess of Thule*, is overdone; and here, as in that book, he has fallen into the mistake, which is perhaps of no great importance but still is a mistake in art, of making his Highlanders talk broken English to each other. Mr. Black has the art of giving a certain charm to this quaint manner of speech in his printed version of it; but it is not likely that his personages would find it so captivating as to abandon for it their native tongue. However, there are no doubt many readers who will be glad to welcome old friends in these stories as well as in "The Man who was like Shakspeare" and "The Highlands of the City," which are, to our thinking, more successful.

Lady Silverdale's Sweetheart, which appears here for the first time, is a very good specimen of the art of story-telling. There is no very striking incident in it, and the people concerned in it are such people as one may meet any day; but the narrator manages to excite a lively interest in them and in their fortunes. Lady Silverdale is a widow of thirty-five with considerable beauty, who does not look as old as her age. At the opening of the story she is walking in the Mall with her son of eight or nine years old, whom she asks if he remembers his uncle Frank, who is coming back to England, "and you must tell him how glad you are to have your dear uncle back again." "I am not glad, mamma, and I hope he won't come and see us," said the young gentleman frankly. "Why?" "Because he is a bad man, that wants to kill the Queen, and give our house, and my pony, and all that we have, away to the beggars." On asking for the source of this startling information Lady Silverdale finds that "Maudey read it in the newspapers." Uncle Frank, who, as may be guessed from Harry's account of him, holds Radical views in politics, is a cousin of Lady Silverdale, who would have married him in their young days; but Frank Cheshunt had no money, and his cousin Mary's parents wished her to marry Lord Silverdale. To this, being a dutiful daughter, she consented, and not long after a passionate leave-taking, with many vows of secret constancy between the cousins, Frank saw that a marriage had been "arranged" between Silverdale and [illegible] Mary:—

> Of course, he flew into a series of violent frenzies; at one time vowing to himself that he would go and shoot the man who had stolen his sweetheart's love from him; at another declaring ruthless war with the perjured aristocracies of all countries; at another resolving to write a book that would hold the mirror up to heartless women and cause them to blush—if any shame were left in them—at the picture of their own meanness, and cruelty, and corruption. Happily for himself, he had his living to work for; and these wild schemes were unable to struggle against the immediate pressure of actual facts.

He was called to the bar more with the hope of getting some appointment as a reward for the traditional Conservative devotion of his family than with the intention of practising. But he forfeited all chance of Conservative patronage by joining "an informal association of what were at the time known as 'Aristocratic Radicals,' and becoming one of their most vehement speakers and pamphleteers. Some of those young noblemen and gentlemen had a mild way of toying with revolution over their claret, and spoke of barricades in the same breath with blue china; while, having been compelled by the higher criticism to give up revealed religion, they had consoled themselves with a gentle deification of the British workman."

This description is accurate and amusing enough; but Mr. Black has, we think, made a slight slip as to the effect which Frank Cheshunt's joining this party had upon his fortunes. He is described as having none of the *dilettante* spirit which belonged to the admirers of blue china and the red flag; his writings gained immense influence, though without the aid of money he failed to get into Parliament. He is represented altogether as being just the kind of man to whom a Government would be likely to give a place by way of muzzling him. However, the Government of which Mr. Black writes may no doubt have had a soul above such a proceeding. Frank Cheshunt in the midst of his active life had his fits of recollection and despair like any one else. "Sometimes, sitting alone by himself at night, he would go back to the old days, dream for a while, and then seek refuge in Alfred de Musset or Heinrich Heine. Grief seemed more bearable when it was put into musical words." Presently Frank met with a certain Alexander Thompson, a merchant who had made a fortune at the Gold Coast, and might have been fairly expected to join the respectable ranks of Toryism when he came back to England to spend it. This, however, was not the case:—

> Nothing but rank Communism would do for him—theoretical Communism, that is to say; for of course a man who had worked hard for a fortune could not be expected to share it among the poor. He bought for himself a big house in Palace Gardens; he had it luxuriously furnished; and he gave elaborate dinners to those young men—mostly younger sons, it is true—who were vastly discontented with existing institutions. He acquired a pretty taste of his own, too, in the way of luxury. A lady once asked him where he got a certain very beautiful service of dinner glass, as she was anxious to have some of the same; to which he replied that, wishing to have the service unique, he had had the moulds broken. The theory of Communism, one sees, has its limitations in practice.

This man took a great liking to Frank, partly because he had not the trick which many of the revolutionary aristocrats had of

† *Lady Silverdale's Sweetheart, and other Stories.* By William Black, Author of "A Daughter of Heth," "A Princess of Thule," &c. London: Sampson Low & Co. 1876.

staring silently at him through a single eyeglass, and swore that he would get Cheshunt into Parliament if money would do it. "We know quite well," says Mr. Black, "that money cannot. Sure enough, however, Frank Cheshunt got into Parliament." Mr. Thompson was kind enough to complete his benevolence by dying and leaving Frank a fortune; after which he lost his seat in Parliament, took to travelling, heard of Lady Silverdale's widowhood, and after two years had gone by drove up to her door in a hansom.

It is from this point that the movement of the story begins, and it is kept up with singular art to the end. Frank makes his proposal, and is accepted, and he dreams of a life in a foreign land by the side of some blue lake where the time of their former separation shall be as forgotten as a dream. "It is perhaps needless to point out that these vague aspirations were but the incipient signs of retrospective jealousy—one of the most perilous of the passions." Unfortunately the blue lake and the foreign home do not appeal to Lady Silverdale in the same way that they do to her lover. She does not see their approaching marriage in the romantic light which it has for his eyes; and she is anxious to avoid any appearance of haste. During the few months of waiting Cheshunt is bitterly oppressed by Lady Silverdale's friends and relations, who force upon his attention the time that he has determined to ignore. But he consoles himself by looking forward to the day when he shall have separated his wife from old associations, and made her so happy that she will be well content to be where he is, and desire nothing more. But when they have married Frank discovers that his wife does not take the same view of what their married life should be that he does. At Dover she insists on waiting a few days to cross, on the chance of getting better weather. Presently he finds that by waiting she has managed to get a packet of letters from her country house, and he immediately goes out to smoke a cigar. "I hope," said he, when he returned, "that you don't mean to have letters dogging your footsteps all over the Continent?" "My dear Frank," said she, looking up in perfect innocence, "we are not going into banishment, are we?" The end which must follow such a beginning is tolerably plain. As the two go on, Cheshunt becomes more and more irritated at his wife's constant references to the children she has left behind, until at St. Martin he breaks out in wrath:—

> Every one who drives from Geneva to Chamounix ought to stop at the small village of St. Martin, where, while lunch is being got ready, he may walk down to the bridge over the river, from which the first impressive view of Mont Blanc is to be obtained. Frank Cheshunt and his bride did so; and as they leaned on the stone parapet, over the chalky-green and rushing waters, they found before them the great white shoulders of Mont Blanc standing far, and high, and clear in a cloudless sky. It was a spectacle that called for silence.
>
> "It is very pretty," said Lady Silverdale. "Really, the white and the blue are exactly like—"
>
> "Like one of Maudey's drawings?" said he, fiercely. "Is it literally impossible for you to look at any given object, or to pass a single moment in the society of any being, without continually harping on Maudey and Ernestine, and Ernestine and Maudey?"
>
> She did not answer him. She turned her head away, and tears began to run down her cheeks. He knew he had been a brute.
>
> "Come, Mary," said he, and he took hold of her arm, "you must forgive me. I am very sorry. I did not mean to hurt you."
>
> For the rest of that day she maintained a strict silence as regarded Maudey and Ernestine—an enforced silence that was perhaps more irritating than free speech. It raised a certain barrier between them.

Lady Silverdale on her side has a certain denseness of apprehension in the matter of jokes, and is apt to construe good-humoured raillery into intentional insult; and her feelings are liable to be constantly hurt by the expression of her husband's political views. This state of things is common enough and unpleasant enough; the author's merit is in having managed to tell such a story without leaving a jarring impression on the reader's mind. The end is reached at Ouchy, where again Frank for a moment expresses his anger at Lady Silverdale's anxiety for letters from England. A little after this they agree to get back to Paris as soon as possible, and Frank says he must run over to London for a day or two to write an article. From this day his dream of romantic happiness with Lady Silverdale disappears, and they both live comfortably ever afterwards:—

> So far the story is its plain truth: this may be added, perhaps, as a guess—that if Frank Cheshunt should now and again—by some such accident as happens to many—see a beautiful, tender face in his dreams—a face familiar, yet strangely unfamiliar, to him—the face of a woman whom he has loved; and if his heart should grow sick with the pain of seeing her turn away from him; and if he should follow with a pitiful agony the receding form wringing its hands with grief, and withdrawing from him at last the beautiful, bedimmed, never-to-be-forgotten eyes, you may be sure that the face and the figure he beholds with mingled yearning and anguish in these phantom halls of sleep are those not of Lady Silverdale, his wife, but of Mary Cheshunt, his cousin, and his early love.

AMERICAN LITERATURE.

THE life of Alexander Hamilton is perhaps, to thoughtful readers, the most interesting of American political careers; and the biography executed by Mr. Morse* is the best extant biography of Hamilton—a former very elaborate Life, written by a member of his own family, being too long and too minute in detail for the patience and leisure even of the most diligent students of modern history. Mr. Morse has condensed into two volumes of moderate size, and in large type, all the most interesting facts and incidents of Hamilton's political career; and as the great Federalist statesman entered upon public life before he was eighteen, and, with a few short intervals, during which he took a lively and active interest in public affairs, was among the most prominent of American politicians down to the moment of his premature death, his political career is in truth nearly the whole of his life. Perhaps we might have been told a little more concerning the personal character and domestic history of so distinguished and so estimable a man. Room might have been found for a few more of his letters, and we might have been informed a little more clearly respecting details which would have thrown some light not only on his individual character and habits, but on the general tone and style of life prevalent among the first Republican statesmen of America; of whom, in his private circumstances, manners, and mode of living, Hamilton was probably a better average example than Virginian planters like Jefferson and Washington, or stiff, hard, formal Puritans like the two Adamses. Nevertheless, Hamilton was so early, so completely, and so passionately a politician and a public character, that even a biography more purely political than this might have afforded a fuller insight into his nature than memoirs usually do, however fully and however deeply they may enter into domestic history. There is perhaps among the great actors in the Revolution and founders of the American Republic no character so thoroughly estimable, so entirely free from stain or suspicion, so distinguished by public virtue and personal amiability, as that of Alexander Hamilton. It is impossible, of course, for Englishmen to approve the conduct of an English subject who, within a year after his first landing in America, threw himself heart and soul into a wanton and needless rebellion, and, without the excuse of birth or close personal interest in the revolted colonies, took up arms against his sovereign and his country. But it is easy to understand how a youth of eighteen, at a time when the philosophy of French Liberalism was at the height of its influence, might be carried away by popular sympathies and by enthusiasm for a cause that professed to be that of liberty; and it should be recorded, as highly to the credit of so young a partisan, that Hamilton, who at once became a leader among the rebels, distinguished himself by his moderation and his sense of justice, and offered a strenuous resistance to those senseless and brutal outrages on the large minority that adhered to their allegiance, the perpetration of which disgraced the revolutionary cause. As a soldier, Hamilton was distinguished both by skill and daring; and, though he was the aide-de-camp of Washington, his conduct in the case of André was such as to exempt him entirely from the indelible stain of innocent blood which rests on the character of his chief; while he indignantly repudiated the infamous attempt to purchase the surrender of Arnold by the release of André, which Washington undoubtedly made, though his admirers, not daring to defend, now endeavour to deny it. In like manner, in his subsequent political career, Hamilton showed himself a profounder statesman and a purer moralist than any of his associates and rivals. He exerted himself to the uttermost against that wholesale repudiation of public obligations which disgraced the Confederation; he was the one American statesman who seems clearly to have foreseen the dangerous weaknesses of the Federal system, which but for him would have been even weaker than it actually was; and his memory is free from the stains which a crooked policy and a disloyal intercourse with the French Minister, Genet, have left upon that of Jefferson, as well as from the factiousness of Adams and the even graver errors of Randolph. At thirty-two he was a poor man, with a family to support, and with splendid prospects at the Bar; but he sacrificed fortune, and, as the event proved, life, to his public duty; he accepted at Washington's request the most difficult and critical post in the first Government formed under the Union—the charge of finances embarrassed by bad faith and previous insolvency—and retrieved them in spite of a desperate and persistent opposition which at one time took the shape of a formidable rebellion. It was owing to his exertions that the efforts of Genet, favoured if not actually seconded by Jefferson, then Secretary of State, to involve the Union in the French war with England, were baffled; yet no man more earnestly and decidedly upheld what he believed to be the rights of America against the high-handed maritime belligerency of Great Britain. His early death, at the age of forty-seven, was due to his vigorous and resolute advocacy of political purity. Aaron Burr was the first of those political adventurers without character, principle, or position, who are the peculiar pest and scandal of America; and Hamilton used all his influence, and even at times separated himself from his party, in order to resist the elevation of such a man to various posts of public dignity. Jefferson was his personal enemy and political opponent; yet Hamilton individually turned the contest between Jefferson and Burr for the Presidency in favour of the former. At last Burr picked a wanton quarrel with Hamilton, forced him into a duel, and killed him under circumstances which excited the bitterest public indignation, and for ever ruined the political prospects of the murderer. Hamilton died extremely poor, not like Pitt, through carelessness—for he was frugal as well as honest—but because, having no private fortune, he had deliberately devoted himself to the unremunerative service of his country. The South may have produced two or three men who could be compared with him; the North, since his time, not one.

A new and very convenient edition of [illegible]

* *The Life of Alexander Hamilton.* By John T. Morse, Jun. 2 vols. Boston: Little, Brown, & Co. London: Sampson Low & Co.

the United States *, of moderate cost, but quite good enough for private libraries, bears the title of "Centenary." It has undergone the author's last and most careful revision, to which, according to the preface, "a solid year of close and undivided application has been devoted;" and the writer claims to have considered carefully every noteworthy criticism that has been sent to him, to have examined every statement plausibly challenged, and corrected whatever, after such investigation, appeared to him erroneous. Six volumes of a small octavo size, but thick and closely printed, complete the History; the first two which are now before us, containing some twelve hundred pages, bring down the record of American discovery and colonization, of the Indian and French wars, only to 1748. We need hardly say that this History is the standard work on its subject; and no man's education can be considered complete who has not mastered it—the story of the great Republican experiment beyond the Atlantic, incomplete as it is, being almost as interesting and important a part of the records of the human race as the story of the ancient Republican experiment tried for a somewhat longer period in Athens. To use the stereotyped phrase, the book is one "which no library should be without."

The Autobiography of a Crystal † is one of those extraordinary books which are more often written than read. It is not difficult to understand that a fanatic with strong religious prejudices, with an exceedingly imperfect apprehension of his topic, and, if possible, a still more imperfect knowledge of his own powers, should undertake to set forth in a single volume the history and philosophy of creation. Nor need we be altogether astonished if such a writer, finding his views of the subject inconveniently vague and somewhat too misty to be safely developed with that approach to scientific accuracy which prose may seem to demand, and having ideas of poetry as dim and uncritical as the rest of his notions, should resort for concealment and protection to the indefiniteness of verse, as such men understand verse. We might also assume, as a matter of certainty, that he would choose the blank heroic metre, as that which combines the license of so-called poetry with the facility of prose; and that the lines so produced would differ from prose only in that they might possibly admit of scanning. Such is, in short, the book which Mr. Dunn has produced. But though the fanaticism of an ignorant theorist or the vanity of authorship may conceive such a work, and even bring it forth in print, we can hardly think that there exist in the reading world a score of persons in whom ignorance, curiosity, patience, and leisure are so happily combined that they should wish and be able to read the volume through.

There are few departments in which American literature is so prolific as in that of biography, and especially sectarian and clerical biography. Almost any leading minister, head of a theological seminary, or prominent preacher, seems to be thought entitled to have his memory preserved, at least in the libraries of schools and colleges belonging to his sect and on the shelves of the booksellers. We cannot say that the quality of these biographies at all corresponds with their quantity, and we should fancy that few of them are read except by the immediate friends and disciples of the deceased. They probably owe such circulation as they have to the same feeling which obliges rich or well-to-do men to give their one, two, or twenty dollars to every object recommended by their Church, however uninteresting it may be to themselves. The *Memoirs of Dr. Eliphalet Nott* ‡ are a specimen of this class of literature. They have at least the merit of comparative brevity, as they do not extend over four hundred pages, and those not very closely printed. On the other hand, they possess singularly little intrinsic interest, and the chief reason why Dr. Nott's life has been written appears to lie in the fact that he lived to the age of ninety-three and was for sixty-two years chief of a great Presbyterian seminary.

A History of Philosophy § which undertakes in the course of 390 pages to deal with all the teachings of all the philosophical schools of Europe, from Thales, Pythagoras, and "the Sophists," down to Mill, Spencer, and Bain, must necessarily be superficial, and is scarcely likely to be accurate. Of course under such conditions Dr. Haven's book can only be serviceable to schoolboys or college students harassed by the demands of a course of instruction as wide in its scope, and therefore as shallow, as this terse account of the thought of twenty-five centuries. It may possibly help such readers to pass an examination conducted by men of the same calibre as the author, and may encourage in them that "belief of knowledge without the reality," that empty affectation of thought beginning and ending in mere words, which was the special abhorrence of the first great Hellenic educator, and seems to be the paramount end and aim of modern instructors; but we cannot recommend it to any one who would rather remain honestly and confessedly ignorant than acquire an incoherent and incorrect smattering of knowledge.

Dr. Brinton's treatise on the Religious Sentiment * is more theological and more metaphysical than its title led us to expect, and is tolerably free from any sectarian bias or special ecclesiastical character. It contains some original suggestions, and a good many gleanings from various sources, which give it a certain interest; though it can hardly be said to throw any new light on the long debated and little understood questions affecting the origin and nature of the feeling which is supposed by writers of a certain school to account for and underlie all the religions of the earth.

A collection of Essays by Mr. John Fiske† which takes its title from the first of the series, contains a variety of reviews of different books, controversial, historical, and other, most of them among the principal works of the last few years. Mr. Fiske handles his subjects with vigour, care, and reasonable independence of thought; and two or three of his essays will certainly repay the trouble of perusal.

A Summer in Europe ‡ is the title of a small volume of lively sketches by an American lady who has devoted "a week" to Holland, "a day" to Ascot, and proportionate time to the rest of Europe, all within the period of a few months; good for railway reading, and so brief that their levity does not become tedious.

Mr. Packard's "Life Histories" § are interesting and valuable, if somewhat technical, accounts of the construction, physiology, and habits of various creatures, principally of the lowest orders of existence; man and the mammals occupying a very few pages at the end of the volume, and more than five-sixths of it being devoted to the Invertebrata.

Mr. Burges's *American Kennel and Sporting Field* ‖ is a somewhat elaborate work on the breeding and training of sporting dogs, in the course of which a very large space is devoted to the pedigrees of particular animals.

Mr. Ewbank's treatise on Hydraulics ¶ is correctly entitled "descriptive and historical." It contains an enormous quantity of curious and interesting information regarding ancient methods of obtaining water for agricultural and other purposes, canals, aqueducts, irrigation, and so forth, as well as regarding mediæval and modern inventions, and a great variety of irrelevant and somewhat incoherent, but not the less interesting, matter. This occupies six hundred pages of the largest octavo size in very close type, sufficiently, but not profusely, illustrated. As it is not a scientific treatise, nor yet available for practical purposes, it will probably find but few readers, and is likely to be largely plundered; containing as it does matter enough to make the fortune of a plagiarist, who will feel himself protected from conviction by the ponderous weight and uninviting appearance of this rich but ill-arranged treasury.

Mr. Lundy's *Monumental Christianity* ** may not improbably share the same fate. The author is wrong-headed, and his leading ideas are so far antiquated as to repel all but the most persevering students; but he has collected a great mass of matter from the early monuments of the Church and from the religious sculptures and inscriptions of the East, illustrative sometimes only of the author's particular crotchets concerning the relation of false creeds to the true, but occasionally throwing valuable light upon the antiquity of particular doctrines or ideas, and even documents; as when several Christian sculptures of the second century are produced to show that the parable of the Vine (and therefore the fourth Gospel, in which alone that parable is found) had already taken a strong and general hold on the mind of the Church. If the author had known how to use his materials, his book might have brought him as much fame and profit as it has evidently cost him care and labour.

A large and heavy volume on the Iron Ores of Missouri and Michigan †† has been compiled by official geologists from the Re-

ports of the State Surveys. Both States, Missouri especially, are rich in available deposits of the metal; and these are near enough to great coal-fields to ensure the creation of a new Glamorgan or Staffordshire beyond the Mississippi whenever the growth of population and the removal of an absurd tariff shall have rendered possible the development of those mineral resources in which the United States are as rich as they are in fertile land and in a climate suited to the production of nearly every one of the most valuable fruits of the earth.

We have several fictions on our list, of which the most attractive is the little volume of stories of the Far West by Joaquin Miller, entitled the *First Families of the Sierras*.* Mrs. Moore has brought herself as well as her characters "On Dangerous Ground"† in the treatment of some of the most delicate and difficult of social and ethical problems, with only a woman's appreciation of legal and practical necessities, and with all a woman's vehemence of impulse and sentiment. *Davault's Mills* ‡ is a novel of ordinary American life, with that amount of sensational element which a novelist is always entitled to introduce; and *Romances and Realities* § form a readable volume, in which the romances are perhaps a little more real, as well as more agreeable, than the realities. Mr. Spencer's *Rue, Thyme, and Myrtle* ‖ is a collection of juvenile pieces which it is creditable to the author's ability and taste to have written before he was eighteen, but by no means so creditable to his good sense and judgment to have published; they are rather better, however, than our next volume, *Hawthorn Blossoms* ¶, the production apparently of a maturity as ripe as the mind of the author is ever likely to attain. It would not be fair to expect much from "Centennial" Poems **; the "other" pieces in this volume suggest that Miss Kate Harrington may write better when the Centenary is over and has for a time sickened the Americans of anniversary demonstrations, which are always provocative of exceeding bad verse.

* *First Families of the Sierras.* By Joaquin Miller, Author of "Songs of the Sierras," &c. Chicago: Jansen, McClurg, & Co. London: Sampson Low & Co. 1876.

GAINSBOROUGH.—The beautiful GEORGINA, DUCHESS of DEVONSHIRE.—This renowned PICTURE is now ON VIEW, at the Gallery, 39 Bond Street, Piccadilly, from Ten to Six o'clock. Admission 1s.

MR. GEORGE LANDSEER'S DRAWINGS and SKETCHES of INDIA Will shortly be EXHIBITED at 168 NEW BOND STREET.

ARTISTS' BENEVOLENT FUND. Incorporated by Royal Charter, for the Relief of the Widows and Orphans of British Artists.
Patron—HER MAJESTY THE QUEEN.
The SIXTY-SEVENTH ANNIVERSARY DINNER of the Corporation will be held at the Freemasons' Tavern, Great Queen Street, on Saturday, June 17, 1876.
Sir WILLIAM FRASER, Bart, M.A., M.P., in the Chair.
Since the foundation of the Society, the sum of £37,077 10s. has been distributed in relieving widows and orphans of British Artists, and during the past year fifty-three widows and sixteen orphans have received annuities amounting to £1,125. The institution is entirely supported by the voluntary donations and subscriptions of artists and patrons of the fine arts.
Gentlemen's Tickets, 21s.; Ladies, 12s. 6d., may be obtained of the Stewards; at the Bar of the Freemasons' Tavern; and of the Secretary, L. YOUNG, Esq., 4 Trafalgar Square, W.C.

UNIVERSITY of LONDON.—Notice is hereby given, that the next HALF-YEARLY EXAMINATION for MATRICULATION in this University will commence on Monday, June 26, 1876. In addition to the Metropolitan Examination, Provincial Examinations will be held at St. Cuthbert's College, Ushaw; Stonyhurst College; St. Stanislaus College, Tullamore; Owens College, Manchester; Queen's College, Liverpool; and Queen's College, Birmingham.
Every Candidate is required to transmit his Certificate of Age to the REGISTRAR (University of London, Burlington Gardens, London, W.) at least Fourteen days before the commencement of the Examination.
May 22, 1876. WILLIAM B. CARPENTER, M.D., *Registrar.*

WELLINGTON COLLEGE.—JUNIOR SCHOLARSHIPS. There will be an ELECTION to SIX in June next. They are open to all BOYS who on June 1 are between Twelve and Fourteen years of age. The Examination begins on Tuesday, June 20.—For further particulars apply to the Rev. the BURSAR, Wellington College, Wokingham.

CLIFTON COLLEGE SCHOLARSHIPS.—EIGHT or more will be open to COMPETITION at Midsummer, 1876, value from £35 to £50 a year, which may be increased from a special fund to £90 a year in cases of Scholars who require it.—Further particulars may be obtained of the SECRETARY, the College, Clifton, Bristol.

HIGHGATE SCHOOL.—There will be an EXAMINATION for FOUR ENTRANCE SCHOLARSHIPS of £75, £50, £40, £40, June 28.—Application to be made to the Rev. the HEAD-MASTER, School House, Highgate, N.

MALVERN COLLEGE. The Third Term will begin on Monday, September 18.

THE GRAMMAR SCHOOL, Cambridge.—The School House is now ready for Boarders. At the last revision (Christmas, 1875) there were 36 Boys from this School at the University, of whom 21 had obtained Scholarships, Exhibitions, &c., at their respective Colleges. An Open Scholarship at Christ's and a Sizarship at Trinity have just been obtained.
For Terms, &c., apply to the Head-Master, J. B. ALLEN, M.A.

HURSLEY, WINCHESTER.—A. M. HEATHCOTE, B.A., Oriel Coll., Oxford, prepares BOYS, between the ages of Seven and Twelve, for the Public Schools. Terms, 100 and 120 Guineas. Holidays as at Winchester College.—Address, Horse Close, Hursley, Winchester.

THE RECTOR of LAVENDON, experienced in Tuition, is prepared to receive Two or Three PUPILS, under the age of Fifteen years, into his House to prepare for the Public Schools, &c.—Address, THE RECTOR, Lavendon, Newport Pagnell, Bucks.

THE Rev. T. L. MONTEFIORE, M.A., Rector of Catherstone, Dorset, and Rural Dean, would be glad to receive TWO PUPILS to Read with his Sons. Terms £150. Healthy situation. Good Sea-bathing.—Address, Charmouth, Dorset.

PRIVATE LIBRARIES, and those of Colleges and Literary and Scientific Institutions, CATALOGUED and ARRANGED by W. T. AYLOTT, Librarian. References will be given to parties by whom he has been engaged.—Address, 27 Cheapside, E.C.

MEMORIAL to LADY AUGUSTA STANLEY.

WESTMINSTER TRAINING SCHOOL and HOME for NURSES.

Chairman—His Grace the Duke of WESTMINSTER.

Vice-Chairman—Sir RUTHERFORD ALCOCK, K.C.B.

At a Meeting held on May 3, in the Jerusalem Chamber, Westminster Abbey, to consider the best means of establishing a Memorial to the late Lady Augusta Stanley, Lord Hatherley took the Chair, and it was

Resolved: "That it is the desire of this meeting that an enduring Memorial should be founded to perpetuate the honoured name of Lady Augusta Stanley; and it is their opinion that such an object may be best accomplished by associating that name with a work of beneficence originated by her, and in which, to the close of her life, she evinced an active and sympathizing interest. They therefore suggest that means be immediately taken, in connexion with the Committee of the Westminster Training School and Home for Nurses, to obtain the Funds required to place that Institution on a solid and permanent foundation in association with her name, and in such form as may be hereafter determined on by that Committee."

It was mentioned at the meeting that the sum of £15,000 would probably be required to purchase a site, and to erect and furnish the Home, which would then be a self-supporting institution.

The Committee gratefully acknowledge having already received the following subscriptions:—

	£	s.	d.
The Duke of Westminster	500	0	0
Lord Hatherley	500	0	0
Lord Overstone	100	0	0
The Rt. Hon. W. H. Smith, M.P.	100	0	0
The Rt. Hon. W. Cowper-Temple, M.P.	100	0	0
The Duke of Westminster	200	0	0
Countess, Marchioness of Lothian	50	0	0
The Rt. Hon. Russell Gurney, M.P.	50	0	0
Mrs. Russell Gurney	50	0	0
The Rev. Lord J. Thynne	50	0	0
J. M. Bate, Esq.	50	0	0
The Hon. Mrs. Lloyd Lindsay	25	0	0
A Friend of Lady Augusta and the Cause	25	0	0
M. M.	200	0	0
M. M. when the Home is completed	100	0	0
Lord Pembyn	50	0	0
The Rev. Dr. and Mrs. Scott	10	0	0
F. M.	100	0	0
Lady Smith	10	10	0
Lord Elgin, Lady Louisa Bruce, and Hon. F. Bruce	20	0	0
Charles Stuart Parker, Esq.	25	0	0
R. C. Browne Clayton, Esq.	25	0	0
The Dean of Lincoln	10	10	0
The Ven. Archdeacon Jennings	10	10	0
The Rev. C. Alfred Jones	10	10	0
Mrs. Cowper	10	0	0
The Hon. Mrs. Bathurst	10	0	0
Total	2,192	0	0

Further Donations will be thankfully received and acknowledged by the Vice-Chairman, Sir RUTHERFORD ALCOCK, K.C.B., 11 Great Queen Street, W.C.; Chancellor the Hon. Tp. Lyttelton, G. HELMORE, Esq., Shorthands, Bromley, Kent; the Hon. Secretary Miss A. DICEY, 107 Victoria Street, S.W.; the Lady Superintendent Miss MURRAY WEBSTER, 8 Broad Sanctuary, Westminster; Messrs. RANSOM, BOUVERIE, & Co., 1 Pall Mall East.

A GENERAL MEETING of the SOCIETY for the PROTECTION of ANIMALS liable to VIVISECTION will be held at the Westminster Palace Hotel, on Thursday, June 1st, at 3 o'clock precisely. The Earl of SHAFTESBURY, K.G., in the Chair. His Eminence Cardinal Manning, Lord Coleridge, Q.C., Right Hon. and Hon. W. Cowper-Temple, Right Hon. Lord de Tabley, Sir Rutherford Alcock, K.C.S.I., A. J. Mundella, Esq., M.P., and Rev. Dr. Abbott, will take part in the proceedings.

The Committee of the Society gratefully accepts the Bill now before Parliament to "Prevent Cruel Experiments on Animals," and especially directs attention to Clause 5, prohibiting all physiological experiments on Dogs and Cats. This exemption was recommended by Mr. Hutton in the Report of the Royal Commission, and the Society deems it to be eminently just and reasonable. In the first place, the creatures in question are exceptionally sensitive; inasmuch that the same experiment inflicted on a dog and on a rabbit may be estimated to involve twice or three times as much pain in the former case as in the latter. And, in the second place, the familiar relation on which these "Household Friends" base their claim to the humane tolerance of the human fellow-creature renders it peculiarly heinous that they should be the victims of cruelty. Against the abuses of exclusion clause it may be remarked that it will affect the only subjects—whether respecting breeds or action on which much reliance can be placed—whose properties may be safely left to be evaded, with impunity, or the use of an esthetics, however judged, is generally taken from the owner for more or less futility; but that by this means it places the experiment beyond the reach of successful prosecution.

The only Amendment which the Committee approve is to the Proviso, that Animals should be used at present under the Act, and Mules. These creatures are likewise extremely sensitive, and extended to Horses, now would ignore, when not for disabled, the ordinary motive for the infliction of experiments. Such a conclusion to their lives would be a cruel service to man most painful, unjust and inhumane.

GEORGE HOGGAN, M.B., } *Honorary Secretaries.*
FRANCES POWER COBBE. }

Offices, 1 Victoria Street Westminster, S.W.

INDIA CIVIL SERVICE.—The following are the SUCCESSFUL CANDIDATES at the recent Open Competition for the Civil Service of India.

No. in order of merit.	Name.	Total of Marks.
*1	Lawrence, Edward	1,918
2	Baker, Edward Norman	1,854
*3	Collin, Edward Woodfall, M.A.	1,770
*4	Shakespear, Alexander M. W.	1,711
*5	Macpherson, Duncan James	1,690
6	Collins, Arthur Herbert	1,662
*7	Monro, Charles Herbert	1,608
*8	Crawford, James Adair	1,591
*9	Bradley, Herbert	1,[illegible]
*10	Cappel, Edward Louis	1,555
*11	Johnstone, James William D.	1,541
12	Atkinson, John Nathaniel	1,527
13	King, Lucey White	1,475
14	Gray, Percy	1,430
15	Irwin, George Robert	1,422
*16	Williams, George Mawdsley	1,415
*17	Impey, W. H. Lockington	1,407
18	Sankey, Henry	1,392
19	Casperz, Charles Peter	1,390
20	Bate, C. Landseer, Modeller	1,351
*21	Nethercole, William	1,308
22	Drew, William Wilkinson	1,307
23	Hull, William Thomas	1,274
*24	Gray, Evelyn	1,272
	Sim, Henry Alexander	1,272
*25	Meredith, Arthur	1,269
*27	Porteous, Alexander	1,260
*28	Dingwall, Arthur	1,257
29	Maurice, H. Hajohn Tyrrel	1,254
30	Seaton, James Clark	1,242

* Pupils of Mr. WREN, M.A. (Christ's College, Cambridge), 4, Powis Square, Westbourne Park, who Prepares Resident and non-Resident Pupils for India Civil Service.

THE Rev. H. J. GRAHAM, M.A. Oxon., receives TWELVE PUPILS to prepare for the Public Schools, at Ashmansworth Vicarage, Faringdon, Berks.

PRIVATE TUITION.—The Rev. F. W. YOUNG, M.A. Oxon, Scholar of his College, Three of whose Pupils (Eleven, Thirteen, and Fifteen years) have recently gained open Public School scholarships, receives a few High Class PUPILS. He is assisted by an Eighth Wrangler, an Oxford Honour Man, and other able Masters; offers every facility for the Modern Languages, and unusual advantages to backward Boys. References to Parents of position. Inclusive terms 100 Guineas.—Cheriborg House, Malvern.

WOOLWICH ACADEMY.—A BENEFICED CLERGYMAN, Wrangler and successful Tutor, wants a COMPANION PUPIL for his son (well advanced), whom he is preparing for the admission Examination, Christmas 1877. Special advantages in Mathematics and Modern Languages. Terms less an object than a boy willing to work.—Address, N. H., Post-Office, Tamworth.

READING PARTY.—The MATHEMATICAL and SCIENCE MASTER at a Public School, a High Wrangler, going to spend a couple of Months this summer in Germany (Recidelberg and the South), would be glad to meet with One or Two GENTLEMEN who might Read with him Mathematics and Physics, or prepare for Matriculation at the Universities.—Apply to DELTA, at David Nutt's, 270 Strand.

UNIVERSITY COLLEGE, LONDON.—The COUNCIL desire to appoint a SECRETARY. He must be a Bachelor of a University Graduate. Candidates will be required to state their age. The initial Salary will be £600 per annum. Further information may be obtained at the Office of the College. Applications and Testimonials will be received not later than June 10.

HARRY BROWN, *Assistant-Secretary to the Council.*

A LADY (thirty-six), daughter of a University Professor, wishes to engage herself as COMPANION to a Lady or Elderly Lady and Gentleman. She is clever, very well educated, and speaks and reads several languages. Is a good reader and musician. Would not object to travel or to chaperone young Ladies. Is sometimes to good society and would be a pleasant companion in a country house. Highest references.—Address, M. A., care of Mrs. Hannover, Upper Terrace House, Hampstead Heath, London, N.W.

HEAD-MASTER for the GROCERS' COMPANY'S MIDDLE CLASS SCHOOL, Hackney Downs.

NOTICE is hereby given that the Court of the Grocers' Company will, on or about the 10th day of June, 1876, proceed to the appointment of a HEAD-MASTER of their School at Hackney Downs, estimated to accommodate from 500 to 600 Boys, and expected to be ready for opening at Michaelmas next. Fixed Stipend £600 per annum. Capitation Fee of £1 per Boy up to 450, and 10s. per Boy beyond that number. A minimum salary of £800 per annum guaranteed for first Three years commencing from Michaelmas next.

The Head-Master will be appointed subject to the provisions of a Scheme of the Endowed Schools Commissioners. He need not be in Holy Orders, but must not accept or hold any benefice having the cure of souls or any office or employment which in the opinion of the Court may interfere with the proper performance of the duties of Head-Master.

Further particulars may be obtained upon application to the CLERK of the Grocers' Company, Grocers' Hall, Poultry, London, E.C.

THE LADIES' VICTORIA CLUB, 25 Regent Street, S.W.

Apply to the LADY MANAGER.

Terms, 2 Guineas per annum. L. S. 3 Guineas.

ON THE BANKS OF THE THAMES.

VALUABLE AND ALMOST UNEQUALLED BUILDING SITE OF ABOUT FIFTEEN ACRES, SITUATE AT HURLEY.

Within a moderate distance of Maidenhead Station, on the Great Western Railway. With Possession.

MESSRS. BROAD, PRITCHARD, & WILTSHIRE, will SELL BY AUCTION, at the Mart, Tokenhouse Yard, E.C., on Tuesday, May 30, 1876, at One o'clock precisely, in One Lot, the valuable FREEHOLD SITE, known for Centuries past as "LADY PLACE," HURLEY, situate immediately on the Bank of the Thames, and having an unInterrupted frontage thereto. The Land comprises about Fifteen Acres, and is enclosed within a massive wall. It is the site of the Old Monastery, and has many interesting historical associations connected with it. From its position it is eminently well situated for the erection of a first-class Residence. The surrounding Society is of a most desirable character, and Sporting is close at hand. The Views from the River are of a charming description, and it is doubtful whether such a site is to be found in this favourite neighbourhood.

Possession will be given on completion of the purchase.

The Land may be viewed, and Plans and Particulars and Conditions of Sale may be had at the Mart, of Messrs. PAWLE, PEARON, & COLDHAM, Solicitors, 11 New Inn, Strand, W.C., or of the Auctioneers, 7 Queen Street, Cheapside, E.C.

MIDLAND RAILWAY.—TOURIST ARRANGEMENTS, 1876.

First and Third Class Tourist Tickets, available for Two Months, will be issued from June 1 to October 31, 1876.

For Particulars, see Time Tables and Programmes, issued by the Company.

Derby, May 1876. JAMES ALLPORT, *General Manager.*

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central position. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel. P. O. RICKARDS, *Manager.*

ILFRACOMBE HOTEL.—Bracing air and beautiful scenery. Appointments Abstract; Wines choice, excellent Cuisine; 200 rooms. Table-d'hôte daily. The Hotel Omnibus meets the Steamers. Direction to MANAGER, Ilfracombe, North Devon.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. The late Dr. EDWARD LANE, M.A., M.D. Edin. For Invalids and the convalescent and Others. Turkish Bathroom in the premises. Private entrance to Richmond Park.

E. DENT & CO., 61 Strand, and 34 Royal Exchange, London, Manufacturers of CHRONOMETERS, WATCHES, CLOCKS, &c. (Catalogues free) to Her Majesty, H.R.H. the Prince of Wales, and Foreign Sovereigns. Makers of the Great Westminster Clock, and of the New Standard Clock of the Royal Observatory, Greenwich.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

DANIEL DESBOIS & SONS (late DESBOIS & WHEELER), WATCH and CLOCK MAKERS, have a good selection of Watches and Clocks of their own manufacture, and also of the best Foreign Work.—3 Gray's Inn Passage, leading from Red Lion Street, Holborn, to Bedford Row.

THE ASTRONOMER-ROYAL Reported to the Admiralty (August 13, 1870) on 40 Chronometers entered for annual competition, "M. F. DENT'S is the finest we have ever had on trial." M. F. DENT, Chronometer, Watch, and Clock Maker to the Queen, 33 COCKSPUR STREET, CHARING CROSS.

BATHS and TOILET WARE.—WILLIAM S. BURTON has ONE LARGE SHOWROOM devoted exclusively to the display of BATHS and TOILET WARE. The Stock of each is at once the largest, newest, and most varied ever submitted to the Public, and marked at prices proportionate with those that have tended to make this Establishment the most distinguished in this country.

Gas Furnaces Baths from £6 15s. to £25 10s.

Portable Showers, 8s. 6d.	Sponging, 21s. to 38s.
Pillar Showers, £3 10s. to £5 8s.	Hip, 15s. to 30s.
Nursery Baths, 15s. to 40s.	

A large assortment of Hot and Cold Plunge, Vapour and Camp Shower Baths.

Toilet Ware in great variety, from 4s. to 40s. the Set of Three.

WILLIAM S. BURTON, General Furnishing Ironmonger, by appointment, to H.R.H. the Prince of Wales, sends a CATALOGUE, post free, containing upwards of 850 Illustrations of his unrivalled Stock, with Lists of Prices and Plans of the 30 large Showrooms, 39 Oxford Street, W.; 1, 1a, 2, 3, and 4 Newman Street; 4, 5, and 6 Perry's Place; and 1 Newman Yard; Manufactories, 84 Newman Street, and Newman Mews, London, W. The Cost of delivering Goods to any part of the United Kingdom by Railway is trifling. WILLIAM S. BURTON will always undertake delivery at a small fixed rate.

FURNISH YOUR HOUSE or APARTMENTS THROUGHOUT on MOEDER'S HIRE SYSTEM. The original, best, and most liberal. Cash Prices; no Extra Charge for time given. Large, useful Stock to select from. Illustrated Priced Catalogue, with Terms, post free.—248, 249, and 250 Tottenham Court Road. Established 1862.

SERVICES in PORCELAIN and GLASS.—The special Patterns for this Season are now ready. Garniture de Cheminée, Articles de Luxe, in Porcelain and Faïence. Mr. MORTLOCK solicits a visit to his Galleries, 203 and 204 Oxford Street, and 31 Orchard Street, Portman Square, W.

HEAL & SON, 195, 196, 197, 198 Tottenham-Court Road. The only House in London exclusively for BEDSTEADS, BEDDING, and BEDROOM FURNITURE.

HEAL & SON.

BEDSTEADS,
BEDDING,
BEDROOM FURNITURE.

HEAL & SON'S CATALOGUE (104th Edition), Containing 450 Illustrations, with prices, sent free by post on application to 195, 196, 197, 198 TOTTENHAM-COURT ROAD, LONDON.

NOSOTTI'S ARTISTIC FURNITURE.

CHOICE CURTAIN MATERIALS.
DECORATIVE AND PLAIN PAINTING.
PARISIAN PAPER-HANGINGS.
LOOKING-GLASSES.

THE REVOLUTION AT CONSTANTINOPLE.

THE surprising revolution which has been accomplished at Constantinople appears to have resulted from a deliberate conspiracy or combination rather than from a spontaneous popular movement. The Ministers who were shortly before placed in power on the demand of the Softas had probably instigated the original movement for the purpose of obtaining official facilities for the attainment of their further objects. MIDHAT PASHA, whose appointment as Vizier was demanded by the Softas, was content in the first instance to take a seat in the Cabinet without the control of a special department. The new SHEIKH UL ISLAM was also privy to the plot, and probably his co-operation was indispensable for the satisfaction of the people. The Ministers seem to have required from the SULTAN a contribution from his private funds to the urgent wants of the Treasury. On his refusal, which had probably been anticipated, the SHEIKH UL ISLAM announced to him his deposition; and as the consent of the troops on the spot had already been secured, resistance would have been useless. The dethronement of an Ottoman SULTAN by an informal but unanimous vote was perhaps to his subjects a less revolutionary proceeding than it might have appeared in Western countries. There has always been a vague belief that the Commander of the Faithful was in some undetermined sense responsible to the people for the exercise of his temporal and spiritual functions. Like a delinquent ecclesiastic in former times, ABDUL AZIZ was forced to resign his pontificate before he was deprived of his sovereign power. It may be hoped that the authors of the change are so far within the influence of civilization as to spare and protect the unfortunate victim of his own vices and of the disasters of his country. The project of limiting the power of his successor is a bolder innovation than the dethronement itself. A fixed Civil List is to be substituted for uncontrolled disposal of the public funds, and it is proposed that a permanent Council of Notables shall share in the administration of public affairs. The demand that the Seraglio shall be suppressed perhaps refers rather to the private advisers of the SULTAN than to his domestic arrangements. Nothing is known of the character of MURAD V., who may be presumed to possess the ordinary qualities and defects of an Ottoman prince. The circumstances of his accession may perhaps serve as a warning against the follies which have proved fatal to his predecessor. ABDUL AZIZ was supposed to have a comparatively manly and vigorous character when he succeeded his brother fifteen years ago. He has since that time taken some interest in the organization of the army, and more especially in the material increase of the navy, but the combination of avarice with gross personal extravagance deprived him of all title to respect. Even his ironclad ships were constructed as expensive playthings, and the army has not lately proved its efficiency. He was not sufficiently a statesman to understand the necessity of conciliating the Christian population, and he actively promoted the financial ruin of the Empire. Since the death of AALI and of RESCHID the SULTAN has constantly changed his Ministers, and of late he has excited the bitter indignation of his subjects by habitual deference to the counsels of his natural enemy. The submission to Russian influence which chiefly provoked the indignation of his subjects was not without apology. As lately as in 1870 the SULTAN or his Ministers offered to resist the abrogation of the Treaty of Paris, on condition of receiving the assured support of England. But no excuse can be devised for the cupidity and prodigality which have tended largely to accelerate the ruin of Turkey. No deposed ruler will have excited less regret or compassion at home or abroad.

The tendency of the revolution will only be ascertained by experience; but it seems to indicate the existence of a public spirit for which the better classes of the Turks have not hitherto received credit. There is reason to believe that the promoters of the movement are not unfriendly to the Christians, though they are resolved to suppress the insurrection in the provinces. If it is true that the late SULTAN had accumulated large hoards of money, the immediate difficulties of the Government will be sensibly alleviated. A permanent Assembly of Notables seems to be an impossible institution. The authority of the SULTAN is in its nature absolute, although it may sometimes be administered in his name by vigorous Ministers, and Notables would be another name for Pashas contending with one another for power and place. Probably the leaders of the reforming party will contrive for the present to exercise the functions of government. As the French Foreign Minister has already suggested, the deposition of the SULTAN may perhaps facilitate judicious concessions; but, until the opinions and the temper of the Softas and of their instigators are better understood, no confident judgment can be formed of the consequences of the revolution. Religious enthusiasm and national self-respect are motives which may easily degenerate into fanaticism and political obstinacy. One great advantage will consist in the check which will probably, for a time, be offered to corruption. The success of the conspiracy explains and justifies the arming of the population which lately caused alarm to foreigners. It will be well if the victorious party is satisfied with its triumph, for it is always dangerous that a multitude should learn the secret of its strength. The garrison of the capital appears to have taken an active part in the deposition of the SULTAN, and the feeling of the army in the provinces will almost certainly be favourable to a change of rulers. The sudden rise in Turkish and Egyptian Stocks as soon as the news was known on Tuesday last curiously illustrates the sanguine and hasty character of speculators. The dangers of Turkey are not yet sensibly diminished.

The events at Constantinople have, as an incidental result, furnished a temporary solution of diplomatic embarrassments. The five Powers who had hastily pledged themselves to a Note devised in the exclusive interest of one of their number have determined to delay the communication which would have been made to the late SULTAN. Austria and France, and perhaps Italy, will not regret the occurrence of a plausible pretext for withdrawing from an untenable position. The secret of German policy has been carefully kept, but for the present it probably consists chiefly in the maintenance of an ostensible concert between Austria and Russia. The party now in power at Constantinople is believed to be unfriendly to Russia, but Prince GORTCHAKOFF may probably not be unwilling to wait until the intentions of MIDHAT and his colleagues are fully understood. Mr. DISRAELI'S admission that there is still great cause for anxiety is certainly not exaggerated. No change of persons can effectually remove the causes which threaten the Turkish Empire with ruin. A homogeneous nation may possibly be regenerated by indignation against previous abuses, but Turkish enthusiasm for reform would tend to the application of principles which are inapplicable to present circumstances. No statesman can obliterate the distinction between the hostile races, or rather between the two religious creeds. The unpopularity of the dethroned SULTAN was caused, not only his vices, but by his in-

ability or unwillingness to employ vigorous measures in the disturbed provinces. One of the Ministers who took an active part in the deposition has from the first been an advocate for immediate war with Servia and Montenegro. It may be found necessary to satisfy popular opinion by a display of energy which will probably furnish Russia with additional pretexts for interference. The rumour that General IGNATIEFF had been recalled has thus far not been confirmed. There is no doubt that one of the unfortunate SULTAN'S chief offences was his supposed deference to the counsels of the Russian Ambassador; but similar influences may perhaps be brought to bear on the present Government.

It would be too much to hope that MURAD V. should prove himself a vigorous and beneficent sovereign. His uncle and predecessor was a selfish voluptuary and spendthrift, but he was not a tyrant. The grandfather of the present SULTAN might have rivalled the fame of PETER THE GREAT if the task which he undertook had been possible. He crushed the mutinous satraps who from time to time had long affected a provincial independence; he destroyed in a pitiless massacre the dangerous organization of the Janissaries; and he introduced among his subjects, with doubtful results, European costumes and habits. His elder son and immediate successor was comparatively gentle in disposition, and he offered no active resistance to the promulgation of decrees of religious equality under the dictation of the European Powers. ABDUL AZIZ might perhaps have prosecuted schemes of improvement if there had been a more hopeful prospect of success. It seems impossible to interrupt the decay of the Empire; yet the ruin which impends cannot be precipitated except at the cost of a desperate struggle between the Mahometans and the rest of the population in European Turkey. MURAD V. probably took only a passive share in the recent changes. His advisers have assumed to themselves the responsibility of amending a condition of affairs which seems to foreigners hopeless. According to some accounts, they have already declared to the five Powers that they decline the two months' armistice, and that they deprecate the presentation of the Berlin Note because it is impossible for them to comply with its terms. If they listen to English counsels, they will not promote the designs of their enemies by obstinate resistance.

ENGLAND AND THE BERLIN CONFERENCE.

THE strange statement that insurances at LLOYD'S were made a few days ago to cover war risks in the Mediterranean has not changed the general opinion that the refusal of the English Government to accept the Berlin Resolutions was prudent as well as bold. The rumours of active preparation in arsenals and dockyards can scarcely be founded on serious apprehensions of war; but the powerful fleet which is now assembled in Turkish waters may produce a salutary impression that the English Government is in earnest. Before the Palace revolution at Constantinople Lord DERBY informed the three Governments which were represented at Berlin that England will not concur in a policy which can only have been adopted by Austria under urgent pressure. The allied Governments, intentionally or otherwise, offer the insurgents a reward for prolonging their resistance. It is absurd to found a complaint against Turkey on the inability of the Porte to introduce effectual reforms until the provinces are at least temporarily pacified. It may be assumed that the armistice which is recommended to the belligerents is not intended to operate for the benefit of Turkey. No guarantee is offered for the withdrawal of Servia and Montenegro from their hostile proceedings. There can be no doubt that both Principalities would obey an intimation from Russia that they will no longer be protected from retaliation. The English Government is not disposed to repeat the sacrifices which were made twenty years ago for the protection of Turkey against unprovoked aggression. Still less would the country approve of aid to the Porte against its revolted subjects; but it is too much to expect that the ancient policy of discountenancing the dismemberment of Turkey should be abandoned in deference to Powers which have formed among themselves a temporary and precarious union. The language addressed by Count ANDRASSY to the Austrian and Hungarian delegates plainly indicates the jealousy with which Austria regards the agitation promoted by Russia. Within a few days the Servian Government has adopted measures which seem almost to amount to a declaration of war. The armaments which were prepared with the aid of Russian officers have sometimes seemed to be directed as much against Austria as against Turkey. As long as none of the great Powers take part in the struggle, it will become the English Government to maintain a watchful neutrality.

The ready adhesion of France and Italy to the successive resolutions of Russia, Austria, and Germany, is easily explained; and it probably means little. Italy is a new, though not unwelcome, member of the singular League or Committee of Great Powers which has for sixty years assumed the right of regulating the affairs of Europe. The most obvious mode of securing an uncertain position, and of laying the foundation of future influence, is to defer with prudent courtesy to the prevailing opinion. As long as the three great military Empires are really or ostensibly united in their policy, the Italian Government could do nothing to counteract their designs. The choice which it may hereafter be necessary to make between a Russian and an Austrian alliance need not be prematurely anticipated. It is probable that popular feeling in favour of the Christian population of Turkey may also affect the policy of the Italian Government. The passionate antipathy of GARIBALDI to the infidel Turk is probably shared by the mass of his countrymen, as it is unconsciously inherited from the time when the Mahometan power was formidable to Christendom, and especially to the Catholic Church. The hasty acquiescence of France in the ANDRASSY Note, and afterwards in the Berlin Resolutions, probably expressed only a fixed determination to abstain for the present from all external action. No French Government will permanently relinquish its claim to independent influence in the course of events in the East. It is suspected that the French Cabinet has already regretted the precipitancy which rendered it impossible to concert a common policy with England. While all parties in France approve of an unenterprising and pacific policy, public opinion would deprecate any appearance of subserviency to German dictation. The paramount object of averting or postponing the outbreak of a European war is not judiciously pursued by the adoption of a vague project which must almost certainly lead to armed intervention in Turkey. If it is a principal aim of French policy to dissolve the union of the three EMPERORS, eager acceptance of their joint decrees seems at first sight anomalous and inconsistent. If it is true that the French Government has suggested the convocation of a Conference or Congress on the Turkish question, the proposal may cause some embarrassment. With every desire to encourage overtures tending to a common understanding, the English Government could scarcely consent to subject a definite policy to the decision of foreign Powers. A Congress sometimes furnishes a convenient method of registering a foregone determination, but it can scarcely be converted into a deliberative Council. An independent State can seldom pledge itself to acquiesce in the decrees of a majority; and in the present instance, though no Congress has been assembled, England deliberately stands alone. Thirteen or fourteen years ago Lord RUSSELL caused great offence to NAPOLEON III. by an argumentative Note in which he demonstrated the inutility of a Congress. It would have been better courteously to decline the EMPEROR'S proposal, without proving that it was unseasonable and absurd; but the reasons which were unnecessarily urged in defence of the refusal to join the Congress are applicable to nearly all experiments of the kind. Soon afterwards Lord RUSSELL himself strove in vain to terminate the Danish war by a Conference which was held in London. Prussia, then allied with Austria, had resolved to detach Holstein and Schleswig from the Danish monarchy, and there was little use in discussing other methods of settling the quarrel with Germany. At the last European Conference, which was held in Brussels, the English representative was not furnished with the powers of a plenipotentiary, and Lord DERBY positively refused to send a delegate to the adjourned Conference which was expected to meet at St. Petersburg. The first condition of international discussion is that all the members of a Conference should be at liberty to form any combination among themselves which may from time to time be thought expedient. On the Eastern question Russia, Austria, and Prussia have repeatedly announced their adoption of a common policy; and they have hitherto

only communicated to the other Powers resolutions which had been already formed in concert. It is possible that the French Government may remove by confidential communications the objections to a Congress which will certainly be raised on the part of England. Perhaps the proposal is mainly designed to remove the impression which had been produced by the hearty assent of France to the Resolutions of Berlin.

At the dinner of the City Liberal Club Lord GRANVILLE said that the course adopted by the Government will deserve approval or censure as it may be found hereafter to be a part of a definite policy or merely a negative measure. If the issue is accurately raised, the rejection of the Berlin Resolutions will scarcely be justified by the application of Lord GRANVILLE'S test. The English Government has assuredly not discovered any miraculous contrivance for the regeneration of Turkey. It has already assented to the project of reform which is contained in the ANDRASSY Note; and whatever party may be in power, England in the future, as in the past, will always urge the adoption of equal laws and of honest administration. The independent position which has now been assumed amounts to a reassertion of the established principles of English policy in the East. The Government will not be an accomplice, and will perhaps not be a passive spectator, while foreign intrigues render the re-establishment of peace impossible. It was not worth while to affect belief in the cordiality of an alliance which may perhaps not long survive the declaration of the intentions of England. The Russian journals already begin to denounce as a hypocritical absurdity the pretence of a harmonious understanding between Russia and Austria. It is well understood that the Austrian Government will not allow Herzegovina to become independent, although guarantees may perhaps be given to the insurgents if they are willing to lay down their arms. If England had acquiesced in the decision of Berlin, the pretence of union might probably have been maintained for some weeks longer. It might then have become necessary for the English Government to make a stand against a new infraction of the Treaty of 1856. The powerful fleet which is assembled in Besika Bay will not now be called upon to resist an attempt to violate the neutrality of the Dardanelles. A comprehensive scheme for reconciling the Government of the SULTAN with the doctrines of civilization would have been more ambitious, and, if it had been practicable, it would have been more beneficial. If the new SULTAN should unexpectedly show a disposition to favour an enlightened policy, he will receive every encouragement. In the meantime the English Government must be content with the more modest enterprise of discountenancing war and revolution.

THE MINISTRY AND THE OPPOSITION.

A NEW Liberal Club has been founded in the City with the certainty of providing an eligible place for luncheons, and the possibility of checking the supremacy of Conservative organization. Lord GRANVILLE and Lord HARTINGTON attended the ceremony of laying the first stone, and said all that two polite peers of moderate views could say to explain the existence of the party they lead and to encourage their supporters. One of the speakers on the occasion remarked that, in preparing for the erection of the new building, it had been found necessary to go down forty feet before a stone could be laid, and that he thought this an apt symbol of the Liberal party. He was not very wrong in his view of the matter. It seems a particularly apt symbol of the party to which he belongs. The Liberals have lately been not unlike people who carefully put a hoarding round their premises and then sink gradually underground. They are, no doubt, preparing to do great things in the future, but at present they may be said to be at least twenty feet off being able to begin to make any show. To keep quiet and organize is at once their safest, their easiest, and their only policy. For the Liberals in their present condition no better leaders could possibly be found than Lord GRANVILLE and Lord HARTINGTON. Lord GRANVILLE frankly owns that he finds it delightful to be out of office, and Lord HARTINGTON feels more and more secure without having even the semblance of a programme. It would not do for him, as he intimated, to be even present when Mr. TREVELYAN'S motion was discussed. It happened by a mere chance that the discussion took place on the eve of the Derby. But Lord HARTINGTON had the graver excuse to offer for his intended absence that scarcely anything would have disconcerted him more certainly than the motion being carried. So long as the county franchise is merely a theme of desultory conversation, there can be no harm in Liberals talking of it in an enthusiastic fashion. But nothing would spoil the electioneering tactics over which Lord HARTINGTON is now called to preside more than a Bill for extending the franchise and redistributing seats, adroitly framed by the Conservatives. It is from a mere party point of view much better to go on digging gently at the foundation, opening Clubs, and mildly reproaching the Ministry. Liberals, like the rest of Englishmen, are for the moment in a state of political comfort. If in home matters the Ministry does not, as the Liberals say, do any one much good, it is equally true that it does not do any one much harm; and, as to foreign affairs, Lord GRANVILLE has the perfect confidence in Lord DERBY which Lord DERBY would extend to him if the Liberals were in office. Lord GRANVILLE was not even quite sure whether it was proper for him to assist in a Liberal organization for election purposes; but he had discovered that the Duke of RICHMOND had done quite as much in this way as he was asked to do, and so he felt easy, and knew that he was doing right. What a Conservative Duke did must satisfy the highest standard about which he need trouble himself; and so he felt fully at liberty to secure decent luncheons for decent Liberals, to paint the sweets of repose, and to assent beforehand to the proposition that a leader in so peculiar a position as Lord HARTINGTON would do well not to show himself while the county franchise was being discussed.

Criticism, bland but not ineffective criticism, is, as these unaspiring but sensible leaders appropriately suggested, the true function of an Opposition which has no immediate hopes of office. And as critics the leaders of the Opposition have lately been by no means unsuccessful. It is not perhaps fair to say that they steadily, by their mere presence, imbue the Ministry with a Liberal spirit; for from the outset the Ministry has been a Liberal Ministry, and, as Lord HARTINGTON owned, it is willing to go in some directions of Liberalism further than the unfailing Conservative majority at heart approves. But at any rate the Liberal leaders are always at hand to remind the Ministry that they would lose ground at once if they leant towards reaction. On several occasions, too, the criticism of the Opposition has borne striking and evident fruit. Lord GRANVILLE and Lord HARTINGTON were far too prudent to revive the wearisome and painful subject of the Imperial title; but they could not forget, and the caters of future luncheons could not forget, that the criticism of the Opposition was in this instance exceedingly effective, and made the Ministry promise to be wise in spite of themselves. The most curious effect, perhaps, of the Royal Titles Act is that it has made for a moment Mr. LOWE, of all men in the world, a popular hero, and for the first, and probably for the last, time in his life he has seen his carriage attended by an admiring crowd. An opposition that ended in making people desirous of getting as nearly as possible under the wheels of Mr. LOWE'S carriage is an opposition which even the sternest Conservative must own to have been effective. In the same way the Liberal opposition succeeded in entirely altering Mr. DISRAELI'S views as to interference in Egypt. Lord HARTINGTON remarked, as he was fairly entitled to do, on the contrast between the grandeur of Mr. CAVE'S mission as it was originally conceived and the tame result in which it ended. No doubt there was such a contrast; but before the Ministry had taken any decisive step it learnt to be wise. To own this does not do the Ministry much harm. The Duke of RICHMOND might mention it at lunch to those whose repasts he organizes, and no one would think the worse of him. The Cabinet were nearly making a mistake, or rather they put themselves in a position in which it was reasonable to suppose they were contemplating something that would be a mistake. But they did not make it, and if it is creditable to the Opposition to have shown the Conservatives their danger, it is also creditable to the Conservatives to have avoided this danger when it was pointed out to them. This is one of the most disheartening features of the times to the organizers of Liberal luncheons. The Ministry are not above being taught. When they see that a thing is fair, they agree to it. When they see that they have made a mistake, they say so and move

in some other direction. Lord GRANVILLE, for example, was eloquent on the improvements which the energy of some young Liberal peers had imparted to the Oxford University Bill; but he forgot to add that Lord SALISBURY was as ready to have his Bill improved as any of his opponents could be to improve it. There never perhaps was a Ministry with so large a majority and at the same time with so little obstinacy.

Lord HARTINGTON commented on the paucity of measures with which the Government is trying to mark the Session. It is quite true that the Government has not many measures which it wishes to carry, that those which it does wish to carry are for the most part unimportant, and that these unimportant measures are being pushed along very slowly. It would, perhaps, be impossible for a Parliament to do less between Easter and Whitsuntide than has been done this Session. Most people would find it difficult to say whether the Government has any measures, and, if so, what has become of them. Some day possibly the Government may try its hand at a really difficult measure; and every now and then a vague idea seems to come over the minds of the more aspiring members of the Cabinet that they would like to distinguish themselves in this way. They dream of settling the problems of local taxation, and even of paring away the anomalies of banking. But for the present they are content with doing little, and doing that little safely. They are not pushed on by any one to do more, and if they attempt more it will be rather from a regard for their own fame and from public spirit than through any external influences. The minds of men are not in the temper to face large problems. This state of quietude is partly due to political tranquillity, and it is also partly due to the pecuniary anxieties which are now telling on so many homes. When distress touches the lower classes, there is often an effervescence of political agitation; but when, as now, the distress chiefly touches a higher class, politics attract a small share of attention; and it seems simpler to laugh over the declaration of an Irish member that, if Ireland had its own way, Irishmen would go not once only, but twice a year to the Derby, than to rack a weary mind with problems of bank issues or the incidence of rates. The country is not really at all discontented with the Ministry for giving it little to think of, and it certainly does not wish any other Ministry to be in office. But this does not prevent it being wise for the Liberals and advantageous for the nation that the Liberal leaders should use this time of lassitude for digging down as deeply as they can, and for nursing their party into readiness for office. That ability and eminence should be fairly distributed, and that there should be a succession of men of different parties ready and fit to serve the QUEEN, is a clear gain to everybody. It is with great satisfaction that impartial judges observe the continual advance of Lord HARTINGTON, not only in political knowledge and prudence, but in mastery of language and command of men. He has more than justified the choice of those who selected him as their leader. He began by being merely the son of a Duke, and he has gone on to be in a fair way to the front rank of those who secure the respect of Parliament and the country.

MR. TREVELYAN'S MOTION.

THE debate on Mr. TREVELYAN'S Resolutions was confined with unusual closeness to the real issue before the House. *Mr. TREVELYAN himself, Mr. FAWCETT, Sir C. DILKE, Mr. BURT, and Mr. BRIGHT exhausted among them* the reasons which convince a large section of politicians that the extension of household suffrage to the counties is just and expedient. Mr. DISRAELI may be considered to have spoken, not only for his party, but on behalf of Lord HARTINGTON, Mr. GOSCHEN, and the other leaders of the moderate Liberal party. His own personal opinion perhaps inclines to a large popular franchise; but he shrinks from the wide changes which must necessarily result from an equalization of the suffrage. Mr. LOWE alone took higher ground when he declared, in consistency with the convictions [redacted] has always entertained, that the test [redacted] tendency to produce the best [redacted] tained. Mr. TREVELYAN in [redacted] with [redacted] by a majority of his own party should discuss principles more seriously than if he were merely expressing a popular opinion. There are few members of either party who share on the question of the suffrage Mr. LOWE'S clearness of perception or his courage. Nearly all the rest of the speakers of the majority contented themselves with excuses for delay, which will be ultimately overruled. Mr. LOWE'S conclusions will perhaps be confirmed by experience when Mr. TREVELYAN'S proposals are in a more favourable season adopted. It is an obvious and easy criticism of Mr. LOWE'S warnings to say that they were uttered in a similar tone ten years ago, and that they were also probably urged at the time of the first Reform Bill. One legitimate argument against every extension of the suffrage has been that it tended to promote further changes in the same direction. Small householders in boroughs naturally desire to increase the power of their own class by giving labourers county votes. If a million of electors were now added to the constituencies, agitation for universal suffrage would become more formidable. It has hitherto been found possible to govern the country under the system of household borough suffrage, distributed in a highly artificial manner which might be thought capricious if it were not accidental; but the experience of two general elections scarcely warrants complacent and absolute security. There is a point at which democratic supremacy would change the whole character of English institutions, and, in Mr. LOWE'S words, would "destroy the "noblest fabric of liberty and justice that human hands "ever raised."

Mr. BRIGHT'S speech had the unusual fault of being an accumulation of commonplaces and of fallacies. For the twentieth time he enumerated with perfect satisfaction all the instances in which his opponents had been in the wrong; and he assumed that the labourers, if they enjoyed the franchise, would have supported his own sounder doctrines. In other words, a low franchise facilitates change, and weakens the Conservative party. The same argument may be used in favour of universal suffrage, which is, as Mr. BRIGHT said, established in the United States, in the great Colonies, and over the greater part of Europe. On the Continent the natural consequences of a wide franchise have been for the most part counteracted by the simple process of not allowing elected Assemblies to control public affairs. There is universal suffrage in Spain, where each successive Minister returns a Congress of his own partisans, and in the German Empire, where Prince BISMARCK exercises almost uncontrolled power. In France the experiment of a sovereign Assembly returned by the votes of the whole population has been for the first time tried since the close of the German war. The establishment of the Empire had been accompanied by the restoration of universal suffrage, which had been previously limited by the Legislative Assembly. The Legislature which was elected in 1871 for the purpose of concluding peace happened to contain an aristocratic and Conservative majority. The country consequently enjoyed for five years a representative Government for the first time since the overthrow of LOUIS PHILIPPE. A Republican Legislature has now maintained itself for two months, and possibly the alarm which prevails among the upper and middle classes in France may prove to be groundless. As Mr. BRIGHT himself is believed to have once remarked, a low franchise is more democratic in England than in any other country, because the great majority of Englishmen live on wages, and not on the returns of property. In the United States, in Canada, and Australia, it would have been impossible to restrict the *franchise; but the result of universal suffrage is not satisfactory. In the Colonies, as in America, the better classes* are excluded from political power, and consequently the conduct of public affairs is entrusted to adventurers and trading politicians. In one of the principal Australian Colonies legislative scandals have recently occurred which would be impossible in England. The prevalence of pecuniary corruption in the United States may be directly traced to universal suffrage.

Mr. FAWCETT'S speech was principally remarkable for the anxiety which it showed to prevent the institution of equal electoral districts. He wished electoral power to be largely redistributed, but in such a manner as to secure a representation of minorities. Reformers will never understand that minorities are much better represented at present by the operation of the anomalies and inequalities which Mr. FAWCETT strenuously condemns. Sir CHARLES DILKE said that the constituency of Liverpool increased every year by

a larger number of voters than the entire constituency of a small borough. If Liverpool and other great towns each returned twenty members to Parliament, the representation of the whole community would not be more complete than at present. London would, with equal electoral districts, return about the same number of members as Scotland. It is not surprising that Mr. FAWCETT should deprecate a mischievous uniformity which Sir C. DILKE seems to approve. A calculated and deliberate representation of minorities is liable to strong theoretical objections, and it is intrinsically insecure. In times of political excitement the majority will not be inclined to submit to limitations which can be abolished in a moment of its own supreme power. Mr. FAWCETT in some degree agrees with Mr. LOWE in believing that external symmetry matters less than the adoption of a system which may lead to good government. Mr. BURT not unnaturally treats the franchise as a right or a privilege, and the exclusion from the right of voting as an affront. The illustration of his argument which he derived from his own personal experience scarcely supports his conclusion. It seems that Mr. BURT worked in pits from childhood to the age of twenty-eight, when, becoming a ratepayer in a borough, he for the first time acquired a vote. Mr. BURT had already shown the fitness to exercise political influence which has since procured him a seat in the House of Commons. The majority of working colliers cannot be credited with equal intelligence and enterprise; yet the objection to give them votes is founded on their numbers, and not on their want of capacity. If all miners vote, the votes of coalowners, of overseers, and of shopkeepers become valueless because they are utterly swamped.

There is neither weight nor sincerity in the arguments which are deduced from the alleged moderation and good conduct of Mr. TREVELYAN'S clients. It would be at the same time insolent and unjust to attack classes which nevertheless may not be prudently admissible to the franchise. The newspapers which circulate among the members of the Labourers' Union advocate revolutionary doctrines, probably because they are supposed to be acceptable to their readers. Mr. ARCH is an agitator of the most extreme type; and it seems that, having been a Dissenting preacher, he devotes himself as earnestly to attacks on the Established Church as to agitation against farmers and landlords. The enfranchisement of some hundreds of thousands of his disciples would not tend to the security of existing institutions; but it will probably be effected in time. The temper of the House of Commons is not favourable at present to sweeping changes. The Government had every reason to be satisfied with a majority of nearly a hundred; and probably some of Mr. DISRAELI'S colleagues were not sorry that he should have occasion once more to refuse a concession to which he was at one time apparently inclined. Mr. DISRAELI has, on a large scale and in less vulgar circumstances, some of the qualities of an American manipulator of elections. He may perhaps sometimes have thought that county householders would be easily manageable, and that they might have no insuperable prejudices in favour of Liberal doctrines. He is now, on the other hand, fully convinced that his own followers are not prepared to take a second leap in the dark; nor is it worth while to risk a majority which varies from sixty to a hundred for the purpose of trying doubtful experiments. One of the numerous causes of Mr. GLADSTONE'S defeat at the last election was the certainty that he would soon introduce household suffrage in counties as a Cabinet measure. His successor at first seemed disposed to tamper with the question; but two years of office have taught him prudence.

DULL TIMES.

THE times are dull rather than hard, but they are very dull. Years have passed since there was so bad a season, and it might have been expected that a season marked by the return of the PRINCE OF WALES would have been one of more than usual brilliancy. In every direction there are signs that the world is economizing, and has less money than it used to have for luxury and recreation. Pictures do not fetch their old prices, houses will not let, the supply of horses exceeds the demand, and servants cannot get places equal to the height of their ambition. London is less gay because London is less rich, and that London should be so far less rich as to have begun to make its economies evident means much in the current history of the country. The wealth of the provinces is poured into London, and when London shows the pressure of dull times, there can be no doubt that times are very dull throughout England. It is not that any great calamity is weighing on the country, but a number of small adverse causes have produced a large unfavourable result. We are not in the midst of a commercial crisis, and if trade is more limited, it is sounder than it used to be. People are not so much ruined as hit, and the number of people who have been hit in various ways is enormous. Large losses have been sustained by the holders of foreign bonds, and many who have been accustomed to live merrily on precarious incomes have found their resources suddenly at an end. But this is an element in the general aggregate of impecuniosity the importance of which may be easily exaggerated. London is not much affected by the miseries of Turkish and Peruvian bondholders, and it is not until the home trade and home revenues are affected that economy becomes transparent. It is because steady people are suffering that London shows signs of distress. The dividends on English railways, for example, have grown less; traffic is decreasing, and apprehensions are entertained lest dividends should fall off still further. The capital represented by investments in railways has naturally diminished in nominal value with decreasing dividends, and investors find not only that they have less to spend out of their income from railways, but that they have less to reckon on as a provision for their families. If the present price of the stocks of the leading railways is compared with that which they commanded a year ago, it will be found that the loss to investors is much greater than that which can be supposed to have fallen on the English holders of foreign bonds; and the holders of English railway stocks are for the most part prudent people who, when they find they have less to spend, are content to spend less, and immediately begin to retrench in all that part of expenditure which is optional. The stagnation in trade not only makes those who live by trade economical in the absence of profits, but has cut down the dividends of banks and of the soundest industrial undertakings. The coal and iron industries are so enormous that bad times with them must mean bad times with thousands of well-to-do families. The depreciation in the price of silver again has seriously affected those who live on remittances from India; and the numerous classes who are dependent on the existence of some sort of activity in business generally, as brokers or agents, feel painfully, though without necessarily having anything to reproach themselves with, that times are dull. Of course there are numerous classes who are not touched at all. The holder of Consols, if he does but hold enough, may still smile at the sorrows of his neighbours. Men and women still die and go to law, and doctors and lawyers are as happy as usual. But the general run of well-to-do people are suffering more or less; and what distinguishes the present period of suffering, and gives it its peculiar character, is that it is not speculative and imprudent persons who are the sufferers so much as the prudent and the respectable householders who have no notion of getting into debt if they have less to spend, but immediately consider in what ways, without altering the permanent position of themselves and their children, they can best cut down expenses.

Even, however, in dull times people will do something, and England under any circumstances is so rich that some small ventures will always be made and some new schemes set on foot. But in times like the present adventurers move in a very modest way. Limited Liability Companies, for example, are not much in favour now, but still Limited Liability Companies are always being formed; and while their number testifies to the perennial activity of the community, their humble proportions and aims testify to the narrowness of the limits within which the spirit of adventure is now confined. Not much fewer than seventy new Companies were registered last month; but most of them were for local or unambitious purposes, and with an amount of capital that cannot much shake the wealth of England even if it is all lost. Skating-rinks and political clubs naturally afford an outlet for the energies of the numerous hangers-on of local society; and if grander objects are sometimes presented to the dreams of cupidity, it must be owned that their authors do not form an exaggerated view of the capital necessary for their purposes. One Company proposes to open a Public House for the People—a description which

seems scarcely sufficient to distinguish this from other places of refreshment; but then the Company proposes to spend only 2,500*l.* in conferring this vague benefit on thirsty souls. Another Company has set before itself an aim no less imposing than that of Fertilizing the South of England; but our admiration of the imposing grandeur of this purpose is diminished when we find that the South of England is to be fertilized by a total outlay of 2,100*l.* There is nothing in this to provoke the jealousy or rivalry of the North; and, generally speaking, as we look through the list of new Companies, we may feel sure that neither their success nor their failure will add much to human happiness, or take much from it. Those, perhaps, who are now troubled with most anxiety are the holders of securities which they see exposed to daily and violent fluctuations on the Stock Exchange. Quiet persons can hardly realize how little these fluctuations for the most part mean. They mostly depend on the calculations of a set of gamblers that, if they resolutely set a lead, they will get a sufficient number of persons to follow the lead, simply because it is set. They decide that a stock shall go down or up, and when times are bad it happens in nine cases out of ten that they decide that a stock shall go down. They sell boldly, and if they once succeed in frightening the *bonâ fide* holders of the stock, they clear a large profit, as, in their desperate anxiety to avoid further loss, these holders rush in and sell for what they can get. Many of these fluctuations, too, are transparently disproportionate to the causes assigned for them. Turkish Stock, for example, rose fifty per cent. on the news of the deposition of the SULTAN, without anything being known of the character of the new SULTAN, or of the policy which had dictated his call to power, or would be likely to be pursued by him after his elevation. Persons who cannot form some sort of judgment for themselves as to the circumstances of foreign countries ought not to hold foreign stocks at all. Nor is it by any means evident that investors gain anything by avoiding buying on their own account, and taking shares in Companies which offer to buy for them, and to hold masses of different securities the proceeds of which they distribute to the shareholders. It is true that in this way one loss cannot bring ruin; but neither can it if the investor himself distributes his investments; and the principle of the association has in itself a peculiar source of danger. There must be some cost of management, and generally the cost is by no means very slight. Even if it costs as little as a half per cent. this imparts an element of risk much greater than it seems to do. To get securities paying steadily on the average of years six per cent. is a task of great difficulty, requiring much attention and special knowledge; but to get securities that will give six and a half per cent. is a very much more difficult thing. The increase of insecurity becomes at each point greater; and thus investors who have their investments managed for them may be sure that they really pay for management, not by receiving diminished safe returns, but by incurring greater risks.

Those who are now suffering, not from speculation, but from the diminution of incomes through the general depression of business in the country, must naturally ask themselves with painful anxiety how long this state of things is to endure. Are they going through a little hour of difficulty which will soon be over, or is business likely to be bad for a considerable time? No doubt, if no new disturbing causes intervene, trade will revive—England is too completely at the head of the commerce of the world for this not to happen some day; for other nations, and especially the United States, must sooner or later work their way into new prosperity, and whatever benefits any part of the world also in some measure benefits England. But there can be no doubt that there is a deep and difficult question to be settled before it can be said that prosperity will again be seen in England such as in our most flourishing days we have witnessed. Can this prosperity revive without a very serious struggle between the working classes and their employers? There are many signs that, for the purposes of general competition, wages are too high in England. Up to the present time employers have, as a whole, made the utmost possible efforts not to reduce wages. They have been content to produce without profit rather than come into collision with those they employ. Reductions of wages have no doubt been made in many districts where great losses must have been sustained if reductions had not been made; but, as a rule, employers have strained their resources to keep up wages, and this cannot go on for ever. Belgium, France, and Germany compete with us at an advantage, and, low as iron is here, it is kept down to this ruinous price by foreign competition. It is no doubt true that, in the long run, wages will rise abroad if orders are taken away from England to be executed there, and there is a general tendency to an equality of wages in competing countries. The wages of English workmen need not fall to the present Continental point to make competition possible; but they must, it would seem, fall in some degree, and the habits of the English workman must change at the same time, and he must be willing to work harder and better. It is perhaps safe to assume that, under the stern discipline of necessity, the English labourer would learn the lesson he needs; but it is only very sanguine people who can believe that he is likely to learn it quickly and calmly. Much has still to be endured and learnt before very lively times are likely to return; but, on the other hand, there is no reason to expect violent convulsions or sudden losses. It is care and prudence and economy that are now needed, and that the respectable classes of English society are willing and ready to exhibit these virtues when called on is evident to any one who notices the changed aspect of the streets and parks of London.

THE COMMONS BILL.

THE opposition to the progress of the Commons Bill has been as ill advised as it was well intended. Mr. CROSS had introduced a measure which was far more liberal in its scope and intention than many persons would have expected from a Conservative Government; but, instead of giving him credit for all that he proposed to do, and showing in a spirit of friendly suggestion what he might do in addition, his opponents have attacked the Bill as though its only purpose had been to make unlawful inclosures lawful. It is possible, no doubt, to go too far in the way of complacency towards Bills that you intend to defeat at a later stage, and an inconvenient practice has grown up of assenting to a second reading without in the least meaning that any one of the provisions assented to shall become law. But even this extreme seems preferable to the opposite practice of moving the rejection of a Bill because it does not in its original form do all that you think it ought and might be made to do. There is a curious inconsistency between the complaint that the Bill does not prevent illegal inclosures and the desire that no Bill whatever shall be passed. If the grievance of illegal inclosures is really urgent, legislation on the subject ought not to be delayed. If it is not really urgent, it is not a valid objection to a Bill which purports to deal with other matters that it leaves this particular matter alone. It can hardly be maintained that the Bill will make things worse than they are now; for so long as the temper of the House of Commons is hostile to inclosures, the obstacle which has stood in the way of their being made for some years past will continue to operate. If the temper of the House of Commons underwent a decided change, it would soon be reflected in the action of the Commissioners, no matter what might be the precise provisions of the Act which they had to administer.

The same spirit of exaggeration which has led those who wish to see open spaces preserved to take up a position of avowed hostility to the Bill has prompted them to propose a strangely injudicious addition to it. This will be best seen from the explanation of the addition which is given in the last Report of the Commons Preservation Society. The ownership of a common, says this Report, is vested in the lord of the manor of which it forms the waste. The tenants of the manor or other persons are entitled to certain rights over it, and when the lord applies to the Commissioners for leave to inclose, he has either to prove that his interest in the common amounts to two thirds of the value of all the interests in it, or to obtain the concurrence of a sufficient number of commoners to make up this proportion. There are certain statutes, however, under which a lord of the manor may claim to inclose without the leave of the Commissioners, and in other cases special customs are alleged to exist which enable him to inclose if the consent of only a few of the commoners has been obtained. It often happens that the lord proceeds to inclose on one or other of these grounds, when, as a matter of fact, neither of

them really exist. But, supposing that he sets up a fence round the common as owner of the soil, and challenges objectors to prove that their rights of common have been disregarded, proceedings to abate the inclosure can only be taken by a commoner. In many cases this is tantamount to their never being taken. The commoners are ignorant of the precise extent of their rights, or they do not care to quarrel with the owner of the land, or they have not the means of undertaking a lawsuit which is sure to involve some expense, and may involve a great deal. The consequence is that illegal inclosures often succeed for want of some one rich enough to contest them. This is an evident wrong both to the commoners and to that larger public which profits by the maintenance of open spaces that is involved in the recognition of rights of common; and it is a valid objection to the Bill as it stands that it does not make adequate provision against this wrong. But the way to prevent inclosures from being made illegally is not to be looked for in a sweeping prohibition of inclosures, even when they can be made legally. Yet this is what the amendment proposed by Mr. Shaw-Lefevre on Monday really came to. He wished to make any inclosure of a common unlawful unless sanctioned by Parliament under the provisions of this Bill. Now, as the law stands, inclosures made under certain conditions without the sanction of Parliament are either lawful or unlawful. If they are lawful, to force the lord of the manor to go to the Commissioners, and ultimately to Parliament, for leave to do what he has a legal right to do, is to deprive him of his property in the common; and though it may be very beneficial to public health and enjoyment that he should be deprived of this right, it is by no means beneficial to public morality that he should be deprived of it without compensation. If, on the other hand, such inclosures are altogether unlawful, as the Report seems to imply, all that is needed is to create a new depositary of the right to take legal proceedings to prove their illegality. The simplest expedient for this purpose is to vest this right in the Inclosure Commissioners, making some provision for the expenses of law-suits in cases where the resistance to the inclosure may prove unsuccessful. These cases, however, would be of very rare occurrence. The mere fact that lords of the manor had to give notice to the Commissioners of their intention to inclose, whether under old statutes or under special customs, would prevent them from making snatches at commons, as they occasionally do now, in the belief that no one will be found to oppose them. It might be necessary at the outset to fight some representative case in order to have the law of the question fully and finally ascertained; but when once this had been done, a lord of the manor would usually take the notice that the Commissioners had been advised to contest his right to inclose as a sufficient indication that no such right existed. Mr. Sandford has promised to propose a clause to meet the difficulty of illegal inclosures; but, unless the Government accept it, it will almost certainly break down on the question of expenses. Such inclosures can only be prevented by putting the right to resist and the purse to pay the cost of resistance in the same hands; and unless the money can be raised by fees, it must ultimately be found by the State. We can conceive of no application of public funds more entirely legitimate than to pay the cost of resistance to illegal attempts to destroy commons undertaken in the conviction that no one will be found to oppose them.

Another grave defect in the Bill is the absence of any sufficient recognition of that larger public who enjoy what Mr. Bristowe happily described as privilege of common. It would be an extremely narrow view of the great Surrey commons to treat them as being of value to no one except the commoners who have the right of pasturing geese, or cutting turf or firewood. They are of inestimable and increasing value to the whole population of London. Year by year London grows bigger, and the journey which has to be undertaken in order to reach any really unspoilt country grows longer. If the wide ranges of heath and down which lie along the southern and western borders of Surrey should be inclosed, it will no longer be possible to reach any such piece of country and to return on the same day, and this impossibility would operate as a virtual banishment of the great mass of Londoners from the scenery which they have hitherto enjoyed. Yet, as the Bill stands, no public body would have any *locus standi* in opposing schemes for inclosing such places. There would remain the chance that the Standing Committee might throw out the scheme presented by the Commissioners, but there would be no opportunity of modifying or improving the scheme supposing that it were not radically a bad one. If notice of every application to inclose land within forty miles or so of London had to be given to the Corporation, this object would be attained. The Corporation has shown great determination and public spirit in the matter of Epping Forest, and the public interest in the maintenance of commons could not be entrusted to better hands. By this means the Londoners who now have the privilege of common in Surrey would at least not be deprived of it without a hearing. It may be objected that but few persons really avail themselves of this privilege. It would be truer to say that those who do avail themselves of it have not always the opportunity of taking a holiday, nor the means of making so long a journey when they do take one; and it may fairly be hoped that, as the tastes and habits of the people improve, the benefit of a few hours in genuine country—not the country of a well-ordered park, but the country of heath and moorland, which comes so much nearer to London than most of us know or imagine—will be more valued. To inclose this land now would be to take advantage of an ignorance which is gradually disappearing, and to store up a host of regrets. To give the Corporation a *locus standi* in resisting such schemes would prevent this advantage from being taken without Londoners being made aware of it.

SCIENTIFIC MURDER.

THERE has lately been an unusual number of cases of poisoning, some purely accidental, and others suggestive of foul play, and it is not surprising that there should have arisen a good deal of uneasiness on this account. It would appear that there is a growing tendency to carelessness and recklessness on the part of non-professional persons in helping themselves to doses of dangerous drugs; and there can also be no doubt that, both because of the more common use of such drugs, and of the discovery of poisons which leave little, if any, trace, poisoning can now be accomplished with less risk of detection than formerly. The benefits of scientific progress are certainly not unalloyed. The introduction of dynamite has given an appalling range to the possibilities of fiendish crime; and it is also evident that human wickedness is subjected to increased temptations, and human life to new perils, by the facilities for poisoning which now exist. There are people who brood over such expedients, not perhaps with any conscious or deliberate intention of actually applying them, at least when the subject is first taken up, but simply from the fascination which the notion of possessing such a terrible power of swift destruction exercises on minds of a certain class; and by and by, hatred, cupidity, or possibly even morbid curiosity, precipitates a fatal experiment. We should be sorry in making these remarks to excite useless alarm, though we suspect that it is impossible to touch on such a matter at all without making timid persons uncomfortable. There was a case indeed the other day in which a man died from fright at the mere sight of a poison-label, which he had not previously observed, on a bottle from which he had just taken a dose of simple medicine. It may be hoped, however, that, if attention is directed to the danger, some checks or precautions may be devised. The case which has just been tried at the Old Bailey at least shows that the subject deserves serious consideration, and, as a psychological study, it is painfully suggestive.

In December last an advertisement appeared in the *Daily Telegraph* to the following effect:—"To medical "men in need of money, or students well up in "chemistry and anatomy. A gentleman engaged "in an interesting experiment is willing to give "liberal remuneration for professional assistance." This advertisement was answered by William Vance, a medical student, who was doing the work of a practising surgeon, and a correspondence through the post ensued between him and the advertiser, "M. Q.," who was subsequently discovered to be Mrs. Smee, though Vance had no idea who his correspondent was, and addressed her as a man. "M. Q." professed to be tired of life, and anxious to do good to a friend by leaving the world, and to have resolved to do this in one way or another. But it was necessary that the feelings of the person who would gain by the death should not be wounded by the knowledge that it was

voluntary, and also that there should be no risk of invalidating the will. A hundred pounds was offered to VANCE for his advice on this subject. VANCE appears to have suggested chloral as the safest poison, and indeed to have supplied that drug, with a small quantity of prussic acid; and he also advised the addition of a few drops of peppermint to give a flavour and neutralize odour. He had evidently studied the situation in a business-like manner all round, and gave very precise and practical instructions. In these days when we are asked to believe that medical men are invariably the most humane and fastidiously scrupulous of all people—as if, unlike all other classes of society, they had no black sheep among them—it is highly instructive to have an opportunity of knowing the deliberate conclusions of a promising medical student on such an interesting experiment as how to kill a person without exciting suspicion and having any bother with a coroner's inquest. In a recent discussion in the House of Lords the Duke of SOMERSET hinted that, if surgeons were prevented from experimenting on cats and dogs, they would do so on their patients; and Mr. VANCE—who may be perhaps the KLEIN of the future in the natural course of development of species—has evidently raised himself to that high philosophic point of view from which a living human being is regarded as only a "subject." Mr. VANCE was not in the least staggered by learning that the interesting experiment in which he was asked to assist was a murder, and he proceeded to give his mind to the subject with genuine professional enthusiasm. We print the significant parts of the letter in full because it is really an important document, as marking the point at which, at any rate, one medical practitioner of our day has arrived. He writes, with sufficiently intelligible meaning, if with dubious grammar:—

"My plan in this sudden death allowed or apparently "suspicious death acknowledged, still a favourable verdict "may be returned, which in no way can invalidate a will "made antecedent to death probably many weeks, the "peculiarity of my suggestion is that, although the actual "cause of death is found out, and that a narcotic, yet the "verdict will be the most lenient—viz., by misadventure; "or, as it is phrased sometimes more specially, 'the de- "'ceased was in the habit of taking chloral, and died from "'an overdose unconsciously administered by himself.' "I can arrange details to square with this and submit "them to you at our meeting or on paper.

"If you like, chloral might be administered to a dog or "a cat, or you might try yourself an ordinary dose and be "thereby cognizant of the *bona fides* of the agent.

"Upon mature consideration, I know of no more feasible "method. The cases of the poisoners PRITCHARD and PALMER, "both doctors, were ingenious; yet they were detected. "They lived before these chloral times.

"As an anatomist and medical jurist, I altogether frown "on any attempt to excite [illegible] "to adduce reasons. [illegible] we might arrange to meet, and "If you adopt the subject. You can select your own "then tak[illegible] "fit time

There is something very touching in Mr. VANCE's pathetic reference to those eminent practitioners Dr. PRITCHARD and Mr. PALMER, who might have poisoned more cloverly if they had lived in more advanced days, and also in his high-minded repudiation of such a low and clumsy method of murder as arterial rupture. He suggests that, after pouring out a dose, his correspondent should dilute what remained in the phial to divert suspicion, and leave it on the mantelpiece, "not "hard by the bed," and throw any other bottle away; destroy all his letters except that as to his remuneration; and "let all around you remain in usual condition, to "imply absence of design; the entire affair is to show "*prima facie* accident." In another letter he said he had been for a trip into the country, but could hardly enjoy it with this matter hanging over him. At the trial Dr. BOND gave evidence as to the poisons found in VANCE's possession, stating that chloral would not leave any trace, unless an examination of the body took place very soon after death; that one drachm of prussic acid would produce death; and that the various poisons were all in use as medicines.

It will be observed from these facts that a person who wishes to murder any one by poisoning has no great difficulty in finding a medical practitioner to give advice as to the best process, or in procuring the necessary materials. Mr. VANCE did not know who was going to be killed by his help, and apparently did not care. It was all in his day's work. That he distinctly understood that there was to be a "sudden death" is admitted in his letter; and his readiness to participate in an atrocity of this kind is not made less horrible or alarming by the good character which was given to him by various witnesses, and which the jury seem to have regarded as carrying with it a license to kill on easy terms. As for Mrs. SNEE, she may perhaps be regarded as suffering in some degree from hypochondriacal mania. There is no reason to suppose that she intended the poison for any one but herself; and, as the result showed, even in her own case, if she had ever any really serious design, she thought better of it. She was a lonely woman, whose husband was, from the nature of his business, much away from home; she had a romantic turn of mind, read rubbishy novels, went a great deal to the play, and had a vague craving for some kind of morbid excitement. In a more fashionable rank of life she would probably have plunged into the whirl of PRINCE'S; but in Camden Town the pleasure of brooding over a murderous plot of the WILKIE COLLINS kind seemed more accessible. It is a painful fact that the vagaries arising from the vapours and ennui of silly, idle women are becoming one of the great social scandals and dangers of the day.

The indictment against the prisoners charged them with conspiring together, and feloniously and of malice aforethought, intending to kill and murder one ELLEN SNEE, and also with conspiring to cause the death of some person unknown. The first count had, however, to be given up, as it was clear that VANCE could not have intended to kill ELLEN SNEE, of whose existence he was ignorant. On the other count both prisoners were convicted, and there can be no doubt that they did conspire to compass the death of some one. VANCE planned the scheme, and apparently supplied the materials, and if Mrs. SNEE had poisoned herself according to his directions, he would undoubtedly have been guilty of murder. Mrs. SNEE's conduct may perhaps be excused on the ground of a kind of temporary aberration, but VANCE seems to have acted in a perfectly cool, collected, and business-like spirit. He accepted the proposal to concert a suicide with cheerful alacrity, and made no attempt to dissuade his correspondent from committing a criminal act. Nor did he think it even necessary, as the Judge observed, to obtain an assurance that the use of the poison would be limited to the person asking for it. Without the slightest hesitation or compunction, he put it in the power of a person of whom he knew nothing, and who might be bent upon or capable of the most atrocious wickedness, to commit a series of murders. It is impossible to imagine a more abominable act, and there has evidently been a failure of justice when such a villain escapes with eighteen months' imprisonment. Mr. Justice MELLOR remarked that [illegible] been framed under another statute as it ought to have been, the sentence might have been ten years' penal servitude. There is a similarity between this case and that of THOMASSEN, which points to the importance of removing any doubt as to whether the planning of murder, or what amounts to murder, without any precise idea who the victim or victims are to be, is to be included in the category of legal murder.

THE *TIMES* ON A FALSE SCENT.

THE *Times* has lately discovered a mare's nest of unusual pretensions. In a leading article which appeared on the Thursday of last week it took to task the Government and the House of Commons for ignorance of the legislative independence of Canada, and the Canadian Ministers for over-modesty in allowing this legislative independence to be recognized in a particular instance as a matter of favour instead of as a matter of right. The occasion of these reproofs was the introduction by Sir CHARLES ADDERLEY into the Merchant Shipping Bill of a proviso that the Act shall not apply to Canadian ships in Canadian inland waters. This clause the *Times* described as "mischievous surplusage," and predicted, with a degree of positiveness which made the prophecy hardly distinguishable from a command, that it would be "cut out in the Lords as misleading." The English Parliament had "abandoned altogether the power of "legislating for Canadian shipping"; and to make the ignorance of the Government more extraordinary and re-

prehensible, the Act by which this was done was passed through the House of Commons by Sir CHARLES ADDERLEY when Under-Secretary of State for the Colonies. "The Act "of 1867," said the *Times*, "which sanctioned the establish- "ment of the Dominion of Canada, declares that 'the exclu- "'sive legislative authority of the Parliament of Canada ex- "'tends to all matters coming within the classes of subjects "'next thereinafter enumerated,' and among them occur, be- "sides the general class, 'the regulation of Trade and Com- "'merce,' the more special class,' Navigation and Shipping.'" It was not only Sir CHARLES ADDERLEY, the *Times* went on to say, who had forgotten the provisions of this important Act. Sir STAFFORD NORTHCOTE had made precisely the same blunder when he maintained, in opposition to an amendment moved by Mr. EDWARD JENKINS, that it was not desirable to draw a distinction between vessels trading under the Canadian and under the British flag. "Desir- "able or not," said his critic, with superb contempt for ignorance in high places, "it was done nine years ago when "the shipping of Canada was made subject to the legislation "of Canada, and the shipping registered in the United "Kingdom remained subject to the legislation of the home "Parliament." Culpable as the forgetfulness of the Government had been, the *Times* was willing to help them out of the dilemma into which their want of care had led them. They had meant to legislate for colonial ships as well as for foreign and British ships when they came into British ports, and the insertion of the word "colonial" wherever the word "foreign" occurs would enable them to attain their object. By the adoption of this simple device there would be "perfect equality of "treatment of all ships of every origin coming to our "ports," while the Bill would not "attempt to overstep "the clearly defined limits of the authority of the home "Parliament."

The article was written in a strain of such unhesitating confidence that many readers of the *Times* must have been surprised to find that it rested on a total misconception of the meaning of the Act of 1867. It is fair to say that, when due allowance has been given to the haste with which the reference to the statute was probably made, the misconception is not a very unnatural one. The writer saw that certain matters were declared to come under the exclusive legislative authority of the Dominion Parliament, and he jumped to the conclusion that matters which fall within the exclusive legislative authority of the Canadian Parliament must necessarily be outside the legislative authority of the English Parliament. He did not stop to consider what the Act of 1867 was intended to do. If the Act which established the Dominion of Canada had for the first time given the people of Canada representative institutions, his interpretation of it would have been perfectly sound. The legislative authority of the Parliament of Canada would have been distinguished from the legislative authority of the English Parliament, and all matters declared to come within the exclusive cognizance of the former would have been withdrawn by the natural force of that declaration from the cognizance of the latter. Unfortunately for the *Times*' interpretation, there had been local Legislatures in the North American provinces before the Act of 1867, and as soon as this fact is remembered the application of the word "exclusive" is altogether changed. Down to the passing of the Act these local Legislatures dealt with all colonial matters, subject in the last resort to the control of the Imperial Parliament. The Act of 1867 created an additional Legislature, the Dominion Parliament, and this necessitated a statutory enumeration of the subjects with which for the future the local Legislatures would continue to deal, as distinct from the subjects which would henceforward be reserved for the Dominion Parliament. But the Act only regulated the relations of the new and the old Legislatures between themselves. It left the relations of both to the Imperial Parliament unchanged. As Sir CHARLES ADDERLEY said, "The Imperial Acts bind Canadian subjects in this matter "just as much as English subjects. It is a total mistake "to suppose that the Act of 1867 in any way altered the "relation of Canadian subjects to the Imperial Par- "liament."

If the matter had ended here, it would not have called for any notice. Leading articles have to be written under pressure, and with very little time for making references; and, provided that journalists do not claim to be infallible, large allowance ought to be made for their occasional errors. But the *Times* was not content to leave the matter here. On Thursday last it printed a letter from "HISTORICUS," proving, with almost needless minuteness, that the opinion that since the Act of 1867 the authority of the Imperial Parliament to bind Canada by legislation had passed to the Dominion Parliament was an error. It might have been thought that, if the *Times* had not been convinced by Sir CHARLES ADDERLEY's statement, and by its own reperusal of the Act, it would not have stood out against the arguments and references which "HISTORICUS" had heaped together. It had been proved to have made a blunder, and to blunders the proverb "least said soonest mended" is emphatically applicable. At all events, "HISTORICUS" had thought the error worthy of two columns of refutation, and this was certainly more honour than it might have seemed to deserve after Sir CHARLES ADDERLEY's explanation. But the *Times* was determined that its mistake should not be soon forgotten; and on the same day it devoted a column and three-quarters to an article in which, under the disguise of an essay to prove that the Imperial Parliament ought not to legislate for Canada, an assumption that it was, to say the least, an open question whether it had the right to do so was ingeniously slipped in. The doctrine that Imperial Acts bind Canadian subjects equally with English subjects is described as a "view held in the "department of the Board of Trade," and as a "position "which 'HISTORICUS' attempts to establish." After a while the writer grows bolder and ventures on the assertion that, by the Act of 1867, "the supremacy of the Crown is "maintained, that of the Home Parliament is abandoned, "and the Colonial Legislature is empowered to make laws "for the colony just as the Home Legislature makes laws "at home." In only one respect does the writer seem to have profited by experience. In the original article he imprudently quoted the words in the Act which he supposed to operate as an abandonment of the supremacy of the Home Parliament. In the second article, though he reiterates his statement, he carefully avoids giving chapter and verse for it. He does, it is true, say that the preamble "indicates the degree of legislative independence to be "enjoyed by the Dominion," and from this he slides into the passage quoted above, meaning it perhaps to be inferred that in the enacting part of the statute there is a clause which gives the Dominion the degree of legislative independence indicated in the preamble. But the authority of the Imperial Parliament is not to be "aban- "doned" without express words. If there is any part of the British dominions for which the English Parliament cannot, if it chooses, make laws, words cannot too soon be accommodated to facts, and nominal independence be given where real independence already exists. How little faith the *Times* places in its own theory may be seen from its sophistical attempt to commit those who maintain that Parliament has the right to legislate for Canada to the wholly different doctrine that it ought to exercise its right. "Can it be pretended," it asks, "that any attempt to regulate" Canadian trade "by an English Act would be politic?" We know of no one who has "pretended" anything of the kind. The art of politics mainly consists in drawing accurate distinctions between occasions in which a right may be exercised and occasions in which it ought to be waived, and where the Dominion of Canada is concerned the latter will be by far the most numerous. But to waive a right is not the same thing as to abandon it, and the difference, though elementary, is often so important that the *Times* will do well to take more pains to grasp it than it has hitherto thought to be necessary.

MR. GLADSTONE ON RELIGIOUS THOUGHT.

SINCE his retirement from office Mr. Gladstone appears to have divided his attention between Homeric and theological studies, and the *Contemporary Review* has had the benefit of his meditations on both subjects. Hitherto, however, he has dealt chiefly with particular burning questions of the day, such as "Vaticanism" and "Ritualism." In the present number of the *Contemporary* he has entered on a larger and more ambitious, or in his own phrase a bolder, undertaking, and endeavours to define and classify the various phases or "courses of religious thought" which dispute possession of the modern European mind. For though he does not confine himself within the doctrinal limits of Christianity, he deals exclusively with the mental conditions of nominally Christian society, not considering that Islamism or Buddhism shows any present signs of a capacity for influencing the religious future of mankind. And we shall certainly be quite content to restrict our own comments on his speculations within the same not very narrow boundary line. Mr. Gladstone premises two explanations—first, that any classification of the kind here at-

tempted must necessarily be more or less a cross division—which is true, only it seems to us to be more true of his own schedule, so to call it, than he is quite aware; and, secondly, that there is a fundamental distinction between principles and opinions—men who are governed by the same principle often differing widely in their opinions, and *vice versâ*. This also is true in itself, but we are not equally sure that Mr. Gladstone is always right in his application of the theory. After settling these preliminaries, he proceeds to his fivefold division of existing "schools or systems," which are thus classified:—(1) the Ultramontane; (2) the Historical, believing in a visible Church, but rejecting the Papal monarchy; (3) the Protestant Evangelical, rejecting a visible Church, but holding to "the great central dogmas" of Christianity; (4) the Theistic school, believing in God and a future life, but not in Revelation; (5) the Negative school, which is subdivided into eight varieties of partial or absolute unbelief. Before following the author into his strictures on these different schools in detail, it is obvious to remark that not only do they more or less overlap one another, in the sense that many religious or irreligious thinkers "will not fall *clean* into any one of the five divisions," but moreover the "principles" themselves overlap. Thus, if Ultramontanism is meant, as it evidently is, to include the great body of the Roman Catholic Church, while the entire Eastern Church is to be brought under the second or "Historical" category, there is, to say the least, something forced and artificial in the nomenclature, considering how very few are the points of doctrinal difference between the two bodies, while as to the principal one of them, the Anglican Church—which is also referred to the Historical division—agrees with the Roman against the Eastern Church. Then again, the "Protestant Evangelical" school, in so far as it adheres to "the central dogmas," stands on the basis of historical Christianity, though perhaps without acknowledging it. Another difficulty, which is not fatal to the theory but cannot fail seriously to complicate its application for any practical purposes, is that—putting aside the last two, which lie beyond the Christian pale altogether—these "schools" are neither confined within the limits of particular communions nor coextensive with them. Thus the Historical school is fully admitted to have its representatives (a good many more, we suspect, than the author supposes) within the Roman Catholic Church, while its proper home is assumed to be in the Eastern and Anglican communions; the Protestant Evangelical is spread over the non-episcopal communities, English and foreign, besides having a large following in the Church of England. And we may add, though the essayist does not say so, that if Ultramontanism is understood as a "principle," and not merely as an opinion about the prerogatives of the Pope, there are Ultramontanes of the first water in other communions beside the Roman, and among those who rival Dr. Cumming in their hatred of Popery. The real fact we take to be that Mr. Gladstone's classification is, not only, as he partially admits, a cross division, but an inaccurate one, so far as his first three schools are concerned. Those who maintain a belief in dogmatic Christianity, whether their dogmas are many or few, true or false, maintain it in the last resort on one of two principles, which may as well be called the Historical and the Protestant as by any other name, however inconsistent or defective may be their method of carrying out their principles. They either rest on the authority of Tradition and a Visible Church, though they may be mistaken in believing this or that tenet—say Papal infallibility—to be really covered by their fundamental principle; or they appeal to the authority of Scripture, as interpreted by the individual judgment under the prop[illegible] unconsciously, be indebted [illegible]ce, though they may really, ho[illegible] interpretation of its meaning [illegible] their faith in Scripture [illegible]s they disclaim.

[illegible] the traditional [illegible] turn to Mr. Gladstone's exposition of [illegible] scheme, which will further illustrate our criti[illegible] we appear to be its weak points. His language is not always as clear as could be desired. Thus, when he begins his account of the Ultramontane system by saying that "it derives its origin by unbroken succession from Christ and his Apostles," he asserts for it that very "historical" basis which would undoubtedly be claimed by its advocates, but which he himself expressly disallows. What he means, if we rightly understand him, is that it is derived by "an unbroken continuity" of development from Christ and his Apostles. But that again is just what the ablest and most moderate apologists of Roman claims—such writers as Möhler and Newman, and Petavius before them, who cannot in ordinary parlance be said to belong to the "Ultramontane school"—have insisted upon; and they have insisted upon it just as much in reference to doctrines which Mr. Gladstone would call historical, like the Nicene, *e.g.* as with reference to those which he rejects; but neither the Eastern nor the Western Church, so far as we are aware, has formally committed itself to the principle. A particular example, which Mr. Gladstone has himself introduced, may serve to make our meaning clear. Transubstantiation is one of those "opinions" which he thinks it probable that many Old Catholics inconsistently retain, though on the historical "principle" they ought to abandon it. Now of course we are not going to discuss the theological merits of the tenet, but we wish to point out to Mr. Gladstone that it has nothing to do with a belief in Papal infallibility, having been formally defined at the Lateran Council in 1215, and held long before; while it is just as much a doctrine of the Eastern as of the Latin Church, and was expressly defined as such at the Synod of Bethlehem in 1672. No doubt Eastern theologians would say that they were only expressing their traditional belief in this case as in the Nicene or Constantinopolitan creeds, whereas others might prefer to designate all alike as developments, but of a strictly historical and legitimate kind. Into that controversy we need not enter here. Our aim is to point out that no such hard-and-fast line can be drawn between the unbroken continuity of the system of the Eastern and Western Churches as is involved in Mr. Gladstone's classification. For the most part, their doctrines, whether described as traditions or developments or corruptions, are precisely the same; and if one party is at liberty to defend them on the ground of history and "the general consent of Christendom," it is hard to see why the same plea should not be equally available for the other. We are inclined indeed to think that Mr. Gladstone has stated his own view of historical Christianity rather than that which would be accepted by "the Eastern or Orthodox Churches," whose "scientific basis" he declares it to be. They might scarcely, for instance, be prepared to restrict the teaching authority of the Church to "the declarations which proceeded from her between twelve and fifteen centuries ago." On the other hand, when he gives special credit to the Eastern Church for freedom from those conflicts with the State, the family, and modern culture which distract, and ever have distracted, her Latin sister, he seems to have forgotten that, whether an advantage or a disadvantage, this is in fact simply the result of that stagnation of all moral and intellectual life which writers so far removed from Ultramontane sympathies as Döllinger and Stanley have dwelt upon as characteristic of Eastern Christendom since the eighth century. The Latin Church may have pursued a very faulty policy in her dealings with the restless social and national life of Western Europe, but the Oriental Churches have been relieved from the necessity for having any policy at all. If we are reminded of Russia, it must be observed that to an external observer—and we do not profess here to be examining the matter deeply—the Russian ecclesiastical discipline looks very like a splendid but crushing Erastianism; and Mr. Gladstone has so little love for "the system termed Erastian" that he expressly declines to include it in his enumeration, as having no claim to be regarded as a religious system at all. We do not say that there is no answer to the charge so frequently and plausibly urged against the Russian Church, but we do think that in discussing "the marks of weakness" peculiar to the Oriental type of Christianity he ought at least to have noticed it.

In dealing with Evangelical Protestantism, towards which Mr. Gladstone occupies a more neutral ground, feeling apparently neither any special sympathy for it nor any special antipathy, the essayist writes with a firmer hand. At all events, this strikes us as the happiest and most evenly balanced of his descriptions of religious parties. He fairly exposes its weaknesses, while he does justice to its strength. Nor are we disposed to quarrel with his account of the "Theistic" and "Negative" schools, except as being somewhat sketchy and incomplete; but we have no room to follow him in detail through this part of his argument. Certainly it is often true of the adherents of both schools, and it is a fact important to bear in mind in judging alike of their characters and their principles, that "they have come to be such not by rejection of Christianity, but by declension from it, and, in quitting their ancient home, have carried away a portion, sometimes a large portion, of the furniture." And, as well on this account as because these schools, if such they can be termed, consist mainly of "select individuals, scattered here and there" [illegible] of [illegible] ecclesiastical or either of them, however plausible or attractive as exemplified in individuals, would be found equal to the laborious duty of reforming and training great masses of mankind—which is, after all, the working test of a religious system or creed that can hold its own in the world. We must be content merely to enumerate the eight subdivisions of the Negative school into Scepticism, Atheism, Agnosticism, Secularism, Revived Paganism, Materialism, Pantheism, Positivism. With the exception of the last, which is a particular and very highly elaborated variety of Atheism, it is obvious that all these currents, or schemes of thought would constantly intersect one another, and might coexist together, or in rapid succession, in the same mind. "Paganism," which in its higher, or "Hellenic" form, is the most graceful and seductive of them all, has indeed the serious practical drawback that "it is plainly a religion for Dives and not for Lazarus"; but we feel sure that there is a good deal of it, so to say, in the air just now, both in literature and in life, and we wish Mr. Gladstone had dwelt a little more on its modern revival, instead of confining himself to drawing an admirable outline of its leading characteristics in ancient Greece; he would have found abundant materials ready to his hand for doing so. We shall look with interest for the second paper, in which he proposes to inquire how and why the currents of thought he has been describing "were brought into their present sharp and unordered motion."

THE SEA OUT OF SEASON

THERE are many places between Penzance and Stornoway where it is quite possible thoroughly to enjoy the seaside in spring, or even in winter. Easter week at Brighton or Torquay may also be very pleasant. A little imitation London with the sea thrown in and the smuts left out is exactly what some people think perfection, whilst the natural beauties of Torquay, added to

its fine climate, make it at all times an agreeable resort. But it is quite a different matter to spend a week in an ordinary retired sea-bathing village which cannot boast of anything but its perfectly flat sands and a good hotel. In fine weather it may be possible to endure the ordeal; but even one day of icy rain coming down in torrents and a north-east wind blowing a hurricane is enough to sink the most buoyant nature to zero and make the most confirmed misanthrope sigh for society. It appears that on the day of Mr. Bravo's poisoning preparations were being made for establishing the family at Worthing for change of air. No one seems to have suggested at the inquest that the mere thought of being shut up in such a place at such a time of year might be almost enough to drive any one of sense to imitate the Irish snakes who "committed suicide to save themselves from slaughter." When a man feeling the effects of a winter of hard work consults the family physician upon his symptoms, he is very probably recommended to "try a little sea air and perfect idleness." Thinking that one resort is as good as another in which to follow out such a prescription, he determines to go to a place in May which a friend had spoken of with praise in September. But sands that are delightful in sunshine are not necessarily pleasant in sleet. A person may not like to be jostled in a crowd, and yet the sight of rows of empty houses with the shutters up may not give him the least enjoyment. To be the sole guest in a large hotel no doubt insures to the visitor an amount of punctilious attention not always to be met with in such establishments. But this luxury has its drawbacks if the visitor is made to feel like a fly under a microscope, or a Royal Highness at a railway-station. Intense silence in a place usually associated with noise and bustle has a strangely depressing effect, which even the champagne ordered for the good of the house does not wholly remove. There is something weird and uncanny in seeing long passages without the slightest trace of portmanteaus, candlesticks, or boots. It is startling to have the bell answered as if the servant were stationed behind the door, and almost annoying never to be obliged to ask for anything twice. In the evening it would be an intense relief to ring the bell every few minutes for the sake of proving that the house was not entirely given over to the ghosts of the departed; but it is impossible to induce the fire to burn so as to require mending oftener than every quarter of an hour, and it is difficult to dispose of more than three bottles of soda water after dinner. Going to bed before ten presents difficulties, for the idea of lying awake listening to the melancholy ditties of the wild waves is too appalling, even for tired nature. But notwithstanding sitting up until the usual hour, the night is probably one of disturbed slumbers. The moaning sea, the driving rain, the ill-fitting window-sashes, and the starlings in the chimney that fidget all night and croak and chuckle continuously from early dawn, make sleep a series of feverish dozes and frightened starts. However, a good breakfast with fish that knows not ice brings some consolation; but after that, and before it too—the deluge. Looking out of the window at the rain which sweeps along horizontally soon ceases to be amusing, but in the afternoon the weather clears a little, and the invalid goes out for a constitutional on the beach. The prospect is not much more cheering, for the sea is like sepia, and the sky is a uniform dirty grey. There is no view, and not a single sail in sight. At one end of the sands a lugubrious-looking man with his arm in a sling and his leg bandaged is limping slowly along. Perhaps the Smashem Railway Company are paying heavily for his lodgings and his shrimps. Near him is another man who also appears afflicted, although he holds in his hand a formidable looking proof-sheet which may be the successful novel of the season or a farce which is to have an unprecedented run. The two men have several miles of the eternal shore entirely at their disposal, yet they do not seem to revel in their vast possessions. Presently a young ladies' school appears on the horizon, and promises a passing diversion. Unfortunately, the girls turn out to be exceptionally hideous and ungainly, and dressed as only English schoolgirls can dress. A sailor with a can of wriggling worms for bait next appears, and it is not unamusing to listen to his practical, if peculiar, views of natural history. He thinks it strange that the eels leave the river at a certain time of year and return half the size, and regrets that the prawns always be small in the season when there is a good market for them, and at their prime when there are no visitors to eat them. There is scarcely a single little footmark to be seen on the sand, and the shells lie ungathered. None of the aborigines ever appear outside their houses, except on Sunday, and then carefully avoid the beach. A group of children in deep mourning are chasing each other round the empty seats on the esplanade, trying to get warm; but the biting wind blows their black ribands into their eyes, and makes them so miserable that they begin to quarrel and take refuge in sulks. Some little brother or sister has probably died of scarlatina or measles, and the rest of the family are sent to inoculate another house with infection for the benefit of future lodgers.

Tired of "the barren, barren shore" and its cold wet sands, the visitor starts on a tour of inspection through the village. He walks down the principal terrace, which is probably called Bellevue. There is considerable, indeed surprising, variety in the architectural adornments of the houses and in the laying out of the miniature gardens. One might almost judge of the proprietors by the arrangement of the pots round the windows. The house in which the little maid-of-all-work is singing as she polishes the teapot looks promising. The next one, where the rose-tree has been allowed to fall off the porch for want of a few nails, ought certainly to be avoided. The lodgers who mysteriously disappear every autumn are now allowed on a treat to stand at the window in their shirt sleeves on wet days when no one is likely to come. Some of the landladies are sitting behind their curtains like sly old spiders; others, who have climbed, are preparing tea for them in the smart, but bare, parlour that the small fry are taught to disappear at the smallest hint and hide themselves like the little sand-crabs. One old lady is sitting knitting, her expression calmly supercilious, for she has let to a "good family" for the long season, and she is sure of more than her rent in the shape of perquisites. Another in easy circumstances who depends on getting a fancy price for a few weeks at the height of the season, is only now taking up her carpets and having them beaten on the common. This causes much indignation to her neighbours, who have put up their clean white curtains. Down a side street is a small shop with "Circulating Library" painted in Brobdingnagian letters. This is a welcome discovery. The simpering librarian, who also sells Berlin wool, is only too glad to display her treasures. But there is something rather strange about the books. There are several shelves quite full of orthodox-looking volumes in sets of three, but the names on the backs are entirely unfamiliar. No remembrance of having seen them reviewed, even in the *Cumberland Meteor*, can be revived. Are they unique? Has a Company been formed to print single copies of romances that can find no publisher? There are such titles as *Pale Pimpernel*, *Plantagenet of Navarre*, *Widow's Wishes*, *Spider's Love*, *To-morrow Morning*, which remind a novel-reader of things he has waded through, but on opening the volumes he does not find the most distant acquaintance. The custodian of these remarkable books is quite hurt at an insinuation that the new stock has not yet arrived. She considers her collection of the most fashionable and interesting character. Of *Daniel Deronda* she knows as little as the young lady who thought he was an officer in the Guards who had to resign his commission for cheating at cards.

But one of the most amusing things about a place before the season has begun is the makebelieve that is kept up. The omnibus, the hotel fly, and several crazy basket-carriages meet every train with praiseworthy pertinacity. The drivers cultivate a high rate of speed, and look as full of importance as stage-coachmen. But they go to a bourne from which no travellers ever seems to return, and the horses frisk back gaily with empty traps. A waiter stands at the hotel door flicking his napkin and ready to take an order for a sumptuous repast at a moment's notice. The brisk chambermaid flutters about in her highly starched dress, and seems to be overwhelmed with the preparations for fresh arrivals. Between the showers numberless donkeys appear on the common and vehicles more picturesque than inviting. Notices of lessons in swimming are posted about which cause a shiver, and there are cries of different things to sell but no one to buy. Any amount of spades, buckets, hats, and sand-shoes are hanging outside the shop doors, and although the pastrycook still wisely keeps his shutters up, there are sufficient bottles of sweets in the grocers' shops to poison the children of a whole county. A Punch and Judy man appears to spy out the land; but after a very languid performance, in which many of the principal scenes are suppressed, he goes off slanging his wife, and is no more seen. Toby creates quite a sensation amongst the dogs of the village with his smart red collar, his superior attainments, and knowledge of the world. But Toby's master could only get ragged urchins for audience, and ragged urchins don't pay. A photographer tries to ply his trade, but his tent is blown into the sea, and only saved by accident. The postman makes his appearance many times a day with a bag of dimensions suited to a London morning delivery. It is thrown over his shoulders, and in his hand are a few letters for a school at the extreme end of the beach. As he passes the swept and garnished lodging-houses and pauses to look at a new flower or speak to the grey parrot, he raises many a delusive hope in the hearts of the hungry spiders awaiting their prey. If landladies were not creatures outside the pale of human sympathy, we might wish to be a millionaire, to take all the houses that now lie so heavy on their minds, pay the rents, and send the poor wretches to a far-away midland county where for a time they could be free from anxiety and from the depressingly monotonous plash of the ever-breaking waves.

THE LITERATURE OF AGRICULTURAL AGITATION.

MR. BRIGHT made a very curious observation in the course of his speech on Mr. Trevelyan's motion. In describing the excitement which prevails among the agricultural labourers in certain quarters he referred incidentally to the sort of literature which is being largely circulated amongst them, and remarked that "there are many things in some of these papers which it would be better if the agricultural labourer did not read; many things which no intelligent friend of his would have placed before him for his mental instruction." And then, strangely enough, he went on to say, "But the papers are there, and the labourers are reading them," and to argue that, therefore, it would be well to put more power for mischief into the hands of those who are being educated in this objectionable and dangerous school. Mr. Bright also thought it necessary to give a stimulus to the movement by declaring that there was a great deal of "social tyranny in the counties to be broken up." We have no intention

here of discussing the questions between the various classes of agriculturists which are involved in this agitation; but it may be doubted whether people are generally aware of the character which the agitation is assuming, and it may therefore be worth while to give some idea of it. We may admit at the outset that in a case of this kind it would be absurd to be too nice or fastidious as to the manner in which a public controversy is conducted. Some roughness of speech, and even violence of demeanour, is only to be expected, and it is also natural that the rhetorical programme of the agitators should be stretched beyond their immediate hopes and plans. When men are deeply interested in anything, they are pretty certain to get excited and to use strong language. It may be supposed also that there may be very loud and angry barking without a serious intention of biting. At the same time, making every allowance for frothy extravagance, there seem to be in this agitation symptoms of what may prove to be really grave trouble. At any rate the spirit of the movement ought to be distinctly understood.

We presume that the *National Agricultural Labourers' Chronicle*, which is the organ of the Trade-Union, and also of what is called a "Land Union," which is apparently an offshoot of the other body, is one of the papers with which Mr. Bright expressed his dissatisfaction; and we have only to turn over a few recent numbers to find abundant justification for much stronger strictures. It is of course difficult to say what impression this and kindred newspapers produce on the minds of the labourers; but there can at least be no doubt as to the ideas which the leaders of the agitation desire to instil, and their method of procedure. We find in the *Labourers' Chronicle* for May 13th an article on the Land Question containing a gross personal attack on the Queen. She is accused of having "revolutionized the Constitution to serve her greed of property," and of receiving from the Duchy of Lancaster large sums annually to which she has no right whatever. It is also asserted that various Crown lands which ought to belong to the nation have been shamefully jobbed away to noble families. "We cannot find space or time," says the writer, "to go through all the counties; but we can say that all our rich landowners, dukes, baronets, and squires had and have the plunder." And then the writer goes on to demand that "wherever any plunderer has appropriated any house or land the property should be seized; and if the actual person is alive who converted public property into private, he should be prosecuted with some severity as a highwayman or a burglar, by way of a caution to others." He winds up by inquiring whether, with all these forests, and chases, and other Crown lands, "there is no land available to keep our peasantry in England?" and demanding "a careful consideration" of the Land question, which, it appears, implies the abolition of "the land monopoly of some two hundred families," and the subdivision of all Crown lands, old and new, for occupation "by the peasantry at fair rentals."

In the succeeding number of the same journal there is an article in which it is urged that "nothing but a real pinch of suffering" will ever bring English farmers to their senses; that, "if the landlords cannot be curbed and compelled by law and reason, they must be eventually by force"; and that, if there is to be a revolution, the sooner the better. Further on there is a characteristic argument in favour of putting the labourers in possession of the land; a man's land, it is urged, is different from his watch. "Who made the land? Who made the watch? The land-maker is not there, the watch was not." "The only injury we inflict on the county is a mental one, in depriving the landlord of [illegible]. On the other hand, that is tantamount to enslaving [illegible] hands, they would not only live the prospect is held out to [illegible] the surplus would pay all taxes, and get the land somehow." At a meeting in Nottinghamshire one [illegible] in plenty, but amid great applause, laid down the principle that [illegible] reduce the [illegible]ion"—meaning possession—"of the soil by the mass of the people is their first and inalienable right, and the only foundation of national prosperity." This is, in fact, the common cry; that farmers and landlords should be abolished, and that every labourer should till his own bit of land, paying rent to the Government. The poet's vision of the time

> Ere England's griefs began,
> When every rood of ground maintain'd its man,

is taken up as a practical scheme to be enforced by legislation. There is another feature of this literature which is also very significant. It is said that at the German gaming places in other days all the garden walks were laid out so as, no matter in what direction the visitor started, always to bring him back to the tables. And in the same way, whatever may be ostensibly the subject of any article in the *Labourers' Chronicle*, we are always coming round to the Land Union scheme. There is, for instance, what purports to be a story of "Village Gossip and Village Folly," but we have not got far before we come upon a puff of the Land Union. There is another tale in instalments called "Nehemiah Nudge, the Waste Land Reclaimer," the course of which is perpetually interrupted by digressions on the "sterling advantages" of the new project through which "the down-trodden labourer shall advance step by step to the land of plenty." "Do you mow the hay," the writer asks, "in your employers' fields, and is not the sweet smell of clover pleasant to your sense? Would it not be more pleasant if the meadow were your own?" Do you admire your masters' beasts, and "would not it be far more exhilarating if the team were your own?" "Would not the swinging flail sound sweeter, the grain look brighter, and the straw have a more musical rustle, if you were thrashing your own sheaves in your own barn? Would not the innocent sheep and lambs win more of your admiration and delight, and look whiter and fairer, feeding in your own pastures with your own initials on their sides?" And so on, each question being answered, "Then join the Land Union." And as the writer goes on he grows quite enthusiastic about "cultivating the wastes and turning the barren regions into grazing pastures" for the peasantry, till at last he gives way to his emotion in typographical emphasis, and he exclaims, "Give the Labourers Land! Land for the English Labourer," in large capitals. At the meetings on this subject the professional agents always lay stress on the "tremendous power" which the labourers would wield if they would apply themselves systematically to the acquisition of land. "Land! Land!! Land!!! for the Landless Labourers! Cheaper Food!" is, in sensational type, the heading of an article calculating that, "if every farm-labourer (600,000) had an acre of land to cultivate, it would add from six to eight shillings per week to his income, or an aggregate of from 10,000,000*l.* to 12,000,000*l.* per year to their present inadequate wages, and would produce yearly for general consumption 72 million bushels of potatoes, 11 million bushels of corn, 2½ million fat pigs, 12 million heads of poultry, 250 million eggs, besides tons of cabbages, carrots, onions, parsnips, peas, apples, and other fruits and vegetables." The labourers are called upon to remember that "every penny subscribed will be real property, bearing interest at 5 per cent. and upwards"; that "every penny will buy 4½ square feet of land; every sixpence 27 square feet, every shilling 54 square feet, and every pound over 1,000 square feet, at 40*l.* an acre." And a ballad has also been composed for the propagation of the same ideas, with the refrain—

> It's land that we want, and mean to have it too;
> Yes, some of the land of old England—
> Some of old England's soil!

This is the vision which is systematically kept before the eyes of ignorant and dissatisfied labourers. They are led to believe that unless, somehow or other, they can get the land into their own hands, there is no hope of improvement for them; but that, this step once attained, they will live for ever in ease and plenty, with perpetual sunshine and overflowing harvests. The other side of the picture—the risks of agriculture; the possibility, or rather probability, of failure when cultivation is attempted by incompetent persons who have no knowledge of farming beyond the mere manual labour which it involves; the outlay for machinery, manure, and rent; the chance of bad harvests—all this is of course left out of account in this rosy forecast of steady and unchequered prosperity. It is impossible to imagine anything more insane than the idea of taking the land away from those who have the means and experience to cultivate it properly, and putting it into the hands of poor and ignorant labourers. Yet this is what the agricultural population are being taught to regard, not only as the only remedy for their grievances, but as a right. It may be said that all this is very foolish, idle talk, and that the labourers have a right to their own opinions as to what [illegible] for them. Of course will deny this; but delusive kind leading to disaster. For the present, [illegible] it is proposed that the labourer shall have only so much land as he can buy; but he is also encouraged to believe that the soil is his by right, and that the usurpers who now hold it must somehow be swept away. As this idea gets more deeply rooted in his mind he will perhaps come to think that the process of buying land in the market is rather a slow one, or he may find himself impoverished by his bargain. There is also another possibility which ought not to be overlooked. What security is there that the funds of the Land Union will not be mismanaged? One day it may perhaps be found that, as in the case of other Land Societies, the capital has been hopelessly sunk in unprofitable investments. In short, it is easy to see how in this and other ways a very dangerous state of things is being created. A body of ignorant and discontented men are being practised upon by fanatical agitators and adventurers who hold out to them the prospect of a social revolution. For the present the dupes are hopeful, and think that their dreams may be fulfilled by peaceful means; but when they find how little progress they make towards this ideal, and how many difficulties there are in their way, a change of temper may come over them. During the strike of 1874 the agitators went about denouncing the farmers and landlords as "brutal oppressors," and even little children in the roads bawled after the farmers as they drove to market that labourers would soon have their gigs. Nor has this spirit subsided. A meeting of labourers is to be held at Yeovil on Monday, and the language of the placards, which are also adorned with sensational pictures of the wrongs and miseries of the peasantry, is a sufficient indication of the influences which are to be brought to bear upon the gathering. The labourers are addressed as "White Slaves of the West," and are asked:—"Who burnt three cart-loads of your charity-deeds, and put other parchments where the rats eat them? Who have been educated by the charities left for you? Who kept you in ignorance while they enclose your common lands? Echo answers who? You dry bones of the valley! stand upon your feet." At the top of this bill appears, in conspicuous letters, "Address by Canon Girdlestone"; and it is announced that the "Dead Marsh in Saul" will be played "in memory of Henry Steevens, a farm-labourer of Somerton, whose last words were 'Jane, I'm starving!'" The following "burning questions," as they are called, will then be discussed—emancipation of the mind, freedom of religion, equal

laws for rich and poor, restoration of our charities, manhood suffrage, both Houses of Parliament to be elected by the people, election expenses to be paid by rate, &c. A red card has also been distributed, "to be worn on the hat," with a picture of a skeleton ploughing, under the supervision of a fat farmer, and the words "Thus saith the Lord! Behold the hire of the labourers who have reaped your fields, which is of you kept back by fraud, crieth: and the cries of them which have reaped have entered into the ears of the Lord of Sabaoth. . . . Hear this, O ye that swallow up the needy, ever to make the poor of the land to fail, that ye may buy the poor for silver and the needy for a pair of shoes. Woe unto him that buildeth his house by unrighteousness and his chambers by wrong, that useth his neighbour's services without wages, and giveth him not for his work. The congregation of hypocrites shall be desolate, and fire shall consume the tabernacles of bribery." It is easy to say that all this is only windy rant and means nothing serious. But there can be little doubt that this perpetual agitation is instilling very dangerous ideas and aspirations into the minds of the labourers which ought to be taken into account in considering the expediency of giving them the franchise as a battering-ram.

THE CÔTENTIN.

THE "pagus Constantinus," the peninsular land of Coutances, is, or ought to be, the most Norman part of Normandy. Perhaps however it may be needful first to explain that the Latin "pagus *Constantinus*" and the French *Côtentin* are simply the same word. For we have seen a French geography-book in which *Côtentin* was explained to mean the land of *coasts*; the peninsular shape of the district gave it "trois côtes," and so it was called *Côtentin*. We cannot parallel this with the derivation of Manorbeer from "man or bear"; because this last is at least funny, while to derive Côtentin from *côte* is simply stupid. But it is very like a derivation which we once saw in a Swiss geography-book, according to which the canton of Wallis or Valais was so called "parce que c'est la plus grande *vallée* de la Suisse." And, what is more, a Swiss man of science, eminent in many branches of knowledge, but not strong in etymology, thought it mere folly to call the derivation in question. It was no good arguing when the case was as clear as the sun at noon-day. Now, in the case of Wallis, it is certainly much easier to say what the etymology of the name is not than to say what it is; but in the case of the Côtentin one would have thought that it was as clear as the sun at noon-day the other way. How did he who derived Côtentin from *côte* deal with other names of districts following the same form? The *Bessin*, the land of Bayeux, might perhaps be twisted into something funny, but the *Avranchin* could hardly be anything but the district of Avranches, and this one might have given the key to the others. But both *Côtentin* and *Bessin* illustrate a law of the geographical nomenclature of Gaul, by which, when a city and its district bear the same name, the name takes two slightly different forms for the city and for the district. Thus we have Bourges and Berry, Angers and Anjou, Perigueux and Perigord, Le Mans and Maine. So *Constantia* has become *Coutances*; but the adjective *Constantinus* has become *Côtentin*. City and district then bear the same Imperial name as that other Constantia on the Rhine with which Coutances is doomed to get so often confounded. How often has one seen Geoffrey of Mowbray described as "Bishop of Constance." In an older writer this may be a sign that, in his day, Coutances was spoken of in England as Constance. In a modern writer this judgment of charity is hardly possible. It really seems as if some people thought that the Conqueror was accompanied to England by a Bishop of the city where John Huss was burned ages afterwards.

We have called the Côtentin a peninsula, and so it is. Sir Francis Palgrave points out, with a kind of triumph, that the two Danish peninsulas, the original Jütland and this of the Côtentin, are the only two in Europe which point northward. And the Côtentin does look on the map very much as if it were inviting settlers from more northern parts. But the fact is that the land is not really so peninsular as it looks and as it feels. The actual projection northward from the coast of the Bessin or Calvados is not very great. It is the long coast to the west, the coast which looks out on the Norman islands, the coast which forms a right angle with the Breton coast by the Mount of St. Michael, which really gives the land its peninsular air. We are apt to forget that the nearest coast due west of the city of Coutances does not lie in Europe. We are apt further to forget that the whole of that west coast is not Côtentin. Avranches has its district also, and the modern department of Manche takes in both, as the modern diocese of Coutances takes in the older dioceses of Coutances and Avranches.

Part of the Côtentin then is a true peninsula, a peninsula stretching out a long finger to the north-west in the shape of Cape La Hague; and this most characteristic part of the land has impressed a kind of peninsular character on the whole region. But we must not forget that the land of Coutances is not wholly peninsular, but also partly insular. The Norman islands, those fragments of the duchy which remained faithful to their natural Duke when the mainland passed under the yoke of Paris, are essential parts of the Constantine land, diocese and county. Modern arrangements have transferred their ecclesiastical allegiance to the church of Winchester, and their civil allegiance to the Empire of India; but historically those islands are that part of the land of Coutances which remained Norman while the rest stooped to become French. The peninsula pointing northwards, with its neighbouring islands, save that the islands lie to the west and not to the east, might pass for no inapt figure of the northern land of the Dane. They formed a land which the Dane was, by a kind of congruity, called on to make his own. And his own he made it and thoroughly. Added to the Norman duchy by William Longsword before Normans had wholly passed into Frenchmen, with the good seed watered again by a new settlement straight from Denmark under Harold Blaatand, the Danish land of Coutances, like the Saxon land of Bayeux, was far slower than the lands beyond the Dive in putting on the speech and the outward garb of France. And no part of the Norman duchy sent forth more men or mightier, to put off that garb in the kindred, if conquered, island, and to come back to their natural selves in the form of Englishmen. The most Teutonic part of Normandy was the one part which had a real grievance to avenge on Englishmen; in their land, and in their land alone, had Englishmen, for a moment in the days of Æthelred, shown themselves as invaders and ravagers. But before the men of the Côtentin could show themselves as avengers at Senlac, they had first to be themselves overthrown at Val-ès-dunes. Before William could conquer England, he had first to conquer his own duchy by the aid of France. Bayeux and Coutances were to have no share in the spoil of York and Winchester till they had been themselves subdued by the joint might of Rouen and Paris.

It is singular enough that the two most prominent names among those which connect the Bessin and the Côtentin with England should be those of their two Bishops, Geoffrey of Coutances, for a while Earl of Northumberland, and the more famous Odo, Bishop of Bayeux and Earl of Kent. Geoffrey would deserve a higher fame than he wins by the possession of endless manors in Domesday and by the suppression of the West-Saxon revolt at Montacute, if we could believe that, according to a legend which is even now hardly exploded, the existing church of Coutances is his work. William of Durham and Roger of Salisbury would seem feeble workers in the building art beside the man who consecrated that building in the purest style of the thirteenth century in the year 1056. According to that theory, art must have been at Coutances a hundred and fifty years in advance of the rest of the world, and, after about a hundred and twenty years, the rest of the world must have begun a series of rude attempts at imitating the long-neglected model. But without attributing to the art of Coutances or the Côtentin so miraculous a development as this, the district was at all times fertile in men who could build in the styles of their several ages. A journey through the peninsula shows its scenery, so varied and in many parts so rich, adorned by a succession of great buildings worthy of the land in which they are placed. The great haven of the district is indeed more favoured by nature than by art. In the name of Cherbourg mediæval etymologists fondly saw an Imperial name yet older than that which is borne by the whole district, and the received Latin name is no other than *Cæsaris Burgus*. Yet it is far more likely that the name of Cherbourg is simply the same as our own Scarborough, and that it is so called from the rocky hills, the highest ground in the whole district, which look down on the fortified harbour, and are themselves condemned to help in its fortification. The rocks and the valley between them are worthy of some better office than to watch over an uninteresting town which has neither ancient houses to show nor yet handsome modern streets. The chief church, though not insignificant, is French and not Norman, and so teaches the wrong lesson to an Englishman who begins his Côtentin studies at this point. But, four miles or so to the west, he will find a building which is French only if we are to apply that name to what runs every chance of being præ-Norman, the work of a day when Rolf and William Longsword had not yet dismembered the French Duchy. On a slight eminence overhanging the sea stands Querqueville, with its older and its newer, its lesser and its greater, church, the two standing side by side, and with the outline of the greater—the same triapsidal form marking both—clearly suggested by the smaller. Of the smaller, which is very small indeed, one can hardly doubt that parts at least are primitive Romanesque, as old as any one chooses. It is the fellow of the little church of Montmajeur near Arles, but far ruder. But at Querqueville the name is part of the argument; the building gives its name to the place. The first syllable of Querqueville is plainly the Teutonic *kirk*; and it suggests that it got the name from this church having been left standing when most of its neighbours were destroyed in the Scandinavian inroads which created Normandy. The building has gone through several changes; the upper part of its very lofty tower is clearly a late addition, but the ground-plan, and so much of the walls as show the herring-bone work, are surely remains of a building older than the settlement of Rolf.

From the rocks of the Norman *Scarborough*, one of the only two railways which find their way into the Côtentin will carry the traveller through a district whose look, like that of so much of this side of Normandy, is thoroughly English, to Valognes, with its endless fragments of old domestic architecture, remnants of the days when Valognes was a large and aristocratic town, and with its church, where the architect has ventured, not wholly without success, on the bold experiment of giving its central parts the shape of a Gothic cupola. Is its effect improved or spoiled—it certainly is made stranger and more striking—by its grouping with a spire of late date immediately at its side? There is much to please at

Valognes; but when we remember the part which the town plays in the history of the Conqueror, that it was from hence, one of his favourite dwelling-places, that he took the headlong ride which carried him away safely from the rebellious peninsula before Val-ès-dunes, we are inclined to grumble that all that now shows itself in the place itself is of far later date. The castle is clean gone; and the traveller to whom Normandy is chiefly attractive in its Norman aspect may perhaps sacrifice the Roman remains of Alleaume if the choice lies between them and a full examination of the castle and abbey of St. Saviour on the Douve, *Saint-Sauveur-le-Vicomte*, the home of the two Neals, the centre, in the days of the second, of the rebellion which caused William to ride so hard from Valognes to Rye. A characteristic church or two, among them Colomby, with its long lancets, may be taken on the way; but the great object of the journey is where the little town of St. Saviour lies on its slope, with the castle on the one hand, the abbey on the other, rising above the river at its feet. The abbey, Neal's abbey, where his monks supplanted an earlier foundation of canons, has gone through many ups and downs. Its Romanesque plan remained untouched through a great reconstruction of its upper part in the later Gothic. It fell into ruin at the Revolution, but one side of the nave and the central saddle-backed tower still stood, and now the ruin is again a perfect church, where sisters of mercy have replaced the monks of St. Benedict. Here then a great part of the work of the ancient lords remains; with the castle which should be their most direct memorial the case is less clear. Besides round towers—one great one specially which some one surely must have set down as Phœnician—the great feature is the huge square tower which forms the main feature of the building, and which has thoroughly the air of a Norman keep of the eleventh or twelfth century. But when we come nearer, there is hardly a detail—round arches of course alone prove nothing—which does not suggest a later time. And the tower is attributed to Sir John Chandos, who held the castle in Edward the Third's time. Did he most ingeniously recast every detail of an older keep, or did he choose to build exactly according to the type of an age long before his own? Anyhow, as far as general effect goes, the tower thoroughly carries us back to the days of the earlier fame of St. Saviour. The view from its top stretches far away over the peninsula of which it was once the citadel to the backs of the hills which look down on Cherbourg and the sea, the sea which, if we believe the tale, bore the fleet of Æthelred when the elder Neal drove back English invaders more than three hundred years before Sir John Chandos.

The visitor to St. Saviour may perhaps manage to make his way straight from that place to Coutances without going back to Valognes. In any case his main object between St. Saviour and Coutances will be the great Romanesque abbey of Lessay; only, by going back to Valognes and taking the railway to Carentan, he will be able to combine with Lessay the two very fine churches of Carentan and Periers. Of these, Carentan has considerable Romanesque portions, the arches of the central lantern and the pillars of the nave which have been ingeniously lengthened and made to bear pointed arches. Lessay, we fancy, is very little known. It is out of the way, and the country round about it, flat and dreary, is widely different from the generally rich, and often beautiful, scenery of the district. But few churches of its own class surpass it as an example of an almost untouched Norman minster, not quite of the first class in point of scale. We say untouched, because it is so practically, though a good deal of the vaulting was most ingeniously repaired after the English wars, just as St. Stephen at Caen was after the Huguenot wars. Some miles over the *landes* bring us again into the hilly region round the episcopal city, and Coutances is seen on its hill, truly a city which cannot be hid. Of its lovely minster we once spoke in some detail; of the city itself we may add that none more truly bears its origin as a hill-fort. The hill is of no extraordinary height; but it is thoroughly isolated, not forming part of a range like the hills of Avranches and Le Mans. And, saving the open place before the cathedral—perhaps the forum of Constantia—there is not a flat yard of ground in Coutances. The church itself is on a slope; you walk up the incline of one street and see the houses sloping down the incline of the other. In the valley on the west side of the city is a singular curiosity, several of the arches of a mediæval aqueduct. Pointed arches, and buttresses against the piers, are what we are not used to in such buildings. A road by a few small churches leads to Granville on its peninsula, with its strange church where Flamboyant and Renaissance die away into a kind of Romanesque most unlike that of Ragusa, and the Cotentin has been gone through from north to south. The modern department and the modern diocese go on further; but the "pagus Constantinus" is now done with; the land of Avranches, the march against the Breton, has a history of its own.

THE STRAITS SETTLEMENTS.

THE correspondence or controversy between Lord Carnarvon and Sir W. F. Drummond Jervois on our past and future policy in the Straits Settlements furnishes an interesting example both of the sort of questions that arise in the East and of the working of the new system of colonial government by telegraph. It appears that Sir George Balfour, having served much in those Settlements, desired to place his experience at the disposal of the Colonial Office. He accordingly wrote a letter to Mr. Lowther in November last, shortly after news had arrived of Mr. Birch's murder, in which he says that so long as we had the old quiet in the Straits which terminated with the government of General Cavanagh, we might have abstained from energetically mixing in Malay politics; but from the hour when Sir A. Clarke established a Resident at Perak the old sleepy policy was at an end. "You cannot now draw back; you cannot stand still; and the only solution of our complications is active and decided enforcement of our power over these petty Malay chiefs." He adds that the disturbances then recently reported were favourable for opening up this fine land, and he recommends the construction of roads, the navigation of rivers, the presence of a large force, the destruction of native stockades and defences, the punishment of murder and breach of faith, and rewards and pensions for good service. He is only moderately alarmed at the prospect of a "holy war," as the Arabs, who would lead it, are fond of money, and might be threatened with deportation to Arabia, where the holy character would be as unmarketable as coals at Newcastle. The writer thus far seems to adopt the same policy as Governor Jervois, and, although he thinks that a military officer would have succeeded better than the late Mr. Birch as Resident at Perak, yet he regards the "upholding of our influence" as the Resident's proper business; and we may assume that he would not be satisfied with tendering advice only to be disregarded. Finally, by an intelligible metaphor, he declares that "Malay weather is suitable, pleasant in some respects"; and he hopes that a little judicious energy will soon bring "the affair" to a close.

If we rightly interpret Sir George Balfour's letter, it recommends a policy which Lord Carnarvon has rejected. The weather may be tempting, but he will make no voyage, and in his view there is no "affair" to be settled, and no particular scope for judicious energy. The substance of his telegrams and despatches to Governor Jervois is to do nothing, and to do it very much. Of course the outbreak must be vigorously suppressed, but it is not to be made an opportunity for anything like that "opening up" of the Malay peninsula which Sir George Balfour contemplates as probable. Lord Carnarvon seems to wish and almost hope for the restoration of that "old quiet in the Straits" which the late Governor, or destiny, destroyed. He has not the smallest desire for energetically mixing in Malay politics, and we may perhaps assume that he does not sympathize with the inclination of the new Governor to commence or prosecute a conquering and civilizing administration. Above all, he counts the cost of war, and remembers that military success, in itself gratifying, may disagreeably influence the year's estimates. On the whole, the Colonial Secretary may be regarded as a drag, often useful, but sometimes irritating, on colonial activity. He has so sharply reprimanded Governor Jervois for thinking and acting for himself that other governors are not likely hereafter to exhibit offensive originality. Enthusiastic posthumen, if there are any, would probably measure the happiness of mankind by the number of telegrams received; but a colonial governor may be excused for wishing Downing Street "[illegible]" when it demands telegraphic explanations of policy at the crisis of a revolt. It appears that Governor Jervois assumed office rather more than a year ago, and, having taken time to look about him, he had formed his plan of administration, which he erroneously believed to be in accordance with Lord Carnarvon's policy. Before his arrival, an "engagement" had been entered into between the British Government on the one side and Sultan Abdullah of Perak and certain chiefs on the other, by which it was arranged that British officers were to be appointed as Resident and Assistant-Resident in Perak, and "their advice was to be taken and acted upon on all questions other than those touching Malay religion and custom." As regards this "engagement," it may be questioned, first, whether the late Governor, Sir Andrew Clarke, had authority to enter into it; and, secondly, what it meant. But Governor Jervois found it in existence, supposed it to be binding, and understood it in its obvious sense. Even Sir George Balfour, although he thinks that "a captain of native infantry" as Resident would have had special power of persuasion, implies, as we understand, that there must be a power of compulsion in the background. Governor Jervois found that the relations between adviser and advised were unsatisfactory. The Resident's advice was disregarded, and he must either passively witness acts which he disapproved, or practically assume the government of the country. We all know that native princes are supple in manner and obdurate in conduct; they will sweetly promise everything and pertinaciously do nothing. "As intractable as he was civil, as obstinate as he was courteous, and as firm as he was seemingly acquiescent," is Governor Jervois's neat sketch of Ismail, the rival of Abdullah as Sultan of Perak. Lord Carnarvon has the telegraph at command, and if he can perform a task to which white-washing a negro would be a joke, a grateful nation will applaud him. He may perhaps encounter a difficulty like that which the Watch propounded to Dogberry when he charged them to call at the alehouses and bid those that are drunk get them to bed. "How if they will not?" On a moderate estimate of the longevity of Governments, it is probable that Lord Carnarvon's policy will last his time, although really it is more hopeless than Dogberry's; for the night's drunkards would be sober in the morning, but the Ethiopian cannot change his skin, nor the leopard his spots, nor the Sultans of Perak their polite intractability. We may observe that even at the Colonial Office they often listen to advice which they do not follow.

Governor Jervois contends that he was only pursuing a course

initiated under sanction from home by his predecessor, and further that this course was necessary. The former question is personal and temporary, while the latter has general and lasting interest. Lord Carnarvon has dealt fully with the past transactions, but he reserves the question of future policy for a separate despatch, and whatever he writes upon this important subject will be carefully considered, although the task he undertakes is, we fear, rather too like mopping up the ocean. The latest Parliamentary paper issued on this subject contains a despatch as long as a pamphlet from Governor Jervois, and Lord Carnarvon's answer, which is not much shorter, and appears to have been presented to Parliament as soon as it was sent off. Colonial governors are allowed, or at least assume, considerable latitude as well as longitude, in the language they address to the Colonial Office, and perhaps the annoyance of perpetual telegrams is compensated by the opportunity of publishing pamphlets at the national expense. Lord Carnarvon, on the other hand, although perfectly courteous to his subordinate, is not so meek as when he addresses the blustering politicians of South Africa. But, after all, the "cheek" of the Governor or the responsive snub from the Colonial Office is of small importance to any but the giver and receiver. The matter of public interest is the future relations between the British Government and Perak and the other Malay States. "Even if it were ever contemplated," says Governor Jervois, "that the Residents should confine their attention to merely giving advice, it has been found from the very commencement that such a course has been impossible." Again he says:—"When I arrived here in May last I found that each Resident was practically administering the government of the State to which he was accredited, and I certainly always considered that this was understood to be the case in the Colonial Office, as it certainly was by every one out here, from the very commencement of the Residential system." This remark applies to all the States to which Residents had been accredited, and in the case of Perak the necessity for this course was enhanced by the anarchy caused by the rival claims of Ismail and Abdullah. The writer then quotes his predecessor's instructions to Mr. Birch, issued nearly a year before the outbreak, as to the revenue of Perak. He is to allow the existing system to go on for the present, but "he will use his best exertions to put down, by force if necessary, all unlawful exactions, of whatever nature." We do not see how these instructions could be carried out by a mere adviser of the Sultan. He then quotes from Reports by Mr. Birch showing how he carried out these instructions, and these Reports were seen by Lord Carnarvon. When he arrived at Singapore he found, as he says, that each Resident was practically administering the government of the State to which he was accredited, and he considered that he should only be carrying out the views of the Colonial Office in supporting such a system, and endeavouring, if possible, to bring it to a successful issue. This system was not introduced by him, but he found it in operation, and he considered it under the circumstances a logical consequence of intervention. In his view the only question with regard to Perak is whether the policy should be maintained of governing by a British officer in the name of the Sultan, or whether the country should be annexed as a portion of Her Majesty's dominions; and we cannot help thinking that, however Lord Carnarvon may labour to show that there is a third course open to him, it will ultimately appear that this is the only question. The revenue of Perak would increase, and the Government is assured by influential and wealthy Chinamen that, if Perak were under British rule, swarms of industrious Chinese would flock in; and these, with the Chinese and British capital which would soon be invested, would completely change the face of the country. The agricultural and mineral wealth of Perak is very great, and with the introduction of immigration and coolie labour, the Malays would soon be outnumbered, and all difficulties respecting them would cease.

Lord Carnarvon answers that Mr. Birch's Reports were seen to contain indications of an assumption by the Residents of duties in excess of their position as counsellors, and on this account he cautioned Governor Jervois against the growth of this tendency. Further, "he cannot admit that the system introduced by the Governor when the proclamations were issued, providing for the Government of Perak in the name of the Sultan by British Commissioners responsible to the Governor, was merely a slight modification of the existing system as already approved." Lord Carnarvon rightly holds that this was a considerable change, on which the Home Government should have been consulted, and it is difficult to perceive that necessity for immediate action which was assumed by the Governor. But even if this necessity existed, "the telegraph was available," and Lord Carnarvon thinks it should have been used. We may be sure that any possible exposition by telegram of the Governor's plan would have drawn a negative from home, and if the matter were urgent and could not be briefly explained, the Governor rightly acted on his own responsibility. But we doubt the urgency. The Governor admits that he erred in miscalculating the resistance which the Proclamation would provoke. We cannot help thinking that so grave a step should not have been taken without preparation, which would have involved reference to the Colonial Office and consequent prohibition. As to the past, therefore, Lord Carnarvon is well founded in his strictures, but we incline to think that Governor Jervois has more correctly gauged the future.

THE ROYAL ACADEMY.

V.

IT is hard to tell whether portrait-painting as an art is rising or falling, but certain it is that prices are rising. Of this encouraging fact to Academicians and others we may quote a cogent proof. Gainsborough painted the famous Duchess of Devonshire, a picture which, it is said, was in the year 1839 purchased for 50*l*. The other day, when, on the death of a well-known collector, the work had to be brought to the hammer, the state of things was changed as follows. The bidding began at 1,000 guineas, the next bid was 3,000, and then, with mad advances of 1,000 guineas, alternating with comparatively lucid intervals of only 500, the picture was finally knocked down, amidst applause, at the extravagant sum of 10,100 guineas, the highest price, it is supposed, ever realized in a London auction mart. We need scarcely add that this is the picture which has since been cut from its frame and stolen. Such being the rise in prices, it is no wonder that the genius of our generation, especially when the genius is so distinguished as that of Sir Francis Grant, should be given up to portrait-painting.

Portraiture, though often deemed a monotonous art, displays considerable variety. It is true that it often falls a victim to modern fashion, that conventional backgrounds are transmitted from generation to generation; but, on the other hand, faces that are far from fair, and figures that are by no means faultless, acquire "style" through treatment—a style sometimes borrowed from Vandyck, and sometimes from the Dutch, a style occasionally touched with dignity and with a deep glow of colour reflected from Titian, and often with a grace and persuasive manner as if certain artists of our day had inherited the palette and the pencil of Reynolds. Mr. Pettie's "Portrait in the Costume of the Seventeenth Century" (886) is in bearing worthy of Vandyck, and in colour recalls Venice. Mr. Sant and Mr. Archer, on the contrary, strive to emulate Reynolds. The fault of Mr. Sant is that, though graceful, he is colourless in the two "Daughters of Mr. Carl Siemens" (197). An analogous example of composition portraiture is Mr. Archer's "Spring Flowers. Norah and Hilda, twin daughters of the late Mr. David Reid" (41). This habit of transforming a mere portrait into a fancy composition is much to be commended, the manner is caught from Reynolds, a master who had a happy knack of suggesting a story through a situation, and of enhancing the childlike simplicity of youthful sitters by landscape surroundings which never violate the modesty of nature.

Mr. Leighton has tried a fresh technique in the vigorous head of "Captain Richard Burton" (128). To gain power, he exchanges his usually smooth surface for a rough texture loaded with pigments which stand out in absolute relief; thus extremes meet. Mr. Ouless also favours us with vehement handling in the head of "The Right Hon. Edward Ploydell Bouverie" (77). The same artist, in "The Portrait of Sir R. P. Amphlett" (456), achieves success in great measure by the studied relation between the head and the hands—a reciprocity of action, resulting as usual in the expression of governing intellect and will, which seems to have been suggested by certain celebrated figures by Titian and Raffaello. Our artists are wise thus to lay down their lines in the old landmarks. Mr. Wells is among the most liberal of contributors; he sends no less than seven works—one a landscape. In the portrait of "Dr. Lionel Beale" (1327) he relies on the now common device of loading on colours to gain force. But it is to be observed that our painters, in giving forth the abundance of a full-charged pencil, lack the adroitness of the old masters—Rembrandt and others—who with a firm lusting brush left marks of undulating lines which, as in line-engraving, express the modelling of surfaces.

Mr. Orchardson's best picture is a "Portrait" (107); the head, kindled into fiery colour, has been forced up by intensity of background; the treatment is defiant, but scarcely extravagant. The best work of Mr. Prinsep's also is a portrait; the artist has a fortunate subject in "The Lord Lawrence" (1334); the merit of the work greatly lies in the harmonious relation maintained between head and hands, which is always, as we have said, a distinguishing mark of intelligent portraiture. Mr. Watts is quite himself when giving intellectual consistency and concentration to the head of "Mr. Macnamara, Surgeon to Westminster Hospital" (1275). It may be objected, however, that the principle of subordination of draperies and accessories has been carried too far. We have before done justice to the portrait of "Mrs. Sebastian Schlesinger" (248), by Mr. Millais. The artist seems to strive to combine the intellectual with the esthetic in the head of "The Right Hon. Lord Lytton, Viceroy of India" (240). Sad it is to confess that the male and female portraits of this year add point to the satire that, while God makes the man, the milliner makes the woman. Foreign painters are at their worst, especially Herr Koberwein, in his wooden effigy of the "Duke of Edinburgh" (105), and Herr Muller, in the portrait of the "Princess Louise" (395). Also conspicuous among failures are contributions from Mr. Hallé (1162), from Mr. Sandys (1139), and Mr. Charles Landseer (293). The following have deservedly obtained general commendation:—"Viscount Enfield" (312), by Mr. Lehmann; "Mrs. Marmaduke Whitaker" (386), by Miss M. Brooks; "Mrs. Henry King" (866), by Miss Starr; and "Mr. Thomas Selway, Stonemason, Ottery St. Mary" (1096), by Lady Coleridge.

Landscapes wherein figures take a prominent part have been for many years on the increase throughout Europe. We all know that even in Italy the time for "Flights into Egypt" and the like

is past; but in place of such sacred compositions the French addict themselves to classic idyls, and the English to pastorals peopled by rustic peasantry. Mr. F. Morgan, in a sunny, pleasant scene, well painted and happily composed, has combined haymaking, haymakers, and geese (2). Geese have become quite the fashion since Mr. Frederick Walker showed their pictorial value for high lights and for headlong movement. Mr. John Linnell, senior, somewhat after the manner of Rubens, felicitously composes landscapes with figures; the secret of success with him, as with all others, being the ordained unison between humanity and what Mr. Carlyle would call the universe. "The Hollow Tree" (51) is the simple theme which Mr. Linnell enhances by colour and enlarges by outlook across a distant landscape. Mr. Hook, who again disports himself on the confines of ocean, and Mr. Boughton, who prefers to take his stand inland, are other artists who bring figures into intimate relation with the primal elements of earth, air, and water. It may be objected, however, that, for the sake of effect, Mr. Hook sometimes exalts his figures to colossal proportions. We have marked for commendation "Mountebanks on a Wet Road" (349), by Mr. Richards, and "Lowering Marble from the Quarry—Carrara" (460), by Mr. Poingdestre, an artist who has favourably identified himself with these mountains of marble.

Landscapes this year receive hard treatment under anti-sympathetic hangers. Several artists who by arduous study have gained an acknowledged position find themselves absolutely excluded, while some of the worst landscapes, if they but come from within the pale of the Academy, gain distinction. Take as an example Mr. Vicat Cole's "Decline of Day" (308). The scale is ten times in excess of the motive, the execution is weak, the effect meretricious. The election of Mr. Oakes over the heads of several highly qualified competitors has taken the world a little by surprise. After the artist's usual manner, "Fording a Tidal Creek" (6) confounds creation with chaos. Better brought together is "Sheltered" (36); in this cove of the sea the wind is on the wave, and wind and rain are in the sky; the colour is modestly grey and wholly harmless. Not so, however, the flaring colour of "Sir Thomas's Tower" (532), by Mr. Brett, a leading competitor for the Associateship. The rocks here are as of cast iron coming out of a furnace. We can well understand that Academicians, who mostly have reached the state of mind in which "to rest and be thankful" becomes a welcome motto, are afraid of close contact with artists who threaten a conflagration. But Mr. Peter Graham was always safe from fire, though not from flood; and yet we fear that "Moorland Rovers" (885) will not open to him the doors of the Academy. Mr. MacWhirter, however, may approach a little nearer to the goal by "The Lady of the Woods" (511), a title not inappropriately given to feathery birch trees, which often raise their graceful heads among sterner growths as fairies of the forest. We may also note for commendation "An Autumn Evening; Barges passing a Lock on the Thames" (20), by Mr. Leader; "Coney-hurst Cottages" (5), by Mr. Adams; and "Capri, from the Valley of the Pines, Massa; Morning Effect" (489), by Mr. White.

"Over the Hills and Far Away" (106) we have already done full justice to. Mr. Millais's boy rushes into a rainbow, and evidently he has gained a little knowledge of nature since the time when he depicted a [illegible] district. Below repeating the precise order of prismatic colours [illegible] apple of an almond merest tiro in science knows that, in the not unusual first class in [illegible] two rainbows, the second reverses the colours [illegible] one first. In a previous article we enumerated some of the principal landscapes in the Exhibition; we may now add an impressive scene, "Near Via Reggio, where Shelley's Body was Found" (945), by Mr. W. B. Richmond. The artist has cast over an array of mountains, backed by a lurid tempestuous sky the dramatic intensity and grandeur which we have reason [illegible] when a disciple of high art transfers his motives from [illegible] landscape. An ominous storm bursting suddenly into [illegible] of sunset glory stands in natural relation to the tragic death [illegible] author of "The Revolt of Islam." We may here mention [illegible] amateurs on whom professionals can afford to look kindly. [illegible] Hunt Hardinge seems to have been greatly impressed by a "Mountain Pass in the Valley of Cashmere" (1299) and Sir Robert Collier, in "The Austrian Tyrol" (21), fails with other amateurs only because, misled by ambition rather than guided by knowledge, they all shoot at the moon and miss. Reverting to professional artists within the Academy, we come across certain bridges and water-wheels perpetrated by Mr. O'Neil, an Associate who does not appear quite competent to compete for a prize in "the O of Giotto."

Marine-painting is in decadence; yet the First Lord of the Admiralty argued at the annual dinner that it is "in maritime States that the fine arts have most succeeded," and that "the maritime supremacy of this country will *pari passu* be accompanied by excellence in art." Mr. Ward Hunt also ventured on the statement that Her Majesty's ship *Inflexible*, at the launch of which he had assisted, would prove a fit subject for the painter. When we look around the Exhibition, these hopes prove delusive. Mr. Cooke still naturally shows his old predilection for fishing-boats on the Zuyder Zee (223), and Mr. Hook continues to catch crabs in a little boat in chopping waters (254). We must give a passing word of praise to "Shearing Wraick in the Sound of Harris" (98), by Mr. J. Macallum; "Home from the Herring Fishing" (610), by Mr. Allan, and "A Lifeboat" in a devouring sea (455), by Mr. Henry Moore.

Animal-painting is sounder on the Continent than in England. Sir Edwin Landseer set an example which others have followed and exaggerated; he and his emulators make animals ape humanity; the poor dumb creatures are expected to speak, weep, or laugh. This excess of misplaced sentiment is possibly but the reaction from the stiff and stuffed animals which Mr. Cooper and Mr. Ansdell continue to paint and exhibit year by year. Too much after the circus style are "The Mares and Foals; Picardy" (557), by Mr. Davis. More sober and true to nature are horses ploughing on a spring morning (506). Mr. Beavis usually paints horses as if he had tried horse-breaking but never succeeded. Mr. H. Hardy is guilty of a most obnoxious menagerie, brought together on the pretext of "God's Covenant with Noah" (899). Such hideous creatures do not deserve to be saved from a Deluge; the colour is as detestable as the forms are disagreeable.

The two Galleries devoted to water-colour drawings, chalks, etchings, and architectural designs present little out of the common. Of the last we shall have something to say on a future occasion. Among the drawings, however, we may note "The Casket" (655), by Mr. Muckley; "Schoolwards" (696), by Mr. Lidderdale; "The Last Sight of Fiammetta" (757), by Mrs. M. S. Stillman; and "Idle Moments" (803), by Miss E. S. Guinness. We cannot congratulate Mr. E. M. Ward on "Jour maigre; the Fish-market, Caen, Normandy" (689); nor Mr. Chevalier, who was present by command at "The Grand Review on the Occasion of the Marriage Festivities at St. Petersburg, 1874" (857).

Mr. Henry Blackburn is the author of a pretty pamphlet entitled "*Academy Notes*, with upwards of one hundred illustrations of the principal pictures at Burlington House." The illustrations have all the more value because the drawings have in many cases been made by the artists themselves. The accompanying letterpress is intentionally descriptive and not critical. These illustrated Notes, which now reach a second year, are an improvement on the first. The little book, published at a modest cost, may serve as a pleasant reminiscence of many works with which we have sought to make our readers acquainted.

THE OPERAS.

TWO operas of widely different schools—*Semiramide* and *Les Huguenots*—have been given since M. Faure's appearance, with strong casts, at Drury Lane. *Semiramide* is an admirable example of the pure Italian school. There is immense opportunity in the story for dramatic treatment; but the composer's chief care was to produce a succession of melodious sounds. This result he perhaps never attained more fully than in the *Semiramide*, where every florid cadence, almost every harmony, whether for voices, for instruments, or for both combined, is completely beautiful. While the ear is in this way delighted, the eye might be equally pleased with the pomp and splendour of the Assyrian Court. But even if this condition were fulfilled, one could scarcely avoid longing at times for the dramatic fire of the later composer. Situations of the most intense character are lost in mazes of exquisite tunefulness, and here and there, notably in the accompaniment to Arsace's air in what, according to the book, is the second scene of the third act, Rossini's use of the orchestra reminds one of the term scornfully, and not altogether unjustly, applied to the Italian orchestration by the newest German school, who call it the twanging of a big guitar. It is the fate of established principles in art as in politics to be attacked in the interest of progress, and the result of the conflict in both cases illustrates the doctrine of the survival of the fittest. The stormy fire of Phèdre's terrible story is in some way quenched by the slow stateliness of Racine's verse; and so is that of Semiramis's no less terrible one by the abundant sweetness of Rossini's music; but both play and opera have in different kind qualities by which they are likely to live in spite of later methods.

It depends greatly upon the singers in *Semiramide* whether the effect of the opera shall be dramatic as well as musical; and it would be difficult to find three singers so well fitted to invest the three principal parts with the desired passion as Mlle. Titiens, Mme. Trebelli, and M. Faure. Mlle. Titiens may be said, as a comedian and a singer, to belong to no school; she has in her acting, as in her vocalization, a sweeping grandeur which is exclusively hers. M. Faure and Mme. Trebelli have both brought the method of the French school to perfection; and each shows what effect constant and careful study, allied to the finest natural talent, can produce. M. Faure, whose costume and make-up were, as always, admirable, gave a most striking representation of Assur. He conveyed the idea of a villain, commanding, cold, and remorseless, whom nothing could divert from his purposes. The effect of the spectre's appearance on him is merely transitory. In the next scene alone with Semiramis he has completely recovered from the disturbance of his faculties, and there is a lofty, almost careless, scorn in his taunting her with their joint plot for her husband's death. It is worthy of remark how the singer, exhibiting here almost precisely the same facial expression which he presents more than once as Mephistopheles, yet gives to it another character which is dependent on something more than the different framing of the face. M. Faure appeared a little hoarse on the first production of *Semiramide*; but, as was only to be expected, his singing of the florid music was so sure and finished, his phrasing so well studied, that one would have been more than content with such singing even if it had not been combined with admirable acting. Mlle. Titiens's Semiramis is a splendidly tragic figure, and Mme. Trebelli's

Arsace is the embodiment of youthful ardour and nobility. The great duet between the mother and son was sung perfectly, and the expression on the one side of repentant, on the other of pitying, tenderness was admirable. Of the performances of these two singers, as of the others concerned in the opera, we spoke at length last year. A defect in the stage management which was then apparent remains unaltered. The amount of light upon the stage in the last scene gives an impossible air to the blind wandering after each other of the three principal characters. It is as if they were performing some curious dance figure. One would like to know also how carved elephants come to play an important part in the decoration of Semiramis's palace, and why the name of Ninus is written over his tomb in choice Italian. The overture was well played, the delicacy of the violin passages being, as before, admirable, and the choruses were given steadily.

One could hardly wish for a finer performance of *Les Huguenots* than has been given at this house. The dramatic feeling, the tunefulness, the command of orchestral resources, the power of investing music with characteristic passion, which together make up what the disciples of Herr Wagner are pleased to call "the olla podrida of Meyerbeer," do not often find such complete expression. It is the more strange that this contempt for Meyerbeer should be entertained, inasmuch as, if we are not mistaken, Herr Wagner's starting-point was the necessity for fitness in the music of an opera to the dramatic requirements of its story; and this is precisely what is found in Meyerbeer. However, Meyerbeer never recognized the real power of Herr Wagner, which may be some reason for Herr Wagner's disciples objecting to Meyerbeer; and there is some truth in what M. Blaze de Bury has said: "Les Allemands sont impitoyables; ils ne pardonneront jamais à Meyerbeer d'avoir pris en France le point d'appui de sa renommée, de les avoir voulu conquérir de chez nous."

The instrumental performance at Drury Lane was excellent, and would have seemed to us nearly perfect but for Sir Michael Costa's singular fondness for noise. The *Huguenots* does, no doubt, require a certain amount of noise, but it is surely not desirable to exaggerate this to the extent of drowning the voices, which are intended to be sustained by the orchestra. In the singing and acting of the opera it would be difficult to find much defect. Signor Fancelli and Mlle. Titiens appeared together again as Raoul and Valentine, and gave the great duet with surprising power. From Mlle. Titiens, indeed, one expects nothing else; but Signor Fancelli, who, with many merits, is apt both to phrase and act with some heaviness, seemed to us on this occasion to do better than he has ever done before. Mlle. Titiens's splendid voice was in perfect order, and her acting, even to the management of the two falls in the scene with Raoul, was, if possible, finer than ever. Another duet very finely sung and acted was that between Valentine and Marcel, which part was filled by Herr Rokitansky, who has reappeared after a long absence. Since Signor Medini's too short appearance here, no Marcel at all equal in merit to Herr Rokitansky has been seen; and Herr Rokitansky has the advantage of Signor Medini in certainty of intonation. He represented the bluff warrior and faithful servant with great truth and simplicity, and his powerful voice, which seems to have no harsh note in it, and to take without effort tones deep as the thunder, was managed with masterly skill. It would be well if the promise of Herr Rokitansky's appearance as Bertramo in *Roberto il Diavolo* were fulfilled. Mme. Trebelli's bright gaiety of manner and action, and exquisite skill and feeling in singing, made one wish, as always, that there were more of Urbano. The laughing impertinence with which she looks at Marcel in the first scene is delicious. Mlle. Elena Varesi sang the music of Marguerite de Valois with freshness and fluency; but one desired something more like royal dignity in her demeanour. Mlle. Varesi spoilt the effect of a good dress by the staring red face which she carried. Signor Rota's St. Bris was in all respects satisfactory, and M. Faure appeared as Nevers. There is a story that M. Faure's first performance of this part was the result of a wager with a manager that he would give it importance. Whether that is true or not, it is matter of record that M. Faure was the first singer who brought the part into light, and in so doing showed that Meyerbeer treated the personages in the second rank of his work with as much care as he gave to those in the first.

M. Faure's Nevers is the essence of gaiety, courtliness, and chivalry; the type in character of the Cavalier in romances which treat of Charles I.'s time. In his hands Nevers becomes the principal person in the first scene. One cannot help watching him as he sits at table, even when he is not singing, and observing how the actor's talent comes out even in the handling of his goblet. It is not recklessly brandished as goblets generally are in operatic drinking scenes; the Count seems to be really drinking and talking with a company of light-hearted friends; for M. Faure's wonderful brightness of manner seems to communicate itself to those around him, to create life where one too often sees the mechanical motion of puppets. Throughout the scene M. Faure's acting is the perfection of high comedy, and the small piece of business at the end when he stands laughingly in Marcel's way as Raoul goes out is admirably invented and executed. It is perhaps needless to say that his singing in this scene, as throughout, was perfect. While speaking of this scene, we may suggest that it would be desirable to bring in Raoul's letter without an envelope. In the second scene M. Faure's dignity in the quartet of the oath was remarkable; and it was with a fine perception that he made the outward expression of Nevers's wrath at the rejection of St. Bris's daughter by Raoul second to that of St. Bris himself. Nevers's appearance in the second act is very short, but the tender and chivalrous devotion of M. Faure's manner as he approached Valentine, the grace and dignity of his aspect as they went to the barge, gave it a singular importance. His most striking scene was of course in the third act. Here the changing expression of his face as he listened to the opening of St. Bris's designs for the extermination of the Huguenots, the repressed anger and scorn with which, having risen, he pulled off his gloves and flung them impatiently down as he took his place again, the moody attitude in which he sat until every one else had taken the required oath, led well up to the fine outburst of indignation and disdain with which, again rising, he refused to degrade his sword to assassination, and flung it at St. Bris's feet. The action gave the perfect idea of a chivalrous soul revolted at vileness; and the reassuring tenderness with which he paused and stooped to kiss Valentine's hand before he went out under the guard of St. Bris's soldiers was like the last fine touch to a splendid picture.

THE DERBY.

ON three candidates in particular for the great race of last Wednesday the attention of the public has been for weeks past directed. Petrarch, Skylark, and the Mineral Colt had each of them special claims to consideration, and each has been persistently supported by a large body of partisans. After the absurdly easy victory of Petrarch in the Two Thousand Guineas, it was difficult to find any sound reason for opposing his chance for the Derby. That the horse was not fully wound up at Newmarket was patent to the most ordinary observer; that he won in a style which has rarely been equalled was equally indisputable; and the utmost that could be urged by those whose wish was father to the thought that Petrarch was not a first-class horse was that he was only called upon to beat a second-class field. It was said that both the Middle Park Plate and the Two Thousand fields were of moderate quality, and that therefore it was no very great achievement to carry off these two races. It was not Petrarch's fault, however, if his opponents were not of first-rate quality. A horse can do no more than win his engagements in good style, and beat fairly and squarely such company as he may chance to meet. That Petrarch did this there can be no manner of doubt; and the greatest horse that ever was foaled could not have improved on the form shown by the son of Lord Clifden and Laura in the only two races for which he has started. It was said also that a horse with such astonishing speed is not always a stayer; and the fact of Petrarch's having won a mile race in a common canter was seriously urged as a reason why he would be unsuccessful in one over a mile and a half. Considering that until a horse has tried in public to compass a mile and a half it is premature to suggest his inability to accomplish this feat, the worth of this argument cannot be very highly rated. Every winner of a great race, however, has a certain number of enemies as much as every loser has of apologists; but even the most ingenious critics were unable to anticipate danger to Petrarch in the Derby from anything that finished behind him in the Two Thousand. The case of Julius Cæsar, of Great Tom, of Wild Tommy, and of Coltness was by common consent abandoned as hopeless; and it became necessary to look in another direction for the threatened opposition to the Two Thousand winner.

The public form of Kisber, better known as the colt by Buccaneer out of Mineral, deservedly commanded a great amount of respect. It is true that he was beaten three times as a two-year-old, by Levant, Farnese, and Gilestone in the July Stakes, by Farnese and M. de Fligny in the Stetchworth Stakes—both in the Newmarket July Meeting of 1875—and by Petrarch in the Middle Park Plate; but his solitary victory in the Dewhurst Plate was held by his friends to atone amply for his previous failures. In that race the Mineral colt not only beat Springfield, accounted at that time one of the best two-year-olds of the season, as well as Bay Wyndham and King Death, both winners of important events, but also ran away from Madeira, the second to Petrarch in the Middle Park Plate. Great expectations had been formed of the Mineral colt in the Middle Park Plate, and his signal defeat in that race was at once repudiated by his friends. When, therefore, a fortnight later, over a longer course, he succeeded in beating Madeira much further than Petrarch had beaten her, his supporters at once jumped to the conclusion that he was a genuine stayer, and longed for the time to come when he could do battle with the son of Lord Clifden once more. Certainly, as far as appearances went, the Mineral colt looked as if he would develop into a wear-and-tear animal, without a great dash of speed, but capable of staying over long courses; but still he had been beaten under circumstances that made it necessary to devise excuses for him, and it would have been an extraordinary circumstance if in a single fortnight a horse could improve a stone in form. Undoubtedly Petrarch gave the Mineral colt a stone beating in the Middle Park Plate, and for our own part we inclined to the belief either that Madeira went off between the Second October and Houghton meetings, or that Petrarch won the Middle Park Plate so easily that half the field were pulled up, and the barren honours of second place became a matter of chance, rather than that the son of Buccaneer and Mineral made such astounding progress in so short a space of time.

The last of the trio, Skylark, besides being a splendid-

looking horse, worthy in his outward characteristics of his illustrious sire King Tom, had the rare recommendation of being unbeaten, and of having won all his six races in thoroughly gallant style. As a two-year-old he won the Gladiateur Stakes at the Newmarket July Meeting, beating M. de Fligny; the Chesterfield Stakes at the same meeting, beating Gilestone and Hellenist; the Rutland Stakes, beating nothing in particular; and a rich Post Sweepstakes of a thousand sovereigns, beating King Death, Twine the Plaiden, and Coltness. This year, Skylark, having made all the improvement during the winter that could be expected, has run twice with equal success; and there were only two reasons why he has not figured for some time past at the head of the Derby quotation. The first was that doubts existed as to his soundness. He is known to have always been affected with curby hocks; but that ailment has not prevented many horses from winning great races. Of late, however, the rumour spread that one of his forelegs had shown signs of giving way, and in consequence his position has been seriously assailed, while, as week after week passed by and no rain fell, and the ground became harder and harder, his supporters were unable to conceal their anxiety. The second objection to Skylark was that he had never beaten anything better than M. de Fligny, Gilestone, Twine the Plaiden, and Hellenist. We have already mentioned that a similar objection was raised against Petrarch himself; and therefore it came to this, that the only two unbeaten horses of their year were both cavilled against because it so happened that they had never had an opportunity of meeting to decide their respective claims to superiority. We may add a remark which ought properly to have been made earlier, that one desperate argument for the discomfiture of Petrarch was found in the recollection that more than one winner of the Two Thousand had failed to repeat his victory at Epsom. Macgregor, it was remembered, who carried off the Two Thousand in a canter, was only a bad fourth in the Derby; but it was forgotten that the ground in 1870 was unprecedentedly hard, that the long drought had almost driven trainers distracted, and that only the week before the Derby Macgregor had been sent to Bath to race on ground as hard as adamant; that, in fact, everything within human power had been done to render his defeat a certainty. On the other hand, the double victories of Lord Lyon and Gladiateur were equally worthy of remembrance, and indeed the expectation of the winner of the Two Thousand finishing there or thereabouts in the Derby has become an axiom of the Turf which the event rarely contradicts.

The antecedents of the horses which finished behind Petrarch in the Two Thousand were duly referred to by us at the time, and need not be dwelt upon again. It was the universal opinion that not one of them had the slightest chance of turning the tables on the son of Lord Clifden and Laura at Epsom, and hence their names, up to the very last, remained almost unmentioned. But outside their ranks there were several promising candidates in addition to the Mineral colt and Skylark. Of these All Heart, who ran three times as a two-year-old, and was beaten on every occasion, was, strange to say, nearly as good a favourite as Skylark, who had run six races and had been victorious in all. All Heart made his first appearance at Doncaster in the Champagne Stakes, and, being totally unable to go the pace, was beaten by King Death and M. de Fligny, as well as by the winner, Farnese. Two days later, over a slightly longer course which it was deemed would suit him better, he was again beaten by Farnese, who carried a 7 lbs. penalty, but succeeded, at the same difference in the weights, in shaking off M. de Fligny. And, lastly, at the Second October Meeting, Farnese presented him with 10 lbs. and for the third time gave him a handsome beating. Against these three defeats what was there to set to the advantage of All Heart; what was there to be pleaded in his excuse? In his favour were his breeding, by King Tom out of Marigold, the dam of Doncaster, and his grand appearance, worthy of his relationship to the illustrious Derby winner of 1873. Seldom has a two-year-old excited such a feeling of unqualified admiration as All Heart when first he appeared in public in the paddock at Doncaster. "There goes a real Derby horse" was the verdict pronounced on all sides, and not all his defeats could alter the original conclusion of a jury whose judgment is seldom very far wrong. There is no doubt that All Heart comes of a family which requires time to bring out its great racing qualities. He was altogether raw, unformed, and unfit for racing as a two-year-old; and, for our own part, we never could see what object his owner had in view in prematurely forcing his powers, in exposing him to annoying defeats, and in jeopardizing his chance of future success. There was no chance of his winning last year from Farnese, at that time in the zenith of his career; but there was a great chance of his temper being spoiled, not to say of his breaking down. It did not need three defeats to inform us that All Heart was not in racing condition last season, and it was taking a good deal on trust to assume that, because he was half-brother to Doncaster, and because he was an uncommonly good-looking horse, therefore by the time he reached three years of age he would come out in very different form, and would scatter his enemies right and left. Those, however, who had seen All Heart this spring—and his owner has allowed him to be inspected by the accredited representatives of the sporting press, thus setting an example which, if generally followed, would dispose of the touting nuisance much more effectually than any hostile action on the part of the Jockey Club—had expressed themselves as thoroughly satisfied with the progress he has made, and their favourable reports no doubt tended to increase the confidence felt in his capacities. Of the remaining Derby candidates there is no occasion to speak much. Bay Wyndham's form as a two-year-old was very in and out. After winning the Woodcote Stakes from Charon, Kaleidoscope, and Father Claret, he secured the two-year-old Biennial at Ascot from Hellenist and Zee, but only beat the latter by half a length; but later in the season he suffered defeat from M. de Fligny at Goodwood and from the Mineral colt at Newmarket. Forerunner was well beaten by Springfield at York, but won two races afterwards in moderate company at Ayr and Newmarket. There was nothing like Derby form in these performances, and such favouritism as he has enjoyed was probably due to the fact of his being a stable companion of Julius Cæsar, who ran second to Petrarch in the Two Thousand. If he was discovered to be much better than Julius Cæsar, his friends might be excused for indulging some hope of his taking the measure of the cracks of the year. Bracounier was the hope of the Frenchmen; but his public performances did not warrant the idea of his carrying off the Derby, though through Camembert, who ran very fast in the Two Thousand and subsequently defeated Coltness and Wild Tommy, some sort of a line might have been obtained. The antecedents of Hardrada showed him to be a fair, honest horse, somewhat deficient in quality; and of Advance and Wisdom—better known as the colt by Blinkhoolie out of Aline—it is not necessary to speak.

It will thus be seen that, though the Derby field only numbered fifteen, the meeting of the two unbeaten horses, Petrarch and Skylark, and the antagonism of the Mineral colt, combined to give especial interest to the race; while the confidence of the friends of All Heart and Forerunner in the ability of their favourites to give a good account of themselves remained unabated up to the last moment. The holders of paddock tickets hardly got a return for their money this year; for though Lord Falmouth's pair, the Mineral colt (who was named Kisber on the morning of the race, the precedent set by Baron Rothschild in the case of Favonius being strictly followed) and Wild Tommy, came early into the paddock, it was not till the very last moment that Petrarch and Lord Rosebery's three—All Heart, Father Claret, and Bay Wyndham—put in an appearance. In fact, they merely walked through the paddock to the course, so that visitors could only obtain the most casual glance at them before hurrying back to the stand in order to see the preliminary canter. Kisber was unanimously pronounced the best-trained horse of the whole party, and All Heart the grandest-looking. Skylark also was in splendid condition, but opinions differed as to his soundness, some declaring that he walked lame, while others saw nothing whatever the matter with him. Wild Tommy excited attention on account of his immense height; but we do not think that much notice was taken of Forerunner in the paddock, despite the rumours of what he could do with Julius Cæsar. After he had cantered, it was a very different case; and there was a regular scramble at the last moment to back the horse who was generally voted the best galloper of the fifteen. Petrarch looked perfection itself, full of quality, and in perfect condition; but, strange to say, his preliminary gallop made him more enemies than friends. All Heart, too, failed to give satisfaction to the critics. His fighting action was complained of, and he pulled so tremendously that it seemed doubtful whether his jockey would be able to steer him safely round the turns. On the other hand, the style of going of Forerunner and of his stable companion Julius Cæsar was immensely admired. Though the parade was a little late, there was not much delay afterwards; and, after one or two insignificant breaks away, the flag fell to a rather straggling start, of which All Heart got all the worst. Father Claret made the running as well as he could, with the object of assisting his stable companion; but the pace for all that was wretched for the first half-mile, and his stable companion was past all assistance. We are not going to denounce All Heart as an impostor because he utterly failed to get near the front in the Derby. We think he will show a very different form some day, and that he still wants time; and he certainly is not the kind of horse who can stand being chopped at the start. Probably he is deficient in pace, and certainly he failed conspicuously last Wednesday to make up for the disadvantage he experienced at the outset, and he never once got on terms with his horses. At the top of the hill the pace improved, and Petrarch came round the bend with a clear lead, Kisber and the Russley pair, Forerunner and Julius Cæsar, being his nearest attendants. Up to three hundred yards from home Petrarch's victory appeared a certainty, but the extra distance stopped him, and when Kisber challenged opposite the hill, he seemed incapable of making an effort. From that point the Hungarian horse drew away further and further at every stride, Forerunner following in hopeless pursuit, and Petrarch dropping still more in the rear. It was quite a case of hare and hounds, and the leading hounds were not even well together at the finish. Kisber won by five lengths from Forerunner, who beat his stable companion Julius Cæsar by three lengths, Petrarch finishing as far behind the third, and Skylark being nearly as far behind Petrarch; so that between the winner and what we may call the main body of the field there was an interval of more than a dozen lengths. Seldom has the Derby been won in such hollow style, and seldom has there been so poor a struggle for the second and third places. The defeat of Petrarch was of course a great disappointment to his supporters, for no horse could have looked or gone better. His speed is extraordinary, and it is probable that over his own distance—a mile—he will hold his position against all opponents. The superior staying power of Kisber enabled him to dispose of the Two Thousand winner over a mile and a half course,

and he finished as if he would not have minded an extra half-mile. In short, the further he went the further he won; and there can be no surer test than that of a horse's ability to stay. Forerunner's forward positions showed that the sanguine opinion formed of his merits was not so much of an exaggeration after all; while his stable companion Julius Cæsar had obviously made considerable improvement since the Two Thousand day. The great three-year-old race of the year was carried off by the best trained, though not the best looking, horse; and to the skill and judgment of his trainer must be attributed, to a large extent, the easy victory achieved last Wednesday by the son of the expatriated Buccaneer.

REVIEWS.

MALLESON'S ESSAYS AND LECTURES ON INDIAN SUBJECTS.*

ANY attempt to make Indian subjects more attractive or popular deserves success. We have just learnt from Mr. Trevelyan that the sale of his uncle's Essays on Clive and Hastings far exceeded that of other papers from the same brilliant pen. Sir John Kaye has given us excellent biographies of Metcalfe and Malcolm, has imparted to the war in Afghanistan the interest of a Greek Trilogy, and has described the sufferings and deeds of our countrymen during the Mutiny in a style which, if turgid or redundant, is never tame. Colonel Malleson, evidently bent on similarly inducing English readers to comprehend Indian topics, has reprinted six papers which, about ten years ago, were either published by him in local reviews or read before heated but attentive audiences at Calcutta. No one subject has any direct or necessary connexion with any other. Three English generals and their campaigns are treated of in as many papers. A fourth is devoted to a native State. In a fifth we have the sad tale of the unfortunate Irishman who began his career as a soldier of the Grand Monarch at the age of nine, and ended it, to the shame of his adopted country, when he was not quite sixty, on the Place de Grève. The sixth paper discusses the last campaign of a native soldier of fortune whose military achievements may have occasionally turned the heads of others of his race and colour who possess his restless ambition without his sterling ability. In the Mahratta wars, in the raids of the Pindarries, in the grand-chances afforded to indigenous talent by the Mutiny, no one came to the surface who could compare with Hyder Ali. A writer of Colonel Malleson's political and literary experience may be assumed to handle his favourite subjects with dexterity and ease. And it is no more than his due to say that the leading authorities have been carefully consulted; that the facts have been marshalled with perspicuity; that the comments are, on the whole, apposite; and that the lectures are readable and not too long. A little revision would not have been amiss. But any one of the papers can be read separately, without a feeling of ennui; and there is a moral to be drawn from every one of them, although we may not agree with Colonel Malleson, who, to apply an Eastern proverb, is rather apt to look at Leila with the eyes of Majnun. Some of these reprints would have been the better for a notice of events that have occurred since their first publication. Here and there, too, we have an unpardonable sameness of phraseology. The expression "a tremendous fire" occurs no less than four times in two pages and a half, in the account which the author gives of Lord Lake's unsuccessful attempt to reduce or storm the fortress of Bhurtpore.

Nearly forty pages are taken up with a eulogy on the rulers of the native State of Bhopal. Colonel Malleson lays no more than proper stress on their hereditary good qualities, their capacity for governing, and their unswerving attachment to the British rule. Indeed there is something very exceptional and striking in the position of this State and in the merits of its Nawab and Begums. It was founded by an Afghan nobleman named Dost Mahommed, in the general scramble for good things which ensued after the death of the Emperor Aurungzebe. It has thus been in existence for rather more than a century and a half. It is pretty nearly in the centre of India. No chain of inaccessible mountains, no principalities ruled by friendly chiefs of the same creed, afforded it any protection against attack and absorption. More than once its independence was threatened by the armies of Gwalior and Nagpore. The British Government interposed, and immunity from invasion secured to Bhopal for more than half a century was repaid by the fidelity of the Begum to us in 1857; a fidelity which was proof against intimidation, evil counsels, the contagion of disorder and riot, and whispered doubts of our ability to weather the storm. No address could have been more appropriate than one delivered by Lord Canning to the late Secunder Begum, in the presence of warriors who had been quite equalled by this lady in courage, and of statesmen who were inferior to her in decision and tact. Re-writing or editing at a later date, Colonel Malleson might have informed his readers of the circumstances attending the death of this lady, whom he holds up as an example; of the great pride which she took in her condition as feudatory of the Queen; and of her dying wishes for the prosperity of Her Majesty and the Government. We are glad to be able to assure any readers of these essays that the Secunder Begum left behind her a daughter worthy of her name; and that the Shah Jehan Begum has accepted her responsibilities, has discarded all notions about the disabilities of women, has made a tour of her dominions, and has not slackened in the work of administrative reform. It is not by way of depreciation that we remind readers that Bhopal is a compact province, of moderate extent, just calculated to call forth powers that would be unequal to a kingdom of wider range. The population may be about three-quarters of a million. The yearly revenue is said to be under one hundred and fifty thousand pounds. The forces consist of rather more than four thousand troops of all arms, with seventy-three guns. The State pays a tribute of twenty thousand pounds to the Imperial Exchequer, besides smaller sums towards education and the repair of roads. In the recent discussions regarding the Royal Title, no better illustration could have been given of the subordination of a Mahommedan principality, loosely called "independent," to the paramount Power. Such a lieutenant, or delegate, of the Court of Delhi is now simply in his proper position, with hereditary privileges maintained and guaranteed by the foreign Power on which that Imperial position has devolved.

We pass from a line of illustrious women to three English generals, Lake, Havelock, and Lord Strathnairn, better known in Indian annals as Sir Hugh Rose. They were all successful, and yet very unlike each other. A large space is devoted to the first, and this expansion may be justified by the importance of the operations in the Doab of Hindustan and the Upper Provinces of India, in which it was the good fortune of Gerard Lake to play a conspicuous part. A soldier who triumphed over the Mahrattas trained under Perron and De Boigne, under whom four or five thousand British troops were more than a match for four times that number of enemies at Delhi, who reduced Agra and captured the fort of Aligurh by storm, and who thus gave full scope for the sagacious and commanding policy of the Marquess of Wellesley, is doubtless entitled to no mean place in the gallery of Indian captains. But even Colonel Malleson cannot disguise the fact that Lake "was not much of a tactician." He had certainly as a young man learnt something of war from Frederick of Prussia, and he had been impressed with the fatal effects of inaction by Cornwallis's surrender in America. But in real truth his generalship mainly consisted in rapidly pursuing and coming as soon as possible, at all hazards, to close quarters with the enemy. In this respect he reminds us very much of a more recent head of the Indian army—Lord Gough. The latter at Ferozeshah and Chillianwalla, charging the Sikhs at three in the afternoon through dense jungles, and at Goozerat only held back by the late Sir John Cheape and Sir P. Grant, reminds us very much of Lake, who is described as leading the charge of cavalry at Laswarree in the morning, and heading the 76th Regiment in its advance in the afternoon. A saying current in Indian society to this day, attributed to Lord Lake, bears out this view. A subordinate who talked about some elaborate report was quietly disposed of with the curt remark, "D—n your writing; mind your fighting." Pluck, vigour, and eagerness to close with the foe have done wonders against Rajpoots, Afghans, Mahrattas, and even Sikhs. But we should recommend young officers who think they may have the chance of confronting any European force equipped with arms of precision and commanded by no mere pedantic students of the art of war, to take their lessons of strategy from Havelock, and not from Lake. A very good account of Monson's disastrous retreat before Holkar is given in this essay. It shows the fatality incident to expeditions based on Lord Lake's principles, and not supported by his decision and coolness. Every subaltern and native soldier in India knows the travesty of the couplet on Warren Hastings:—

> Ghore pŭr howdah, hāthi pŭr zeen
> Is tarah bhag gya Kurnel Munseen.

In other words,

> Saddles on elephants, howdahs on nags,
> Thus Colonel Monson disorderly lags.

More correctly it would be, in prose—thus Colonel Monson ran away. Nor, in assigning to Lord Lake his exact position as a general, can we accept the author's exculpation of his failure to reduce Bhurtpore. To begin the siege of a fortress with an imperfect knowledge of its defences, with artillery inadequate to efficient attack, to persevere hopelessly and to abandon the attempt after a loss of more than three thousand men, is not usually associated with great strategy. Nor can we admit that a policy by which the Raja eventually conceded all our demands was "not the less successful." On the contrary, for more than twenty years, our civil and military servants often had Bhurtpore cast in their teeth by surly Mahommedans and wily Hindoos. "Is that the way to Hansi?" said one of our officers to a stout-limbed Jāt cultivator of Upper India only a few years before the capture of the renowned fortress by Lord Combermere. "I can't tell you," was the reply; but pointing in another direction, "that's your way to Bhurtpore."

The lecture on Havelock ought to be read as a fitting introduction to the admirable biography of this great captain by his brother-in-law, Mr. Marshman. There the reader may learn how Havelock was at Charterhouse about the time of Julius Hare, Thirlwall, George Grote, Sir C. Eastlake, and the actor Yates; how he served in Burmah in 1824–5; how he formed one of the illustrious garrison of Jellalabad; and how, in the Sikh campaigns and during a long period of neglect and inaction, he was gradually maturing those theories and acquiring that mastery of the principles of real warfare which enabled him to raise the spirit of the Indian com-

* *Essays and Lectures on Indian Historical Subjects.* By Colonel G. B. Malleson, C.S.I. Second Issue. London: Trübner & Co. 1876.

looking horse, worthy [illegible]. Great as have been the illustrious sire Kirkee's mere handfuls of British troops skilfully [illegible] of our Indian history, it may reasonably be contended whether any services have ever equalled those of Havelock between the 1st of July, when he assumed command of Allahabad, and the 25th of September, when he relieved, for the first time, the garrison of Lucknow. During July the whole of the Doab was in the hands of the insurgents. Cawnpore had fallen; we were besieged at the very capital which we had marched down to take; no gleam of sunshine illumined our political horizon; and peaceful and prosperous provinces were in the possession of mutineers. With forces that never exceeded two thousand, and which were soon reduced to fifteen hundred or a thousand men, Havelock fought nine actions, and won them all; and it was no pedantry that led him to record the fact that the battle of Cawnpore was gained by a flank march similar to the manœuvre of his favourite, Frederick II., at Leuthen. He had treasured up, ready for use, all the legacies of military commanders and critics, and at the age of sixty-two he astonished Europe by appearing as a general whose first campaign was as masterly as if it had been the crowning success of a long series of victories. Why the Indian Government superseded Havelock in his triumphs by appointing Outram to the command of the relieving force, neither Colonel Malleson nor Mr. Marshman has been able to explain to our satisfaction. But fortunately, if Havelock was a stern tactician, Outram was the soul of chivalry and honour, and refused to deprive his comrade in arms of the reward which then lay just within his reach.

The time is hardly yet come when the campaign of Lord Strathnairn in Central India can be dealt with like those of Outram and Havelock. Colonel Malleson lays too much stress on Major Rose's early services in Ireland, when he moved a few troops with rapidity in order to put down certain political and seditious meetings. These desultory chases over hills and bogs after men who aspired to be heroes of cabbage gardens may have been a sort of preparation for the pursuit of more disciplined and more numerous rebels in Saugor and Jhansi. But the most remarkable part of Lord Strathnairn's career is that a large part of his work had been diplomacy, and that he never saw any real fighting between 1820 and the Crimean War. In India he had to contend against heat, sickness, a march across a wide and not very easy country, and adversaries with considerable pretensions to military skill. Tantia Topi, or the "weaver," who had become an "artillerist," and the fierce and bloodthirsty Rani of Jhansi, were no ordinary rebels. The campaign in Central India is described by Colonel Malleson in a narrative clear and succinct, and not one whit more eulogistic than its difficulties warranted. And in days when a bold assumption of responsibility is not often the virtue or the failing of diplomatists, no historian is likely to forget that Colonel Rose took on himself to call on the British admiral to occupy Besika Bay with his fleet, while Mr. Gladstone shortly afterwards covered himself with ridicule by only budgeting for a trip of the Guards to Malta and back.

The essay on Count Lally is the story of a gallant Franco-Hibernian, zealous, impetuous, honest, wrongheaded, and quite unequal to the triple task of conciliating natives, overcoming the incapacity of his impracticable colleagues, and beating a compact army of Englishmen and Sepoys, commanded by such a leader as Coote. But, flagrant as were Lally's errors, they were cruelly punished, in a way quite in harmony with the spirit that animated the corrupt and degraded Monarchy which he served. The execution of Lally is a parallel to the crucifixion of an unsuccessful Carthaginian admiral, and it is also a good illustration of the principles of judicial awards which, before the French Revolution, sent the family of Calas to the gallows, and La Barre to the wheel. We have only room for a hasty mention of Hyder, of whom it might have been said by us, pretty much as Pyrrhus said of Curius and his legions, "This barbarian has nothing barbarous in his military arrangements." Colonel Malleson has given a spirited account of the ill-advised movements which ended in the slaughter and capture of Colonel Baillie's detachment. It is some consolation to us to think that the grandson of Hyder died only a few years back, a loyal supporter of the British Government, and that, as we have already said, in all the splendid chances afforded to native talent by the great Mutiny, nobody rose to the top who could compare with the leader called familiarly the *Naik*, in other words, the *Petit Caporal* of Seringapatam and Bangalore.

POLLOCK'S PRINCIPLES OF CONTRACT.*

THE design of Mr. Frederick Pollock's book on Principles of Contract is to elucidate those general principles which are, or ought to be, equally applicable to law and equity; and now that "the lamentable division of jurisdiction," as the late Lord Westbury called it, has come to an end, the equally lamentable division of exposition in text-books which has hitherto prevailed ought to come to an end also. We had for some time thought that a treatise on equity for the use of common-lawyers was desirable, and the grandson of a Chief Baron of the Exchequer, which was a court both of law and equity, was a proper person to compose it.

In order to show the need of such a work, we will take an actual example from the transactions of ordinary life, and see what are the legal principles applicable to it, and where they may be found. A gentleman takes a furnished house from April 1, for six months of four weeks each, under a written agreement which provides that the rent is to be payable every four weeks, and that if notice be given before the expiration of any period of four weeks the house may be given up at the expiration of the next period. After the agreement has been signed, the intended tenant, who is at a distance, finds that he does not want the house quite so soon, and the landlord finds that he cannot conveniently give it up on the appointed day. The landlord, in fact, retains possession until the 13th April, and this is done under some arrangement between the agents of the parties as to the nature of which it may be assumed that they will differ. On the one hand, it may be said that, admitting that the rent did not commence until April 13, when possession was given, yet, when possession was given, it was given on the terms of the written agreement; and therefore the day for giving notice would be at the end of each period of four weeks from April 1. On the other hand, it may be said that the agreement is to be read as if the date had been altered from April 1 to 13, so that for all purposes the latter would be the date of the agreement. Now suppose that the tenant gave notice to quit on May 8, the question would arise whether that notice ran from May 11 or from May 27, and on this question would depend the tenant's liability to a fortnight's rent. It may perhaps alarm both landlords and tenants of furnished houses to hear that difficult legal questions arise out of these circumstances. But, in the first place, an agreement for a six months' tenancy of a furnished house relates to "an interest in land," and therefore must be in writing. In the present case the original agreement was in writing, but the tenant sets up a variation of it which he would seek to prove either by letters written by himself to the landlord's agent or by verbal communications between the two agents, or by both combined. The common law has always strictly held that a written agreement where the law requires writing cannot be varied by subsequent arrangement by word of mouth. But the Court of Chancery has in some cases taken cognizance of these "parol" arrangements; and in one well-known case where a court of law refused to do this, it has been stated on high authority that the result of the case would have been in equity exactly opposite to what it was at law. Now, however, all branches of the High Court of Justice are bound to administer both law and equity. Yet there might be a further question raised on these apparently simple facts. We have spoken of an agreement for a tenancy of a furnished house, which must be in writing; but the transaction above described might be regarded as an actual "demise" or lease, which, in a class of cases which includes this, may be either by writing or word of mouth. In the first point of view, parol evidence to vary the written agreement would not be admissible at law, but might in equity; in the second point of view, parol evidence for the same purpose would be admissible both at law and in equity.

We have probably said enough to show the absolute necessity to ordinary practitioners of such a general view of the Law of Contract as Mr. Pollock proposes to supply, and we will now refer to his book to see what help it gives in the class of cases of which we have offered an example. He has a chapter on "Agreements of Imperfect Obligation," by which he means "agreements which, though they confer no right of action, are yet recognized by the law for other purposes." Where there is an imperfect obligation there is a right without a remedy. This is an abnormal state of things which can be produced only by the operation of some special rule. Such rules may operate—

1. By way of condition subsequent, taking away a remedy which once existed.

2. By imposing special conditions as precedent to the existence of the remedy.

3. By excluding any remedy altogether.

The Statutes of Limitation furnish an example of the first class. The Statute of Frauds (29 Car. II. c. 3. s. 4) furnishes an example of the second class, which we will briefly follow Mr. Pollock in considering. That statute enacts that "no action shall be brought" in five classes of cases which it specifies, and of which "a contract or sale of lands," or any interest therein, is one, unless the agreement or some memorandum thereof shall be in writing and signed by the party to be charged, or his agent. The words "contract or sale" are probably a misprint, and it is remarkable that, although the statutes have been in some sense revised, these words have never been corrected. Mr. Pollock uses the term "informal agreement" to signify any agreement which comes within this enactment, and does not comply with its requirements, and he considers what is the effect of the enactment on "informal agreements." There was some early authority for saying that it made them void, but this is not now the law. They give rise to imperfect obligations, and neither the obligation itself nor any right immediately founded on it can be directly enforced. But it is recognized for the purpose of explaining anything actually done in pursuance of it, and anything so done may in many cases be a sufficient foundation for a new obligation *quasi ex contractu*. A was the landlord, B the tenant, and C wished to become tenant of a farm; and C agreed to pay to B 100*l.* for the goodwill, out of which 40*l.* was to be paid to A for his consent to the assignment of the lease. The arrangement was verbal, and C paid the 100*l.* to B, who said that "words were wind," and refused to pay over

* *Principles of Contract at Law and in Equity, being a Treatise on the General Principles concerning the Validity of Agreements, with a Special View to the Comparison of Law and Equity, and with References to the Indian Contract Act, and occasionally to Roman, American, and Continental Law.* By Frederick Pollock, of Lincoln's Inn, Esq., Barrister-at-Law, late Fellow of Trinity College, Cambridge. London: Stevens & Sons. 1876.

the 40*l.* to A. But on action brought by A against B, the Court said that, if one agree to receive money for the use of another upon consideration executed, however frivolous or void the consideration might have been in respect of the person paying the money, if indeed it were not absolutely immoral or illegal, the person so receiving it cannot be permitted to deny his having received it for the use of that other; and accordingly A succeeded in the action. The Court said in effect that, as the arrangement was verbal, C was not bound to perform it. But he did pay the money to B, partly for B's own use and partly for the use of A. And the consideration was executed—or, in other words, A consented to the assignment—and therefore B held the 40*l.* for the use of A. But, further, it has always been the doctrine of equity that one who has partly performed an informal agreement may sue for a "specific performance" by the other party, "if the acts of part performance have been done on the faith of an existing agreement, and have been of such a kind that the parties cannot be restored to their original position." A familiar example is that of an informal agreement for sale and purchase of land, where the purchaser takes possession and lays out money on the land. In this case equity would compel the seller specifically to perform the contract, or, in other words, to convey the estate. But at law the seller might eject the purchaser, take the benefit of his outlay, and, if sued on the agreement, rely on the statute; or, in other words, commit a fraud by help of an enactment against fraud. And where the contract had been duly made in writing, evidence could not be received at law of a subsequent "parol" variation. In the well-known case of Goss *v.* Lord Nugent, there was a written contract providing for a good title to several lots, and the purchaser after the contract, and with notice of a defect in the title to one lot, verbally waived the objection and entered into possession, but afterwards resisted performance of the contract; and it was here that the seller could not maintain an action for the purchase-money on account of the statute. Lord St. Leonards, commenting on this case, says that, although the general rule upon the statute is the same at law as in equity, yet a purchaser is at liberty to accept a defective title if he thinks proper; and if he does so, and thereupon is let into possession, "equity would bind him by his act, and compel him to complete the purchase." We notice, though not by way of complaint, that Mr. Pollock does not cite this case of Goss *v.* Lord Nugent, nor the comment of Lord St. Leonards on it, although he cites and discusses more recent cases involving the same principle. The scope of his work is so extensive that this head of it is necessarily treated with more brevity than the practitioner may find convenient; and perhaps hereafter he or others may pursue further the useful labour of exhibiting in one view both the law and equity of Contract under its leading heads. In a recent case there had been a written agreement between a brewer and a publican for granting a lease of a public-house on specified terms, one of which was that, if the lease were sold at a premium, the brewer should receive half of it. A lease was granted, but the terms of it varied from those of the written agreement, and this lease was afterwards sold by the publican at a premium, of which the brewer claimed half. The publican successfully resisted this claim, on the ground that the agreement, which was originally in writing, had been varied by parol, and therefore the brewer was suing on a contract concerning land not in writing, and the statute says that no such action shall be brought. The decision in this case was given shortly before the Judicature Act came into force, and the defence prevailed at law, although one of the Judges intimated that in equity the result might have been different. We may now return to the case with which we started. There was a written agreement for letting a furnished house, and we will now suppose that the variation as to the time of giving possession was by parol only. We will also suppose that the landlord would sue on the written agreement, and the tenant, as defendant, would set up the parol variation. Now, as the statute says that "no action shall be brought" on an informal agreement, it might be contended that this is not equivalent to saying that no defence shall be set up, and therefore that a parol variation might be relied on to answer a claim, although not to found one. But Mr. Pollock has met this argument by reference to a case where the Court said that "the statute must mean that informal agreements are not to be enforced in any way."

Turning now to more elementary matter, we observe that Mr. Pollock has dealt fully with the subject of "consideration," of which a proper understanding is essential to any useful study of the law of Contract. He first explains that in Roman law "informal agreements (*pacta*) did not give any right of action without the presence of something more than the mere fact of the agreement. This something more was called *causa*. Practically the term covers a somewhat wider ground than our 'consideration executed.'" Perhaps a few words of Latin which have been transferred from the *Digest* to some of our law books put the matter as clearly as it can be put:—"Nudum pactum est ubi nulla causa subest præter conventionem; sed ubi causa subest ibi fit obligatio et parit actionem." Where there is a "causa" the nude pact becomes clothed with an obligation on which an action may be founded. Many writers on English law use "nudum pactum" in the sense of an agreement without consideration; but if Latin terms are used by English writers, they should be used correctly, as they are used by Mr. Pollock. He cautions readers to bear in mind that "in Roman, and therefore also in early English, law nudum pactum does not mean an agreement made without consideration." Sir Henry Maine, in his *Ancient Law*, has put this clearly:—"A contract was a pact (or convention) *plus* an obligation. So long indeed as a pact remained unclothed with the obligation, it was called *nuda* or *naked*." Originally a pact could only be thus clothed by the solemn form of the *nexum*. Afterwards certain contracts could be made obligatory *re*—that is, by delivery of a chattel, *e.g.* by loan of a horse. At a later stage of Roman law the prætor gave equitable relief on pacts wherever there was *causa*, meaning nearly what our law means by executed consideration. Mr. Pollock properly commences his work by distinguishing between "agreement" and "contract." It has become the habit of English lawyers to talk in equity of the "specific performance of an agreement," whereas the same instrument, if sued upon at law, would produce an "action of contract" or "on promise." Cases in equity would be digested under the head of "agreement," and cases at law under "contract." In the section of the Statute of Frauds to which reference has been made all these words—"promise," "contract," and "agreement"—occur; and some commentators on this statute have given a meaning to the change of phrase which perhaps was not contemplated by its authors. Mr. Pollock takes "agreement" as the larger word, to which use its derivation from "aggregatio mentium" is suitable; and "in the case of a contract something remains to be done by one or by each of the parties which the other has or will have a right to call upon him to do." In the language of Roman law there is an "obligation" between these parties, or the "vinculum juris" binds them; and "this," says Mr. Pollock, "is the specific mark of contract." Returning to the subject of "consideration," we observe that he does not fail to notice that the meaning of *cause*, in the French Code Civil, does not coincide with that of consideration in English law. The principle of our law has always been that an agreement embodied in a deed under seal does not require a consideration to support it, but that in an agreement in writing only or by word of mouth a consideration must be shown. Thus, to take a class of cases which are clearly explained in this book, suppose that a man after cohabiting with a woman promises to pay her an annuity. Now, if he promises this by deed, she can sue him on it, but if he promises by letter or verbally she cannot. The law does not here refer to the moral nature of the transaction, but, as the cohabitation is past, it applies the general rule that a mere bygone matter is not a consideration to support a promise not under seal. Such an agreement, says Mr. Pollock, "is merely voluntary," and "if under seal it is binding; otherwise not." After fully explaining the doctrine of consideration as it has been matured in our law, Mr. Pollock remarks that, "formal contracts remain, strictly speaking, outside the scope of these rules, which were not made for them, and for whose help they had no need." The ancient validity of formal contracts could not be amplified, but it might be restrained; and the decisions of modern times show a tendency to restrict the distinctive privileges of deeds. Equity admits in theory that a voluntary deed cannot be impeached merely for being voluntary, but Mr. Pollock shows, under the head of "Undue Influence," that a system of presumptions has been established which makes it difficult for persons claiming under a voluntary deed to uphold its validity. We may illustrate this by supposing a promissory note to be given without consideration, and sued upon at law. Then, as between the immediate parties to the note, the want of consideration would be a defence. But if the same transaction were carried out by bond under seal, there would be no defence at law, unless fraud could be shown; whereas in equity "undue influence" might be set up. Now under the Judicature Act all branches of the High Court administer both law and equity; and therefore there was need for a treatise which would bring both under one view.

If space permitted we might draw much more interesting matter from this book. We will only notice "the capacity of the governing bodies of Companies to bind the corporation by their acts" as a subject of great practical importance, of which Mr. Pollock gives a clear and comprehensive view.

MYTHS AND SONGS FROM THE SOUTH PACIFIC.*

THROUGHOUT the islands of the Hervey group, says Mr. Gill, the custom prevails that "each member of the family has a separate food-basket, so that if hungry at night he should only take his own share, and not encroach upon his neighbours." In a somewhat similar manner each island of the Polynesian Archipelago has, it is remarked in the preface, "its own religious and mythological dialect," similar to that of neighbouring isles, but marked by distinguishing features of its own. From the island of Mangaia, one of the Hervey group, Mr. Gill has brought away an account every way excellent of the religion and mythology which he found existing there two-and-twenty years ago, but which are now mere matters of the past. His book will serve many good purposes, among others that of impressing (as Professor Max Müller says, in a preface which adds considerably to the value of the work) "upon students of religion and mythology the necessity of caution, the advantage of special research, and, above all, the necessity of a scholarlike treatment." Many a deplorable exhibition might have been spared us if every writer on mythology and religion had shared Professor Max Müller's opinion, that "what we have to learn is, first of all, to distinguish,

* *Myths and Songs from the South Pacific.* By the Rev. William Wyatt Gill. With a Preface by F. Max Müller, M.A., Professor of Comparative Philology at Oxford. London: Henry S. King & Co. 1876.

to study each religion, each mythology, each form of worship by itself, to watch them during successive periods of their growth and decay, to follow them through different strata of society, and, before all, to have each of them, as much as possible, studied in their own language."

One of the most remarkable features of Mangaian legendary lore, as it existed of old in the memories of the priestly class, was the elaborate and methodical scheme of cosmogony which it seems to have taught. No such idea occurs in it as that of a Supreme Being who creates a universe out of nothing. "The primary conception of these islanders as to spiritual existence," says Mr. Gill, "is a *point*. Then of something *pulsating*. Next of something greater, *everlasting*." Afterwards comes "the Great Mother and Originator of all things," the parent of gods and men, who dwells in Avaiki, the lower world, the abode of spirits, from which the earth is dragged up, being "but the gross outward form of an invisible essence still there." Above spreads the sky, a blue vault of solid stone, divided into ten separate heavens, which constitute "the Elysium of the brave." To these heavens ascend warriors slain on the field of battle. Their spirits linger for a time about the spots on which they fell. At length they gather together on the edge of a high cliff facing the setting sun. Suddenly a mountain springs up at their feet, which they ascend by means of a road "over the spears and clubs by which they were slain." When they reach the summit, they leap into the blue expanse, thus becoming the peculiar clouds of the winter (or dry) season. During the rainy season they cannot ascend into their Paradise. In June, the first winter month, the air is full of expectant ghosts, their great number hiding the sun for whole days, and occasioning the dull, heavy sky, the cold, and the melancholy usual at that season. This state of things lasts till August, "when the coral-tree opens its blood-red blossoms, and the sky becomes mottled, and light, fleecy clouds pass over the heavens." They are the spirits of the warrior dead preparing for their flight. "The heavens soon become cloudless; the weather bright and warm. It is because they have taken their departure." It is true that one legend represents Rongo, the god of battles, "as coming up from the nether world at certain periods in order to feast himself upon the spirits of those slain in battle assembled for their last journey. With bits of ripe banana Rongo tempts them to his side, and then treacherously swallows them whole." But they eventually emerge safely from the paunch of the grim god, and ascend to their dwelling-place in the upper sky. There they live in happiness, decked with garlands of sweet-scented flowers, and looking down with amused contempt on the vulgar herd of ghosts in the lower world. For ordinary spirits do not fare so well. After leaving their earthly tenements, they, according to one account, wander at first disconsolately along the seashore, "arrayed in ghostly network, and a fantastic mourning of weeds picked upon the way, relieved, however, by the fragrant heliotrope, which grows freely on the barren rocks. A red creeper, resembling dyed twine, wound round and round the head like a turban, completed their ghostly toilet." Their only consolation is to follow the sun, or to revisit their former homes, wandering after dark among the trees near their well-loved dwellings, at times venturing to peep inside. Sometimes they huddle together in "the Red Cave," one of their chief gathering points; at other times they clamber up "the open, lawn-like place above the cave, out of reach of the billows and foam of the ocean." At length comes the hour for their departure. The chief of the band summons his ghostly followers. They assemble at the Red Cave and watch for the rising of the sun. As soon as it appears they go forth to meet it. Then, turning round, they follow it, assembling at an appointed spot before sunset. When the sun is on the point of sinking into the ocean, the ghosts flit after him along his path of gold, and follow him into the lower world, through the hole which gives them access to it. According to another account, the ghosts first seek the westward-looking cliff from which the souls of warriors slain in battle take flight for the sky. When they arrive there a large wave approaches from the sea, and at the same time a gigantic Bua tree springs up from Avaiki, the lower world. On to the branches of this tree the dead are obliged to clamber, and, when it is freighted with human souls, it sinks into the world from which it came. At its root is a great net into which the spirits fall, and which carries them, "wriggling like fishes in the vain hope of escape," into a vast lake. Eventually it is pulled up, and the draught of souls is laid before "the inexpressibly ugly Miru," who "feeds her unwilling victims with red earth-worms, black-beetles, crabs, and small blackbirds." Besides these delicacies, they are regaled by Miru's four daughters with bowls of strong kava. When stupefied by the draught, they are carried away to the oven and cooked. Miru and her family subsist on such spirits, the refuse being the share of her servants.

On one occasion, it appears, Miru was deceived by the ghost of a mortal man named Tekaue, or "The Chin." When at the point of death, he directed his friends, as soon as the breath was out of his body, to place on his stomach a cocoa-nut kernel and to cover it up with the grave-clothes. In due time he descended into the spirit world, and appeared before Miru, a hag possessing only one breast, and wanting half of one arm and half of one leg. She gave him a bowl of food, and told him to empty it. To his horror, he found it was full of living centipedes. But while holding it to his lips, he contrived to let them fall on the ground, munching meanwhile the cocoa-nut kernel. Miru waited for him to show signs of thirst, in order to direct him to seek relief in a lake close by. "None that dived in that water ever came up alive; such was the anguish and quenchless thirst so distracting their thoughts that they were invariably drowned. Miru would afterwards cook and eat her victims at her leisure." Weary of waiting, at last she dismissed him from the lower world, and told him to seek the upper, but not to tell any one what he had seen; the latter part of which order he did not obey.

The first man who died a natural death in Mangaia, says a very elaborate myth, was Veĕtini, the "All-Separating," in memory of whom his parents Tueva, the "Mourner," and Mauga, "Food," together with his sister Tiki, the "Fetched," instituted the signs of mourning and funeral games which were afterwards observed among the islanders, amongst whom grief was of old manifested by blackened faces, shorn hair, and slashed bodies, and by the wearing of mourning garments possessing a "very offensive smell . . . symbolical of the putrescent state of the dead." The funeral ceremonies occupied from ten to fifteen days, during which no beating of bark was permitted in the neighbourhood of the dead, lest offence should be given "to the female demon Mueu, who introduced cloth-beating to this world, but who herself beats out cloth of a very different texture. Her cloth-flail is the stroke of death." Veĕtini was buried near the seashore. Wistfully did his relations look towards the north, after his funeral, but in vain. Next day they sought him along the western shore of the island, singing dirges as they walked, until they were overcome by weariness, and lay down to sleep in a cave near the sea. Afterwards they sought him in vain on the southern shore, arriving at last on the eastern coast, where they again passed the night in a cave. Ere dawn Tueva rose to watch the sun rise, and presently he noticed "a tiny dark speck beneath on the ocean, which, as the sun advanced on its course, grew larger and drew nearer, passing over the ocean in the bright trail of the sun." This was Veĕtini, who had been permitted to revisit the upper world "in consequence of the passionate lamentations of his parents, and to comfort their sorrowing hearts. He also came to show mortals how to make offerings of food to please the dead." In order to allow him time to converse with his friends, the sun was stopped in its course for a time. When it again moved on, Veĕtini was solemnly conducted to the western shore. As the sun neared the horizon, gilding the waves with its light, Veĕtini shouted:—

> Thrust down the sun,
> That I may return to nether-land!

His parents strove to lay hands on him. "But, lo! they grasped at a shadow. They watched him gliding swiftly over the western ocean in the ruddy track of the sun, and, with its last rays, Veĕtini, now a tiny distant speck in the train of the King of Days, for ever disappeared." In a song composed about 1760 this story is thus referred to:—

> Tueva, who seven times lamented for his boy,
> Asked, "Why didst thou return to this world?"
> "I came," said Veĕtini, "to instruct you
> In making food-offerings to the dead,
> Offerings to those in spirit-world;
> Gifts from their relatives,
> Who yet linger in this upper world."

In obedience to his instructions, it became the custom to provide the dead with cocoa-nuts and other eatables. Seventeen years ago, says Mr. Gill, an aged heathen couple lost their only son, a Christian. A day or two after the funeral, they walked across the island to his grave, arriving there after dusk with a basket of cooked food and some unopened cocoa-nuts. "With many tears and affectionate words they called upon their boy to eat the food and drink the nuts (carefully opened for the convenience of the ghost at the grave, and the contents poured out upon the earth), which they had carried six miles. The aged couple slept under a tree, close to the last resting-place of their son; and at dawn on the following morning departed."

On one occasion an escape was effected from spirit-land. Kura, the wife of Eneene, was leaning against a Bua branch when it broke. She fell to the ground with the fragment of the sacred tree, the earth opened beneath her, and she dropped through into the lower world. There she was caught in the arms of a number of "infernals, called 'the army of Marama,'" who tied her to the central post of a house, with the intention of cooking and eating her the next day. Over her was set a blind old guardian named Tiarauau. Meanwhile Eneene had heard of his wife's disappearance, which had been witnessed by his sister. So, carrying in his arms an idol made of Bua wood, he went to the fatal spot, and uttered an invocation to the divinity of the sacred Bua tree. The earth opened, and he also dropped down into spirit-land. There he discovered his captive wife. Noticing that eight paths led from the house in which she was imprisoned, he plucked eight cocoa-nuts, and scattered their contents over the pathways. Hundreds of rats immediately came hurrying to the feast, and made such a noise as partially distracted the blind guardian's attention. Then, making a hole in the thatch of the house, Eneene descended to where his wife was, untied her bonds, and took her place while she crept out and hasteped "to the foot of the closed chasm by which she had so summarily entered Avaiki." For some time he waited patiently, answering in an imitation of her voice when called upon by the demon watcher. At length he followed in her steps, and found her awaiting him at the appointed place. Just then Tiarauau's voice was heard giving the alarm. Clasping his wife in his arms, Eneene cried aloud:—

> United in one fate,
> We ascend, we rise,
> To light, to light,
> To clear mid-day.

At the sound of these words "the gloomy rent again opened, and

both were borne through the chasm up to this world of ours, where it was still daylight. A moment later, and the enraged 'army of Marama' would have caught Ensene and Kura, so close were those infernal hosts upon their heels." If Mr. Verkovitch, the collector of the *Bulgarian Popular Poems*, had found this tale told of "Orfen" in Bulgaria, he might well have considered it a powerful argument in favour of his hypothesis that Orfen and Orpheus were one. But that similarity does not always prove kinship is one of the many points made clear in Professor Max Müller's excellent preface to this most valuable book. As he says:—

> At first, no doubt, we feel startled by such coincidences; and that they often offer a *primâ facie* presumption in favour of a common origin cannot be denied. But as we read on from one mythology to another, our sensitiveness with regard to these coincidences becomes blunted, and we feel hardened against appeals which are founded exclusively on such evidence.

JACK.*

M. ALPHONSE DAUDET'S new novel, which, in a dedication to M. Gustave Flaubert, he describes as "ce livre de pitié, de colère et d'ironie," is not much more pleasant than his last, *Fromont Jeune et Risler Aîné*, but in point of matter and treatment it is far more striking. It was impossible to avoid the conclusion that for much of the construction of that book its author was indebted to Thackeray's *Vanity Fair*, while the style curiously enough reminded one here and there of Dickens. The outline of M. Daudet's present work resembles that of *David Copperfield* in being the history of a child devotedly fond of his mother, who makes a second marriage, or what passes for a marriage, with a man who dislikes the boy, and puts him to work in a class of life far below that in which he was brought up. But M. Daudet's treatment of his subject is original, and it is probable that the likeness between his framework and that of the English novelist is the result of chance.

The opening scene of the book cleverly displays the character of Jack's mother:—

> — Par un *K*, monsieur le supérieur, par un *K*, le nom s'écrit et se prononce à l'anglaise... comme ceci, Djack... Le parrain de l'enfant était anglais, major-général dans l'armée des Indes... lord Peambock... Vous connaissez peut-être? un homme tout à fait distingué et de la plus haute noblesse, oh! mais vous savez, monsieur l'abbé, de la plus haute... Et quel valseur... Il est mort, du reste, d'une façon bien affreuse, à Singapore, il y a quelques années, dans une magnifique chasse au tigre qu'un rajah de ses amis avait organisée en son honneur... Ce sont de vrais monarques, il paraît, ces rajahs... Celui-là surtout est très renommé là-bas... Comment donc s'appelle-t-il?... attendez donc... Mon Dieu! J'ai son nom au bout de la langue... Rana... Rama...
>
> — Pardon, Madame, interrompit le recteur, souriant malgré lui de cette volubilité de paroles et de ce perpétuel sautillement d'une idée à une autre... Et après Jack, qu'est-ce que nous mettrons?

She has come to place Jack (par un K) in the institution of the Jésuites de Vaugirard; but the recteur of that institution is a man of the world, and when, to his question as to the boy's name, she replies with some confusion by producing her card, which bears "ce nom souriant et insignifiant, Ida de Barancy," he, who has already his suspicions, asks if that is also the child's name. The interview ends by his agreeing to receive Jack under certain conditions as to her visiting him, which she indignantly refuses; and Jack, taken home by her, carries with him a pleasant recollection of the recteur's kind manner, and a wonder why he should have said with such a singular tone as they went away, "Pauvre enfant—pauvre enfant!"

It will have been seen that Ida de Barancy is a woman as to whose character there can be little doubt; and the story of her life is not altogether edifying. One could wish that M. Daudet, who is evidently capable of giving interest to subjects which are neither well worn nor disagreeable, had struck out a new line, instead of following the beaten track of satirizing what it pleases him to call "Mœurs Contemporaines." The vices attacked in *Jack*, and in a host of other cleverer and less clever French novels, do not, except in the mere fashion of their practice, belong more to this than to any other time. But they are no doubt convenient objects for the exercise of the wit and indignation which a novelist feels himself capable of expressing. When one has a quiver full of shafts of "ironie" and "colère," it would be a pity to keep them idle; but a first-rate archer should surely look for some better mark than a target so riddled and ragged with arrow-holes that its very existence seems doubtful. The infidelity of wives and husbands, which is the staple of French plays and novels, is probably not more common in France than in other countries; but, as Mr. Hamerton well observes in his clever book *Round My House*, writers of romance must find love interest, and as there is little to be got out of French life before marriage, it has to be sought afterwards. The starting-point of M. Daudet's novel cannot perhaps be condemned precisely on this ground, inasmuch as Ida de Barancy never had a husband; but later on the author has introduced, perhaps from mere force of habit, a tale of adultery in the mechanic class which is perfectly needless to the story.

The author's skill in the handling of character is shown chiefly in the cases of Ida de Barancy and of D'Argenton, the man who inspires her with her first real passion. Ida, with all her frivolity and vice, is saved by a certain childishness from becoming utterly odious; and with singular art the reader is shown how, until the last and most cruel experience of her shallow nature, Jack is able to retain his impression of her as she appeared in his childhood. D'Argenton, the incarnation of cold selfishness and empty conceit, who is in his own estimation the successor of Musset with a new force and depth of poetry, who is continually taking an attitude of defiance towards the world which has never seen and is incapable of appreciating his poems, is just the man to whom the shallow, sentimental Ida would become a willing slave. The occasion of her first seeing in him the ideal of her life is a "séance publique et littéraire" at the Gymnase Moronval, an impecunious and miserable establishment kept by a creole, to which Jack is sent after Ida's failing to get him admitted at the Jésuites de Vaugirard. Moronval, the proprietor, came to Paris intending to make his fortune as an advocate; but his pronunciation, which caused him to say "misère" for "misérable," stood in the way of that, and after various vicissitudes he hit upon the notion of setting up a school for the many children sent from tropical countries to Paris. Among his pupils he counted no less a person than the heir presumptive to the throne of Dahomey, whom, on his father's deposition, he converted into a servant. Moronval's great ambition, however, was to start a review in which he might display his learning and power of writing, and it occurred to him that Ida de Barancy might be induced to furnish the necessary funds. It was principally with a view to this that the *séance* was given:—

> Moronval avait lancé quantité d'invitations dans le monde artistique et littéraire, celui du moins qu'il fréquentait; et des coins les plus excentriques de Paris, tous les Ratés de l'art, de la littérature, de l'architecture, s'empressèrent en nombreuses députations.
>
> Ils arrivaient par bandes, transis, grelottants, venus du fond de Montparnasse ou des Ternes sur des impériales d'omnibus, râpés et dignes, tous obscurs et pleins de génie, attirés hors de l'ombre où ils se débattaient, par le désir de se montrer, de réciter, de chanter quelque chose pour se prouver à eux-mêmes qu'ils existaient encore. Puis, la gorgée d'air pur respirée, la lumière du ciel entrevue, réconfortés par un semblant de gloire, de succès, ils rentreraient au gouffre amer avec la force nécessaire pour végéter.

The various descriptions of life among those *Ratés*, poets without publishers, doctors without diplomas, singers against whom all managers combine in a cabal, who give themselves up to affected admiration of each other and sincere abuse of the rest of the world, are among the best things in the book; like most of it, they are cynical, and like much of it, they are true. Moronval's object in this particular assembly of the *Ratés* defeats itself. The proceedings are long kept waiting for the arrival of the "Comtesse," as, by way of advertisement, he calls Ida de Barancy; at length D'Argenton consents to recite his "Credo de l'Amour":—

> Debout devant la cheminée, les cheveux rejetés, la tête haute comme s'il débitait ses vers aux moulures du plafond, le poète déclamait d'une voix aussi emphatique et vulgaire que ce qu'il appelait son poème, laissant des espaces après chaque effet, pour permettre aux exclamations admiratives de se faire jour et d'arriver jusqu'à lui.
>
> Dieu sait que les Ratés ne sont pas avares de ces sortes d'encouragements.
>
> — Inouï!
>
> — Sublime!
>
> — Renversant!
>
> — De l'Hugo plus moderne!
>
> Et celui-ci, le plus étonnant de tous:
>
> — Goethe avec du cœur!
>
> Sans se troubler, éperonné par ces louanges, le poète continuait, le bras tendu, le geste dominateur:
>
> Et de quelques lazzi que la foule me raille,
> Moi je crois à l'amour comme je crois en Dieu.
>
> Elle entra.
>
> Le lyrique, toujours les yeux en l'air, ne l'aperçut même pas. Mais elle le vit, elle, la malheureuse, et dès ce moment ce fut fait de sa vie.
>
> Il ne lui était jamais apparu qu'en pardessus, en chapeau, vêtu pour la rue et non pas pour l'Olympe; mais là, dans cette lumière blafarde des globes opalisés qui blêmissait encore son teint pâle, en habit noir, en gants gris-perle, et croyant à l'amour comme il croyait en Dieu, en lui fit un effet fatal et surhumain.
>
> Il répondait à tous ses désirs, à tous ses rêves, à cette sentimentalité bête qui fait le fond de ces âmes de filles, à ce besoin d'air pur et d'idéal qui semble une revanche de l'existence qu'elles mènent, à ces aspirations vagues qui se résument pour elles dans un mot très beau, mais qui prend sur leurs lèvres l'expression vulgaire et dégradante qu'elles prêtent à tout ce qu'elles disent: "l'artiste!"

It is a good touch by which Ida, full of anxiety to know D'Argenton, is made continually to give him unintentional offence; he is persuaded, however, soon after the *séance*, to dine at her house in company with Moronval and his wife. Here again, by constant attention to his wants, which interrupts the flow of his discourse, she hurts his feelings. He is employed in detailing his interviews with various editors who have refused his contributions, and at the end of each interview, "Alors," he says, "je lui ai dit ce mot cruel." Whenever the narrative reaches this point, the luckless Ida interrupts the poet with a recommendation of some dish, so that "le mot cruel retardé si longtemps ne faisait plus d'effet, d'autant que le plus souvent c'étaient des choses comme ceci, 'A bon entendeur, salut' ou 'Monsieur, nous nous reverrons.' A quoi d'Argenton ne manquait jamais d'ajouter 'Et il était vexé.'"

In spite of these misadventures, however, Ida's devotion to D'Argenton is at last rewarded; they take a small house at Etiolles, and Jack is recommended during their absence to the paternal care of Moronval. This care takes such a shape that Jack flies from it and makes his way alone to Etiolles; the description of his journey is singularly true and touching. There his life is for a time pleasant and smooth enough, but presently D'Argenton resolves that the boy ought to make his own way in the world, and, urged by one of the *Ratés*, who has a brother in the works there, he sends him to become a workman at Indret. It is in the description of Jack's life from this time that the real value of M. Daudet's novel lies. So far as we know, there has been no attempt before this to unfold the habits, character, and daily life of a French mechanic. Jack starts as an apprentice in

---

* *Jack: Mœurs Contemporaines.* Par Alphonse Daudet. Paris: Dentu. 1876.

the iron foundry an employment for which physically and mentally he is thoroughly unfitted by his rearing. The description of the life to which he finds himself condemned, surrounded all day by noisy cruel machines and by men and boys yet more cruel, has a terrible truth. It would be impossible to do justice to the remarkable strength and reality of this description by extracts, the more so because M. Daudet has the rare art of concentration, and in this part of his work hardly uses a word too much. It is disfigured, however, by the coarsely-handled story of intrigue of which we have spoken, and of which the only purpose seems to be to introduce a horribly vivid account of a whole day of a workman's debauch into which Jack is plunged by mischance. This, however, might easily have been introduced by other means; and the presence of the episode is the more to be regretted because Roudic, the husband, is a mere recasting of Risler Ainé. As a contrast to Jack's life at the iron foundry we have an incisive representation of Ida and D'Argenton in their forest home, Ida more devoted, D'Argenton more selfish, idle, and petulant every day. Jack finally becomes a stoker on board an ocean steamer, and becomes more and more degraded by the brutalizing life which M. Daudet describes with a bitter force. In his first spell at carrying up the buckets of used ashes from the furnace to the sea Jack turns faint, and a comrade offers him brandy, which he, warned by his one former debauch, refuses:—

— Non, merci, je n'en bois pas, dit Jack.
L'autre se mit à rire.
— Tu en boiras, dit-il.
— Jamais! . . fit Jack.

But a little later, after an hour's stoking:—

Il se sentit aveugle, sourd, sans haleine, étouffé par le sang qui montait, les yeux troubles sous les cils brûlés. Il fit ce qu'il voyait faire aux autres, et, tout ruisselant, s'élança sous la "manche à air" long conduit de toile où l'air extérieur tombe se précipite du haut du pont par torrent. . . Ah! que c'était bon. . . Presque aussitôt, une chape de glace s'abattit sur ses épaules. Ce courant d'air meurtrier avait arrêté son souffle et sa vie.

— La gourde! cria-t-il d'une voix rauque au chauffeur qui lui avait offert à boire.
— Voilà, camarade. Je savais bien que tu y viendrais.

Through all Jack's brutalized life the idea of his mother remains to him as the hope of a haven of rest, and what he finds that haven in the end to be M. Daudet has told with considerable force, but with not enough for his subject. *Jack* is not a book for maidens and boys, nor is it one that is pleasant to read; but it is valuable for its representation of a little-known kind of life, and remarkable for a good deal of imagination, as well as for its satirical power.

THE SUEZ CANAL.*

THE two works whose titles will be found below may conveniently be reviewed together, since both treat of the history of the Suez Canal. Yet they are very unequal in merit and value, and they deal with their subject from different points of view and for dissimilar purposes. M. de Lesseps's volume is a *mémoire pour servir* rather than a history properly so called. It supplies materials indispensable to the historian, but it does not pretend to give an exhaustive, or even a connected, narrative. It has all the interest and all the value that belong to documents of its class, but it is necessarily incomplete and one-sided. What M. de Lesseps knows, or at any rate what he chooses to tell, of the objects aimed at in the construction of the Canal, and the jealousies, rivalries, suspicions, plots, and counterplots that were aroused by its projection and marred its execution, the volume sets before us. But it is obvious that this story requires to be checked and filled by the Turkish and Egyptian accounts, and still more by the correspondence and despatches of Lords Palmerston, Clarendon, and Stratford de Redcliffe on the one side, and on the other by those of the late Emperor Napoleon and the political and financial adventurers by whom he was surrounded. Yet, though the book is necessarily one-sided, it has all the interest attaching to original documents that enable us to trace the conception and gradual shaping out, in spite of difficulties without number, of a project which is visibly revolutionizing commerce, transforming naval construction, and exercising a profound influence upon international relations. It has, too, the more human and personal charm inseparable from the story of the hopes and fears, the plans and disappointments, the struggles and triumphs, of one of those original minds which affect the fortunes of a generation. With unflagging interest we follow the movements of M. de Lesseps as he successively fascinates the Viceroy of Egypt and moulds him to his will, then wins over the Empress of the French, and through her directs French diplomacy to the furtherance of his project, gradually obtains the support of Austria, Prussia, and Sardinia, imperiously bullies the Porte, and finally confronts Lords Stratford de Redcliffe and Palmerston themselves. The translator, we must add, has done his part exceedingly well. We are offended by none of those Gallicisms and awkward unidiomatic phrases which too often disfigure translations. Mr. Percy Fitzgerald's work, unlike M. de Lesseps's, is presented to us as a complete history, political, financial, and engineering, of the Canal. But it is hardly time yet to carry out such a task in a satisfactory manner. While the interest excited by the purchase of the Khedive's shares is fresh the public may be glad to have such an account as Mr. Fitzgerald's volumes supply. That account, however, leaves much to desire. Mr. Fitzgerald appears to be a hero-worshipper. He is not satisfied with admiring M. de Lesseps, but adopts all his views. It never seems to have occurred to Mr. Fitzgerald that, without suspecting M. de Lesseps of bad faith or conscious misrepresentation, his theories, inferences, and imputations might require critical sifting. In this way Mr. Fitzgerald is led to do something less than justice to Lord Palmerston. Now that the Canal is made, nobody, we presume, would desire to revive the spirit of hostility with which Lord Palmerston opposed its construction. But it argues a strange ignorance or a strange forgetfulness of the Europe of twenty years ago not to appreciate and do justice to the motives which inspired Lord Palmerston's opposition. Of course we do not expect M. de Lesseps to make himself the apologist of the statesman who delayed so long the execution of the great enterprise with which his name is linked, and who added so largely to its difficulties. But an English writer ought to be able to understand that the statesman was actuated neither by narrow insular prejudices nor by totally unfounded apprehensions.

M. de Lesseps—for his personal history is to so great an extent the history of the Canal that we necessarily begin with him—is the son of an official of the first French Empire. Napoleon did not abandon the idea of making French influence predominant in Egypt on the failure of his invasion of that country. He only felt compelled to change his tactics; and it argues a high opinion on the Emperor's part of the elder Lesseps that, on the conclusion of the Peace of Amiens, he was sent to represent France at Cairo. The Mamelukes were irreconcilably hostile to the French; and accordingly Napoleon directed his agent to seek out a Turkish officer to fill the place of Pasha of Egypt, who might be trusted to control the Mamelukes. It is sufficient evidence of M. de Lesseps's knowledge of character that he selected Mehemet Ali, then an unlettered soldier, unable even to write his name, who had recently arrived from his native Macedonia at the head of a thousand horsemen. The projector of the Suez Canal, it will thus be seen, had an hereditary claim to the gratitude of the Egyptian Vice-regal family. M. de Lesseps, the son, also entered the diplomatic service of France. He was successively Consul in Tunis, Egypt, Holland, and Spain; was then appointed Minister at Madrid; and was finally sent to represent his Government at Rome. M. de Lesseps had distinguished himself greatly in the course of his career, and had excellent prospects before him; but he quarrelled with his Government at the time of the French expedition to Rome, and retired from the service. He disapproved of the *Coup d'état*, and did not vote for the Empire; and he seemed to have settled down as a country gentleman, to pass the remainder of his life in obscurity, when the death of Abbas Pasha gave him the opportunity for which he had been watching during long years. When in Egypt, he had been treated with special consideration by Mehemet Ali, who recognized the debt of gratitude he owed to the son of the man who had been the founder of his fortunes. By this means he had been able to form a close friendship with Mahommed Said, the brother of Abbas, and in various ways to place him under an obligation. Long after M. de Lesseps's departure, and when Abbas had become Pasha, Mohammed Said fell into disgrace. He was accused of conspiracy, his family was exiled, and he himself had to fly. He made his escape to Paris, was there visited and befriended by M. de Lesseps, and the early intimacy that existed between them was renewed and cemented. On the death of Abbas, Mohammed Said became Viceroy, and in answer to a letter of congratulation he sent M. de Lesseps a pressing invitation to visit him at Alexandria. In his early consular days, while laid up in quarantine at Alexandria, M. de Lesseps had had his attention directed to Denon's work on the expedition to Egypt, had been fascinated by Napoleon's idea of a canal across the Isthmus, had studied the reports of the engineer Lepère, and ended by adopting the project as his own. The inquiries and studies of subsequent years strengthened his attachment to the scheme, but he had been obliged to postpone indefinitely its realization. Now, however, that his patron was master of Egypt, he revived the idea, and, encouraged by the warmth of the reception he met with, he after a little preparation proposed it to the Viceroy, and found it at once adopted. The impulsive disposition of the new Pasha makes it probable that he acted with very little reflection, and rather to gratify one to whom he was eager to prove his friendship than from any well-founded estimate of the benefits the enterprise would confer upon Egypt, and certainly without any adequate conception of the difficulties which the scheme would have to encounter. At the same time M. de Lesseps's volume shows that Said Pasha was eager to improve and regenerate Egypt. He was ambitious to signalize his reign by great works that would make it famous as well as benefit his subjects. But unfortunately he wanted the businesslike qualities necessary to guide him to the attainment of his objects. He was only an Eastern despot eager to play the part of a Western reformer. Yet it is to be noted further to his credit that, however thoughtlessly he may have committed himself to the project of the Canal, when once he had given his word he never departed from it. Obstacles and even dangers only led him to make fresh sacrifices. Indeed the prodigality with which he heaped grants and concessions upon M. de Lesseps and his Company have largely contributed to bring Egypt into its present financial embarrassments. On the very first proposal of the scheme it was, as we have said,

* *The Suez Canal: Letters and Documents descriptive of its Rise and Progress in* 1854-1856. By Ferdinand de Lesseps. Translated by N. d'Anvers. London: Henry S. King & Co. 1876.

The Great Canal at Suez; its Political, Engineering, and Financial History. By Percy Fitzgerald, M.A. 2 vols. London: Tinsley Brothers. 1876.

adopted by the Viceroy. He and M. de Lesseps were then upon an excursion into the interior; on their return the Consuls of the several European Powers waited upon the Viceroy to pay him their respects, and he seized the opportunity to announce that he had decided upon the Canal, and had granted a concession to M. de Lesseps. The British Consul-General allowed it to be seen, without delay, that objection from England was to be expected. But Mohammed Said waited not a moment. He completed the concession, and chartered the Company, with M. de Lesseps as its director and founder.

M. de Lesseps had won a great triumph, but the real difficulties of his enterprise were only about to begin. The extraordinary ascendency he had acquired over the Viceroy placed the resources of Egypt at his disposal, enabled him, without expense, to have a preliminary survey of the Isthmus effected, and, in a word, supplied him with the means of executing his project. But he and the Viceroy had thought it advisable to obtain the sanction of the Porte for the concession, and this the Porte could not be induced to give. M. de Lesseps attributes the unwillingness solely to fear of Lord Stratford de Redcliffe, and tells us that the Sultan and the Grand Vizier were personally favourable to the Canal. But we should be inclined to question the correctness of the statement. The Grand Vizier, no doubt, led M. de Lesseps to believe as much. But the notorious duplicity of Turkish diplomacy, the universal resort of weakness accustomed to be bullied, disposes us to attach little weight to the assurances of the Grand Vizier, who, indeed, must have been deceiving either M. de Lesseps or the English Ambassador. And even if we were to credit the Porte with the most enlightened views, it might well look with suspicion on a project promoted by a Power which had first attempted the conquest of Egypt and had then supported Mehemet Ali in his revolt against his sovereign. But the Sultan's Government had strong reasons for not offending that Power, then actively fighting its battles in the Crimea, and it had also good reasons for not offending a vassal whose troops were the very flower of its army. However, M. de Lesseps sees in the shuffling and deception of the Porte only the hand of England, and with much cleverness and courage he set himself to combat English hostility. It was not difficult to enlist the French Government in his cause. The Empress zealously entered into his views. The Emperor affected a prudent and dignified reserve. It was necessary to be cautious and to respect English prejudice. Nevertheless, French agents were active in his behalf; and as those were the days when French influence was at its height, the Courts of Europe smiled upon M. de Lesseps. He further opened a correspondence with Mr. Cobden, in the hope of securing the influence of that gentleman on his behalf; and then he went in person to Constantinople to confront Lord Stratford de Redcliffe. But with all his diplomatic ability, he was obliged to confess himself vanquished, and had to vacate the field. From Constantinople he repaired to Paris. He had interviews with the Emperor; he duly plied him with memorandums and information, and obtained instructions to the French Ministers to give him all the assistance in their power. But still he was duly cautioned as to the necessity of respecting English opinion in the matter. Having thus made all his preparations, and having talked over the Paris Correspondent of the *Times* and induced him to write favourably of the enterprise, he visited London. The account of his interviews with Lord Palmerston is to the English reader perhaps the most interesting part of the volume, as it is certainly not the least characteristic. Lord Palmerston frankly avowed his hostility, and M. de Lesseps, on his side, was overwhelmed with astonishment at the futility and inconsistency, as he thought, of the arguments used by a Minister whose influence was felt all over the globe, and whose very prejudices the most powerful monarch of the day was anxious to respect. We are not concerned to defend Lord Palmerston's policy in all respects; and, as it happened, his opposition proved to be unavailing. Yet the opposition was not groundless. The Third Empire professed itself the heir of the policy of the First, and what the policy of the First Empire in Egypt was is known to all the world. It is also known that Lord Palmerston himself, not many years before, had barely avoided a war with France on account of Egypt. Nay, more, even if we assume that the construction of the Canal was a purely commercial enterprise, without a political thought behind it, will any one say that, if France had been successful in the late war, and had dictated peace at Berlin, our communications with India would not now be imperilled? The opposition of Lord Palmerston, therefore, was neither unreasonable nor merely prejudiced. That it failed was mainly due to the boldness, fertility of resource, and energy of M. de Lesseps, who, tired of Turkish delays, began the Canal without the Sultan's authorization, in the just confidence that, protected as he was, force would not be employed to stop him.

ARCHÆOLOGICAL SKETCHES IN KINTYRE AND KNAPDALE.*

"BUT where are the ruins of the Abbey?" a visitor to Glastonbury was one day asked by a stranger who had come from a distance to see these famous ruins, and was then actually standing in their midst. Of course the questioner was thought very stupid, and perhaps Captain White may think us equally stupid for repeating the question, in spite of ourselves, when, on opening his first volume, we light upon his sketch of the "Ruins of Saddell Abbey from the South-West." But really we took the drawing at first sight for a study of the trunks and twigs of trees of sundry sorts and sizes. On looking again we can dimly make out three dark-looking bodies, intended for fragments of wall, in the middle distance. As these scraps are all that is left of the ruins, we are not at all surprised to hear that "it is utterly impossible to ascertain the architectural character of any portion of the monastery." Nor have its archives fared better than its stones. It is no wonder, then, that "the history of this religious house is almost a blank from first to last." Yet Saddell or Sagadull Abbey was the only considerable church in the district which Captain White has chosen as the field of his labours. Truly, the work of compiling two large volumes of Archæological Sketches from materials so scanty must have been even more disheartening than the task of making bricks without straw. The author's first sight of these interesting remains was not cheering. "The tombs were all wet with rain—the nettles, plentiful here as in all other similar spots, limp and dripping—and a melancholy wind sighing through the boughs overhead." Who that has ever tasted the dreary delights of a wet summer in the North can recall such a scene without a shudder? But, dismal and depressing as it must have been, it was powerless to damp Captain White's enthusiasm. The stones that were not to be found in their proper places on the walls he hunted out in neighbouring buildings, and chiefly in the stables of the Laird. In like manner, he has raked up all sorts of incidental notices of the abbey, and legendary stories connected with it. With such shadowy materials as these, and one original document of the house, a charter of James IV., he manages to fill three chapters. From these we gather that Saddell was a house of Bernardine Monks—"Nasturtiums," as we heard them called the other day by a Mrs. Malaprop of our acquaintance—and was in bygone days of much importance, to its own monks at any rate, though "not a word," we are told, "appears in any of the chartularies extant of the other Cistercian houses alluding directly to the monks of Saddell or any of their transactions." Yet Saddell had an abbot as its head when its more wealthy rival, the Cluniac house at Paisley, could only boast of a prior. The solitary charter sets forth that Reginald, the son of Somarled, was the founder. Captain White, however, is bent upon proving that this good work ought to be laid to the score of the father and not of the son. The question is not after all one of much moment, as it can only make a few years difference in the date of the foundation. Perhaps, as in the case of the Temple, the building was planned by the father but begun only by the son. We must not leave Saddell without mentioning that "from the faint tracks or mounds left in continuation" of the fragments of wall, Captain White has been "enabled to ascertain with tolerable certainty that the church was cruciform." As this is not an unusual form for churches in Western Christendom, the comment "The Cistercians, it may be noted, were rather given to build their churches in this shape," might surely have been spared.

As for the rest of the ruins which find a place in Mr. White's pages, they do not pretend to be anything more than simple parish churches. How simple the parish churches in those parts were it is impossible to realize without seeing their remains. As Captain White admits, "a generally prevailing plainness, sometimes bareness, of ornamental detail throughout" is one of the chief peculiarities of the church architecture in Argyleshire. Quantity before quality seemed to be the principle of church-building acted on in the Highlands in early times. In the most unexpected and now unfrequented places one comes upon the rough stone gables pierced by narrow lancet lights with just enough left of the connecting walls to trace out the limits of one of these tiny churches dedicated to the holy Bride or Blane, or some other less familiar saint whose jaw-cracking name recalls the golden age when the "land of the Saints" meant Ireland. The very frequency of these little chapels is supposed to bear witness to the existence of a much denser population at the time they were built than is now to be found in those thinly-peopled solitudes. If it were so, the proportions of the ruins certainly show that the population did its church-going by deputy or in relays of half a dozen at a time. Their poverty, too, is the more remarkable when contrasted with the rich and elaborate ornamental work found on the monuments lying near them. It is to these monuments that Captain White has specially turned his attention, and he has done for the sculptured crosses and slabs of Knapdale and Kintyre the same good offices which Mr. Stuart did some time ago for the standing stones of the Eastern counties.

The Argyleshire stones may be divided into two classes, the standard crosses and the sculptured slabs. On the latter the cross-hilted sword takes the place of the cross, and all the other ornaments are grouped round it. The sword is often surmounted by a galley, a favourite device in a region of lochs and islands, where roads were few and communication was carried on by boats. As the inscriptions are in most cases so much rubbed as to be unreadable, it is impossible to fix exactly the date of these curious and beautiful efforts of memorial art; but that they are much more modern than the Eastern stones is evident to any one who compares the two. Those strange symbols whose meaning and origin have been so much disputed, the crescent and sceptre and the joined circle known as the spectacle ornament, are not found in the West. It is but fair to say, however, that Captain White has found one stone on which there is a pattern in outline in which he traces the idea of the crescent and sceptre. From his drawing we should

* *Archæological Sketches in Scotland.* By Captain T. P. White, R.E., F.S.A. Scot. Vol. I. Kintyre. Vol. II. Knapdale. Edinburgh and London: Blackwood & Son.

say that the figure is not decided enough to warrant such a conclusion. Another distinctive feature of the Eastern stones is the strange beast called by courtesy the elephant. The legs of this queer creature resolve themselves into volutes, a sure sign that he was drawn in that primitive stage of art when the imitation of feet is felt to be beyond the reach of human skill. Artists, whether in the infancy of life or of their art, are ever prone to resort to some such simple expedient for veiling their own inability to finish off the extremities of their creations. Now the animals of even the oldest of the Western stones are all provided with feet of some sort—a sure sign of a great advance in artistic skill. The elephant on the very curious cross at Eilean Mor, the only one we believe to be found in the West, shows at once the points of likeness and difference between these two classes of monuments. The artist who designed it has been faithful to the tradition that there ought to be an elephant on the stone, but he has succeeded in making something much more like the "earth-shaking beast" than the conventional animal with its trunk turned back along the spine, the only pattern in favour on the earlier stones. Why the Picts, or whoever else put up these stones, should have fixed on an elephant as the most suitable design to be carved on their tombstones, must ever be a puzzling question. One suggestion is that the animal is no elephant, but an imitation of certain monsters in wicker-work in which in Pagan times human victims were burned alive. Whether this surmise be correct or not, it is very evident that for long after the introduction of Christianity the symbols of Paganism found a place side by side with the emblems of the Christian faith on these early memorials of the dead.

Next to the stone of Eilean Mor among the Argyleshire stones in point of antiquity stands the curious cross at Keills, a drawing of which forms the frontispiece of Captain White's second volume. He thus describes it:—

> This beautiful and singularly antique-looking piece of monumental sculpture is a pillar of a peculiar shape not commonly met with in the Scoto-Irish crosses, and stands 7½ feet high. The carving is confined to the eastern face, the reverse and the edges being left plain, which is somewhat unusual. The group of figures, and central boss at the intersection of the shaft and cross-piece, are raised into much higher relief than the remaining surface, and thus become the leading members of the sculpture. The effect is at once rich and graceful. The boss is flanked on either side by a pair of animals; above the boss is an angel treading down a serpent; below it a figure in prayer. The grouping is thus a crosswise arrangement, and very well balanced it is. The plait-work round the angel's figure, and the rest of the slab's surface, are in uniform relief. The six squares or panels of fret-work, and the curious scrolling of spirals, are thoroughly Irish in character, but rarely seen on the slabs of southern Argyllshire. We have noted, however, a similarity to the type of these spirals at Cladh Libile in South Knapdale. Two pair of animals, with plait-work much worn down, complete the ornament of the Keills cross.

The points which this cross has in common with the Camus stone in Angus were noticed by Mr. Stuart, and Captain White now traces its resemblance to the crosses at Kilkenny and Kirklispeen. It is therefore doubly interesting, not only from its own merits, but as a connecting link between the arts of two different branches of a kindred race. The likeness between the crosses in Ireland and in Argyleshire is not surprising when one considers that the inhabitants of both countries were really one people. This likeness, Captain White tells us, is less strongly marked in Kintyre than in Knapdale and the islands. But though they are like enough to show that they were worked from the same design—and how these designs remind one of the borders of the Irish MSS.—there are still points of difference enough to show that the artists who worked them out were no slavish imitators, but possessed genius enough to give to the works of their hands a character of its own. The open circle round the cross occurs only in two instances in Scotland. One of these is found in Islay, the other is the noted Iona cross. Curiously enough, it is only on these same specimens that the serpents common to the Irish and the Eastern stones are found.

The bosses so frequent on the crosses in the other districts are not found in Kintyre, though there, as elsewhere, one finds the shears, the mirror and comb, the mermaid, the hunting scenes, the rich tracery of leaf-work, and the beautiful interlaced or basket-work, which is a never-failing ornament on the stones of East and West alike. From the lavish and very early use of this pattern it has been supposed that the earliest of these standing stones were intended to reproduce still earlier memorial crosses made of basket-work. St. Mungo, the story goes, once set up a cross of sea-sand near Borthwick; and unless the legend means to imply a miracle on the part of the saint, it is clear that, if his cross was to stand erect, the sand must have been held together by a case of some sort, very possibly wicker-work. Even as late as 1603 Lord Dillon reported that on an island in Lough Derg he found a cross of interwoven twigs standing at the east end of St. Patrick's chapel. The beauty of the foliage on the Argyleshire crosses is a proof that they are not very old. Leaves were as hard as feet to the early Celtic artists. They seldom tried to copy them, and when they did, they failed signally.

The handsomest of the Kintyre monuments is the cross now standing at Campbelltown. Its date is about 1500. It stands ten feet ten inches high, is of the well-known wheel form, and is covered on both sides with elaborate carving. But the beasts and figures which on the earlier stones are the prominent objects are here shoved off to the extremities, while the rest of the surface is covered with that luxuriant leaf-work which at first was used only for filling up corners and borders. Of about the same date apparently is the beautiful and perfect cross at Kilmory Knap. From the inscription, "Hic est crux Alexandri Macmillan," it is called the Macmillan Cross, and popular tradition refers it to the palmy days of the clan, when their chief was lord of Knap, and gave his name to one of the towers of Castle Sween.

Captain White has done a good work in thus showing that some good things besides grouse and salmon can come out of the West Highlands. Those who wish to find them, however, must resolutely turn their backs upon the "comforts of the Saltmarket," and, leaving the beaten tourist track, be content to sojourn for a season in regions sacred to the smell of herrings, whisky, and peat-smoke. They will be rewarded by lighting on many beautiful specimens of a lost art, such as those which Captain White has rescued from oblivion in his handsome volumes. Those volumes, in all that relates to the sculptured stones, are valuable and interesting. The illustrations, made from his own sketches, are excellent. But we are sorely puzzled to make out what class of readers the rest of the book is meant for. The general reader, that omnivorous being with an ostrich-like appetite for print of any sort, will hardly consider Kintyre of consequence enough to make it worth his while to master all the details about the Kings of the Dalriads, Somarled's exploits, and the perplexing pedigrees of the Lords of the Isles, and the doings of the Columban saints, contained in Captain White's first chapters. Readers who are really curious about the sculptured stones probably know already more than Captain White can tell them about the history of Scotland, and will not care to hear over again familiar legends and traditions, or to wade through the oft-repeated descriptions of West Highland scenery, which would be more in keeping in one of Mr. Black's novels than among archæological sketches. The book would be very greatly improved by cutting away a great deal of the printed matter and retaining merely critical notices of the originals of the plates. As long as the author keeps to his special subject, he is clearly writing of what he knows something about, but directly he steps beyond it we find him tripping. Any one who has read Mr. Burton's History ought to know better than to treat the Jenny Geddes legend as other than pure fiction. To talk of the "unfortunate curate" at whom her "cuckie-stool," whatever that may mean, was aimed, is simply nonsense. It was the Dean and the Bishop of the King's new-made diocese of Edinburgh who served as butts for the cutty-stools or other missiles of the mob. To call Walter FitzAlan the "first of the race whose fortunes in after days were to be so faithfully followed by Somarled's posterity" might sound well if one did not know that the Lords of the Isles were as thorns in the side of the whole race of Stewart from the first to the last. And when we find an author writing of the man who gave counsel to kings, and swayed the hearts of their subjects, "Abbot Bernard appears to have been an ecclesiastic of very great fame in the reign of Louis VI. of France," we are driven to thinking that it was over the ruins of Saddell that he first made the acquaintance of the Cistercians and their saintly founder. We hope Captain White will continue his work, and ere long give us another volume with drawings as good of the stones of the Isles. By calling attention to the simple beauty of these memorial stones of a bygone day, his work may, we trust, do something towards reviving the power of making artistic tombstones—a gift which, like that of making prayers, has been denied to the present generation.

HER DEAREST FOE.*

MRS. ALEXANDER has two capital requirements for a successful story-teller; she is always good-humoured even when satirical, and she is discreet in her sympathy with her characters. Certain authors fall too much in love with theirs; but Mrs. Alexander, like her heroine Kate Travers, keeps herself well in hand, and allows her emotions to go only so far as her reason and judgment approve. She makes no faultless monsters even of those who are evidently her favourites, and whom we take therefore to be the exponents of her own thoughts on humanity and life. Her heroes are men very much as we see them in the world, with the prejudices of caste, the faults of temper, the moral inconsistencies belonging to human nature in general; but they are gentlemen, and not so weak in the knees, not such stuffed puppets, as women's men for the most part are. And her heroines are essentially women of honest flesh and blood, affectionate, sincere, natural; with their little shortcomings too in the higher regions of morality, but exceedingly feminine and loveable. Maggie, in *The Wooing O't*, was a specially delightful person, and so is Kate Travers or Temple in this present book; both, though unlike in personality, are women governed rather by reason than by impulse, and both, though affectionate and emotional, are women without passion or sensuality. This is indeed a noticeable feature in Mrs. Alexander's work; her characters, though living enough, do not rise into passion, seldom touch the depths of pathos, and never descend into sensuality; and she makes no demands on her readers by the tragic quality of her scenes and circumstances. She is always bright, amiable, and amusing; and rather skims the surface of life with a light hand and a pleasant smile, than dives into its graver depths or ventures to explore its more mysterious ways.

A certain spirit and glow in the character of Kate Travers give it the look of having been drawn from the life; and the mixture of determination and relenting, of rooted enmity and growing love, that she feels for her "dearest foe," Sir Hugh Galbraith, is very well con-

* *Her Dearest Foe.* A Novel. By Mrs. Alexander, Author of "The Wooing O't," "Which Shall It Be?" 3 vols. London: Richard Bentley & Son. 1876.

ceived and carried out. The whole progress of the love affair is excellently done; there is not a touch too many, not an indication too broad, but all is painted in with the lightness and delicacy which distinguish Mrs. Alexander's style, and which we find wonderfully refreshing after so much that is heavy and so much more that is indelicate in modern literature. For all this the story has not the same freshness as *The Wooing O't;* and, save in the scenes between Kate and Sir Hugh, it lacks life and "go." The business details are cold and a little confused; the conversations run into tedium, and, always with the exception of the scenes just mentioned, are not very interesting; too much of the story is told in these conversations instead of by scenes and events, which is the more pleasant and enlivening method; and there are some mistakes in grammar and diction which we are surprised should have been made. Twice the author uses "strata" as a noun singular; she speaks of "houses of a very superior description from the lowly cottages," &c.; "*bête noir*" is as faulty as "syrens"; "Mrs. Travers was too much occupied with other things than to bestow any on him" will not parse; nor will the "piquante peculiarities of his position"; such a phrase as "diapasons of delight" spoils a very pretty and effective scene; and what is her quarrel with those useful, if humble, parts of speech, the relative pronouns, that she never by any chance uses them when she can make her meaning clear without them? The absence of all distinctive "that's" and "which's" gives a singularly bald and disjointed character to writing; and the author would do well to take these discarded servants into her employ on the next occasion. These are the small blots which disfigure *Her Dearest Foe*, and which a little care would have obviated. A graver fault, we think, may be found in the treatment of Ford's action and influence on the story. The sketch of his character is exceedingly good:—

> If Mr. Ford had been a tall, dignified patrician with a schedule of debts and a doubtful past, or an eager, fiery democrat, burning to right the wrongs of every one under the sun, but leaving his children to fight their own battles the best way they could, the task of dissecting such characters—demonstrating their defects, demanding admiration for their nobler aspects, asking sympathy for their trials, compassion for their weakness, and justice tempered by mercy for the total—would be deemed no unworthy task for a novelist's or biographer's pen. But when the subject "of the sketch" is a middle-aged man, of middle height and sloping shoulders—of good business capacities, of undoubted integrity, of unimpeached morality, guiltless of any excess, his principal recreation a mild taste for art and a keen ambition to be attired as becomes a swell—which of our young lady readers would care to be informed how vanity and weakness combined to ruin and corrode much that was good, and how in a man, whose life of quiet, unvaried work knew little that was bright, an intense, unresisted passion, too strong for the character it dominated, mastered his reason and drove him into the wilderness where right and wrong were confounded in outer darkness.

While this description is good, Ford's action on the story, though important, is abortive. Though the motive is clear which urged him to forge a will and then propose to Mrs. Travers to destroy it, so that they might have the link of a common crime between them, and she might be thus thrown into his power and forced to accept his love, yet the author has not made this, which should have been, and is, one of the most momentous circumstances of the drama, strong enough in detail. The villany of Ford would have had more vitality if it had more thoroughly permeated the story, not merely been a thing which, when done, had to be undone. It has the look now of being something adventitious rather than integral to the plot—something not sufficiently welded into the life of the drama, though it is in fact the pivot on which the whole turns. It is rather the effect of a past cause than the most essential of the circumstances by which present events are governed; and this gives one the impression of perpetually looking back, which is not conducive to that sense of growth and progress which a novel should always produce. Ford committed this villany, but he has no active part in baffling, or trying to baffle, the efforts of the widow and her friends to bring the crime to light, as would have been the case in real life—adding to his first sin others induced by the dread of discovery. He is often spoken of, but seldom appears; and when he does appear, the situation is not sufficiently strong or striking—at least after the first scene where he makes love to Mrs. Travers. And this creates a curious feeling of unreality, from which the author's former works have been singularly free.

There are one or two scenes in this book so good as to make us regret that we have so few of them. The opening scene, where Kate's husband, Mr. Travers, is dying, is very well done. It is strong and reticent, free from hysterics, and natural; and that where Kate acts for the first time as Sir Hugh Galbraith's amanuensis is wonderfully graphic and lifelike. Indeed all the scenes between the widow and her "dearest foe" are excellent; they are the real story, while everything else comes in as padding. There is a *verve* in the description of her enmity, which, entirely removed from coarseness or exaggeration as it is, gives one the impression of latent strength, both in Kate and her author, which is to be understood only by those who read the book. Like the famous "look" which the dispossessed woman gives to her successful rival and enemy, it includes more than it expresses; but indeed this is the effect which Mrs. Alexander's writing has on us. There seems to be generally more in her than she ever brings forth; as if she could rise to greater success if she would but give herself the trouble of trying. We do not care much for Fanny Lee or her "young man" Tom. Nothing is more difficult than to give liveliness and naïveté quite naturally and without silliness; and we can scarcely say that the author has been entirely successful with Fanny. She serves all the better as a foil to Kate Travers; but we do not think that this was quite the author's intention; for we take it that Miss Fanny Lee was intended to be admired on her own account, and not merely commended as a background against which the beauties of her companion's nature shine with increased lustre. As the laughing young *ingénue* on the stage, contrasted with the greater depth and sweetness of the widow, she would come out very well; but in a novel she is scarcely so successful. This, however, is a necessity with the kind of character; and Mrs. Alexander has not failed more than her predecessors in an intrinsically hopeless task.

The story of *Her Dearest Foe* is simple, and made up of circumstances so dramatic that they would easily fall into an acted play. An elderly man, Mr. Travers, has married somewhat beneath himself in outward condition of life, though the woman herself is his equal, and perhaps his superior; and the story opens with the scene of his death, when he expires with a half-expressed doubt as to the justice of the will which he has made. A certain cousin, Sir Hugh Galbraith, had been led to believe himself the old man's heir; when he hears of the marriage he is naturally irate, and writes to his cousin with more freedom than prudence. On this Mr. Travers makes his will, and leaves everything he possesses to his wife. After this outburst it is known that he makes another will, whereby he bequeaths his fortune differently, and in favour of Sir Hugh; and this is the will of which he speaks when he expresses a hope, coupled with doubt, that he has done what was right. But the will cannot be found; and the widow takes possession under the former document. Ford, the confidential clerk of Mr. Travers, has long cherished a secret passion for the wife of his employer. After she has taken possession under the first will, he comes to her one day and produces one which leaves everything absolutely to Hugh; offering to destroy it, however, if she will sanction his doing so. Like a high-spirited and honourable woman she refuses, and rejects his proffered love with as much scorn as his proposal to commit a crime; gives up to Sir Hugh what she no longer regards as her own; changes her name, and takes a Berlin wool-shop in a small country place where she is not known, her friend Fanny Lee accompanying her. Here it is that Sir Hugh Galbraith is brought after an accident in the hunting-field; for the fair widow lets lodgings as well as sells silks and wools. And here it is that the first lines of the love affair are laid between her and the man who thus becomes her "dearest foe." All these scenes are perfectly well done. Mrs. Alexander has written nothing better, and the whole of this part of the book would, we think, dramatize with complete success; but we confess to a sense of weariness and heaviness in the collateral scenes and circumstances, of which there are too many. The conviction has been strongly forced upon Mrs. Temple—as Kate Travers calls herself—that the will which Ford propounded is a forgery; and this is the basis of the fight between her and Sir Hugh, helped on by certain disrespectful words to herself which she has overheard in Kensington Gardens. Hence the love which grows up in her heart for him, and that which he shows so plainly to her, are embarrassing facts, to say the least of them; and the play of the story lies in the balance between this love and her sense of justice to herself. We will not say how the story ends, but it ends happily, which is one point in its favour.

The character of Hugh is well touched in, but he is rather too much of a churl in his temper for such a bright and brave woman as Kate Travers. It is to be hoped that our gallant soldiers and gentlemen are not often so sour-natured. The sketch of his early boyhood and moral training, though slight, is exceedingly well done; and the book altogether abounds with bright and sparkling passages, and some good philosophy of a serene and pleasant kind—just such philosophy as a clever, but thoroughly womanly, woman would naturally hold.

FRENCH LITERATURE.

SAINTE-BEUVE'S popularity would seem to be on the increase, for all men of letters who had any dealings with him are apparently about to give us their reminiscences. Last month we had to notice two curious collections of *Sainte-Beuviana*, one of which, the *Chroniques parisiennes*, consisted of a series of real *causeries* addressed to the *Revue suisse* from 1843 to 1845. The editor of that periodical, M. Juste Olivier, equally distinguished as a critic and as a poet, was a great friend of his Parisian coadjutor; he had known him both in France and at Lausanne, and had a considerable share in bringing about the course of lectures on Port-Royal which occupies so remarkable a place in Sainte-Beuve's literary career. Here, then, was a new source of information available towards a biography of the French critic—a source, let us add, far richer than M. Troubat would lead us to suppose; for, as we have seen, M. Juste Olivier's acquaintance with his correspondent was anterior to 1845, and it lasted till Sainte-Beuve's death. We have now, in the May number of the *Bibliothèque universelle*, the publication of M. Olivier's own memoir, containing details of the most interesting kind * concerning not Sainte-Beuve only, but Victor Hugo, Alfred de Vigny, Alfred de Musset, and all the romantic school of literature in France. The present instalment gives us only the first part of these reminiscences; they are well

* *Bibliothèque universelle et Revue suisse.* Mai 1876. Lausanne: Bridel.

written and possess real value. The number also contains an article by M. Secrétan on Darwinism, and the concluding part of Montalembert's posthumous essay on Spain.

The immense mass of works on the French Revolution has recently been increased by a monograph on the events of Thermidor* and the termination of the Reign of Terror. M. Ch. d'Héricault, who takes decidedly the anti-democratic side, writes nevertheless with great impartiality, and his introductory chapter on Robespierre strikes us as a correct estimate of the formidable dictator, who, despite his wretched exterior, the decided inferiority of his talents, and the worthlessness of his character, soon rose to the height of power because he made himself the champion of equality—because he was the foremost and most persevering of those who sacrificed the principles of liberty to the levelling mania, which was the only thing the French revolutionists really cared for. M. d'Héricault has made excellent use of a number of documents hitherto imperfectly or not at all known. He describes the *dramatis personæ* without yielding to the temptation of making caricatures, and the sentence he pronounces against the Revolutionists is the natural result of his narrative of the events which occurred between September 1793 and the famous 9th Thermidor. If the event of that day deserves to be remembered as one of the greatest triumphs ever obtained by liberty and humanity, contemptible as were the men who played the leading part in it, it is because on the 9th Thermidor the existence, not merely of the French Republic, but of society itself, was vindicated against democracy gone mad.

The Revolution occupies also a conspicuous place in M. Auguste Vitu's amusing book, *Ombres et vieux murs.*† The old walls about which he writes are those of public buildings which have long since disappeared to make way for wider streets and more fashionable mansions; the shadows belong to the various epochs of modern French history. Suleau, the journalist, the citizen Pache, Marat, the Friend of the People, Danton, and Paul Louis Courier, may be named amongst the most conspicuous. M. Vitu's sketches are not limited to Paris; he takes us to the castle immortalized by the name of Lesdiguières, to the frontiers of Savoy, and in his company we spend a profitable hour at Versailles, discussing the famous legend of the banquet given by the guardsmen to the soldiers of the Flanders regiment. M. Thiers has often enough before now been accused and found guilty of inaccuracy, and M. Vitu is only one amongst a legion of critics who think that history should not be transformed into a pamphlet. We should be glad if he could find time to perform himself the task which he recommends to writers having both leisure and knowledge at their command—a new History of the French Revolution. In the meanwhile we heartily enjoy his unpretending *feuilletons*, and readers who wish to know something about the men of the *ancien régime* will do well to study the concluding chapter devoted to a short account of the Court Almanac.

M. Vitu's gallery of portraits comprises several original characters that have had their day, but are now completely forgotten. If we except the patient investigators who study the byways of literature, where shall we find a man who has ever heard the name of Suleau, or glanced at the effusions of "Le petit Gautier"? It is very much the same with the heroes of M. Charles Monselet's new work.‡ Mercier's *Tableau de Paris* may be familiar to some of our readers, and a stray volume of Elegant Extracts has probably given others a specimen of Cubière's *bel esprit*, but that is all. Yet, as M. Monselet correctly remarks, the eighteenth century should not be judged exclusively from its leaders; behind Voltaire and Rousseau, Montesquieu and Buffon, there is a host of second and even third-rate writers who had abundance of energy and life, and whose influence over their contemporaries was greater than is generally supposed. In those days any one who could handle a pen believed himself or herself to be a writer; we say "herself," because M. Monselet's characters include one lady, Olympe de Gouges, who expiated on the guillotine the unpardonable offence of wishing to be famous. At any rate she gave proof of a certain amount of courage, and so did Mercier, for he did not hesitate to call Bonaparte *un sabre organisé*, and to board in his den the Duke de Rovigo, Mme. de Staël's friend. As for the "Cousin Jacques," or, to call him by his real name, Beffroy de Reigny, it may be questioned whether any newspaper editor ever carried the art of puffing further than he did, and his subscribers must have been somewhat astonished at finding themselves dragged in like the chorus of a Greek play on the first page of a slovenly printed newspaper, and exclaiming, to the tune of "Vous danserez, Biron,"

> Serez-vous toujours joyeux,
> Moraux et point ennuyeux?
> Nous ferez-vous toujours rire,
> Sans prodiguer la satire?

The request was certainly a modest one, and "Le Cousin Jacques" could not do less than say, "Oui, nous le jurons!" whereupon the subscribers, *faisant une pirouette*, answered in unison, "Nous nous abonnerons!"

With M. Philarète Chasles we go back to the middle ages§, and to the dawn of modern civilization. The first essay contained in this volume treats of the intellectual and social condition of the world shortly after the first preaching of Christianity. The last introduces us to Gutenberg's printing-office and to the Renaissance period. Between these extreme dates what a crowd of great events and distinguished names! Around the well-known figures of St. Jerome, Sidonius Apollinaris, Salvian, and St. Cyprian, M. Chasles has endeavoured to reconstruct the Christian Church as it existed from the second century to the tenth. Hrosvita, Sebastian Brandt, and Alexander Barclay afford him the opportunity of studying the earliest manifestations of the novel and the drama in mediæval times. With Dante we are asked to watch an episode in the struggle between the temporal power of the Emperors and the pretensions of the see of Rome. All these chapters, originally written for periodical publications, bear that semi-sensational colouring which characterizes essays that aim at being lively, even when the subjects discussed are very much the reverse. M. Philarète Chasles, however, so honestly acknowledges this blemish that we will not dwell upon it further; the volume itself shows on the part of the author an extraordinary amount of reading, and in some degree reminds us of Disraeli's *Curiosities of Literature*.

M. Barthélemy Saint-Hilaire's translation of Marcus Aurelius*, illustrated as it is by excellent notes, and completed by an alphabetical index, is all that might be expected from so eminent a scholar. M. Saint-Hilaire's intention has been to publish a work of edification in the strictest sense of the term; he considers that on the ground of ethics Hellenic wisdom joins hands with the teaching of Christianity, and that the ancient Stoics deserve a place between the *De Imitatione Christi* and St. Francis de Sales's *Introduction à la vie dévote*. To the objection that Marcus Aurelius and Epictetus were heathen, our translator answers that moral truth is independent of religious differences, and that the *perennis quædam philosophia* spoken of by Leibnitz affects all questions bearing upon right and wrong, duty, virtue, and vice.

The Société de l'Histoire de France published, several years ago, an excellent edition of D'Argenson's Memoirs. Amongst the many public characters referred to by the liberal old statesman was a certain Count de Plélo†, till then very little known, but who appears to have occupied a distinguished place in the Paris society of the last century. The favourable manner in which D'Argenson speaks of him excited the curiosity of M. Rathery, who resolved upon erecting a biographical monument to the Count de Plélo, warrior, diplomatist, and author, member of the Société de l'Entresol, and as such recommending himself to the notice of all champions of political and religious freedom. In M. Rathery's volume our readers will find the full-length portrait of a thorough gentleman, who must have seemed rather eccentric to the contemporaries of Mme. du Deffand and Marshal de Saxe, for he was in the habit of scrupulously paying his debts, he loved his wife, and attended to his religious duties. Count de Plélo had one defect (*errare humanum est*); he was over-zealous as a diplomatist, and Talleyrand would no doubt have shelved him in consequence. Compiled from the Chabrillan family papers, and from documents preserved at the French Foreign Office and in the archives of the War department, this monograph is full of interest as a contribution to the history of the eighteenth century. We regret to say that it is the last work of M. Rathery's, who died in November 1875, and to whose memory a touching tribute is paid in the introductory pages.

The Countess d'Aulnoy's *Relation du voyage d'Espagne* was some time ago reviewed in this journal. We must now say a few words of the Memoirs which form the second volume of the work.‡ These Memoirs were copied almost verbatim by the Countess from a MS. entitled *État de l'Espagne de* 1678 *à* 1682, which was long supposed to be the work of the Marquis de Villars, and was published as such in 1861. Its authenticity has never been impugned; in fact, it tallies exactly with the despatches of Louis XIV.'s Ambassadors, and therefore Mme. d'Aulnoy's narrative, which is merely an expansion of it, deserves full credence. The characters introduced in the *Relation du voyage d'Espagne* appear for the second time in the *Mémoires*, but here they are more minutely described, and the Countess, who was mixed up with all the intrigues of the Court of Madrid, relates the preliminaries of the diplomatic difficulties which led to the war of the Spanish Succession. The book begins with the death of Philip IV., and gives one a wretched idea of a monarchy which had in other days ruled the destinies of Europe. Mme. d'Aulnoy's style is brilliant and agreeable, but she does not always sufficiently explain facts which are quite obscure to us, however clear they may have been two centuries ago. Here the editor comes to the rescue, giving us in her notes all the information required to understand the Countess d'Aulnoy's allusions.

M. Lemerre's *Livre des sonnets*, published some months ago, was an admirable anthology of its kind; now comes, by way of a companion volume, the *Livre des ballades*.§ Under this title are included some of the most original specimens of French literature; for, in the strictest acceptation of the term, the ballad, as it was cultivated by Villon, Christine de Pisan, and Charles d'Orléans, has nothing whatever in common with the metrical tales of Goethe and Bürger, or the legends versified by M. Victor

Hugo. Any reader who studies the history of ballad composition which forms the introduction of the present collection will soon see that there are ballads and ballads, just as there were in Molière's time "fagots and fagots." Talking of Molière reminds us of Vadius, in the *Femmes savantes*, who, wishing to show his genius, begins by "Hom, c'est une ballade"; being a pedant, he was naturally made to select a kind of composition long out of date, and to court ridicule by exhibiting his taste for a superannuated style of writing. It is singular that the literary innovators of 1829, whilst reviving the *sonnet*, the *triolet*, and the *rondeau*, completely neglected the ballad; for, we repeat, the poems to which this name has been wrongly ascribed are nothing else than the *Lieder* of modern Germany. The collection now given to the public by the joint talent and scholarship of MM. Lemerre and Asselineau is a most interesting work; it begins with Froissart, and takes us to M. Théodore de Banville. Villon's celebrated piece on the *Neiges d'antan* forms, of course, one of its chief ornaments; and the copious notes supply us, among other things, with an account of the laws according to which these little compositions were written by the best mediæval and Renaissance poets.

Books on America abound; since the appearance of M. Claudio Jannet's startling volume, which we noticed lately, three more have been published almost simultaneously. M. Chotteau places himself at the historical point of view *, and describes the various events which led to the separation of the United States from the mother-country. When we say that the preface is by M. Edouard Laboulaye it is needless to add that the tone adopted is one of constant and blind panegyric. M. Paul Toutain † appears to have studied American life with the simple desire of knowing the truth about a society which has been unduly extolled by some, unfairly depreciated by others. When he arrived at New York his enthusiasm about the Yankees was extreme; he has returned to his native country only moderately satisfied with the civilization of bowie-knives; the warmest admirers of America, he says, are those who have never been there. M. Simonin's volume ‡ is fuller of details than M. Toutain's; it contains the impressions of a traveller who has visited the United States five times, and has had many opportunities of studying American manners and customs from every side. He acknowledges that there are shades in the picture of New York life, and that the moral condition of the States is not of the most satisfactory kind. The *régime* of unlimited freedom has, he remarks, been on its trial for nearly a century; and, as the old Puritan traditions of the early settlers are dying away, abuses and excesses are cropping up luxuriantly, because they are no longer checked and denounced by public opinion.

The second volume of General Ducrot's *Défense de Paris* § takes us from the month of October 1870 to the battle of Champigny. Having previously sketched what may be called the period of preparation, he now shows us the French troops assuming the offensive, endeavouring to break through the German entrenchments and to set free the approaches to the metropolis. From the details given by General Ducrot it is evident, first, that the artillery was at that time in a very incomplete state of efficiency; and, secondly, that there existed a want of unanimity between the various branches of the army. The old traditions of what were called the "special services" (Artillery and Engineers) had fostered amongst them a spirit of false pride which prevented the harmonious co-operation so essential in war. General Ducrot's volume is supplemented by numerous elucidatory documents and illustrated with maps and plans.

M. Emile Gebhart is an enthusiastic admirer of Italy ‖; for many years it has been his intention to write the history of the Italian Renaissance, and in the meanwhile he has put together in a readable and suggestive little volume a series of sketches referring to various epochs and characters in Italian annals. As M. Gebhart says in his preface, the books which we were formerly wont to consult on the subject are now quite obsolete, and the conditions of a great people who have sprung into political life within the last fifteen years cannot be appreciated from the journals of travellers who lived and wrote half a century ago or more. The chapters detached by our author from his projected work are intended to illustrate certain distinctive features of Italian genius, and the introduction describes, with considerable accuracy, the progress, merits, and drawbacks of the Renaissance movement.

Two other publications relating wholly or in part to Italy are also before us. One is M. Charles Clément's collection of essays ¶ on the fine arts, originally printed in the *Journal des Débats*, and containing an excellent estimate of Raffaelle and a notice of Michael Angelo; the other is M. Elisée Reclus's geographical work **, the recent instalments of which treated specially of the two Mediterranean peninsulas. If beautiful maps, woodcuts carefully engraved and placing before us choice specimens of scenery and costumes, scientific treatment, and an attractive style could induce every one to study geography, our French neighbours would not deserve much longer the reproach cast upon them by German savants.

The *Petite bibliothèque Charpentier* is still living upon Alfred de Musset, the last instalments published containing the author's *Poésies nouvelles* and the first volume of the comedies.* We need not do more here than announce this elegantly printed series of literary *chefs-d'œuvre*. The *Epître à Lamartine* and the four *Nuits* have lost nothing of their freshness, and they are doubly striking when compared with the so-called poetry which M. Félix Frank, to quote only one instance, publishes under the title *Poème de la jeunesse*.† The gorgeous octavo called *Parnasse contemporain* ‡ is, like all anthologies, very unequal; we have noticed, however, several remarkable pieces by M. Théodore de Banville and M. Victor de Laprade.

We must not conclude without mentioning a fresh addition to the list of periodical publications; the first number of the *Courrier littéraire* § was issued at the beginning of March, and the Parts 1-4 enable us now to judge in some measure of the merits of this new journal. It appears twice a month, is edited by M. T. Colani, and is an excellent guide to the intellectual movement of the day. Amongst its contributors may be named Professor de Gubernatis, M. Reuss, M. Marc Monnier, and M. Gabriel Monod.

FRED. W. BREAREY, *Hon. Sec.*
Maidenstone Hill, Blackheath, S.E.

MISS GLYN (late Mrs. Dallas) has the honour to announce to her Friends and the Public, and to the Clergy and to Barristers, that she will teach READING and ELOCUTION during her leisure from public work, at her residence, 19 Mount Street, Grosvenor Square, W.

UNIVERSITY COLLEGE, BRISTOL.—The COUNCIL are about to appoint the following PROFESSORS and LECTURERS:

1. Professor of Chemistry.
2. Professor of Modern History and Literature.
3. Lecturer in Mathematics and Applied Mechanics.
4. Lecturer in Experimental Physics.
5. Lecturer in Political Economy.
6. Lecturer in Classical History and Literature.

The Stipend of the two Professors will be £300 per annum each, with a proportion of Students' fees. The Council guarantees a minimum emolument of £400 per annum.

The appointments of Lecturers are temporary, the engagement lasting only from October 1876 until the end of April 1877. Each Lecturer will receive an Honorarium of £150 and half the Students' fees.

The latest day for sending in applications is June 23.

Further particulars may be obtained from the Secretary.

By Order of the Council, EDWARD STOCK, M.R.C.S. Eng., *Secretary.*

Temporary Office, Shannon Court, June, 1876.

QUEEN'S COLLEGE, 43 and 45 Harley Street, W.—The PROFESSORSHIP of GEOGRAPHY is now VACANT. Applications will be received till June 17. Particulars may be had on application to Miss GROVE, at the College Office.

E. H. PLUMPTRE, D.D., *Principal.*

UNIVERSITY COLLEGE, LONDON.—The COUNCIL desire to appoint a SECRETARY. He must be a University Graduate. Candidates will be required to state their age. The initial Salary will be £500 per annum. Further information may be obtained at the Office of the College. Applications and Testimonials will be received not later than June 10.

HARRY BROWN, *Assistant-Secretary to the Council.*

FETTES COLLEGE.—SCHOLARSHIPS.—Four of £40 per annum. Competition in July.—Apply for particulars to HEAD-MASTER, Fettes College, Edinburgh.

WELLINGTON COLLEGE.—JUNIOR SCHOLARSHIPS. There will be an ELECTION to SIX in June next. They are open to all BOYS who on June 1 are between Twelve and Fourteen years of age. The Examination begins on Tuesday, June 20.—For further particulars apply to the Rev. the BURSAR, Wellington College, Wokingham.

CLIFTON COLLEGE SCHOLARSHIPS.—EIGHT or more will be open to COMPETITION at Midsummer, 1876, value from £20 to £50 a year, which may be increased from a special fund to £90 a year in cases of Scholars who require it.—Further particulars may be obtained of the SECRETARY, the College, Clifton, Bristol.

HIGHGATE SCHOOL.—There will be an EXAMINATION for FOUR ENTRANCE SCHOLARSHIPS of £70, £50, £40, £40, June 28.—Application to be made to the Rev. the HEAD-MASTER, School House, Highgate N.

MALVERN COLLEGE.

This COLLEGE contains THREE DEPARTMENTS—the CLASSICAL, MODERN and PREPARATORY LOWER SCHOOL.

Boarding and Tuition, under Fourteen, £80; over Fourteen, £90. Non-Shareholders pay an extra fee of £5. Special advantages for Sons of Clergymen and House Boarders.

For further information, apply to the Rev. ARTHUR FABER, M.A., Head-Master, late Fellow and Tutor of New College, Oxford.

The THIRD TERM will begin on Monday, September 18.

THE GRAMMAR SCHOOL, Cambridge.—The School House is now ready for Boarders. At the last revision (Christmas, 1875) there were 26 Boys from this School at the University, of whom 21 had obtained Scholarships, Exhibitions, &c., at their respective Colleges. An Open Scholarship at Christ's and a Sizarship at Trinity have just been obtained.

For Terms, &c., apply to the Head-Master, J. B. ALLEN, M.A.

THE Rev. T. L. MONTEFIORE, M.A., Rector of Catherstone, Dorset, and Rural Dean, would be glad to receive TWO PUPILS to Read with his sons. Terms £150. Healthy situation. Good Sea-bathing.—Address, Charmouth, Dorset.

HURSLEY, WINCHESTER.—A. M. HEATHCOTE, B.A., Oriel Coll., Oxford, prepares BOYS, between the ages of Seven and Twelve, for the Public Schools. Terms, 100 and 120 Guineas. Holidays as at Winchester College.—Address, Home Close, Hursley, Winchester.

BONN-ON-RHINE.—Mr. A. C. PEARSON, B.A., St. John's Cambridge, has taken the Management of the House which for the last Thirty years has been successfully conducted by Dr. W. C. PERRY. He prepares a few PUPILS for the Universities and the Civil and Military Examinations, and for the higher posts in Mercantile life.—For terms, &c., address 26 Bachstrasse, Bonn-on-Rhine.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. (Scholar) Oxon., assisted by a Cambridge Honourman and a competent staff of Teachers, prepares for the Universities and for all Competitive Examinations. Pupils successful at the last Minor Examinations of the Line.

THE RECTOR of LAVENDON, experienced in Tuition, is prepared to receive Two or Three PUPILS, under the age of Fifteen years, into his House, to prepare for the Public Schools, &c.—Address, THE RECTOR, Lavendon, Newport Pagnell, Bucks.

THE Rev. H. J. GRAHAM, M.A. Oxon., receives TWELVE PUPILS to prepare for the Public Schools, at Aslampstead Vicarage, Pangbourne, Berks.

WOOLWICH ACADEMY.—A BENEFICED CLERGYMAN, Wrangler and successful Tutor, wants a COMPANION PUPIL for his Son (well advanced), whom he is preparing for the admission Examination, Christmas 1877. Special advantages in Mathematics and Modern Languages. Terms less an object than a boy willing to work.—Address, N. H., Post-Office, Tamworth.

AN OXFORD GRADUATE, in Classical Honours, Moderations, and Final Schools, and of some experience in Tuition, desires a TUTORSHIP, abroad or in England, for the Long Vacation. Good references.—Address, S. E., Lincoln Coll., Oxford.

HEAD-MASTER for the GROCERS' COMPANY'S MIDDLE CLASS SCHOOL, Hackney Downs.

NOTICE is hereby given that the Court of the Grocers' Company will, on or about the 16th day of June, 1876, proceed to the appointment of a HEAD-MASTER of their School at Hackney Downs, estimated to accommodate from 300 to 600 Boys, and expected to be ready for opening at Michaelmas next. Fixed Stipend £100 per annum. Capitation Fee of £1 per Boy up to 400, and 10s. per Boy beyond that number. A minimum salary of £500 per annum guaranteed for first Three years commencing from Michaelmas next.

The Head-Master will be appointed subject to the provisions of a Scheme of the Endowed Schools Commissioners. He need not be in Holy Orders, but must not accept or hold any benefice having the cure of souls or any office or employment which in the opinion of the Court may interfere with the proper performance of his duties as Head-Master.

Further particulars may be obtained upon application to the CLERK of the GROCERS' COMPANY, Grocers' Hall, Poultry, London, E.C.

ALDENHAM GRAMMAR SCHOOL, near Watford, Hertfordshire.—HEAD-MASTER.—The GOVERNORS will shortly proceed to the ELECTION of a HEAD-MASTER.

The School has lately been reconstructed, under a Scheme of the Endowed Schools Commissioners.

The School Buildings are modern. There are large School-rooms, Dining-rooms, and well-ventilated Dormitories, and a Playground of over twelve acres.

The Head-Master must be a Member of the Church of England, and a Graduate of Oxford or Cambridge, or a Graduate of some University within the British Empire.

He will receive a fixed Stipend of £200, and also Head-Money of Five Pounds (£5) for each Boy in the School, and will also receive profits on the Boarders in the House.

The present number of Boarders is fifty-five. There is room for over one hundred.

Assistant-Masters to be appointed by the Head-Master, and to be approved by the Governors, will be paid under the Trust.

He will enjoy his House and Garden free of rent and taxes.

The course of instruction in the School will comprise such subjects as are required in Schemes settled by the Commissioners for Endowed Schools of the first grade.

Candidates are requested to forward their applications, with copies of testimonials, before July 10 next, after which day the Governors will proceed to the Election. Further information may be obtained from the undersigned.

CHARLES R. VINES, *Clerk to the Governors.*

Brewers' Hall, Addle Street, London, May 29, 1876.

A LADY (Thirty-six), daughter of a University Professor, wishes to engage herself as COMPANION to a Lady or elderly Lady and Gentleman. She is cheerful, very well educated, and speaks and reads several languages. Is a good reader and secretary. Would not object to travel or to chaperone young ladies. Is accustomed to good society, and would be a pleasant companion in a country house. Highest references.—Address, J. A., care of Mrs. Hannover, Upper Terrace House, Hampstead Heath, London, N.W.

PRIVATE LIBRARIES, and those of Colleges and Literary and Scientific Institutions, CATALOGUED and ARRANGED by W. H. AYLOTT, Librarian. Reference will be given to parties by whom he has been engaged.—Address, 32 Cheapside, E.C.

TO ARMY TUTORS at the SEASIDE.—ADVERTISER proposes an EXCHANGE of HOUSES for Six or Seven Weeks commencing about July 4. He offers a large comfortable House in about 4½ acres of Garden, with Stabling, one mile from Cheltenham, on a hill, with near view of the Cotteswolds.—Address, H. A. J., Hillcourt, Marle Hill, Cheltenham.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. *Physician*—Dr. EDWARD LANE, M.A., M.D. Edin. For Invalids and those requiring rest and change. Turkish Baths on the premises. Private entrance to Richmond Park.

OVERLAND ROUTE and SUEZ CANAL.—Under Contract for the conveyance of the Mails to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, viâ the Suez Canal, every Thursday, from Venice every Friday, and from Brindisi, with the Overland Mails, every Monday.

Offices, 122 Leadenhall Street, E.C., and 25 Cockspur Street, S.W.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

P. Q. RICKARDS, *Manager.*

ILFRACOMBE HOTEL.—Bracing air and beautiful scenery. Appointments perfect; Wines choice; excellent Cuisine; 250 rooms. Table-d'hôte daily. Tariff on application to MANAGER, Ilfracombe, North Devon.

E. DENT & CO., 61 Strand, and 34 Royal Exchange, London, Manufacturers of CHRONOMETERS, WATCHES, CLOCKS, &c. (Catalogues free) to Her Majesty, H.R.H. the Prince of Wales, and Foreign Sovereigns.

Makers of the Great Westminster Clock, and of the New Standard Clock of the Royal Observatory, Greenwich.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

DANIEL DESBOIS & SONS (late DESBOIS & WHEELER), WATCH and CLOCK MAKERS, have a good selection of Watches and Clocks of their own manufacture, and also of the best Foreign Work.—9 Gray's Inn Passage, leading from Red Lion Street, Holborn, to Bedford Row.

MONOGRAMS.—RODRIGUES' NOVELTIES in MONOGRAMS, Crests and Addresses. Steel Dies Engraved as Gems.

RAISED, RUSTIC, GROTESQUE, and ECCENTRIC MONOGRAMS artistically designed for any combination of Letters. NOTE PAPER and ENVELOPES Stamped in Colour Relief, and brilliantly Illuminated in Gold, Silver, and Colours, in the highest Style of Art.

HENRY RODRIGUES, 42 PICCADILLY, LONDON.

LITERARY MACHINE, patented, for holding a Book, Writing Desk, Lamp, Meals, &c., in any position over a Bed, Sofa or Easy Chair, as used by Prince [illegible], from 21s. Invalid Couches, adjustable to 100 positions, £5 5s.; Bath Chairs, 30s.; Bassinette Chairs, £7 10s.; Easy Chair (Bed and Couch combined), from £8; Carriage Chairs, £3 15s.; Bed Rests, 12s. 6d.; Drawing-room Tables, &c.

J. CARTER, 6A New Cavendish Street, Great Portland Street, London, W.

PICTURES, BRONZES, and WORKS of ART on SALE at 39 Southampton Street, Strand. Pictures Cleaned, Lined, and Restored, if liable, worst condition. Frames Cleaned or Regilt equal to New. Estates attended to. Commissions.

CHARLES DEAN, 39 Southampton Street, Strand.

THE

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,076, Vol. 41. June 10, 1876. [Registered for Transmission abroad.] Price 6d.

PUBLIC BUSINESS AND THE MINISTRY.

UNLESS some practical question of home or foreign policy should unexpectedly require discussion, there seems to be no reason why a dull Session should not have a quiet ending. The Royal Titles Bill has become law, and the Merchant Shipping Bill has at last passed the House of Commons. Private members cannot hope after Whitsuntide to attract serious attention to their measures. There are still one or two Intoxicating Liquors Bills pending, and there is a Bill for the repeal of the Contagious Diseases Acts; nor are the measures of the Home Rule party entirely exhausted. Lord SELBORNE'S Bills against the Inns of Court will not in the present year pass the House of Commons, and the annual Wednesday Bills have been for the most part already debated and dropped. Mr. BUTT'S motion for Home Rule will be rejected after a conventional debate. The Government measures which remain are numerous and not unimportant, but few of them will excite active interest. The Appellate Jurisdiction Bill is a compromise to which the profession has already assented; and it would have been difficult to carry the Bill for which it is a substitute through the House of Commons. The debate on the question in the Upper House confirmed the opinion that the LORD CHANCELLOR had acted wisely in retaining the jurisdiction of the House of Lords. The LORD ADVOCATE is in charge of several Scotch Bills on which the Scotch members will form a conclusive judgment, and the SECRETARY and SOLICITOR-GENERAL for IRELAND will, if the Irish members consent, pass three or four Bills on matters relating to their own departments. Mr. CROSS will encounter little opposition to his Prisons Bill; and the debates on the Inclosure of Commons must be nearly finished. The Oxford and Cambridge University Bills will not be opposed on the preamble, and the opponents of clerical fellowships and privileges will be defeated after a discussion on clauses. Neither House of Parliament is startled by proposals for giving a body of Commissioners absolute power to redistribute revenues amounting to some hundreds of thousands a year. The precedent will not be forgotten by future innovators; but private property is, for the present at least, safer than corporate endowments. Mr. CROSS'S odd announcement that the two Bills are to proceed simultaneously will be practically verified by the early and rapid progress of both.

The only considerable party contest which is likely to occur will be raised on Mr. FORSTER'S amendments to Lord SANDON'S Elementary Education Bill. The questions in dispute are not immediately urgent, and the Government may safely rely on its majority. There may perhaps be other matters to occupy the Legislature during the remainder of the Session; but they are not sufficiently pressing to be easily remembered. Notwithstanding a series of mistakes committed during the last autumn and in the early part of the Session, the position of the Ministers seems not yet to be weakened. If there are any impatient politicians who blame the Government for want of legislative originality and vigour, they cannot but admit that the leaders of Opposition are equally unproductive. The only serious political change which has been proposed is not approved by the Liberal leaders, although Mr. BRIGHT spoke and Mr. GLADSTONE voted for Mr. TREVELYAN'S Resolution on household suffrage in counties. The principal opponent of the scheme was a member of the late Government, and Lord HARTINGTON, Mr. GOSCHEN and several of their colleagues declined to vote for the motion. It would be difficult to form a Cabinet in which the extension of the franchise and a comprehensive redistribution of seats should form an open question. The division of the Liberal party on the subject of constitutional change is the more embarrassing because other political issues are difficult to devise. After a longer or shorter interval there will probably be a reaction such as that which succeeded to the universal acquiescence in Lord PALMERSTON'S political optimism; but ambitious Liberals of mature age may perhaps feel that their chances are passing away. A younger generation may find fresh opportunities of remodelling the political system, and perhaps of subverting some of the institutions which still remain. For the present the country is tolerably well contented with Ministers who have no revolutionary aspirations, and who at the same time are not disinclined to modest reforms.

Two members of the Government have during the present Session acquired additional influence in the House of Commons. Mr. CROSS as Home Secretary, and as the author of several judicious measures, commands general confidence; and Sir STAFFORD NORTHCOTE, though he has sat for many years in Parliament, has of late perceptibly improved as a debater. If his Budget was open to criticism, the questionable principles which it involved had been repeatedly professed by his opponents and sanctioned by the House of Commons. The perverse system of imposing fresh taxes for the unnecessary purpose of paying off the debt has not yet lost its temporary popularity. In the general conduct of business Sir S. NORTHCOTE has taken a prominent part, as in the tedious debates on the Merchant Shipping Act. Mr. DISRAELI, who has the good sense to be conscious of his imperfect knowledge of the details of business, is fortunate in the aid of colleagues who are capable of supplying his own defects. Taunts directed against the financial inconsistencies of the PRIME MINISTER fall harmlessly on the head of a CHANCELLOR of the EXCHEQUER who has never talked carelessly on subjects which he thoroughly understands. Mr. HARDY'S department has during the present Session furnished little occasion for debate. Mr. WARD HUNT is thought to have acquitted himself creditably in the technical discussions on the navy which are from time to time raised by professional critics or amateurs. On the whole, the Cabinet sustains its reputation of including more than an average amount of ability. While four or five of its ablest members sit in the House of Lords, the Ministers in the Commons are fully a match for their predecessors and adversaries. Mr. DISRAELI prudently holds himself aloof from debates of minor importance; and he perhaps sometimes regrets the partial secession of his ancient antagonist and rival. Sir S. NORTHCOTE is always ready to take his place; and, though he is not an orator, his ample knowledge and increasing readiness qualify him for the task of defending the Ministerial measures. There is no reason to suppose that the PRIME MINISTER will have frequent occasion to intervene in debate during the remainder of the Session.

If there were no other reason for being contented with the apparent stability of the Government, the threatening or disquieting aspect of foreign affairs would incline prudent politicians to deprecate a change. It is true that no definite declaration of policy has been made public, and there is some ground for the conjectural rumour that within the Cabinet itself two different tendencies are struggling for

predominance. It is said, but not on sufficient authority, that Lord DERBY, Sir STAFFORD NORTHCOTE, and some of their colleagues, demur to an active policy which is supposed to be favoured by Mr. DISRAELI and Lord SALISBURY. The report is perhaps founded on assumed differences of temperament, but it is easy to believe that in a difficult crisis judgments and opinions may vary. The only decisions which have yet been made public have been provisionally approved. It was thought that the Government was right in assenting to the ANDRASSY Note after a cautious suspense, and nearly all Europe has applauded the refusal to concur in the dangerous pledges of the Berlin Note. Down to the present time the country reposes in the present Ministers a tentative confidence which was not bestowed on their predecessors. Lord DERBY is not suspected of readiness to engage in rash adventures, but neither he nor his colleagues have at any time displayed the precipitate timidity which resulted in the payment of the *Alabama* penalty and in the rupture of the Treaty of Paris. Mr. DISRAELI's knowledge is seldom accurate, but he is incapable of the wilful ignorance exhibited recently by Mr. GLADSTONE when he professed not to know whether the kingdom of Prussia had been altogether effaced in the German Empire. It is not improbable that the relative strength and popularity of political parties may for some time to come be principally dependent on questions of foreign policy. Mr. GLADSTONE apparently neither knows nor cares for the fate of Europe, if only England can maintain a safe isolation. Lord GRANVILLE and Lord HARTINGTON have thus far abstained with patriotic prudence from hasty censures or from unseasonable curiosity which might compromise the public interest. The Ministers have not yet committed any known mistake; but the state of affairs must have become more intelligible before it can be known that their conduct has been firm and prudent. The flagrant blunders of a former generation of statesmen in 1853 may serve them as a warning.

TURKEY.

THE dark and suspicious tragedy which has occurred at Constantinople will tend to abate any goodwill which may have been felt in Europe towards the new Government. The SULTAN and his Ministers must have been ill-advised if it is true that they have already intimated to the Continental Powers their determination to reject the proposed armistice and the other terms of the Berlin Note. It appears probable that they will anticipate the demands of the five Powers by spontaneously offering an armistice to the insurgents. It would seem obviously prudent, even if the Porte had resolved on a policy of resistance, to profit by the short delay in the presentation of the Note, and to allow time for a possible divergence of policy among discordant allies. The English Government will not be suspected, except by the idle newsmongers who attribute to its machinations the dethronement and perhaps the death of the SULTAN, of having recommended to the new SULTAN the adoption of dangerous courses. The reforms proposed by the five Powers have for the most part been long since urged upon the Porte by English Ministers; and a policy mainly directed to the prevention of war would not be promoted by an immediate rupture. The GRAND VIZIER and his more active colleagues have probably contented themselves with endeavours to convince the insurgents and their neighbouring abettors that they are determined to enforce submission, and, if necessary, to retaliate on the enemies who have hitherto carried on hostilities with impunity. Turkish diplomacy must have strangely degenerated if assurances of reform have been spared to the Governments which it is necessary to conciliate, or at least to restrain from active interference. The mysterious death of the dethroned SULTAN may probably create additional difficulties. A new excuse will have been furnished for hesitation in recognizing his successor; and perhaps the unfortunate victim may be represented as a martyr to the Russian alliance, which indeed was the immediate cause of his fall. The authors of the revolution, though they have from the first repudiated the charge of ill-will to the Christians, are, as leaders of a reforming party, almost necessarily associated with orthodox and national principles or prejudices. Turkish religion and patriotism, when most sincere, necessarily bear an exclusive character. The late SULTAN'S unpopularity among his own people was certainly not produced by any supposed want of liberality towards his Christian subjects.

In the discussion of Turkish affairs it is constantly necessary to check positive statements by calculation of probabilities, for the authors of contemporary Eastern history employ themselves in the promotion of various political schemes rather than in the narration of current events. The Berlin Correspondent of the *Times* has within a few days published alarming statements which are strangely inconsistent with the accounts from Vienna, from Constantinople, and even from St. Petersburg. The Berlin Correspondent, though he is well informed, habitually writes with a definite purpose which is supposed to coincide with the policy of his own Government. It is not impossible that Prince BISMARCK may desire to produce misunderstanding between England and Russia; nor could the object be more effectually attained than by the circulation of the rumours which have lately formed the substance of the Berlin correspondence of the *Times*. It will be prudent to wait for further confirmation of the startling reports of formidable preparations for war. It is asserted that the Servian army is assembled on the southern frontier of the Principality under a Russian general, and that a large sum of money has been contributed to the military chest in the name of Russian benevolent societies, but really by the Russian Government. According to the same account, the well-known agent who has hitherto affected to confine himself to philanthropic exertions for the benefit of the insurgents and their families has handed over to the Prince of MONTENEGRO the control which he had himself never professed to exercise of the military operations. The erection of a fortified camp with a large garrison in Bulgaria is reported, although it is believed at Constantinople that the Bulgarian insurrection is suppressed. The still more surprising statement is added that the King of GREECE, who is now at Copenhagen, has suddenly placed his army on a war footing, and that he has negotiated a loan with certain German capitalists, who must apparently be much in want of a profitable investment of their funds. All these wonderful events may possibly have occurred, but they may also be imaginary.

One of the numerous reasons for doubting the German version of the policy of Russia is that war between Turkey and a league of the petty States in the neighbourhood would not, whatever might be its result, tend directly to Russian aggrandizement. Servia and Montenegro, united or separate, would become not more, but less, dependent on their powerful protector if they had largely increased their territories, and amalgamated with themselves a kindred population. The Greeks also, who were supposed, since the failure of the Cretan insurrection, to have postponed their projects of aggression, have always cultivated an independent ambition which would be antagonistic to the designs of Russia. It is scarcely possible that the Greeks should combine with the Slavonic tribes in a concerted attack on the Turkish Empire in the hope of establishing themselves at Constantinople; but, if Greece were in a state of military or financial readiness for war, it might be thought practicable to obtain possession of Crete, and perhaps of Thessaly. The alternative of defeat must also be taken into consideration. Servia and Montenegro together contain the population of an average English county, and the force of Greece is insignificant. Except in alliance with an insurgent population in Bulgaria as well as in Bosnia, the supposed confederacy would be no match for the Turkish Empire. In former wars the Turks have almost always proved themselves most formidable after the occurrence of preliminary disasters. The commanders who have hitherto hesitated and blundered in dealing with the insurrection will be superseded by more capable successors; and the new Government is probably persuaded that it will be easier to deal with the Montenegrins and Servians as open enemies than as combatants who always possessed a secure retreat into a country which was supposed to be at peace. The Greeks, who have absolutely no cause of quarrel with Turkey, must be separately dealt with. They know by former experience that, if the Great Powers should unfortunately be drawn into the contest, they must submit to the direction of the Governments which may possess supremacy at sea. On the whole, it is doubtful whether Servia and Greece will run the risk of Austrian and English intervention.

If there are strong reasons for disbelieving in the reported declaration of war by the petty States, it is not less

improbable that Russia will openly attack Turkey. All the elaborate machinery of the Triple Alliance will have been wasted if a policy is suddenly adopted which must lead to immediate collision with Austria, and perhaps to a cessation of friendly relations with Germany. The efforts made by the organ of the German Government to create misunderstanding between England and Russia can scarcely be suggested by sympathy with projects of Russian aggrandizement. Although Germany would not take part in a war in Turkey, a conflict between Russia and Austria might induce either party to court a French alliance. The contingency of a Russian war with Turkey in which Austria should remain neutral may be dismissed as practically impossible. The influence of Hungary in the councils of the monarchy would prevent a suicidal acquiescence in Russian aggression. Count ANDRASSY has taken no pains to disguise the probable antagonism of Russia and Austria; and the Russian journals have already begun to ridicule the fiction of harmonious co-operation. In the present state of the Eastern question there are many elements of danger; but fortunately all Powers have a common interest in an expectant and temporizing policy. It must not be forgotten that Russian intrigues in Servia, Montenegro, and the adjacent Turkish provinces have been again and again commenced, to be afterwards baffled and suspended. It is not impossible that the solution which seemed in the first instance to be least objectionable may be ultimately adopted. The occupation of the disturbed districts by an Austrian force, if it could be effected with the consent of the Porte, would give time for the conclusion of some tolerable arrangement. No other method would be as efficacious in repressing outrage and retaliation; and the compulsory re-establishment of internal peace would exercise a beneficial influence on the neighbouring provinces. Neither Servia nor Montenegro would risk a contest with an Austrian army; nor could Turkish Pashas venture to disregard the injunctions of the commander of an occupying force. It is believed that some time since Russia would not have disapproved of the measure; and the same reasons which then existed might still recommend it for adoption.

DREUX AND NOHANT.

IN a manner studiously unostentatious the head of the House of ORLEANS has conveyed to the family burial place at Dreux the remains of his numerous relations who have died in England since the Revolution of 1848 cost the dynasty its throne. It is now twenty-eight years since LOUIS PHILIPPE and his QUEEN came to seek refuge and taste the long-forgotten joys of safety at Claremont. There they lived and died, unnoticed but not unhonoured. The KING, not improbably the last of the long line of French Kings, survived only two years to ponder on the instability of human greatness; but the life of the QUEEN was protracted to extreme old age, and was dignified to the last by the exhibition of constant serenity and unassuming piety. The Royal couple were buried temporarily at Weybridge, where also were deposited the remains of the lamented Duchess of ORLEANS, who, in the darkest hours of the family trials, had shown a spirit and a courage that did much to redeem the tameness with which LOUIS PHILIPPE slipped out of a position which he had schemed and sinned so much to gain and to hold. Death, too, was busy with the younger members of the ORLEANS family; and the Count of PARIS has now transferred to Dreux the remains of eleven of his relatives. It was the earnest wish of the old KING that, when the proper time came, he and those of his race who died in exile might finally rest at Dreux; and the COUNT has at last been able to fulfil the wishes of his grandfather. The proper time has come, not in the shape of a time of restoration and family triumph, but in the shape of a time when politically the family is so completely extinct that no one heeds the doings of the Count of PARIS more than the doings of any private gentleman. Marshal MACMAHON had not the slightest difficulty in according his sanction, although he politely seemed to attach a respectful importance to the occasion by begging that everything might be conducted with the utmost privacy. There can be no apprehension of the burial of LOUIS PHILIPPE being followed by the disastrous consequences which attended the mistaken pomp of his own reception of the remains of NAPOLEON. No mortal was ever less suited to become a legendary hero. Neither in life nor in death was he popular with his countrymen, and his faults have been vividly remembered, while his merits have been almost completely forgotten. Through a variety of causes, his descendants, though free to live in France, and commanding much respect through their character, their ability, and their wealth, are of scarcely any account in the political combinations of the present or of the immediate future. That they should pay the last honours to their dead is looked on as a natural exercise of proper piety, but provokes no ill will, because it awakens no fear. How completely the station of the ORLEANS princes in France has now become that of private gentlemen could not be better illustrated than by the very great difference in the interest and passions that would have been excited if the proposal had been to remove from their resting-place the remains of the dead, not of Weybridge, but of Chislehurst. The day will no doubt come when the BONAPARTES are sufficiently triumphant or sufficiently forgotten to permit the transportation of the remains of LOUIS NAPOLEON to France; but to get them there now would need a new *coup d'état*.

At the moment of this reawakening of ORLEANS recollections, one of the most famous writers of France, who even in the days of LOUIS PHILIPPE had conquered a great name, has passed away. GEORGE SAND has died at Nohant, where she passed her childhood, where she has long lived, and where she found so many of the scenes that she has delineated in her romances. No French writer of her time has exercised a greater influence over the thoughts, the feelings, and the tastes of Europe. She embodied more fully than any other writer all that was great, noble, passionate, feverish, and morbid in her generation. Having the immense advantage of writing in French, she commanded a ready access to kindred spirits in every country. If it was easy to disapprove of her writings, it was impossible not to admire them. If her own errors were reflected in her works, those who knew her history were aware that she was as much sinned against as sinning. Nor, although she treated the history of female frailty with an over-indulgent tenderness, was there ever anything that trenched on the monstrosities of vice in what she wrote. Her heroines, even when frail, were never ignoble, and in the midst of her scepticism she breathed a religion of her own. To most human beings, to part with the creed of their childhood is to part with religion; but it is not so with all; and those who did not share the general fate found in the pages of GEORGE SAND an expression of all that they felt and of more than they dreamed. It must, too, be added that she could paint virtue in forms as sweet as they were original. The author of *Lélia* and *Indiana* was also the author of *Consuelo* and *Mauprat*; and in the range of fiction it would be difficult to point to heroines more novel, winning, and elevating than CONSUELO and EDMÉE. It is impossible not to recognize that, for good or for evil, one of the most marked features of European life during the last half-century has been the growing aspiration of women for a larger, if not a happier, life; and no writer has more powerfully stirred, or more intensely experienced, the feeling than GEORGE SAND. Her views as to religion and women were so completely herself that she could never possibly escape from them; but her range of imagination and sympathy was so wide that she could depict with equal felicity the simplest and the more complex phases of human life. In narration, in conversation, in description, she never lost the charm of a style at once fluent, intelligible, and strong. She was profound without puzzling, and pathetic without gushing. Her art concealed her art; and in her delicate and minute studies of the characters of women, she totally avoided that wearisome examination of tiny motives and passing hesitations with which the authoresses of our day and country so painfully depress the spirits of the men who are persuaded or flattered into reading their compositions. As she wrote for her bread, she naturally wrote far too much for her fame, and her warmest admirers could scarcely keep pace with her publications. Her collected works will therefore be a burden to the shelves of posterity; but her masterpieces will live, and will delight mankind as long as the literature of the nineteenth century has any attraction for the minds of men.

The House of ORLEANS may be said to represent not inaptly the prose, and GEORGE SAND the poetry, of French life and character. A country needs both prose and poetry, and Europe is much the poorer when the prose and the poetry of French life are not represented in a conspicuous and adequate manner. LOUIS PHILIPPE himself, with his

peddling anxiety to be always on the safe side of the hedge, his keen eye for the main chance, and his *bourgeois* passion for putting his family into good things, was perhaps too prosaic to be a satisfactory representative of the life of French gentlemen at its best. But the Duke of ORLEANS had every quality that could awaken affection and respect, and to his early death, more than to any other single cause, may be attributed the fall of his family from power. The Duke of AUMALE is as well known in England as in France, and is universally recognized as a finished type of a prince combining varied accomplishments and wide knowledge with a keen love of work and a strict attention to business. The Count of PARIS himself would be one of the best of monarchs, as he is one of the worst of aspirants; and his countrymen observe, with a sort of contemptuous admiration, that he is equally suited and indifferent to success. No one would use success better if success could be rained out of heaven into his lap. Few people have ever done him a greater personal kindness than his cousin of CHAMBORD, whose obstinacy and timidity have saved him from the nuisance of having some day to reign. A Republic in which the ORLEANS princes are the first gentlemen of their country is probably the political system which the Count of PARIS most approves. The prose of a country life, as opposed to the poetry of adventure, enthusiasm, aspiration, and dissatisfaction, includes all that makes daily life go on in a sedate, dignified, busy, and prosperous manner; and it is not an unwelcome task to have, like the ORLEANS princes, to show this mode of existence at its best. But the poetry of life, enthusiasm, passion, the longings and questionings of disquietude, will only cease to be felt in France when France loses altogether its place in Europe; and one of the voices that spoke most eloquently to the world of these things has now been hushed into silence at Nohant. In France it may be necessary to note the defects of the ORLEANS princes and to dwell on the shortcomings and aberrations of GEORGE SAND; for men must criticize what may from proximity affect them too powerfully. But in England too little rather than too much justice is likely to be rendered to the varied excellences of French life, and we are not called on to allow any great sternness of judgment to mingle with the memories and feelings which Dreux and Nohant awaken.

THE COMPULSORY CLAUSES OF LORD SANDON'S BILL.

LORD SANDON'S Education Bill is a more considerable measure than adverse critics might have expected from the present Government. Farmers are most admirable and useful people; but they are apt to think that minding rooks (needful, no doubt, in its proper place) is the only practical shape that the education of the young agricultural labourer can ordinarily assume; and it might have been argued that there would have been nothing strange if, in a Cabinet which has the interests of the farmers so much at heart, an excessive allowance had been made for farmers' prejudices. The rural districts can hardly be said to have been prepared for more stringent legislation by the Agricultural Children's Act. That singularly weak-minded statute has remained inoperative in almost every part of the country, and, if its existence has had any effect on the rural imagination, it has probably been to encourage the notion that laws which tend to throw difficulties in the way of procuring field labour are not meant to be obeyed. The Government have not had the advantage, therefore, of ascertaining the farmers' attitude towards an extension of educational pressure; and it is the more creditable to them that, in the absence of any information on this point, they have extended to agriculture a class of provisions which have hitherto been applied only to manufactures. Whether the success of indirect compulsion in the latter sphere does or does not supply a reason for trusting to indirect compulsion in the former sphere is a question which it is not easy to answer. There is no doubt that the Factories and Workshops Acts have in many cases failed to bring any considerable number of children within the educational net. We do not know, however, to what extent this failure is due to the machinery by which the Acts are enforced. The position of the Inspectors and Sub-inspectors under the several Factory and Workshops Acts has been in many respects an invidious one. They have sometimes been regarded as a species of spy sent down from London to scent out the pleasant ignorant ways in which decent country people have been content to walk. The Government do not appear to be sure enough of their ground to interfere with the jurisdiction of the Factory Inspectors; for, after enacting that in school districts where there are no School Boards the provisions of the Bill shall be enforced by the existing local authorities, an express exception is introduced to cover the case of such factories and workshops as are now within the jurisdiction of the Inspectors. Probably, if the present Bill is found to work well, the powers of the Inspectors will hereafter be transferred to the several local authorities. There can be no need for maintaining a special authority charged with the supervision of a particular set of cases which do not differ in kind from the cases which are left to the local authorities. Mr. GIRDLESTONE, indeed, maintains that nothing "will have "any effect in the rural districts except making paid "officers, such as Inspectors, appointed either by Government or the Quarter Sessions, instead of voluntary "agencies, responsible for the enforcement" of any Education Act. But the creation of a staff of paid officers adequate to the work of seeing that every child in the country is at school would constitute a very heavy additional burden, either on the taxes or on the rates; and it is highly improbable that any Government would be able to carry such a Bill as Mr. GIRDLESTONE desires through Parliament, unless they were able to say that the experiment of enforcing the Education Act in the same way as other Acts are enforced—that is, by the agency of the local authorities—had been tried unsuccessfully. If this Bill passes, the School Boards, or, where there are no School Boards, the Town Councils in boroughs and the Guardians of the Poor in all other places, will be bound to see that no child is employed under ten years of age, and that no child is employed between ten years and fourteen who has not obtained a certificate either of a certain proficiency in reading, writing, and arithmetic, or of a prescribed amount of attendance at a public elementary school. If this power had been given to School Boards, and if at the same time School Boards had been established in every parish, the Bill would probably have been commended even by the National Education League. But it must be remembered that Town Councils and Boards of Guardians are elected by the same persons as School Boards would be elected by; and if the enforcement of school attendance by indirect means might safely be entrusted to School Boards throughout the country, it is not easy to see why similar results may not be anticipated from the exercise of the same powers by bodies elected by constituencies substantially identical with those that elect the School Boards.

Nor does the Bill leave the case of a local authority neglecting its duty unprovided for. By the 19th section the Education Department are empowered, if they are satisfied that a local authority has failed to perform its duty under the Act, to appoint any other person whom they may think proper to perform the duty of the defaulting authority. No limitations are imposed upon the Education Department as regards the nature of the evidence on which they are to satisfy themselves that the local authority is not doing its duty. They are at liberty to supersede it if they are satisfied on this point, "after such inquiry and "such notice as they think expedient." It is not true, therefore, that the dispositions of the local authorities are the sole measure of the efficiency of the Bill. Down to the point where inefficient performance becomes non-performance, no doubt this is so; but as soon as the local authorities have passed that point, the dispositions of the Education Department become the measure of efficiency. This 19th Section is of importance from another point of view. The duties of the local authorities do not end with the enforcement of indirect compulsion. There are certain measures which they are bound to take in the way of direct compulsion, even where they have not availed themselves of the permission to make compulsory by-laws under the Act of 1870. The 7th Section of the Bill provides that, if it appears to the local authority that the parent of any child between five and fourteen "continuously and habitually, and without reasonable excuse, "neglects to provide such elementary instruction for his "child as will enable the child to obtain a certificate under "this Act," it "shall be the duty of such local authority "to apply for an order of court to compel the parent "to sent his child to school." We imagine that

under this section the power of the Education Department to declare a local authority in default, and to nominate substitutes to perform its duties, would apply to the case of a local authority which disregards the proved existence of cases of continuous, habitual, and inexcusable neglect within its jurisdiction. If this reading of the clause is correct, the enforcement of attendance at school, whether children are at work or at home, will rest in the last resort with the Education Department; and nothing has yet suggested a doubt that the Department will be equal to any duties that Parliament may throw upon it.

How far the Government are justified in making two bites of a cherry, by leaving the adoption of direct compulsion as the ordinary means of enforcing attendance at school to the choice of the local authorities, must be decided in a great degree by the knowledge which they have of the probability that the permission will be used. If a very large number of local authorities are prepared to make compulsory by-laws as soon as the Act is passed, nothing more need be said in favour of the course which Lord SANDON has adopted. And it is at least possible that he may have information pointing unmistakably to this result. Even in the contrary case, the result might show that a more stringent law would be impolitic because premature. The opinion of the clergy has advanced in this matter with remarkable rapidity; and when the power of enforcing attendance at school can be had without the dreaded accompaniment of a School Board, the local authorities in parishes in which the parson is the principal influence may promptly arm themselves with this new weapon. There is no question but that one cause which has led the clergy to think so well of compulsion is the disheartening emptiness of the very schools which they have worked so hard to set up; and if the indirect compulsion provided by the Bill does not very soon effect a radical improvement, the same spectacle will drive them to desire the more radical measures which the Bill puts within their reach. If the clergy of a parish are eager to induce the local authority to pass compulsory by-laws, it will probably not be very long before they gain their end. Their influence in the election of Guardians will be considerable; and the reputation of being more reactionary and obstructive than the clergy is not one which any considerable number of laymen will care to earn. If voluntary schools are not filled under such a Bill as Lord SANDON'S, they are not likely to get so good a chance again, and this is a fact which the clergy will probably not be slow to appreciate at its proper significance.

ITALY.

THE Italian Government has issued a manifesto showing what would be the resources at its command in case of war. On paper the figures given make a very creditable show. The army of Italy is large even in these days of huge armies. It reaches a nominal total of 435,000 men, of whom 340,000 belong to the first army and 95,000 to the second. Behind this force come another body of 90,000 men who have had six months' drill, and one of 265,000 men who have had fifty days' drill. These figures must, however, be subjected to considerable reductions in order to estimate the number of those who could be really relied on for service; but the Government asserts that it could send 300,000 men into the field thoroughly well drilled and completely furnished with all the materials of war, and armed with breechloaders of a new pattern, while a force at least equal would remain in reserve to fill the gaps made in the first force as war went on. If Italy had to send an expeditionary army beyond its own borders, it could in fifteen days muster at least 100,000 men for the purpose. Further, Italy has ten ironclads in readiness, and four more which could be made ready in a short time. It is said that explanations were asked by the representatives of foreign Powers as to the reasons which had induced the Ministry to publish a statement which, at a moment when rumours of war were afloat, might seem calculated to inspire apprehension. The reply given was that the statement was simply meant to encourage and please the Italians. If such an answer had been given by any other Government than the Italian, it would have been looked on as a mere subterfuge. But all the world is perfectly ready to accept the explanation of the Italian Government as strictly true. The Italians suddenly find themselves in a new and strange position. They see Italy, to their great delight, announcing herself and treated by others as a sixth great Power, and they can hardly believe that this honour is not somewhat greater than they can justly claim. The Ministry merely wish to assure them that they are getting no more than their due. The present Ministry cannot be accused of a wish to puff themselves by showing the strength of the army. They have had nothing to do with the army of which they are proud. It has been the creation of their predecessors, and especially of General RICOTTI, whom they had to replace when they came into office. For many years General RICOTTI has been labouring to make the army a reality, and to get together a force which would, if ever called on to serve, wipe out the memory of Custozza. His work has been only partially accomplished, and it is uncertain how much of the Italian army is fit for more than defensive warfare. To a very great extent he built up his force on the Prussian model, and imitations of Prussia are apt to be very deceptive. They are sure to give a large nominal force; but it is only when the system has been perfected by long and laborious efforts that it escapes from the two defects that mark its infancy—the want of drill and discipline in the men, and the want of experienced leaders, and especially of non-commissioned officers. The Italians may have a general, but no one knows that they have one; and if they have any considerable number of officers, and particularly of officers of a humble grade, who know their business, they are very fortunate. Still, although it would probably be very rash to look upon the Italian army of 600,000 men as equal to a German army of the same size, there can be no doubt that the Italian army, with all its defects, is strong enough and sound enough to make the nation which has endured many sacrifices to create it justly proud of possessing it, and entitled, through possessing it, to considerable weight in the councils of Europe.

That Italy has not the slightest wish to use its army if it can help it is not only notorious, but it is a necessary consequence of its position. If a respectable army has been one of the aspirations of Italy, so also has a balanced Budget; and nothing would vex the Italians more than to disarrange their finances once more just at the time when they have placed their credit on the best footing it has occupied since a united Italy existed. Count MAMIANI has recently expressed the general feeling of his countrymen in a letter summing up the reasons why the policy of Italy must be one of absolute non-intervention unless war should be forced on her. The feelings of Italy are entirely with the insurgents as against Turkey. They have too lately gone through a struggle for independence themselves not to sympathize with the efforts of others to shake off an alien yoke; and the present Ministry has so strong a Garibaldian element in it that it would especially lean to a cause which the patron of universal freedom has taken under his protection. But the Italians have very strong motives for wishing to see the efforts of Russia to command the access to Constantinople defeated. They aim above all things at being a Mediterranean Power, and a Russian fleet at home in the Dardanelles would be as great a blow to Italy as to England. One of the dangers, too, which the present crisis involves presses on the Italians as it does on us. They cannot be indifferent to the prospect of a war of fanaticism between Mahometans and Christians. If the flames of such a war were once lighted, there is no saying how far they might extend. The Italian [illegible] true, no possession like India in which the [illegible] be raised so as directly to affect them; but the whole [illegible] North Africa, until the borders of Algeria are reached, is in the hands of Mahometans, who, if the cry of a holy war were once sounded, would be almost certain to take their proper share in it by massacring the Christian population. This population is largely Italian, and Italy is deeply interested in such trade as exists between North Africa and Europe. Italy may therefore be credited with a very sincere desire to see peace preserved, if some means can be found of at once guarding the Christian subjects of Turkey from oppression, and appeasing the religious passions of the Mahometans. In order to effect this object, Italy has to take care that her voice is heard. She must appear on the scene somehow, and ensure that she has a share in the final decision of the Powers. She does not pretend to be in a position of security and independence like that of England; and therefore, when the purport of the Berlin Note was communicated to her, she at once assented. She ran the risk of isolation if she prematurely claimed independence, and it seemed wiser to assent to what she may not have very cordially approved than to

have been told that it did not signify whether she assented or not. No Power, however, can have welcomed with greater satisfaction the firmer attitude of England. What England wants in the East is precisely what she wants, and in following the lead of England she would both pursue her proper aims and acquire an importance which her neighbours would not hesitate to recognize.

The internal history of Italy has lately been diversified by a remarkable incident. When the new Minister of the Interior, Signor NICOTERA, took possession of his department, he found among the archives a Black Book in which his predecessors had recorded all the scandals that spies and informers could rake together as to the lives of public men to whom they were in any way opposed. The new Minister turned with natural interest to the index, and there found mentioned his name and the names of most of his friends. The leaves in which their characters and lives had been portrayed were missing; but Signor NICOTERA, by a little judicious firmness, managed to compel their restoration, and he read all that had been said or imagined against him for years. Rumour soon told the secret of this curious discovery, and the subject was brought to the notice of the Chamber. The Minister had an excellent opportunity of damaging his political opponents far more than any secret records could in any case have damaged him. Signor LANZA attempted to extenuate the mischief of a bad practice by saying that no Minister supposed that the records were strictly true. The sources of information were known to be untrustworthy, and the records were not meant to be taken for more than they were worth. But no afterthought of the kind could justify a practice which was as stupid as it was undignified and mischievous. If the same party were eternally in power, it might believe that in such records it had an armoury of secret weapons against its adversaries. But directly a Parliamentary vote laid bare these records to the persons detained, it was shown that to have collected them was a silly mistake. The notion of storing up anecdotes of public men collected for the benefit or amusement of Ministers by the drogs of mankind was a legacy from the old days of childish despotism under which Italy was for ages misgoverned. The Italians have got past their babyhood now, and all parties are probably equally glad that the growing sense of the nation makes the recurrence to such a practice henceforth impossible. The Ministry gained by being the first to denounce and discontinue the practice; but even those who had adopted it were not much hurt by having been discovered to have done something which, if very foolish, was also very Italian. One more piece of antique barbarism has disappeared under the influence of new ideas; but the Italians are better aware than foreigners can be that there are many other things of the same sort which must disappear before Italy can be what the best Italians wish and hope to see her.

THE POLITICAL ECONOMY CLUB.

THE speeches at the Political Economy Club in honour of ADAM SMITH are in many respects interesting. With the exception of M. LAVELEYE, all the speakers may be regarded as disciples of ADAM SMITH; and the advocate of modern Socialism, or of compulsory interference with every relation of life, professed with conventional courtesy to be in some sense a follower of the great champion of economical freedom. Of all who took part in the discussion, Mr. LOWE was perhaps the most consistent votary of the orthodox economical doctrine; and on one question the opposition which he perhaps anticipated was not forthcoming. M. LÉON SAY and Mr. GLADSTONE agreed with Mr. LOWE that commercial treaties of reciprocity are neither necessary, nor in ordinary cases legitimate, modes of promoting freedom of trade. It had been thought that Mr. GLADSTONE was prejudiced in favour of the French Treaty of 1860, in which he had a considerable share; but it appears that he rests the defence of the measure on its true grounds, as the only practicable contrivance by which an instalment of Free-trade could then be introduced into France. He added the remarkable statement that all the authors of the Treaty, including the Emperor NAPOLEON, theoretically disapproved of treaties of reciprocity; but it was necessary both to evade the restrictions of the French Constitution and to cheat the nation into a belief that relief to consumers was offered in the interest of producers. As Mr. GLADSTONE truly said, the conversion of England to Free-trade between 1840 and 1860 was generally regarded on the Continent as a crafty consummation of a deliberately selfish policy. It was thought that English producers only challenged competition when they found themselves strong enough to defy it. There was, in the opinion of foreigners, no reason why other communities should throw down the scaffold before they had completed the building. The Emperor NAPOLEON and Mr. COBDEN foresaw that the example of France would be more efficacious; and their calculations have been partially justified. Mr. GLADSTONE attributes the modified extension of sound economical doctrines on the Continent to the lessons derived from the French Treaty. M. LÉON SAY seems to concur in the belief that a deviation from strict economical principles has been in this instance beneficial. The approaching termination of the various European treaties will test the soundness of Mr. GLADSTONE'S sanguine anticipations.

M. LAVELEYE'S speech was probably received with proper deference and courtesy, though its tendency was to prove that ADAM SMITH and his disciples have from the first been hopelessly in the wrong. Political economy has never professed to be a complete ethical or political system. Mr. GLADSTONE eagerly adopted Mr. NORMAN'S indisputable remark that other objects must often be preferred to direct material advantage. If the warning is superfluous, it is at least unobjectionable, and it leaves a sufficiently wide field for economical researches and exertions. The paternal solicitude with which M. LAVELEYE and his school would superintend the distribution of wealth is inconsistent with the fundamental principle of the science which was founded by ADAM SMITH. As many previous socialists have complained, political economy is the systematic theory of selfishness, or of the absolute and irresponsible control of private property by its owners. That it is for the interest of society that the total amount of property should be as large as possible seems to economists to require no demonstration. ADAM SMITH held that the object would be most effectually attained by an unlimited reliance on the estimate which producers and owners form of their own private interests. Nearly all the legislative changes which were enumerated by the majority of speakers at the Political Economy Club were successive applications of ADAM SMITH'S protest against legislative interference. According to M. LAVELEYE, Belgian Chambers of Commerce already demand the entire abolition of Customs duties. It is not improbable that the commercial treaties which have shaken the system of Protection may, before the end of the present century, be discarded by the more enlightened nations as obsolete. Even Russia may at some future time seek to enter within the pale of economical civilization; and at a much earlier period American consumers will discover that they have been cajoled into payment of tribute to native manufacturers. M. LAVELEYE thinks that the theory of production or accumulation is nearly exhausted. He would now concentrate attention on the principles of distribution, which ADAM SMITH left to take care of themselves. M. LAVELEYE enumerated a long catalogue of German, French, and Italian writers who have, as he thinks, reconciled political economy with justice, with religion, and, above all, with their own notions of social fitness. M. LAVELEYE'S formula, "A chacun suivant ses œuvres" is perhaps less plausible than LOUIS BLANC'S demand of "A chacun selon "ses besoins." In a complete scheme of philanthropy it is an oversight to omit all provision for the aged, the infirm, and the idle. The defect of both chimeras is that they purport to dispose of wealth which would never have come into existence if an arbitrary distribution had been anticipated. M. LAVELEYE'S phrase means that no man should own anything except what may be assigned to him by some external authority as the due reward of his services to society. The object has been partially attained in some of the communistic associations of America, and more completely in mediæval monasteries. Equality under a beneficent and omniscient despotism is the first condition of the socialist economy. It is a mere delusion to suppose that the modern theory of arbitrary repartition can be reconciled with ADAM SMITH'S principles of production. Men will not toil and save for others as if they were working for themselves and their families. The supposed reconciliation of political economy with justice, religion, and equal division of goods is equivalent to the abolition or denial of the motives which have been exclusively regarded by ADAM SMITH and his followers.

Although all the speeches at the Political Economy Club are worth reading, the main interest of the occasion proved to be not scientific, but political. Mr. GLADSTONE has at last announced a conversion which has long been foreseen to the theory which is known as the voluntary system. The remoteness of the subject from the purpose of the meeting renders his declaration the more deliberate and significant. Mr. LOWE, whose fine reasoning powers are sometimes diverted or deranged by impulses of fancy and of temper, had quoted with approval ADAM SMITH'S denunciation of academical endowments. His annual tirade against literature at the Institute of Civil Engineers seems to imply that one of Mr. LOWE'S objections to fellowships and professorships is that they tend to promote the studies in which he once excelled and which he now despises; but the freaks and twists of a powerful intellect may be easily tolerated. Mr. GLADSTONE adopted Mr. LOWE'S censure of endowments more gravely and with a more comprehensive purpose. "He must confess," he said, "that very long "observation and practice in public affairs made him from "year to year more and more sensible of the objections to "endowments, and less and less convinced of their coun-"tervailing advantages to the community." By a natural fallacy, Mr. GLADSTONE attributes to observation and experience the results of an intellectual process which is peculiar to himself. It seems impossible for him to retain any conviction for more than a limited time; and his ecclesiastical tendencies, which are regarded by his political admirers as reactionary, oddly coincide with his rapid adoption of democratic opinions. In denouncing University endowments, Mr. GLADSTONE was probably influenced by a love of symmetry. There can be little doubt that his condemnation applied primarily to Church establishments. Several years have passed since Mr. GLADSTONE unexpectedly professed himself a supporter of universal suffrage. He has now accepted another main article of the Radical creed; and in denouncing academical endowments he has advanced beyond many of his allies. In replying to Mr. GLADSTONE, Mr. FORSTER wisely confined himself to a defence of endowments for purposes of education. The discussion was but indirectly connected with the business of the day. The arguments for and against Established Churches and endowed Universities have little or nothing to do with political economy.

THE FRENCH RADICALS AND THE GOVERNMENT.

THE French Radicals seem to be losing patience with the new Legislature. The charge of inactivity has certainly some colour of truth about it. No one who wishes well to the Government or to the country can accept M. TALLANDIER'S theory that the present Chamber was elected to undo the work of its predecessor; but even a Conservative may feel that it is hardly wise for the new Chamber to do so little work of its own. Bonapartists and Legitimists agreed in cheering the warning that the country, if subject to a series of disillusions, might ultimately call for a despot. M. TALLANDIER can hardly be ignorant that there is no disillusion which would so certainly bring about this result as the discovery that a Republican Government meant government by men like-minded with himself. It is intelligible that even a French Radical should prefer anarchy, or even the Empire, to the present order of things. In politics, where abstract principles come in at the door, common sense too often flies out at the window. But it is not intelligible that even a French Radical should persuade himself that his views are the views of the great body of his countrymen. The late elections showed plainly enough that, though France does not desire a Republic without Republicans, she still less desires a Republic composed of none but extreme Republicans. Still a little more activity in introducing and carrying the measures which the most moderate Republicans admit to be necessary would advance the reputation alike of the Cabinet and the Legislature. M. DUFAURE could only say, in answer to M. TALLANDIER, that the Chamber had examined the credentials of its members, and that numerous Bills had been prepared. But this is rather a beggarly account to give of a Session in the second week of June. Even now judgment has not been given on the credentials of all the deputies, and the elections to fill the places of the unseated members have only just been held. At this rate of proceeding it will take one Session out of five to get the Chamber of Deputies into working order. It is fortunate that the accident of M. BUFFET'S personal defeat decided the question of his retirement, since, if he had met the Chamber as Minister, and declined to take its verdict until its composition had been finally settled, public affairs might still be administered by a provisional Cabinet. As regards the preparation of Bills, on which M. DUFAURE so prides himself, it can only be said that the children have come to the birth, but there is not strength to bring forth. A well-stocked set of pigeon-holes may be a cheering sight to a Minister's subordinate, since to him it represents a record of work accomplished. But to a Minister it is only a reminder of work yet to be done; and at M. DUFAURE'S age it seems singular that this prospect should cause him any satisfaction.

The one measure which the Deputies have been seriously at work on is the University Bill, and to this M. TALLANDIER'S description of the Chamber's duty may be applied with perfect appropriateness. The law of last year allowed the creation of free Universities, and entrusted the granting of degrees to a mixed jury taken from the several Faculties of the State University and of the free Universities. Whatever may have been the merits of this solution, it was doomed, in the estimation of the new Chamber, by the very fact that the clergy had shown themselves contented with it. Possibly, if there had been less activity in the founding of Catholic Universities during the recess, less hostility might have been shown to the compromise upon which they were supposed to rest. But the State University is necessarily an exceedingly influential body, from the large number of students whom it annually trains for active life; and to the average Frenchman there seemed something revolutionary in the notion that young men might obtain degrees, not only without having themselves studied at the State University, but without receiving its certificate as to the result of their labours. Accordingly the first measure brought forward by the new Government was a Bill to restore to the Faculties of the State University the exclusive right of examining for degrees. This proposal may be regarded in two aspects. Supposing that the free Universities were willing to send up students to be examined by a rival University, we are inclined to think that it would matter little that the Examiners were taken exclusively from the State Faculties. The number of candidates for degrees is so large, and the withholding of a degree inflicts so serious an injury on a young man's prospects in life, that it is inconceivable that any substantial injustice should be done to students, no matter where they might have received their education. We should as soon expect Examiners from Oxford or Cambridge to pluck candidates for the Indian Civil Service because they come from the University of London. It is to be feared, however, that the adoption of the new rule will, as a matter of fact, act very injuriously on the creation of free Universities. Their existence will depend, first, on the provision of the necessary funds, and next on the provision of the necessary students; and the abolition of the mixed jury will tend to discourage both these processes. There is a certain glory in contributing money to found a Catholic University which shall in all respects be on a level with the State University. Such liberality helps forward a conspicuous triumph of the Church, and brings with it the social, as well as spiritual, advantages which the Church in France has to bestow on her faithful children. It is a different matter contributing to found a Catholic University which will, after all, be nothing more than a sort of affiliated college to the State University. Catholics of an economical turn of mind will be able, when asked for subscriptions, to plead the degrading position in which the proposed University will be placed in reference to the State University, and to decline to have any hand in thus lowering the Church. Even the zeal of the clergy may wax cold when the students over whose education they have control must apply for degrees to the State University. It will irritate them in something the same way that the tutors of Keble College would be irritated if they had to send their men to be examined by the tutors of Balliol. The desire to secure a particular kind of education must be thoroughly genuine if it is not checked by having to submit to an obvious and recurrent indignity in order to gratify it. Besides this, however anxious the examiners may be to act with perfect fairness to all the candidates who present themselves, there will always be an impression on the minds of students and the parents of students that it is a good

thing to be taught by the same persons that examine, and this impression is likely to keep down the number of the students in the Free Universities. Under any circumstances, it would have been a hard matter for them to establish themselves in the face of the organized rivalry of the University which has so long enjoyed the monopoly of the higher education in France, and this additional obstacle may turn the scale against them.

The opponents of the Bill will probably have more strength in the Senate than in the Chamber of Deputies; but it is not to be desired that the first contest between the two branches of the Legislature should have its origin in what is virtually an ecclesiastical conflict. This inconvenience might be avoided, and the professed object of the Bill secured without bringing ruin on the free Universities, by the adoption of an amendment similar to that which M. RAOUL DUVAL unsuccessfully brought forward in the Chamber of Deputies. According to this plan, the examination degrees would be conferred by the Minister of Education on certificates of capacity awarded by a jury nominated by himself. The effect of this would be that, while the State would retain the key of the vestibule to the professions, and so satisfy a condition which most Frenchmen think indispensable, the degrees would be granted and the examinations held by the Government which is the common superior both of the State and of the free Universities. Supposing that the Universities of Oxford and Cambridge enjoyed the sole right of conferring degrees on behalf of the State, and that the University of London resented the indignity of being compelled to present its students for examination at one [illegible] other of them, the easiest way out of the difficulty would be for the Education Department to take on candidates examinations into its own hands, and themselves before from all Universities alike presented of course be re- a State Board. Such a chance. But it does not sented by the University of the University which the appear that it is the [illegible] much as the protection of the Legislature has [illegible] intrusion of unqualified persons community [illegible] as completely as the Government measure, into the would have the additional merit of not preventing that development of educational freedom which was secured by the law of last Session.

BANKRUPTCY LAW.

THE LORD CHANCELLOR has undertaken to make another attempt to amend the law of bankruptcy, and he has at least one fact to start with which cannot be disputed—that is, that the Act of 1869 has utterly broken down. In those days it was thought that the bankrupt's estate was being eaten up by court officials, solicitors, and accountants; and the object of the Act was to give the creditors the power of realizing and distributing the debtor's property through persons appointed by themselves. In theory, nothing could be more equitable than this arrangement; but in practice it has not only failed to remedy the evils against which it was directed, but has introduced other evils of a much more serious and disgraceful kind, and the last state of the unfortunate creditors is worse than the first. At this moment the bankruptcy law is nothing more than a cover for a gigantic system of swindling, carried on by fraudulent debtors with the connivance of solicitors and accountants who share the plunder. It is worth while to bring together the principal features of the present situation. Last year there were 1,797 failures in the United Kingdom, representing total liabilities of about thirty millions sterling; and it is calculated that of the total number of persons and firms engaged in business three per cent. were unable to meet their engagements. It also appears that the cost of realizing and distributing debtors' estates has greatly increased, that many debtors get off by paying nominal dividends, and that the bulk of the property impounded goes to the solicitors and accountants, while the creditors receive hardly anything. "It happens," says the highly competent Committee on whose Report the LORD CHANCELLOR has based his Bill, "not occasionally, but so frequently as almost to form the rule, that a stranger, so far as appears on the face of the proceedings, is enabled by the proxies he has obtained to vote himself trustee, to fix his own remuneration, to nominate the Committee of Inspection, to order the payment of costs, and, finally, to vote in liquidation cases the discharge of the "charge." The trustee, in fact, is more frequently the agent of the debtor than of the creditors, and there is a regular traffic in proxies in order to secure the appointment.

The result of this system is that, year by year, there is a continual increase in the number, and decrease in the amount, of compositions. In 1874, out of 2,549 compounding debtors, only 162 were able to pay their creditors more than half what they owed them, 1,803 more than a fourth, 1,059 more than an eighth, including 501 whose composition averaged only a few pence in the pound. Last year the compositions had risen to 2,691, and were even smaller than before. It also appears that a large proportion of these compositions never reach the creditors. There are just now 3,000 open bankruptcies, and from 16,000 to 17,000 open liquidations by arrangement, and the number of such cases is constantly increasing. The trustees' accounts are not submitted to any official supervision, and in many cases there is no supervision whatever, and they retain all unclaimed dividends and undivided surpluses. They are thus exposed to a strong temptation to keep the money in their hands by declaring small dividends over a considerable period, giving as little publicity as possible to the notices, and raising obstacles to the actual payment of the dividends to small people. At the present moment it is calculated that trustees have from three to four—some say eight—millions in their hands, besides [illegible] received under the Trust Deed Clauses of the Act of [illegible], and held without supervision or audit. Under these circumstances it is not surprising that trustees are, as a rule, a bad lot. The LORD CHANCELLOR stated that last year one-sixth of the whole body were in default in the execution of their duties, and that a large proportion of them had bolted and could not be found; and he also gave some striking examples of their predatory habits. It will be observed that a system of this kind simply offers a premium to dishonesty. Fraudulent debtors are encouraged by the facilities which are put before them for escaping from their liabilities, and solicitors and accountants are also exposed to temptations which are more than ordinary human nature can be expected to resist. A gangrene is thus established which is spreading through the whole commercial world. It is bad enough that creditors should be robbed in this way; but the injury to public morality is infinitely more serious, and it is evident that sharp measures are required. Theoretically, no doubt, creditors have a right to take the property of debtors into their own hands, and so far the present Act is sound enough. But experience has conclusively shown that, as a matter of fact, creditors either cannot or will not take care of their own interests in this respect. They have other things to do than look after debtors and trustees, and they are therefore at the mercy of any professional man who gets hold of the job. It may be said that, if creditors will not take the trouble to do what they can for themselves, they must bear the consequences; but, in the first place, it is very little that such a scattered and disjointed body can do in self-defence against an organized professional combination; and, in the second place, the interests of the public at large must be considered. It is monstrous that a system which tends to foster reckless speculative trading, bad debts, and widespread dishonesty, should not only be tolerated, but encouraged by the law.

The existing system being indefensible, the only question is in what form a remedy should be applied. The Committee appointed by the LORD CHANCELLOR came to the conclusion that the abuse of proxies and the want of official supervision were at the bottom of the mischief. They therefore proposed that the trustee should be appointed, not by a loose body of creditors, but by the Committee of Inspection, and should hold office at its pleasure; that arrangements should be made to secure that the whole body of creditors should know what is going on, and should take part in any decision; and also that, in all important proceedings, the creditors should have the benefit of supervision by the Court of Bankruptcy. And these recommendations have substantially been adopted in the LORD CHANCELLOR'S Bill. The intention is to make the trustee more distinctly the servant, instead of the master, of the creditors, and to interpose the Court as a check on abuses; and to a certain extent these precautions would no doubt operate beneficially. It is possible, however, that the inspecting Committees might not prove sufficiently earnest and capable bodies; and the Court [illegible] certainly [illegible]

very difficult task to look after a large body of professional trustees with strong personal reasons for deceiving, if not defying, it. Mr. MANSFIELD PARKYNS, Controller of the Bankruptcy Court, who in the main agrees with the Report of the Committee, of which he was a member, has drawn up a memorandum on this point which, to say the least, deserves serious consideration. His view is that the proposed method of supervising the trustees is open to the objection that it is costly, cumbrous, and difficult to work; and that experience, as well as theory, is in favour of the principle that the receipt and payment of moneys should be entrusted to an official staff, which, under proper organization and control, could perform such duties with perfect security, and at infinitely less cost, than when individual cases are separately undertaken by professional men. The appointment of a separate trustee to each estate implies a separate arrangement as to his remuneration, and separate supervision by each Committee of Inspection, the members of which may or may not know enough of bankruptcy rules and practice to discharge the duty properly. In any case it is, Mr. PARKYNS contends, obviously extravagant to employ so many agents, each requiring a handsome profit, to do what would be better done by a permanent and responsible official, with the aid of a few practised clerks; while, on the other hand, there would be waste of another kind in allowing some twenty thousand irresponsible agents to make expenses, and keeping up a large and costly official staff to control them. The proper course, in Mr. PARKYNS'S judgment, would be to make some officer of the Court of Bankruptcy *ex officio* trustee, to act provisionally till the choice of the unpaid creditors' trustees, and afterwards jointly with them, giving assistance, but not interfering unless it be necessary in the interests of the creditors generally. This *ex officio* trustee should be bound at once to pay all moneys arising from the sale of property or otherwise, except as required for carrying on trade, to a general collecting office, which should be altogether independent of both the Court and of the trustees, and which should collect the debts due to the estate, keep accounts, and from time to time report how matters stand. These accounts would be audited by the controller, who would send an abstract to each creditor, and inquire into any complaints made to him. In this way Mr. PARKYNS believes that the expenses of bankruptcy and liquidation would be kept down, while security would be provided against any embezzlement of the large funds now left at the disposal of irresponsible agents. The co-operation of creditors in general for useful supervision being apparently out of the question, there is reason to doubt whether the changes proposed in the Government Bill would be sufficient to eradicate abuses; and it would certainly seem to be cheaper and simpler to place the charge of the money in the hands of a regular officer, responsible to the public, than to leave it with persons who, when wanted, might be found, as the LORD CHANCELLOR said, to have gone away and left no address. This is really the critical part of the question, and it is to be hoped that it will receive due consideration.

LITERARY SUCCESS.

WORDSWORTH went a long way towards adopting the doctrine that the immediate success of a writer is normally in the inverse proportion to his merits. The attractions of such a doctrine for the unpopular founder of a new school are palpable. Even Wordsworth's grand self-esteem required some plausible explanation for the indifference or ridicule which greeted the *Excursion* in the generation which went mad over Scott's Lays and Byron's *Childe Harold*. We need not at this moment speculate upon the causes which delayed the wider recognition of Wordsworth's poetical significance, nor discuss the relevancy of the examples brought to justify his theory. Undoubtedly many great works have only shown their true proportions after passing the ordeal of more than one generation of critics. And yet, though contemporary reputation is not an accurate measure of permanent fame, we should be inclined to hold that the divergence is considerably less than Wordsworth chose to maintain. Meanwhile the doctrine is naturally regarded with favour by a good many people who have thus much in common with Wordsworth, that nobody cares for their poetry. It would be almost cruel to tear away the transparent device by which this palpable fact is reconciled to their vanity. When a man is seriously convinced that his want of popularity measures the degree by which he is too good for the world at large, we should not care greatly to undeceive him. Let him enjoy in the consolation which cannot be taken from him—the posthumous applause of future generations. Conceit of this kind need not excite much resentment, for it is obvious only to its proprietor.

Sometimes, however, the sentiment takes another form. Instead of quietly wrapping himself in the consciousness of his own merits, the unpopular author takes to abusing the world. He deplores his fate, and holds that either some strange combination of accidents, or the jealousy of his brethren, *or* the malevolence of critics, has prevented him from obtaining the reputation which is his due. He does not hold that temporary obscurity is a natural incident of genius, and therefore a cause for some secret complacency; but that fame is distributed capriciously to good and bad writers alike. His excellences would be comprehended by the world if only the world could once be got to look at them; but he is mocked by fortune, or possibly ill treated by his publishers. This theory is a really mischievous one. Its victim, thinking that publicity is the one thing needful, tries to obtain it by unworthy means. In some cases, though the expedient is too expensive to be common, he takes to advertising of the ordinary kind. More frequently he tries to advertise himself indirectly by adopting some oddity of manner and sentiment or advocating some absurd paradox, purely for the sake of forcing himself into notice. Men of really fine abilities have fallen into such errors often enough to make it worth while to inquire how far does mere accident—that is, some cause independent of the real value of a book—determine its acceptance with the public?

We may begin by assuming one principle. Every writer who is at all entitled to be a writer—every one, that is, who has something to say or a new mode of saying something—has what we may call a natural circle of readers. There is, that is to say, a certain number of persons scattered up and down in the country who are prepared to receive his teaching, and are attracted towards him by a spontaneous affinity. They are so many potential disciples who will appreciate him if he is once fairly brought before them. A writer, of course, has, as Pope said of Johnson, to be *dêterré*. His writings may circulate in such obscure channels that they may not come to the notice of his spiritual congeners. Sometimes, as in the case of Bunyan, the circulation may of itself create a prejudice against him in the minds of the official dispensers of praise. Critics of the Addison and Pope school had a good deal of positive prejudice to surmount before they could see much merit in the favourite of an ignorant set of Dissenters. Or, again, it is possible, and, in the case of a very original writer, it is probable, that he may have to form the taste which he is to gratify. His style may repel at the first glance, as was the case with many readers of *Sartor Resartus*, though a more familiar acquaintance with it may convert the disgust into enthusiasm. The love of any very novel form of expression must be an acquired taste; and people are slow to acquire a taste until they have been assured on very good authority that the labour will be rewarded. Such difficulties have undoubtedly retarded the growth of many high reputations. But they are difficulties inherent in the case. A man who chooses to adopt a new language, or to write for a non-literary class, has only himself to blame if his admission to high honours is slower than in the case of less ambitious writers. Hume complained bitterly of his want of recognition by his contemporaries; but it was obviously unreasonable in a man who wrote upon obscure metaphysical questions, and took the side most opposed to the prevalent beliefs, to count upon speedy success. If we would alter men's habits or principles, we must have the reformer's virtue, the power of waiting patiently for the growth of the seed sown upon uncongenial ground.

Such obstacles to fame may be regretted; but it is unreasonable not to be prepared for them. We may add, however, that they are less troublesome now than of old, and that they are less aggravated by those accidental hindrances which would form more legitimate ground for some annoyance. Very few writers, in fact, of any moderate power have much difficulty in reaching their readers. The means of publication are too easy, and the circulation of literary knowledge is too rapid. We are much more inclined to be surprised at the speed with which any promising author becomes known to the world. Two or three articles in a magazine suffice to make a name known to all readers interested in the writer's subjects. Almost every book of the slightest pretensions is certain to be reviewed in a dozen journals. The reviews, it is true, are often such as not to flatter the vanity of the author; and we need not deny that they are often careless or unjust. But the damnatory power of critics is greatly exaggerated. If a book is condemned on account of its opinions, the condemnation acts as an advertisement to the opposite party. If its purely literary qualities are unjustly condemned, the criticism has less of this indirect utility; but even in such cases it is a fact that the book which suits a general taste very soon gains a circulation in defiance of the most authoritative condemnation. Indeed the real misfortune is of the opposite kind. The chance that a good book will meet with no recognition is far less than the chance that a bad book will be absurdly overpraised. The commendations of thoughtless critics do incomparably more mischief than their attacks. The worst of all services to a rising author is to flatter his vanity and encourage him to relax his efforts. It might be invidious to bring forward examples; but our memory must be very short if it does not present us with many instances of men of high promise who have been corrupted by premature adulation, and have gone on trying to repeat an early success when they should have been pushing forward to more arduous attempts.

Of all complaints, in short, the least founded seems to be the complaint that a man has not been able to bring himself into

tact with his natural circle of readers. The means of publicity are so abundant, the art of advertising has been brought to such a pitch, the very assaults of critics are so often indirectly useful, and the silent or, as we may say, the underground, spread of reputation is so rapid and certain, that a writer may count with almost complete confidence on being brought into contact with all who are competent to appreciate him. The one real danger is that a great man may be for a time lost in the throng of factitious reputations, or that the public taste may be perverted by the reckless adulation of third-rate writers. The last danger is indeed a serious one; but it does not imply individual injustice; and no man of real power need grudge the temporary participation of his glory by inferior writers. The grain will be sifted from the chaff soon enough, when they are brought into real competition amongst tolerably intelligent consumers.

When a man has once found his audience, he has little more cause for complaint. It is true that the kind of reputation which is most flattering to the vanity and most profitable to the purse comes at a later period; but it is a reputation of more questionable value. Every considerable writer is in some sense a prophet. He has a doctrine to preach and a sect to form. The sect, as in other cases, consists in its first stage of genuine believers and persons who can really appreciate his merits. But after a time the sect makes its fortune, and then begins to attract more worldly elements. The admirers of any great man, a Shakspeare or a Goethe, consist of three classes. There is the innermost circle of those who read and appreciate; beyond these is the more numerous circle which reads and only affects to appreciate; and, finally, there is the very much larger body which affects to appreciate without taking the trouble to read. A man of mark is surrounded by such bodies of disciples during his lifetime. When his name becomes the object of a literary cult, the readers who are really in sympathy with him propagate their creed with all the energy of new proselytes. "Not appreciate the great Smith or Jones! You must be devoid of the philosophical spirit or the æsthetic faculty." People are for the most part cowardly beyond description in matters of taste, and a devoted band of literary janissaries soon spreads the new doctrine which, as it assimilates heterogeneous elements, speedily degenerates into a superstition. Up to this period the name of the author has been made popular by his books; after it the books are made popular by the name. Praise turns into flattery and fame into notoriety; and another illustration is given of the truth of the famous maxim that nothing succeeds like success. It would be very pleasant, we have sometimes fancied in a cynical mood, to be a celebrated author, because we could then find a market for so much unsaleable trash. We could almost find in our hearts to wish for the premiership with a view to publishing a novel.

It is natural, nay, it is almost inevitable, that a man who is weak enough, as everybody is, to care for fame at all, should be anxious to gain such a position. In fact, it is the proof that he has really made an impression upon the world. It means that his writings have become a true spiritual force, and therefore, as is inevitable, are stirring up a good deal of mud besides setting up more desirable currents of opinion. A man cannot set his mark upon an age without producing much questionable adulation as well as much groundless abuse. But a wise man should school himself to be as little anxious as possible for these inseparable incidents of all good work. For it is such anxiety which produces a spurious imitation of the genuine process. A popularity which overflows the bounds of genuine appreciation may be attained in more ways than one. It may be, as we have said, the result of the zeal of genuine disciples impressing their belief upon others. But it may also be the result of pandering to the ephemeral tastes of the day. The great man is admired by many who do not understand him, because his praises have been sung by those who do. The charlatan is read by thousands who do not really care for him, because he is the fashion. The gregarious tendency of human beings leads them to worship at the shrines of false deities as well as at the more sacred temples. To flatter the taste for literary tinsel, to indulge in bombast or tall talk or sentimentalism, and to succeed in thus winning a wide reputation, requires very great dexterity, which is easily taken for more serious talent. The transitory nature of many great reputations, the vast success which has been followed by utter oblivion, shows undeniably that the feat has been accomplished. And, as a rule, it has been due to the prostitution of real genius. A true teacher of men has abandoned his function and condescended to discount his success in consideration of immediate popularity. That is precisely the danger which underlies the ordinary complaints against the injustice of readers and the unpopularity of great authors. The true meaning of such lamentations is too often that the complainer is prepared to succeed by foul means as he cannot succeed by fair. The best antidote is the recognition of the fact that a man of true literary force is at the present day in little danger of being kept in obscurity by accidental causes; and that, so far as his fame is retarded by intrinsic causes, that is, by the imperfect culture of his audience, he has no right to complain of a difficulty upon which every man must reckon who dares to be original. A man may be tolerably certain of finding full appreciation of all his genuine merits; he has a good chance or runs a great risk of finding sham admirers of his merits and flatterers of his faults; if he has any cause for complaint, it is for complaining of the temptation, not of the inadequate appreciation.

POCKET-MONEY.

THE man who defined happiness as "having a nominal income of five thousand a year and a real one of ten" merely meant that he liked to have plenty of pocket-money. He had made the discovery that it is not in the spending of an income, however handsome, that real enjoyment is to be found, but in the possession of a large percentage over and above the fixed scale of yearly expenses. A shopkeeper with a steadily increasing trade may have more use of his money than some of his customers who are twenty times as rich. Our poor seem to imagine that all lords go about with their purses full of bank-notes of large amount, with which they could light their cigars if it so pleased them, without suffering even temporary inconvenience. They would not give credence to such a fact as that some time ago, when one of our most wealthy young noblemen came of age after a long minority, he felt almost like a younger son. The vast accumulations of the estate had been invested to the last penny in improvements, which, although they eventually added enormously to his rent-roll, left him for the time being practically without pocket-money. He could of course borrow to any amount, but the mere notion of such a thing was too ridiculous. In some way or other the greater number of our aristocracy allow themselves to be so burdened with permanent expenses that they are not able, even if they were willing, to do the great public services which might well be expected from them. Those of our middle classes, too, who have fixed incomes very rarely so apportion them as to leave a sufficient margin for the extras which make all the difference between being able to enjoy life, and spending it in the endless drudgery of trying to make ends meet.

Women, as a rule, suffer a good deal from want of pocket-money. Young men send in their bills to their fathers, and have generally a sum wholly independent of necessary expenses to spend as they please, whilst their sisters have usually only an allowance for dress. In ordinary cases, and particularly where there are many girls of one family, this allowance is not one calculated to show any margin when the milliner's bill is paid. Miss Yonge lately spoke with regret of the ignorant young women who dabble in literature merely for the chance of earning a few pounds. She perhaps for a moment forgot of how much importance even a few shillings may be to a person who finds it almost impossible to make her income cover her inevitable expenses. Girls are often subjected to painful humiliations when staying at friends' houses merely on account of this dearth of pocket-money. They are perhaps forced to allow gentlemen with whom they are only slightly acquainted to pay for cabs or for an admission to a picture-gallery or a flower-show. They suffer agonies from not being able to give tips to servants. But, worst of all, they lose that nice sensitiveness in money matters which ought to be most carefully nurtured, and which of late seems to have gone out of fashion. It is cruel and wicked of parents to permit their children to be placed in circumstances where they are tempted to put themselves under obligations to people from whom they have no right to receive them. A girl, out of ignorance and impecuniosity, may sometimes find herself placed in an equivocal position from which she does not feel able to get free; and cruel embarrassment may be caused because she had not a few shillings in her purse when she wanted them. As a rule, a married woman in the middle classes is not much better off than her unmarried sister in the matter of pocket-money, if she has not brought her husband any fortune, and if she is unhappily burdened with a conscience. She finds herself in possession of house-money and dress-money, and, being probably inexperienced in management, she finds it hard enough to keep within her allowance. She never feels as if she could call a few pounds her own, and is thus deprived of many small pleasures, and even necessaries, which her husband would never dream of refusing to himself. This is one of the reasons why ladies' clubs are not at present likely to become very numerous. Clubs presuppose a certain amount of pocket-money which a woman has not hitherto been supposed to require. A man would feel that life was not worth having if he had to account for every cab, cigar, or brandy and soda; but a lady who is obliged to balance her weekly books would have to chronicle the small beer she gave to a friend at lunch, and all her afternoon cups of tea. She might, however, take refuge in the convenient item of "sundries," which fill an important place in most female account-books. Being obliged to do without pocket-money, and to empty the hitherto fairly abundant half-crowns into the family purse, is the real trial of a young man's life when he marries on the same income which he has hitherto spent on himself. He must remain very much in love with wife and home if he does not sometimes regret the jingle of the sovereigns in his pocket which were not mortgaged to house-rent or servants' wages. It will be well if he always remembers that he cannot both have his cake and eat it. This is the impossibility aimed at by many of our artisans. They encumber themselves with a wife and countless children, and then feel aggrieved if they cannot have as much money to spend on beer, tobacco, and music-halls as their single comrades.

It is provoking to get behind the scenes in a household where the income is amply sufficient if it was only sensibly apportioned, but where every one is made miserable by the constant screw that has to be kept on incidental expenses. The servants, the garden, the stable, swallow up everything. There is no margin left. One of the girls has a fine voice, but it is uncultivated; another draws cleverly, but has not learnt perspective. Lessons would cost too much, so Lucy must go on singing through her

teeth, and Maude doing sketches out of drawing. Perhaps another of the family becomes hopelessly ill from want of proper medical advice. Books, pictures, travelling expenses, and all the little etceteras which add flavour to life, are done without. No one is able to indulge any little harmless fancy or generous impulse. The mother's life is spent in trying to make every pound do the work of two, and her husband's in grumbling at the impossibility of keeping a balance at his banker's. It never seems to occur to them that, by substituting a neat parlourmaid for the puffy butler, and by being contented with fruits and flowers in their season, they might get rid of most of their anxieties and make their children much happier. A hundred a year reserved for household pocket-money can confer a wonderful amount of pleasure. It will buy a new piano, give three people a nice little tour, or present a stained glass window to the parish church, as their tastes may incline. It is dull work drawing cheques for the wages of servants who are only plagues and for the food which they spoil in the cooking. "Where much is there are many to consume it, and what hath the owner but the sight of it with his eyes?" The French understand this better than we do, and reserve a large portion of their income for their amusements, whether these consist in drinking *eau sucrée*, eating bonbons, or going to the theatre. We often spoil our pleasures by not providing for them, and so turning them into extravagances. But this would not be the case if we laid aside money for the purpose of gratifying a legitimate taste, be it for lilies or *Lohengrin*. Any one without a taste does not deserve to have pocket-money. He does not know its use. We mean the word in its widest sense, of course, by which it can be made to include hobbies, whether they take the direction of ragged schools or etchings. Children can scarcely be given an allowance too early, but it should not all be for pocket-money. They ought to be required to provide certain things out of it. This teaches them to distinguish between income and pocket-money. Many people, unfortunately, never learn the difference during a long life. Parents are very apt to forget that their boys require to be taught about the management of money as well as how to do fractions. They avoid speaking on the subject before them, which is generally a great mistake. Young men are often extravagant, entirely from ignorance of the value of money. They get into debt before they are aware of it, and have not moral courage to take means to extricate themselves. They treat the allowance which their father intends to cover all expenses entirely as pocket-money, with painful results to all parties concerned.

The enthusiastic affection displayed towards pattern old bachelors and fairy godmothers of the approved type is mainly, we fear, owing to the command of pocket-money which they take care to have. But without it they could not fill their places to their own or any one else's satisfaction. The happiness that they are able to give keeps them young, and planning surprise gifts fills up many a lonely hour. What glorious visits to the pantomime and the circus, the Crystal Palace or the seaside, the youngsters extract from their magic purses! What Christmas-trees and rocking-horses, kites and canary birds! It is they who supply crisp bank-notes instead of ormulu candlesticks for wedding presents, it is they who help in outfits and buy long-desired watches. They have no children to tempt them to live in a style which they cannot afford. They keep themselves unencumbered with useless and unsatisfactory expenses. Many a young couple beginning life have it in their power to halve their anxieties and double their chance of being comfortable by so preparing their budget that mere everyday so-called necessaries shall not swallow up the whole of their means. But they will have the additional servant, or the diamond necklace, or the pair of horses, or the house in a fashionable street, which leaves them without the much more valuable item of pocket-money.

THE VIRTUE OF RESENTMENT.

OUR readers may possibly be aware that a sharp controversy has been going on in the pages of the *Contemporary Review* between Mr. Spedding and Dr. Abbott about the character of Bacon. Into that dispute we do not propose to enter here. But at the close of his article in the current number of the *Contemporary*, Dr. Abbott propounds a theory, for which he cites high authority, sufficiently startling to have an interest of its own, quite apart from any connexion it may be supposed to have with the circumstances or character of Bacon. "Mr. Spedding," he observes—the italics are our own—"cannot refrain from a sneer, because 'in Dr. Abbott's list of the Christian *virtues* "resentment" holds a prominent place.'" Upon this Dr. Abbott observes:—"Is it possible that a man of Mr. Spedding's education and acquirements can be ignorant that the author of the *Analogy of Religion* long ago set his stamp *upon this virtue* in his well-known discourse on Resentment?" And then, in order to show that Mr. Spedding had no excuse, as a Cambridge man, for being ignorant of this great ethical principle of Bishop Butler's, he proceeds to cite the confirmatory "dictum of Dr. Whewell, borrowed from Butler," "that resentment is a moral sentiment given for the repression of injustice." Now we do not know exactly what Mr. Spedding's contention was, and it is possible that he may have ignored or denied the important ethical truth laid down by these great authorities. Be that as it may, however, Butler certainly does not represent resentment as "a Christian virtue," nor does Dr. Whewell in the passage here cited. But, as Dr. Abbott has shown that it is "possible for a man of education and acquirements," who claims some familiarity with Butler's writings, entirely to misapprehend his meaning, it may be worth while to remind our readers what Butler really does say on the subject in the "well-known discourse" which has been so strangely travestied, although to Oxford men at least the explanation will appear superfluous. Bishop Butler, then, begins by dividing resentment into hasty and sudden anger and that deliberate anger to which the word more strictly applies. The former he describes as often "mere instinct," not based on a sense of injury, but on fear of harm, and implanted in our nature for purposes of self-defence. But deliberate anger, or resentment properly so called, is roused by a sense of wrong or injustice, whether towards ourselves or others, and thus "seems *in us* plainly connected with a sense of virtue and vice, of moral good and evil." This is a very different thing from saying that it is in itself a virtue or vice, and Butler does not admit that it is either the one or the other. On the contrary, he calls it "a *passion* natural to mankind," having for its object moral evil, in the shape of injury, which is resented as such, but of course in a varying degree in proportion to our greater regard for those who are injured, whether ourselves or those dear to us. While therefore the true end of sudden anger is self-defence, the true end of resentment is the administration of justice against offenders. It is "one of the instruments of death which the Author of our nature hath provided" against cruelty, injustice, and wrong, which our natural feelings of compassion might otherwise make it difficult for us to punish as they deserve and as the interests of society require. But so far from considering it to be in itself a virtue, Butler dwells in detail on "the chief instances of abuse of it," though he adds—what is his nearest approach to Dr. Abbott's statement, but what will be at once seen to be a totally different one—that, "as implanted in our nature by God, the passion is not only innocent, but a generous movement of mind." We might indeed fairly compare it to the physical appetites of hunger and thirst which may easily be abused by indulgence in drunkenness or gluttony, as our natural sense of resentment may be indulged till it becomes a mere unreasoning and vindictive hatred, but which are implanted in us to secure our taking the food requisite for preservation of health and life, and are rightly gratified when we do so. There is of course just this difference between the two cases, that no moral character attaches to our bodily appetites, whereas the "passion" or feeling of resentment against wrong has a moral element; but neither appetites nor passions are in themselves virtues, though both may become, so to speak, the raw material of virtuous or vicious action. Resentment is, as Dr. Whewell quite correctly interprets Butler's doctrine, "a *moral sentiment* given for the repression of injustice," and when it is exercised for that end the exercise is a virtuous one; when it is indulged for the gratification of personal malice and revenge, the indulgence is vicious. It is at best, as Butler remarks, a painful remedy, and ought never to be made use of but in order to procure some greater good; for otherwise it directly contradicts its own end, and, being designed for the prevention or remedy of misery, is made to produce it.

From what has been said it will be pretty clear that Dr. Abbott is not, as he imagines, "following Bishop Butler and Dr. Whewell in giving resentment a conspicuous place in the list of Christian virtues," or indeed giving it any place there at all, though he may possibly not have meant to go beyond the teaching of those great writers. But, if so, his language is, to say the least, infelicitous. The notion of revenge, which is resentment in action, being a virtue has, no doubt, prevailed widely, though not, so far as we are aware, among Christians. There is the old maxim to which Butler himself refers in order to put it aside, "Thou shalt love thy neighbour and hate thine enemy." And the gratification of this hatred was very commonly looked upon as not only lawful but meritorious, in heathen systems of ethics. Thus Plutarch makes Osiris ask, "What is the most beautiful thing upon earth?" and the reply is, "To avenge a parent's wrongs." Revenge has always held a high place among the virtues of savage life. And the idea, as far as it survived and was seriously defended among civilized nations, had its root in the psychological fact to which Butler draws attention. A modern writer has observed that, "before an effective administration of justice was organized, private vengeance was the sole preservative against crime, and political assassination against usurpation." This did not indeed render revenge or assassination virtuous, but it threw a halo of seeming goodness over what had become necessary evils; and hence the most cultivated nation of antiquity could elevate two political assassins, who, according to the popular legend, had acted from purely personal and vindictive motives, into the objects of its most enthusiastic hero-worship. The feeling of revenge, in the words of the writer already quoted, "was for centuries the one bulwark against social anarchy, and is even now one of the chief restraints to crime." Mr. Fitzjames Stephen even goes so far as to say that one of the two great benefits of the criminal law is that "it regulates, sanctions, and provides a legitimate satisfaction for the passion of revenge," to which, he adds, it "stands in much the same relation as marriage to the sexual appetite." And this is to imply, what we observed just now, that the passion of resentment is, like hunger or thirst, a thing indifferent in itself, but having a legitimate as well as an illegitimate scope for its exercise. On Butler's principle all three were alike implanted in human nature by the Creator for a good end, and cannot in themselves be evil; but all alike "may be indulged in such ways and

ogrees that at length they become quite another thing from what was originally in our nature."

A modern French school of atheistic writers has laid down the principle that "virtue and vice are natural products in the same sense as sugar and vitriol." This is certainly not the view which Dr. Abbott intends to advocate, but he seems to have fallen into a somewhat similar confusion of thought. Virtue and vice may be called natural products in the sense that they are the result and expression of natural qualities of the mind; but they are not identical with these qualities, and their moral character depends on the human agent, not on the raw material which he employs. At the same time, if the original mechanism of the mind, so to term it, was inherently vicious and sure to produce vitriol rather than sugar as soon as it was put into operation at all, it might be plausibly argued that an atheistic or dualistic explanation of the facts of experience is the most natural one. And accordingly Butler thought it important to meet the objection that "man had implanted in him a principle which appears the direct contrary to benevolence," by showing that the principle impugned is quite consistent with benevolence, and has, under the circumstances of the present world, an obvious and legitimate use. To knock down a scoundrel who is trying to pick your pocket, or who has insulted your mother, may be one example of such use of it; a judge who pronounces sentence of death against a convicted murderer gives formal expression to another. Such acts—and examples of the kind might be indefinitely multiplied—are in various degrees justifiable, or right, or commendable; in some cases they may fairly be designated virtuous. And they are ultimately traceable to this inherent passion of resentment. But to call resentment itself a Christian virtue, and even a conspicuous Christian virtue, is to confound the means with the end, and the natural capacity with the voluntary and deliberate use of it. If Mr. Spedding, as a Cambridge man, is open to the censure of his critic for his ignorance of Butler, he might perhaps retort by advising Dr. Abbott to cultivate a better acquaintance with Aristotle, who would teach him the distinction between a passion, an energy, and a habit, and would certainly not allow virtue to be relegated to the first category. Scholars will remember Butler's about "Nemesis" is much the same as Bish[illegible]

THE BLUE BOOK ON THE INDIAN CIVIL SERVICE.

A BLUE BOOK on a sound, well-contested, and long-standing Indian controversy resembles in some respects a debate on a Resolution in the House of Commons. The subject is thoroughly ventilated with a view to eventual action. Letters take the place of speeches, and instead of flights of oratory there is a flow of minutes. It is true that an Indian Blue Book may be somewhat ponderous, and we miss the incidents of a lively field-day—an epigram from the Prime Minister, a lugubrious prediction of ruin to the Empire from Mr. Lowe, the haze of diction by which Mr. Gladstone endeavours to explain to the House what he does not mean by such expressions as voting dead against your convictions. But the publication to which we now refer soars above Zemindar and Ryot, and deals out full measure to a very large, semi-English, and interesting subject, deserving the attention of householders with moderate incomes and large families. There are no unpronounceable Aryan or Semitic names; no jungles or labyrinths of Revenue and law terms; no stories about unlucky Rajas harassed by importunate creditors or bullied by despotic Residents. The book, in short, has all the animation of a debate in the House on a speculative question, followed by something practical and definite in the shape of a Bill which has passed its third reading.

About a year and more ago the Secretary of State for India put himself in communication with high authorities at both Universities, with the Civil Service Commissioners, with the Viceroy of India, and with the Governors of the Presidencies. The subject of discussion was the mode of selecting and training candidates for the Indian Civil Service. Every person who could throw light on such an important topic has been duly heard. Rulers and councillors have minuted; old civilians high in office, and young men who have just emerged from the drudgery of routine work at isolated stations, have contributed their quotas of knowledge. The pens of members of the Indian Council at Westminster have not been idle. There are important communications from such men as Dean Liddell and Mr. Jowett; and we shall now proceed to show as concisely as possible the gist of these three hundred and twenty pages of close print. Three main questions seem to have arisen in the correspondence, besides a host of suggestions on minor and subordinate points. Has competition answered, and ought it to be retained? What shall be the limit of the age of the candidate? After he has once gained his appointment, where, how, and under what conditions, shall his special training for the Indian service be carried out?

With regard to the principle of competition *versus* patronage, selection, or nomination, there is not very much to be said. Several writers are keenly alive to its extravagances and defects. All parties are, however, agreed that they do not see their way to any other system. The highest, weightiest, and most impartial authorities, whose reputation rests on the efficiency of the subordinate agents through whom they must govern, are quite at one on the following points. The system has effectively kept out the idle, the lazy, and the incompetent. It has recruited the service with many men who are efficient for district work, and with a very fair percentage of others who have displayed exceptional talent and brilliancy. A cynical observer might point a moral on the failure of vast and extravagant expectations by showing that, after all, it takes a big Blue Book to prove that competition gives us men as good as, or somewhat better than, those formerly supplied by the haphazard and cousinly nomination of a dozen elderly gentlemen sitting in Leadenhall Street. But a main justification of the competitive system is the favourable verdict of men who are now ruling India, and who are satisfied with their subordinates. We may add that intrinsic testimony to the better side of competition is found in the writings of the competitioners themselves. It is admitted that in some civilians there is a want of manner, polish, and tact; that the desirable connexion among members of a body exiled from their friends in this country, and isolated from each other in India, is not quite what it ought to be; and here and there we come on a young gentleman who evidently does not quite see that a really noble *esprit de corps* deserves to be welcomed, and not sneered at, even with its risks and its excesses. But the tone in which some of the younger or middle-aged civilians have discussed the questions of their early training, their college or school life, their Indian experiences, their responsibilities and hopes, is excellent. Any plan which turns out men who can deal with State questions from the point of view taken, and with the elevation of thought and language evinced, in several of the letters, which do not err on the side of brevity, carries on the face of it its own vindication. Moreover, the experienced men who are the first to detect flaws and blemishes, and who draw attention to evils against which Lord Macaulay and his colleagues were vainly thought to have provided, have really no other system or theory to recommend. We may assume, then, that, in the present state of public feeling and opinion, candidates for the Indian Civil Service will continue to present themselves at Cannon Row. Improvements can be introduced. Failings will be remedied. The devices of special preparation [illegible] must by half be paid. [illegible] or counteracted by the wisdom of Boards and examiners. But nominations will not again come into fashion.

The controversy about the foundation of the Civil Service is, however, languid in comparison with that which has raged on the limit of age. Men of the widest experience and the calmest judgment are here divided into two irreconcilable parties, and have been led to diametrically opposite conclusions while living in the same atmosphere and working at the same Board. At present any one can compete up to the age of twenty-one; and, allowing for two years of special training in law and Oriental languages, his active career then commences about twenty-three. It has been felt that this limit does not allow a man to take a University degree; and that in most instances he lives and works in obscurity in London, and has no special inducement to reside at either University. Such authorities as Lord Northbrook, the Master of Balliol, and Sir Robert Davies, Lieutenant-Governor of the Punjab, would raise the limit of age to twenty-two, which might keep a successful candidate in England till he was twenty-four. On the other hand, the Governors of Madras and Bombay, Sir R. Temple, Sir W. Muir, and some others in high position would reduce the limit of age to nineteen. The lesser Indian officials are not quite equally divided, more being in favour of raising than of lowering the age. We have no space to go at length into the ingenious and weighty arguments by which these contradictory proposals are supported; but Lord Salisbury, in opposition to the Viceroy and in concurrence with Sir H. Maine and others of his own Council, has boldly decided on reducing the limit of age to nineteen. There are two or three paramount considerations which lead us to the conclusion that the Secretary of State is right. First, there is the English point of view. It is conceded on all hands that the strain of preparing for such an examination, on which a man's whole prospects for life are to depend, is protracted and severe. The sooner it can be got over the better. A man selected at nineteen because he has beaten two hundred competitors in four, five, or half-a-dozen subjects has surely given ample proof that he possesses that sort of ability, application, and steadiness which such a paper trial can gauge. A man rejected at nineteen has still time to turn to another profession. But a man rejected at twenty-two is not likely to go to the Universities, is too late for the army, is hardly fitted for the Church, and is disheartened for the Bar. The proportion of competitors will decrease, and the standard is likely to be lowered, with the extension of the limit. Then as to the Indian or practical consideration. Many of the new generation of civilians dwell feelingly and pointedly on the irksome, repulsive, and petty duties which every one must pass through before he can hope to be put in charge of a district or of a subdivision of a district, or be selected for one of the under-secretaryships in the Foreign, Home, or Financial Department. He must, they say, put his nose to the grindstone and go to school again. He must try petty cases in a stifling atmosphere at a lonely station, and discharge such humble functions as his superior, the magistrate or the joint magistrate, assigns to him. This may be endured, or even accepted cheerfully, at twenty, twenty-one, or twenty-two. But every year of life adds to the disenchantment of the East, and at twenty-four these ignoble occupations become odious and unendurable. We should be inclined even to go further than the Blue Book, and to say that, when an aspiring young fellow of eighteen or nineteen has once shown that he can distance many compeers in a written or oral test, the sooner he gets over his novitiate at Rungpore or at Leia, at Tinnevelly or at North Canara, the better for himself and the State. [illegible] age now selected is that

which limits candidates for such severe and open scholarships as the Balliol, for instance, and others; and, curiously enough, it is practically the age at which the majority of Haileybury men would have been leaving their old college or have been in the fourth and last term of residence. It will scarcely be denied that, if the Court of Directors did nominate incompetent friends or relatives, they did, in this way, occasionally catch statesmen unawares.

We now come to the third question. The candidate having given evidence of solid acquirements in three or four subjects studied in schools or private establishments, at what place or places will he be most likely to complete his course with advantage? It is quite clear that special training in Oriental languages, laws, codes of procedure, and political and social systems, must begin somewhere. In former times opportunities for studying these subjects were afforded at Haileybury and at the capitals of the three Presidencies. Since 1864 passed candidates have been allowed to reside at their own homes, at the Universities, or in London. The result is that a considerable number of them reside in town, at any rate for many months in the year. It is objected to this that men grow up ignorant of each other, with no bond of union, with none of the friendships which soften rivalries and elevate character. No one knows anything about their lives and habits. They may be as dissolute as French students in the Quartier Latin, or as pure and chaste as Sir Isaac Newton. They ought to be brought together in some institution where there is some semblance of discipline and control. And here, parenthetically, step in the opponents of sweeping and revolutionary changes, and say, with some relevancy, that all this might have been avoided if Haileybury had been retained after 1854. But Haileybury cannot now be resuscitated, on the ground of expense and other objections, and there are obvious reasons against the preference of any one University, or any one college at any University, for the residence of passed candidates. Fortunately, an incident to the method of selection and training enables the Government to interpose and lay down certain conditions which, without being one-sided or too stringent, seem calculated to secure the desired end. It has lately been usual to make a certain allowance to passed competitioners to enable them to get through their two years of probation. This burden on the Indian finances is defended on the ground that, had passed candidates proceeded to India at once, they would have drawn monthly salaries for a year or more of infructuous residence either at the Presidencies or at some station. It is also argued that the State has a full right to spend some of its revenue in perfecting its own servants in the duties which it will exact at their hands. Joseph Hume might possibly have urged that the nominees of Directors used to pay 300*l.* a year out of their own pockets for their education at Haileybury, provide outfit to boot, and put down their passage-money, without drawing one farthing from the revenue of India. But we do not care to cavil at this outlay, because it clearly justifies the Secretary of State in attaching certain conditions to the grant. It is now fixed at 150*l.* a year for each candidate. And henceforth this sum will be given for two years to all accepted candidates who shall pass that time at "some University at which moral responsibility for the conduct of the students is undertaken and rules of discipline are enforced." The Universities must be approved of beforehand, but we can hardly be mistaken in assuming that the object of the change is to send most men to either Oxford or Cambridge.

Several other questions naturally arise out of this reform. The period of probation is not to be less than two years. But if the candidate chooses he may not make his appearance in India until the fourth December after winning his appointment. In other words, he may spend fully three years more in following the academical course and winding it up with some University honour. How the pursuit of such distinctions is to be reconciled with the study of Sanskrit or Arabic, Bengali or Telegu, the land revenue and the penal code, is a question for the Civil Service Commissioners, the Secretary of State, and the high authorities of the Universities to settle between them. No doubt some modification of the special subjects is desirable and feasible. But though we have not the smallest wish to undervalue a first class in classics or a wrangler's degree, it is clear to us that these triumphs may be purchased too dearly. We doubt much whether the influence of Munro or Thomason over natives would have been enhanced if they could have put B.A. to their names, and we feel confident that the majority of passed men will not stay at the University of their selection one day longer than the prescribed period of two years. They will be zealous for active work, new scenes, and substantial pay. Every man who goes off as soon as he is permitted will think he gets the start of his compeer who remains to study for honours; and every man so remaining will be grievously disquieted by rumours that his friend or rival has already cross-examined a Pundit, detected a Baboo in cheating, fined six village watchmen for absence from their posts, tried endless cases of *mayeet*, made a successful essay in hog-spearing, shot some jungle fowl, seen the footprints of a tiger, thrown a new light on an obscure section of the code of criminal procedure, and fully held his own with an ancient collector as to the precise effect of the most recondite and difficult provisions of the Rent Act. But this dismal prediction is no reason why the experiment should not be tried. Even if only two per cent. of the candidates take a final degree, the whole body will have had a chance of cohesion and fusion. The polish of University companionship, the graces of academic training, will have been imparted. A connexion such as the Boden Professor of Sanskrit longs for will be commenced. The careers and characters of the selected candidates will no longer be shrouded in impenetrable mystery. They will not feel the solitude of a great city, nor in the crowd, the hum, and the shock of men be conscious of an isolation probably exceeding that which they can ever experience at Banda or Backergunge.

We wish that space permitted us to show in what manner other subordinate topics are discussed in this Blue Book. All kinds of suggestions and hints are thrown out either to widen the area of competition or to improve its material. It is hinted, for instance, that appointments might be offered, as gifts, to men who had taken a first class in classics or were in the first twenty-five wranglers; that there is little use, if any, in compelling successful candidates to sign bonds that they will refund the allowance which they have drawn during probation, if they are ever tempted to throw up India for some English career; that Haileybury, after all, had its favourable aspects; that too much stress is now laid on attendance at law courts and on furnishing reports of cases; that too many subjects ought not to be encouraged; and that the mania for examinations has been pushed to its furthest limits. We may conclude with a word or two on what is popularly known as "cramming." Several able writers have conclusively shown that this objectionable term really describes a process of careful preparation by skilled professors, who take a forward young fellow, develop his gifts and sharpen his faculties, with the view of his passing a series of hard tests devised by examiners who are not likely to be imposed on by a specious and flashy performance. They do not, and cannot, make sieves hold water or empty sacks remain upright. But it is not the less evident, on the other hand, that this elaborate process is not education in its highest sense; and some of the competitioners state confidently their opinion that there are one or two subjects in which knowledge can be "crammed" in the worst meaning of the term. It is also very evident that examination, in this view, assumes an undue importance, and is made the chief end of existence. The intellect is unduly forced and strained; men rely less on themselves, and more on the tutor. He it is who removes doubts, explains away difficulties, prepares typical questions, and exults in the prospect of the final lists in which his numerous pupils with their asterisks will attract the gaze of readers in the *Times*. One of the members of the Indian Council pertinently sums up the matter by asking whether administrators would prefer, for a public servant, the candidate who had come straight from a public school or University with a scholarship, or the man who had been specially fed up like a stalled ox or a fatted chicken? We believe many competent judges would select the former, though twentieth on the list, before the latter, though he might be in the first half dozen. It is not to be supposed that we have heard the last of these changes and modifications. But we are confident that they will improve the training of men whose main object in life must be to preserve and strengthen a wonderful system of government created by a set of men all of whom had been selected by favour, chance, or friendship, and who, in many instances, were sent out to India after passing none but very moderate tests.

A ROMANCE OF AMERICAN SOCIETY.

NOTWITHSTANDING the absorbing interest of the Centennial Exhibition, public opinion in the United States seems just now to be somewhat perturbed by a novel which has lately appeared, and which professes to give a truthful representation of what is called the "inner life" of American society at the present time. This work is written by an American lady, Mrs. Bloomfield H. Moore, who is vouched for by several critics as having the best opportunities of studying fashionable society in her native land; and it is significantly entitled *On Dangerous Ground*. It is difficult of course for any one at a distance to judge how far such a picture is really trustworthy; but it would appear from the criticisms in the newspapers that the incidents are generally accepted as not at all improbable, though there is considerable diversity of opinion as to the moral tendency of the book, some regarding it as a great missionary effort, while others denounce it as appealing to a prurient curiosity and love of scandal. The publishers of the work have been good enough to advertise a long series of what they call "Conflicting Opinions of the Press," in which, however, they take care to leave unfavourable comments to be inferred from the protests of critics on the other side. The *Philadelphia Inquirer* is indignant at the "ignorant and malicious animadversions" which have been cast on this book, its pride in such a local celebrity as Mrs. Moore rising superior to any sensitiveness as to the equivocal moral reputation which she ascribes to that city. The *New York Evening Mail* says that "the characters are types of persons nearly all of whom may be found in various circles of American society, fashionable and unfashionable," and considers it "an eminently wholesome book, as teaching most impressively, but unobtrusively, the much-needed lesson of the dangers of flirtation before marriage and Platonic friendship after." "No young girl, no married woman," it is added, "but will be the better for reading it." The *Hartford Evening Post* assumes that the popularity of the novel proves its morality. "A novel," we are told, "that reaches a third edition in twice as many weeks cannot be pronounced a failure, no matter from what point of view it is looked at; intellectually and morally, as well as on the ground of literary qualities, it must be above the average of works of fiction." We cannot say that our own experience in regard to novels in England or elsewhere enables us to feel this unqualified confidence in

popular taste. The *Literary World* holds that only "men of the lowest instincts" would think ill of such a book. A Dr. Mackenzie gives a certificate that the story treats "a difficult subject with the greatest delicacy," and that the language is drawn from "the well of English undefiled." We must say for ourselves that, leaving the question of morality alone, Mrs. Moore's literary style is scarcely what in this country we should expect from such a source; but perhaps the Doctor judges by the local supply. He is probably a better authority as to the writer's "well-bred familiarity with the subject of the fashionable world." Dr. Hart also applauds the book for its "conversations in the style common to people of refinement and education," and for the "utter absence of slang"; but of course a good deal depends on what is considered slang, and there are various standards of education and refinement.

It is time, however, to leave the critics, and come to the work itself. It is prefaced with a sufficiently suggestive quotation from another American writer—"As a saint you are not amiss; but as a human creature, and a woman among earthly men and women, you need a sin to soften you." This evidently refers to the heroine, Agatha. It has been, we are told, the desire of her life to have a Platonic friendship, but she has hitherto been disappointed in finding all her friends turning into lovers. "More than once had she fancied that she had found her ideal; but each time, scarcely had she given herself up to the full enjoyment of the companionship, before the friendship straightway flamed up into love, and left her nothing but ashes." She was no beauty, but had "much soul in her face." She was of a very independent character, and neither her relations nor teachers had been able, when she was young, to "school her into the reticence which they considered desirable"—an experience which may be conceived to be pretty common among American teachers and parents. As, however, she grew into womanhood she had glided into "those grooves of society" which are usually accepted as "necessary to its maintenance in order and propriety." We meet Agatha first at her father's country house at Newport. Colonel Potten, one of her adorers, is trying to talk himself into her good graces, when her attention suddenly becomes riveted upon a dark corner of the piazza where they were sitting. Here she sees a man and woman sitting closely together, and the man "pressing passionately to his lips the long yellow curls of hair of his companion." Her first impression is that the man must be an idiot to believe in any woman's *chignon* in these days; but when she finds that he is her cousin Frank, and the lady is a married woman, Mrs. Arthur Grey, she is shocked. Colonel Potten explains to her that "this is what the German school of novels is developing in society, either under the name of Platonic friendship, 'affinities,' or 'free love'; it is all the same—this is what it ends in." But she will not let him abuse her favourite creed. That evening, sitting at the window of her bedroom, "her hair fell over her shoulders, and wrapped her in a purple cloud"; and, meditating on her probable future as an old maid, she thought she would like first to have a taste of Platonic love, and then fell into a dream of walking barefoot hand in hand with a man of noble bearing, who carefully guided her steps so that not a grain of sand clung to them; then they came to a muddy bit, but he took her safely over that too, till they reached a high and mossy peak, when he kissed her on the forehead and vanished. This dream confirmed her faith in the coming of her ideal; and she was therefore on the look-out for him. He turns out to be one Carroll Tracey, a literary man, who, however, does not seem to have got beyond translating and copying out other people's verses. He is already married, and his wife's conduct has given occasion to some scandal. It was said that she jilted another lover before marriage, and had since taken up with a new one after it. As one of the characters says, Mrs. Tracey is only one of a set "whom it is a sin to allow to go around loose, turning the heads of half the men they meet." Carroll himself is reported to neglect his wife, writing half the year, and going off shooting and yachting for the rest of it.

Following on Mr. and Mrs. Tracey's steps comes one Paul Howard, a notorious *roué*, who has scarcely concealed designs on Mrs. Tracey, and is her constant companion. In the meantime Agatha and Tracey become great friends, and while Howard's "rich baritone voice blends with Mrs. Tracey's in song after song, Agatha sits at the library table with Mr. Tracey, helping him to recover the time he has lost." He is translating a book, and she takes one chapter while he does another; and they thus discover that there is some mysterious sympathy between them which enables them to arrive at exactly the same ideas, and even forms of expression, as if by instinct. It has already dawned on Agatha that it must be "affinity"; for otherwise, as she says, "we could not so quickly have discovered what was sympathetic in each of us, nor could we have learned so soon to speak with such unreserved candour and to understand each other by a mere word or hint." It may be imagined that the situation is becoming dangerous. She gazes in admiration at his "handsome head"; their eyes meet, and there is "one quick look of appreciative recognition, soul speaking with soul, as it were." She noted that his eyes were peculiar eyes, of that pure grey which is rarely met with, and with long dark lashes, and a disturbing memory began to haunt poor Agatha, for she felt sure she had somewhere seen those marvellous eyes before. Mr. Tracey on one occasion was for a moment at a loss for a word to express his meaning, and asked Agatha to help him. They held the book between them, and as their hands met the touch produced a curious thrill. Then they agreed that they should write the translation separately, and compare the two versions. They proved to be identical. "What a singular coincidence!" exclaimed Agatha. "More than a coincidence," replied Carroll, in the voice of one who smothered some deep feeling. And then Agatha was struck by the lines of care and sorrow on the handsome face, and pitied him on account of his wife. The drift is here plain enough; and, after some high-flown mystic talk, we are not surprised to find Carroll more than once kissing Agatha's hand and gazing tenderly into her compassionate eyes. And then she feels "for the first time in her life the touch of another sending the blood pulsating through her veins in magnetic waves." It seems that from childhood Agatha has been peculiarly susceptible to "animal magnetic influences"; and now, when Tracey reveals to her the misery of his soul, "her strongly sympathetic nature was so worked upon that she seized his hand and, carrying it to her lips, pressed them passionately against it." This act of course amounted to a mutual revelation, and Agatha found herself in love with a married man. That very night Tracey was summoned away from Newport, but missed the steamer, and, returning, looked through a window, and saw his wife clasped in Paul Howard's arms. As he had once before found her in a similar situation with another man, he had no doubt a sufficient reason for casting her off; but it is revolting to find such an event welcomed by him as a piece of good fortune in regard to his relations with Agatha. The divorce is applied for on the ground of incompatibility of temper, so as to avoid scandal, and prepare the way for new marriages on both sides. Agatha has some scruples at first; but, after a time, accepts him as her husband. Mrs. Tracey has meanwhile married, not Paul Howard, or her other lover, Graham, but a third one, Frank Mortimer, Agatha's cousin, who soon tires of her, and runs after other women. In the course of the story Mrs. Grey, thrown over by Frank, goes off with a Mr. Jenkins, and other couples are also exhibited as badly bitten by the "affinities." In a conversation at a dinner party the talk turns on the relative morality of American cities. Mr. Tracey says that, if all he heard of the morals of society in the Quaker city at the time he resided there was true, it had no morals to speak of. Colonel Potten inclines to believe that human virtue is much the same everywhere:—"In Boston married people call their flirtations 'affinities,' and talk of a 'higher law'; in New York they do as they choose, without making any excuses. I do not know much about Philadelphia, but, if the people walk any straighter there, I daresay it is because the streets are so straight that they are compelled to; or, in other words, because every one there knows what everybody else is doing."

It will be seen that the chief characteristic of American society as represented in this work is universal flirtation among married people, who occasionally vary the secret pleasures of intrigue by a divorce and new nuptial ties, which, being frail to begin with, are perhaps soon again snapped. How far this is an exaggeration, we cannot pretend to say; but there can be no doubt that it rests on a certain degree of foundation in fact. It is sometimes said that such persons as Victoria Woodhull and Mr. Beecher are repudiated by the respectable classes in America; but it is difficult to account for the peculiar public position which they occupy, and the indulgent interest they excite, except on the supposition that there is in American society a general looseness of thought and feeling in regard to those arrangements on which social order and decency mainly depend. There may not be much chance of Free Love becoming all at once an organized institution, but it would appear that the spirit of it is spreading, and that domestic life is really getting, as this novelist asserts, upon dangerous ground. We have, no doubt, our own scandals of a similar kind at home, and have no right to throw stones. But what is happening in America may at least be taken as a warning of the consequences of making free with the old securities for decorum under the belief that human nature can suddenly arrest its evil impulses at the brink of peril.

THE AVRANCHIN.

THE town of Avranches is well known as one of those Continental spots on which Englishmen have settled down and formed a kind of little colony. A colony of this kind has two aspects in the eyes of the traveller who lights upon it. On the one hand, it is a nuisance to find oneself, on sitting down to a *table-d'hôte* in a foreign town, in the middle of ordinary English chatter. Full of the particular part of the world in which he is, the traveller may hear all parts of the world discussed from some purely personal or professional aspect, without a single original observation to add anything to his stock of ideas. On the other hand, it must be allowed that the presence of an English settlement anywhere always brings with it a degree of civilization in many points such as is not always found in towns of much greater size which our countrymen do not frequent. But to the historical traveller Avranches is almost dead. A few stones heaped together are all that remains of the cathedral, and another stone marks the site of the north door where Henry the Second received absolution for his share in the murder of Thomas. The city which formed the halting-place of Lanfranc on his way from Pavia to Bec is now chiefly to be noticed for its splendid site, and as a convenient starting-point for other places where more has been spared. Avranches, like Coutances, is a hill-city, and, as regards actual elevation, it is even more of a hill-city than Coutances. But then

the hill of Coutances is an isolated hill, while Avranches stands on the projecting bluff of a range. Seen from the sands of St. Michael's Bay, the site proclaims itself as one which, before the fall of its chief ornament, must have been glorious beyond words. It must have been Leon, as it were, with, at favourable tides at least, the estuary washing the foot of its hill. What the view is from the height itself is implied in what has just been said. The bay, with the consecrated Mount and the smaller Tombelaine by its side, the Breton coast stretching far away, the Mount of Dol coming, perhaps within the range of sight, certainly within the range of ideas, the goodly land on either side of the city, the woods, the fields—for in the Avranchin we are still in a land of pasture and hedgerows—all tell us that it was no despicable heritage of his own to which Hugh of Avranches added his palatine earldom of Chester. And if Avranches gave a lord to one great district of England, England presently gave a lord to Avranches. The Avranchin formed part of the fief of the Ætheling Henry, the fief so often lost and won again, but where men had at least some moments of order under the stern rule of the Lion of Justice, while the rest of Normandy in the days of Robert was torn in pieces by the feuds of rival lords and countesses. But musings of this kind would be more to the point if the city itself had something more to show than a tower or two of no particular importance—if, in short, the hill of Avranches was crowned by such a diadem of spires and cupolas as the hill of Coutances. As it is, Avranches is less attractive in itself than it is as the best point for several excursions in the Avranchin land. The excursion to the famous Mount of St. Michael and its fortified abbey need not here be dwelled on. No one can walk five minutes in the streets of Avranches without being reminded that the city is the starting-place for "le mont Saint-Michel." But no one suggests a visit to St. James, nor even to Mortain and its waterfalls. Nor should we ourselves suggest a visit to St. James, except to those who may be satisfied with a beautiful bit of natural scenery, heightened by the thought that the spot is directly connected with the memory of William, indirectly with that of Harold.

When we write "St. James," we are not translating. The "castrum sancti Jacobi" appears as "St. James" in Wace, and it is "St. James" to this day alike in speech and in writing. The fact is worthy of some notice in the puzzling history of the various forms of the apostolic names Jacobus and Johannes and their diminutives. *Jacques* and *Jack* must surely be the same; how then came *Jack* to be the diminutive of *John*? Anyhow this Norman fortress bears the name of the saint of Compostella in a form chiefly familiar in Britain and Aragon, though it is not without a cognate in the Italian *Giacomo*. The English forms of apostolic names are sometimes borne even now by Romance-speaking owners, as M. James Fazy and M. John Lemoinne bear witness. But here the name is far too old for any imitative process of this kind. And it is only as applied to the place itself that the form "James" is used; the inn is the "Hôtel Saint-Jacques," and "Saint-Jacques" is the acknowledged patron of the parish. Anyhow the effect is to give the name of the place an unexpectedly English air. Perhaps such an air is not wholly out of place in the name of a spot which was fortified against the Breton by a prince who was to become King of the English, and whose fortification led to a war in which two future and rival Kings of the English fought side by side.

For the castle of St. James was one of the fortresses raised by William's policy to strengthen the Norman frontier against the *Bret-Welsh* of Gaul, just as in after days he and his Earls raised fortresses on English ground to strengthen the English frontier against the *Bret-Welsh* of Britain. It stands very near to the border, and we can well understand how its building might give offence to the Breton Count Conan, and so lead to the war in which William and Harold marched together across the sands which surround the consecrated Mount. In this way St. James plays an indirect part in English history, and it plays another when it was one of the first points of his lost territory to be won back by Henry the Ætheling after his brothers had driven him out of the Mount and all else that he had. But the place keeps hardly anything but its memories and the natural beauty of its site. A steep peninsular hill looks down on a narrow and wooded valley with a *beak*—that is the right word in the land which contains Caudebec and Bec Herlouin—running round its base. The church—a strange modern building with some ancient portions used up again—stands on the extreme point of the promontory. This seems the best point for commanding the whole valley, and we may perhaps guess that a less devout prince than William would not have scrupled to raise his donjon at least within the consecrated precinct. But he chose the southern side of the hill, the side to be sure most directly looking towards the enemy; and church and castle stood side by side on the hill without interfering with each other. But the visitor to St. James—if St. James should ever get any visitors—must take care not to ask for the *château*. If he does, he will be sent to the other side of the valley, to a modern house, on a lovely site certainly, and working in some portions of mediæval work, but which has nothing to do with the castle of the Conqueror. The name for that, so far as it keeps a name, is "le *fort*." The open space by the church is the "place du Fort," and the inquirer will soon find that on the south the hill-side is scarped and strengthened by a wall. That is all that is left of the castle of St. James; but it is enough to call up memories of days which, from an English as well as from a local point of view, are worth remembering.

But there is another spot within the land of Avranches which has more to offer in the way both of nature and of art than St. James. Who does not read in the ordinary histories of England, and still more in local books which profess to make extracts from Domesday, about a person called "the Earl of Moreton," whose possessions would seem to have been endless? And people who affect any accuracy with regard to John Lackland before he became King, and who do not drag the Hanoverian fashion of "Prince John" into Angevin times, will often call him too "Earl of Moreton." We have often wondered what they fancy "Moreton" to be. They can hardly think that their "Earl of Moreton" is the same as the "Earl of Morton" who figures in Scottish history so many ages later. But, as the possessions of the first "Earl of Moreton" lay so largely in the West, they may perhaps think, if they think about it at all, that he took his title from Moreton Hampstead in Devonshire. But the "Earl of Moreton" is in truth the Count of Mortain, Mortain in the Avranchin, in the modern department of Manche, which has again a tendency to get confounded with Mortagne in Perche, in the modern department of Orne. The first Count of Mortain who had anything to do with England—and he had a great deal indeed to do with England—was Robert, the Conqueror's half-brother. And his son William, among many pieces of ill luck, had at least the privilege of being one of the few real nephews of the Conqueror among the crowd of persons to whom that relation is inscribed in the mythical pages of genealogists. Lord—Professor Stubbs has taught us that we must not call him Earl—of nearly all Cornwall, with vast estates elsewhere, but especially in Devonshire and Somerset, the Count of Mortain became possessed of the chief place in a quarter of England which might in many ways suggest his earlier possessions in Normandy. No Norman town or castle has seated itself in lovelier quarters than that of Mortain. The town on its height, with its once collegiate church; the wild glen at a little distance, where the castle has utterly given way to a hideous modern building, but where no barbarian has been able to get rid of the rocks and the waterfalls; the height, higher still above the town, whence the eye can range to St. Michael's Mount, all unite to form a picture which is not surpassed by many among the endless picturesque sites of the towns and castles of Gaul. The church of Mortain, in the middle of the town, belongs to a date a hundred years later than Count Robert, but it still keeps much of the stern and grand simplicity of his age. In plan it is almost a perfect basilica, with no break or interruption in its long ranges of columns, and with its single tower, remarkable for the extreme length of its lancets, standing quasi-detached on the south side. The pointed form is used for all the main constructive arches; yet the spirit is thoroughly Romanesque. In Normandy the use of the pointed arch must be set down as a sign of transition; further south one might have set down its use as Saracenic rather than Gothic, so little change has it brought with it in the general Romanesque character of the building. And one point should be especially noticed. Every one knows that the splendid doorways which were such a characteristic feature of the Norman style continued in use after the other features of that style had died out. Now here at Mortain we find on the south side a doorway of this type, while in the west front is a pointed doorway which, along with the rest of the front, is of a more advanced transition than anything else in the building. Some have thought the strictly Romanesque doorway to be a relic of an earlier church; but there seems no reason for such a belief. The western doorway was part of the general design of the west front, and it had to be made according to the last lights in the way of art. The south doorway was not in the same way a part of any whole. It had a distinct being of its own; and if the architect had a lingering love for the type of doorway that was dying out, there was no reason why he should not gratify it in this place. While the church of Mortain itself takes the form of a long basilica, the village or suburb of Neubourg on one of the hills near the waterfalls, has also a small cross church of much the same date, but wholly different in feeling. These and the small remains of the neighbouring White Abbey are all that Mortain has to show us in the way of buildings. It is a goodly stock certainly for a small town which in England would have hardly had anything beyond a single parish church; still we are inclined to grumble when we think what we have lost by the utter sweeping away of the castle from one of the noblest sites on which castle ever was perched. But at Count Robert's other fastness in our own land on the peaked hill of Montacute, we are tempted to rejoice that all trace of the presence of the oppressor has been swept away, and that what once was the hill of Lutgaresbury has come back again more nearly to its state in the days when the pious sacristan found there the wonder-working relic which gave England her war-cry. But in his own Mortain we should not grudge Count Robert any memorial of his history, and we can but curse the barbarism which has swept away the pile round which the whole history of the place gathered. For a castle standing, shattered indeed, but still living and cared for, still looking down with the pride of old times on the lands around it, we must go on to a spot which speaks to us more directly as Englishmen than the dwelling-place of the arch spoiler of the West, to the fortress of the Ætheling at Domfront.

MAGNIFICENT POSSIBILITIES.

THE greatest depth of the sea between Dover and Calais is 200 feet, and the width of the strait is twenty-five miles. Supposing, therefore, that a tunnel could be made and maintained under this strait, the descent and ascent of railway trains in it would be almost imperceptible. Between St. Margaret's Cliff near Dover and Sangatte near Calais, which would be the termini of the proposed tunnel, the distance is less than twenty-three miles, and the lowest point of the tunnel, after sinking to the depth necessary for safety, would, according to the plan of Sir John Hawkshaw and his associates, be less than 400 feet below sea level. It is expected that in the line selected will be found a soil soft enough to be easily excavated, yet hard enough to avoid the danger of the tunnel falling in, and free from fissures by which the sea might enter. The lower stratum of the chalk formation, which the French call *craie grise*, offers the desired quality of soil, and the important question is, whether this *craie grise* is continuous from shore to shore. A Commission have reported to the French Ministry of Public Works on this project of a Submarine Railway, and they say that the soundings taken by Sir John Hawkshaw show that the white chalk exists everywhere at the bottom of the sea between Sangatte and St. Margaret's Cliff, and the subjacent formations crop out to the west of that line with sufficient regularity. The gentle slope of the sea's bottom makes any great disturbance of strata improbable, and the opinion of geologists is against the existence of any important fracture. But nevertheless the Commission think that this vital question of the continuity of the *craie grise* can only be settled by running a tunnel through it. All they can say is, that if this lower chalk does exist in an unbroken stratum, the work of tunnelling under the Channel will be exceptionally easy. As regards cost of construction or probable income, the Commission discreetly avoid expressing any opinion.

Shareholders in any Channel Tunnel Company who had seen this Report could not say they had been deceived. But the uncertainty of success has not prevented the formation of a Company, which has commenced the preliminary work of sinking a shaft and driving a gallery to test the nature of the soil. The Board of Trade, having been consulted by the Foreign Office on the subject, have no doubt of the utility of the work if successfully completed, and they think it ought not to be opposed so long as the British Government is not asked to make any gift, loan, or guarantee towards it. The French Government last year submitted to the National Assembly a *Projet de loi* for granting a concession for a submarine railway, and in the introductory statement the Suez Canal and the Tunnel of Mont Cenis are mentioned as suggesting the inquiry whether it was beyond the power of modern industry "de faire disparaître cette barrière maritime par laquelle l'Angleterre est séparée du Continent." Our Board of Trade, like the French Commission, declined to go into the question of cost; but in the introduction to this *Projet de loi* it is stated that the capital necessary for the execution of the works has been put at 250 millions of francs. But this estimate is evidently conjectural, and at least one-tenth of this sum must be spent in experimental works before any tolerably safe opinion can be formed on the prospect of ultimate success. Both our own and the French Government reserve the right to stop traffic through the tunnel in case of imminent war, and our Government suggest that this interruption should give the Company no claim to compensation. It is rather startling to find the obliteration of our maritime barrier undertaken by the combined skill and capital of France and England; but it is certain that, if this tunnel could be made, it would be made; for the demands of commerce, and the desire to escape the discomforts of a sea-passage, would outweigh all other considerations. It would not, however, be difficult, in case of threatened invasion, to drown the tunnel; and as Dover is, or ought to be, a strong place, we should be able to defend the entrance to the tunnel as long as we could defend anything, and when we could no longer defend it, we could let the sea into it. Military considerations, however, are not likely to decide the question. If nothing appears to qualify present favourable conditions, it is likely that public confidence will grow with the progress of the work, and we may at least say that this is not the most hopeless enterprise for which British capital has been advanced. The *Projet de loi* already mentioned was referred to a Commission appointed by the National Assembly, and the Report of this Commission does not extenuate the difficulties of the undertaking. Nowadays Latin is not much quoted in speeches in the House of Commons, and no Committee would have introduced "Et penitus toto divisos orbe Britannos" into a Report, nor would the Chairman have proposed to predict for financial and industrial power a victory in which there would be no vanquished. But after what flourish their nature will, these Frenchmen come to business, and they distinctly state that observations of the opposite coasts, soundings, and measurements establish favourable probabilities, "mais des probabilités seulement et rien de plus." There is some apparent discrepancy in the measurements given in this Report. It first states that "le Tunnel présente dans sa partie sous-marine une longueur de 28 kilom." Afterwards—"Au centre et sur 26 kilom. le Tunnel présentera une partie légèrement arquée son point culminant vers le milieu du détroit à 100 mètres en contrebas du niveau de la mer et descendant vers les rives par des pentes inégales à 0·038 par mètre." And again—"Des deux extrémités de la partie centrale, on regagnera les rives anglaise et française par deux rampes de onze kilom. de longueur, ayant respectivement 0·0125 et 0·0135 d'inclination par mètre." Thus, as we understand, the length of the Submarine Tunnel would be 26+11 kilom.=37; and this result agrees nearly with the plan proposed by Sir John Hawkshaw and his associate Mr. Brunlees, which shows a length of rather more than 36 kilom. The central portion would be continued on either side in smaller sections for the sake of drainage. The Commission, "malgré les objections fondées que l'on pouvait tirer du caractère essentiellement aléatoire de l'entreprise" did not hesitate to bestow on it "la déclaration d'utilité publique."

In the same page with a report of the operations for sinking the preliminary shaft of the tunnel on the French side, the *Times* publishes a letter advocating another grand engineering project, of which the site would be French, but the interest is said to be universal. The Grand Canal du Midi would be a repetition on a vast scale of work which was done in 1681, when the existing Canal de Languedoc was opened. There is a gap between the most northerly slope of the Pyrenees and the most southerly slope of the Cevennes, and through this gap the river Aude flows to the Gulf of Lyons. The Garonne is navigable for some descriptions of craft from Toulouse to the sea, and the existing canal, beginning near Toulouse, follows for some distance the valley of the Lers, a feeder of the Garonne, and passing through the depression before mentioned, follows the valley of the Aude and the line of the coast to the sea at the port of Cette. But in this course it must cross the watershed between the Garonne and the Aude, and this, with the locks and lifts of an ordinary canal, would not be difficult. But the new and grand project now brought forward proposes to commence a ship canal at Pauillac, which is below Bordeaux on the Garonne, and carry it to La Nouvelle on the Gulf of Lyons, to the south-west of Cette. Ships entering the Gironde can always reach Pauillac, whereas they cannot always ascend to Bordeaux. The port of La Nouvelle is formed by a branch of the river Aude, and perhaps, if it is not a good port, it can be made good, if money be freely spent on it. The proposed canal would be ten yards deep and a hundred yards wide, "free from locks and all other hindrances," and it is destined by its projectors to accommodate the ships which now carry goods from London by the Strait of Gibraltar to the Mediterranean. Unless we knew the levels of the existing Canal de Languedoc, we could not say whether this scheme be practicable; but we will assume that the financial and industrial capacity of the age would be equal to the work, if it were worth doing. It is recommended to French and English capitalists in consideration of an impending, or supposed impending, change in the highways of commerce consequent on the completion of the St. Gothard Tunnel. Some persons profess to expect that trade will thereupon return to something like the route by Belgium, Germany, and Italy, which it followed in the middle ages. But if one line of railway can compete with the sea route, we do not understand why another should not, and there is already the Mont Cenis Tunnel, to which the access from England is through France. Supposing the Channel Tunnel to be open and available for carrying goods, they might be sent from Manchester to Brindisi by either of the Alpine tunnels. But we observe that the Commissioners of the National Assembly recommend the immediate improvement of the harbours of Boulogne and Calais, in the view that, even if the Channel Tunnel be ever finished, there will be more rather than less shipping entering these harbours. We think that Boulogne and Calais should be as far as possible improved before much money is spent on La Nouvelle. There is another project for a canal between Havre and Lyons, with the same object of shortening the water carriage to the Mediterranean; and this work is perhaps rather less remote from the scope of actual experience, whereas we can only reckon the Grand Canal du Midi as a magnificent possibility. The outlet of this canal from Havre must of course be found among the mouths of the Rhône, and we presume that, if a suitable port does not exist, one may be constructed, as Cette was two centuries ago. The attention thus given to canals in France might perhaps be usefully imitated by ourselves. When it has been gravely proposed to make a new mineral railway to bring coals from Newcastle to London, the question may be asked whether our canals and rivers might not be improved to accommodate heavy traffic where speed is not essential. Any project of this nature might, we think, fairly rival the Grand Canal du Midi in the affection of British capitalists.

HERALDRY.

IT has been mentioned in newspapers that the newly appointed Minister of the United States in England belongs to one of the "Knickerbocker families" of New York; but his name indicates Norman lineage. The "long continued and ancient family" of Pierpoint is descended, as the heralds tell us, from Robert de Pierpoint, who came into England with William the Conqueror, and at the time of the General Survey was possessed of the Lordships of Henestede and Wretham, in the county of Suffolk. One of his descendants fought valiantly for King Henry III. at the battle of Lewes, where he was made prisoner. Another married, in the time of Edward I., the daughter and heir of Michael de Manvers, Lord of Holme in the county of Nottingham, and thus the estate of Holme-Pierpoint came into the family. Another

married the sister of William Cavendish, Earl of Devonshire, and had by her a son, who was created Earl of Kingston-upon-Hull by Charles I., and with his near relation, the Marquess of Newcastle, maintained the King's cause in the North-Eastern counties until he was taken prisoner by the Roundheads, and accidentally shot by his own party in an attempted rescue. His son was rewarded for his family's loyalty by the title of Marquess of Dorchester under Charles II., and another descendant was created Duke of Kingston by George I. The name of this family rather seems to have been derived from some place in Normandy, as the name of Croy was from De Croy; and the motto of the Earls and Dukes of Kingston, "Pie repone te," was obviously constructed from their name, just as was the motto "Cavendo tutus" of the allied family of Cavendish. The last Duke of Kingston died without issue in 1773, and three years afterwards his widow was tried and convicted of bigamy, and, claiming "the benefit of the statute," was discharged without that burning in the hand or its substitute which was appointed for first offenders of humbler rank. Just a century ago the fashionable world had indeed something to talk about, and the leading case of the Duchess of Kingston in the House of Lords is still familiar to all lawyers in England and America. Miss Chudleigh had been Maid of Honour to the Princess of Wales, and, according to the evidence, she was privately married to Mr. Hervey; but afterwards the marriage was denied, and a collusive sentence of the ecclesiastical Court was obtained, and she married the Duke of Kingston. It is not wonderful that when a nephew of the last Duke took his name, which is now usually written Pierrepoint, he did not seek to revive the title of Earl or Duke of Kingston.

The late General Lee was undoubtedly descended from the Lees of Ditchley in Oxfordshire, and originally of Cheshire, one of whom was Earl of Lichfield and Colonel of the Grenadier Guards under James II. The motto of this family, "Fide et constantia," would have been appropriate to the career of the eminent soldier who bore their name. The assumption of a motto was, we believe, at pleasure, and accordingly in books of heraldry it is not set down with the same strictness as the arms and crest. Many of these mottoes were the war-cries of some tribe or people, and others were allusive to the bearings, or to the bearer's name, character, or history. The most familiar example of this kind is the "Ready, aye, ready" of the Napiers. The "Through" of Hamilton, the "Forward" of Douglas, and "Thou shalt want ere I want" of Cranston are equally significant. The author of the *Rudiments of Honour*, writing in the year 1723, mentions, as examples of suitable mottoes, "Quo fata vocant" of the Duke of Schomberg, "Sudore et sanguine" of Lord Cutts, and "Che sara sara" of Admiral Russell. Among punning mottoes may be mentioned "Templa quam dilecta" of Temple, "Bonne et belle assez" of Bellasys, "Ne vile velis" of Nevile, "Forte scutum salus ducum" of Fortescue. It could not be said of the author of the *Rudiments of Honour* that the foolish man did not understand his own foolish business, for he seems to have had the whole history and mystery of heraldry at his fingers' ends. He tells us that the martlet or martin is "an agreeable mark of difference for younger sons." For, as this bird seldom lights on the ground, "so they should trust to the wing of virtue and merit, and not to their legs, having no land of their own to set their feet on." The argument in favour of the law or practice called Primogeniture could not be more neatly stated. The swallow, he says, typifies feigned and temporizing friends, who in the spring of honour and summer of abundance gladly converse with those whom in the winter of adversity they will forsake and scarcely acknowledge. The increscent moon, with its horns towards the right side of the escutcheon, signifies the rising of some virtuous man illuminated and honoured by the glorious aspect and beams of his sovereign. The decrescent moon, with its horns towards the left side of the shield, may well befit a man advanced to honour in his old age, when all things decrease with him except wisdom.

The ground of the shield or banner is called the "field," and the figures borne upon it the "ordinaries" or "charges." All figures borne upon the shield are, indeed, "charges," but certain of them are called "ordinaries," and all others are "common charges." The colours are five—namely, *gules*, *azure*, *sable*, *vert*, and *purpure*; to which must be added yellow and white, which, being ordinarily represented by metals, are called *or* and *argent*. There are also two other colours recognized by heralds, but rarely seen in English coats of arms—namely, orange, called *tenne*, and dark blood-red, inclining to purple, called *sanguine* or *murrey*. These colours and metals are expressed in engravings by lines and points or dots. To "blazon" is to describe in proper heraldic terms the bearings of a shield or banner. The nine "ordinaries" are the chief, the pale, the bend, the bend sinister, the fess, the bar, the chevron, the cross, and the saltier. The chief is the upper third of the shield, determined by a horizontal line. The pale is the middle third of the shield when divided perpendicularly. The chevron has two equal limbs forming an obtuse angle, like the rafter of a house. The saltier is the St. Andrew's cross. These ordinaries give their names to the various single lines used in dividing the field where more than one metal or colour is required, such field being described as "parted per pale" when divided perpendicularly, "per fess" when divided horizontally, &c. In blazoning a coat the herald begins with the field, noticing the lines, if any, by which it is divided, then the colours, and next the charges, beginning with the immediate charge—that is, the one which lies nearest the field, as any ordinary, and nearest the centre of the field if a common charge; and, lastly, the more remote or inferior charge. We will now take a simple example of the year 1725 from the "lozenge shield" of Anne, Duchess of Buccleuch, widow of the unfortunate Monmouth and afterwards of Lord Cornwallis. Her arms are blazoned thus:—"Topaz, on a bend sapphire, a star between two crescents of the first." We should have mentioned that the arms of peers are blazoned not by metals and colours, but by precious stones, and *topaz* corresponds to *or* and *sapphire* to *azure*. Thus, in plain language, the shield of Buccleuch is yellow, with a blue band, or stripe, "dexter," that is, from right to left of the *wearer* of the shield, and on the stripe is a star between two crescents, all which are "of the first" colour named—*i.e.* yellow. The supporters are two women in coloured robes, and the motto is "Amo." Another more complex shield of the same date is that of Napier, which is blazoned thus:—

Quarterly, 1st and 4th pearl, a saltire engrailed between four roses rubie, for Napier; 2nd and 3rd topaz, on a bend saphyr, a star between two crescents of the first, within a double tressure, flowered and counter-flowered with flowers de lis of the second, for Scot of Thirlestain.

This means that the shield is divided into quarters, of which the top (wearer's) right quarter is *pearl*, or white, and bears a St. Andrew's cross with jagged edges and four roses in the angles, all *rubie*, or red. The top left quarter is similar to the arms of Buccleuch, with the addition of the double tressure or border "of the second," that is, blue, which was the honourable addition granted by King James V. to John Scot of Thirlestain:—"Quha command to our host at Sautra Edge with threescore and ten launciers on horseback of his friends and followers, and beand willing to gang with us into England, when all our nobles and others refused, he was ready to stake all at our bidding." Wherefore the King granted to the said John Scot "an border of flower de lises about his coat of arms, sike as in our royal banner, and alswae an bundle of launces above his helmet, with thir words, 'Readdy, aye, Readdy,' that he and all his aftercummers may bruick the samen." The fourth and third quarters are respectively like the first and second. The supporters are an eagle "proper"—that is, of his natural colour, and a chevalier in a coat of mail.

The arms of Pierpoint, Duke of Kingston, are blazoned thus:—"Pearl, semi of cinque foils rubie, and a lion rampant diamond, supported by two lions of the last." This means a white shield, bearing red cinque foils "sans nombre," and a black lion standing on his hind legs among them. The supporters are two black lions. The arms of Lee, Earl of Lichfield, are "Pearl a Fess between three crescents Diamond. Supported by two Lions Ermines with each a plain collar of the field charged with three crescents as in the arms." This means a white shield with a horizontal black band occupying the middle third of it, and two black crescents above and one below the band. "Lions ermines" means lions in white coats powdered with black, and by a "collar of the field charged," &c., is meant a white or silver collar with three black crescents. The arms of the Duke of Bedford are "Pearl a lion rampant rubie, on a chief diamond, three escallops of the field." This means that the upper third of the shield is black, and the rest white, and on the black are three white escallops, and below them on the white is a red lion. The supporters are a red lion and a goat of "the last," *i.e.* red, with horns, hoofs, collar, and chain of gold. The crest is a white goat. The "blanche lion" of Mowbray, and afterwards of Howard, is borne on a red field.

The principle that metal upon metal or colour upon colour is false heraldry was always held in England, and although we have rendered "or" by "yellow" and "argent" by "white," it is important to bear in mind the distinction between metals and colours. The professors of heraldry have been treated with much ridicule, and some they have deserved. The refinements of this science, like the subtleties of our common law, are proofs that during several centuries the minds of men lacked healthy exercise. Instead of studying the forms and habits of live beasts, birds, and fishes, the heralds occupied themselves in describing and depicting imaginary animals or monsters. The practical heraldry of early times used simple signs which could be distinguished by an experienced eye in march or battle. The blanche lion really was the "cognizance" of Lord William Howard in the Border wars, and it may be believed that Lord Cranston habitually wore a helmet by which a Scot might know him for a foe. The roll of Caerlaverock, a Norman-French poem of the time of King Edward I., contains a catalogue of knights and nobles engaged in the siege, of which one item is:—"And Maurice de Berkelee, who was present at this expedition, had a banner red as blood, with crosslets and a white chevron, with a label of azure, because his father was living." This coat, as well as the name of Maurice, still remains in the house of Berkeley. "The label is the joy of the parents—namely, the first son," and it may be seen on the shield of the Prince of Wales. When heralds assert the antiquity in this limited sense of their profession, they are secure from ridicule; for they do not usually go back beyond the Trojan war, and Æschylus gives armorial bearings to the leaders of a siege in which the father of Diomed bore part. The saying that the simplest coat of arms is the oldest and most honourable is widely, but not universally, true. One class of bearings properly belongs to the descendants of Crusaders, and among these the cross, in many varieties, the Saracen's head, the escallop-shell, and the byzant are the most familiar. The escallop-shell of Dacre is now borne by the Earl of Carlisle as descendant of the marriage of Belted Will Howard with the heiress of Haworth Castle. The line

Ancient plainness ancient race doth show

might be quoted by the house of Cavendish, which bears "Diamond, three harts' heads cabosh'd pearl, attired Topas"—in other words, three harts' heads, full-faced, white, with golden horns on a black ground. The crest, a serpent "proper," may typify the politic caution expressed in the "canting" motto of this house. The arms of Keppel are simply three white escallops on a red ground. Those of Paulet are three swords on a black ground. Among commoners, the coat of Baines is simple, not to say grim—"Sable a shin-bone in pale surmounted of another in fess argent"; or, in other words, two shin-bones crossed on a black ground. Sir Walter Scott has made us familiar with the three-legged symbol of the sovereignty of Man, which was borne by the Earls of Derby as long as they were Kings in Man. Tremaine, as might be guessed, has three hands and arms similarly disposed. Dalziel bears "sable a naked man with his arms extended proper," and this coat, with the motto "I dare," is said to have been given by a grateful King of Scots, whose friend had been killed and hung up to dry by the Picts, until the ancestor of Dalziel brought off the body. The Royal Arms are now much simpler than they were under Kings who ruled Hanover and pretended to be Kings of France. The yellow lions of England were formerly "impaled" with the red lion and "double tressure counterflory" of Scotland in the first quarter, while the fleurs de lys of France occupied the second quarter, and the harp of Ireland the third, and the lions of Brunswick, the lion in a "semi" of hearts of Lunenburg, and the white horse of Lower Saxony, made a united happy family in the fourth. It must be a great comfort to patriotic Scotchmen that the ruddy lion now ramps in gold in his own peculiar quarter, without being cumbered with the presence of the more pacific beasts of England. The two-headed eagle, "looking towards both east and west," has always symbolized far-reaching empire.

THE ROYAL ACADEMY.

VI.

THE most melancholy side of British art is sculpture. We have seen revivals in architecture, we have witnessed one or more new developments in painting, but in sculpture, after Flaxman and Wyatt, and since the more recent days of Gibson and Foley, the decadence has been continuous. The present collection is one of the worst ever seen either in Trafalgar Square or Burlington House, and in looking round "the Vestibule," "the Central Hall," and "the Sculpture Gallery," we have to encounter not only a deterioration in quality, but an absolute diminution in number. The works now exhibited fall below the average of the last five years. We need scarcely say that this discouraging result was not anticipated when the Royal Academy provided ample and well-lighted halls to honour the presumptive genius of our sculptors.

It has become notorious that the noblest motives seldom animate modern works. Winckelmann, when treating of sculpture among the Greeks, speaks of beauty as the loftiest aim and the central mark in art—"that same Beauty which exhibited herself to the great artists, and allowed herself to be felt, grasped, and figured." This points to something more vital than the vague "general idea" of Reynolds, which in its misconception conduces to the inanities now seen in marble and plaster within the Royal Academy. After this sort is "From Stone to Life: Pygmalion me fecit" (1414), by Mr. Marshall, R.A. Equally indicative of the dying out of vitality and vigour is "Zenobia" (1457), by Mr. Adams-Acton; while "The Spartan Boy" (1443), by Count d'Epinay, shows how noble art may pass into the ridiculous. And yet this puerile figure, which does not possess a single redeeming point, stands in one of the most conspicuous situations in the Central Hall. "The Diver" (1426), by Mr. G. G. Adams, reminds one of the famous "header" in the *Colleen Bawn*. The modelling is as weak as the action is violent; the Greeks in the nude were so close to nature that it could almost be told in an athletic which particular muscles had won the prize. Mr. J. Bell has designed "Peace" (1347) for the great hall of the Foreign Office. The style, a conventional classic, may be said to symbolize peace at any price. The manly sculptors of the middle ages, such as Donatello and others, would have identified peace with something more than passive and powerless submission. In art, as in policy, peace is best protected by a heroism which proclaims preparation for war.

Mr. Boehm cannot be accused of feebleness, though he may be open to the charge of extravagance, in the composite and somewhat incongruous group "St. George and the Dragon" (1433). The horse, rearing so high on his hind legs as to be in danger of falling back on his tail, may have been hired for the occasion from a brewer's team. The dragon is a mean sort of creature, unworthy to be classed with the noble army of dragons which do duty in the pictorial and plastic compositions of Turner and others. Lastly, St. George, well poised in torso and limbs, a figure which might have alighted from a steed in the Elgin frieze, disports himself overmuch as a dandy; if dressed, he might adorn a drawing-room, but, here in the nude, as if ready for the circus, he is not a saint, nor quite a sinner. The group does not hold well together; the study of lines is so chaotic that the composition becomes unintelligible save from a single point of view. At one end we see legs, on the reverse a tail; altogether, we are reminded of a certain image wherein the thighs were of brass, the legs of iron, and the feet of clay. The late Professor Kiss, of Berlin, ruined his reputation by a much better "St. George and the Dragon" than that before us. J. Bonheur, of Paris, favours the Academy with a compact, well-matured composition, executed as by a master hand, "King Pepin le Bref in the Arena" (1418). Mr. Webber is also to be commended for sharp, emphatic modelling in the "Warrior and Wounded Youth" (1407). Mr. Thornycroft is less trenchant in a well-conceived group, "A Warrior bearing a Wounded Youth from Battle" (1440).

Pictorial and picturesque, sentimental and spasmodic styles continue to please the public. Several Italians still frequent the Academy. Signor Fontana supplies a spasmodic personification of Death foiled in his attack upon the living (1384). But perhaps the worst specimen of the modern Italian manner is "The Young Dante" (1394), by Signor Civiletti. This young person has no more to do with Dante than with Romeo or Hamlet. The upper part of the figure is conspicuous by a belt and buttons, while the lower extremities are adorned by a pair of striped breeches. A few flowers decorate the stump on which this piece of desolation reposes. Mr. Junck, whose precise nationality we do not know, cultivates, not wholly without success, a picturesque naturalism in "Thrift" (1434). Here we are led to suppose that a little girl possesses but a single pair of stockings in the whole world; one stocking she is mending, the other she is wearing. The great masters in sculpture, whether ancient, mediæval, or modern, never descended to such trivialities. M. Dalou has reproduced in "marble" "La Berceuse" (1441), a group of a mother, baby, and rocking-chair, which we criticized and commended two years ago, when it was exhibited at this identical spot in plaster under the title "Hush-a-by, Baby." The design gains by being promoted to marble. Marble is to plaster what silk is to cotton.

That religious sculpture should in modern times be so unworthy of religion is almost unaccountable, but the fact cannot be doubted that Canova, Thorwaldsen, and Gibson were more at home with Paganism than with Christianity. In like manner, Mr. Armstead, A.R.A., falls below his habitual standard in a statue of "Religion" (1439), designed to be executed in bronze for a fountain at King's College, Cambridge. We have also seen better works by Miss Grant than "St. Paul" (1404). Not that she has allowed her ideal to be brought down to the level of the tradition that the Apostle of the Gentiles was short or mean in stature. On the contrary, St. Paul as now presented rises at least seven feet high. The objection to be taken is against the art treatment; the figure erects itself rigidly as an inanimate mass, wanting life and destitute of inspiration. To Mr. Lawlor may be accorded the merit of having removed himself from the common reading of the "Mater Dolorosa" (1468), not only in a stern nobility which conquers pain, but in the decisive accentuation of brow, eyes, nostrils, and mouth. The want of such pronounced interpretation of nature has proved the ruin of so-called Christian sculpture in modern days. How much more close at once to nature and to the supernatural are the figures in Gothic cathedrals!

The treatment of reliefs—whether "alto," "mezzo," or "basso"—is usually a test of the state of a school of sculpture. Modern art tends to a mongrel—that is, to a confused mixing up of distinctive styles. Of low relief—taking the Elgin frieze as the standard—one of the purest examples we have seen for many a day is Mr. Caldecott's "metal bas-relief," a "Horse Fair in Brittany" (1499). Here a simple and almost rude incident in nature has been brought within the law and the symmetry of art; so true is it that art exists everywhere, if only the artist be present to bring it forth from its lurking-place. More romantic, and therefore less severe, in the way of low relief, is a medallion, "Sabrina Rising from the Water" (1400), by Mr. Montford. The lines of the composition are mellifluous, as of figures flowing and floating beneath a blue sea. The spectator may suppose himself looking into an aquarium tenanted by fairies instead of fishes. Mr. Woolner, R.A., a master of relief, is particularly prominent this year. The best places at the top of the Central Hall are accorded to him. This artist proves how well he can conform to the strict principles of basso-relievo in his diploma work, "Achilles and Pallas shouting from the Trenches" (1417). To the same sculptor is due the bas-relief, a Crucifixion with attendant figures (1419). The sentiment, unlike that of most religious works in the Exhibition, is not mawkish, but manly. Lord R. Gower's head of Christ crucified—"It is Finished" (1498)—has all the pain of death without its victory; the idea of the great masters would seem to have been a sleep which suggested an awakening, a death with the near approach of a resurrection. Mr. Rodfern's "Crucifixion of St. Andrew" (1349) also ranks below the dignity of sacred art. "The Last Supper" (1359), by Signor Fucigna, is a mere picture translated into high relief. Mr. Tinworth, possibly elated by the unlucky praise of Mr. Ruskin, repeats his spasmodic puppets of last year in two miniature terra-cotta panels, "Judas" (1381), and "The Stable" (1380). The marble medallion which Mrs. L. Cubitt has perpetrated of herself (1402) must be accounted false in art; a bulky head has here been stuck on grossly to a background in still worse taste is Mr. Ewing's alto-relievo bust (1363), surrounded by purple velvet and set in a circular gold frame.

It is impossible here to discuss fully the long-disputed merits or demerits of the Wellington Monument for St. Paul's Cathedral designed by the late Mr. Stevens. After perplexing and painful delays extending over about twenty years, after repeated complaints in Parliament, followed by apologies pleading the over-sensitive genius of the sculptor, who could neither please the

public nor content himself, we have at last some data by which to judge of the long-looked-for performance. The design is strictly monumental, or, as some would say, "architectonic." The leading structural members are an arch sustained by columns with a crowning cornice above. The equestrian statue of the Duke, the climax to the original composition, has been abolished on the plea that a horse ought not to enter a church, though precedents to the contrary are numerous. Two important fragments of the collective monument are now exhibited in bronze. One is a colossal group, "Valour crushing Cowardice" (1427). Cowardice in terror crouches beneath a shield whereon a truly grand figure personifying the valour of the conquering hero rises supreme. The conception, though not servilely imitative, obviously owes much to Michael Angelo; on the whole, it must be admitted that the group goes far to justify the unswerving faith of the sculptor's friends. On the other hand, "The Recumbent Figure of the Duke" (1522), stretched in death upon the tomb, gives a contrary reading. The handling is feeble, fumbling, and vacillating, as of a man who had muddled his subject and at last had lost his way. Hence the interminable delays prolonged into wearisome decades. But for the present we refrain from expressing a decisive opinion on an artist who, while evidently great, at least in conception, failed to make himself understood.

Busts in plaster, terra-cotta, and marble vary in style almost more than portraits on canvas. At any rate, classic adaptations, which had become almost extinct in portrait-painting, are still deservedly prominent in sculpture. To classic modes of treatment, as seen in the busts of the Vatican and the Capitol museums, we owe deliverance from the debasement of modern costume. What can be worse than the effigy of "The late Marquis of Bristol" (1452), by Herr Raemackers; the barber dressed the hair, the man-milliner arranged the collar and necktie, and the tailor cut the coat. To the same order of merit belongs the head of "Sir Henry Cole" (1453), by Mr. Boehm. But perhaps among numberless bad examples the worst is Count Gleichen's bust of "The Duchess of Edinburgh" (1361); this is a composite of decorations, necklace, needlework, and flowers, all carved out mechanically, as by the hand of a stonemason. Nor does Miss Dubray's paraphrase of "The Princess of Wales," (1431) belong to a high order of art. The materials are a conglomerate of marble, gold, and ivory; we need not say that the product is not quite on a level with the chryselephantine sculpture of Phidias. There are fairly good busts by Mr. Durham, A.R.A., Mr. Noble, and Mr. Theed; the general fault, however, is that, in proportion as they shun naturalism, they lose character. Mr. Leifchild's head of "Mr. Bryce" (1480) is firm in touch and incisive in character; Miss H. S. Montalba, in her posthumous record of the late "Mr. Richard Burchett" (1454), is, like her sister the painter, knowing, showy, and clever in seizing on and emphasizing the traits which can be turned to most account for art effect. Terra-cotta is still the rage. In this material, red as brick-dust and assailant in protuberant surface "as quills upon the fretful porcupine," Mr. Boehm's bust of "The Earl of Shaftesbury" (1364) is the best example, while an anonymous "Portrait" (1474), by Mr. Mullins, ranks as the worst. If we could but imagine as a groundwork the head of a ruffian disguised by beard of river-grass, and further clothed with ocean seaweeds, the head before us would find its original. The art is beneath serious criticism. Among literary men who win immortality in marble are "Thomas de Quincey" (1495), by Mr. Steel of Edinburgh; the face is rather flaccid in its over-soft flesh surfaces; but Coleridge under like opium-eating propensities fell into a similar sensitive and nerveless condition. Mr. Woolner, R.A., has long studied "Alfred Tennyson" (1424); indeed he and Mr. Watts, R.A., are the best interpreters through art of a head which reads as the epitome of a life; the poems of many years seem to write their lines across cheek and brow.

The full-length portraits are neither numerous nor remarkable. More energetic than artistic is Mr. Brock's "Model of the Statue of Richard Baxter, to be erected in the Town of Kidderminster" (1411). The style may be said to be "nonconformist," as is the subject; in its vehemence it does not conform to established law and order. But the action arrests attention; one hand rests on the Bible, the other is raised, as sometimes in pictures of St. John the Baptist when exclaiming "Repent ye, for the kingdom of heaven is at hand." A certain breadth and rudeness in the treatment do not militate against the theme. Faint praise will suffice for "Dr. Priestley, erected in Birmingham" (1437). Mr. Williamson represents Priestley in the act of discovering oxygen. It is seldom that scientific operations translate kindly into art forms; after all that has been said to the contrary, art for the most part ends where science begins. Mr. Woolner has endowed with the presence of calm command the "Model for a Bronze Statue of Lord Lawrence, to be erected in front of the Government House, Calcutta" (1442). We remember, after the Indian mutiny, to have heard the Viceroy return thanks in public for a high encomium. He said, "I deserve no praise, I simply did my duty; I could do no less." In this statue we read the man.

THE OAKS.

THE field for the Oaks was twice as large as last year, but we question whether any one of the fourteen competitors was as good as Spinaway, the winner in 1875. The foreigners were in great force on this occasion, Count de Lagrange running Camelia and Allumette (first and second in the One Thousand Guineas), M. Lupin being represented by Enguerrande, second in the French Derby, M. Delamarre by Filoselle, and M. de Mongomery by La Seine. The nine English fillies made but a poor show by the side of their French-bred sisters; and, unfortunately, the best of them, Levant and Twine the Plaiden, went amiss a few days before the race. Of Count de Lagrange's pair, of Twine the Plaiden, Margarita, and La Seine, we spoke at some length when commenting on the One Thousand; and we may now add a few words about the antecedents of the more noteworthy of the remaining competitors. Enguerrande, a daughter of Vermont, the winner of the Grand Prix de Paris in 1864, only ran once in England as a two-year-old, when Kaleidoscope, giving her 8 lbs., beat her by a neck. This year her best performance was in the French Derby a fortnight ago, when Kilt only succeeded in defeating her by a head. As, however, Camembert was barely more than a neck behind her, there was nothing very wonderful about the form. Levant, by Adventurer out of Repulse, was, on her best public form, undoubtedly superior to all the fillies of her year, and was a good match for the best of the colts. She ran thirteen times as a two-year-old, and was unsuccessful on ten occasions. At Sandown Park she was beaten by Kaleidoscope and Red Cross Knight; in a match at Newmarket First Spring Meeting she succumbed to Town Crier; at Chester she was beaten by Bella and Merry Duchess; at Stockbridge by Julia Peachum, King Death, Julius Cæsar, and Coltness; at Nottingham a second time by Julia Peachum; at Brighton by Camelia, Gilestone, and Majesty; and in a second essay at the same meeting by Lucy Hawk and M. de Fligny; at Doncaster by Ithona, King Death, Charon, and Margarita; at Newmarket Second October Meeting by Hardrada and John Day, and, two days later, by Chaplet. Against these manifold defeats must be set Levant's one great victory in the July Stakes at Newmarket, when she defeated one of the finest fields of the season, including Parnese, Camelia, Kisber, Gilestone, Coltness, and Cerberus. It is true that her victory on that occasion was partly, if not mainly, due to the magnificent riding of Fordham, who held her head as if in a vice, and literally drove her in first past the winning-post; and it is also true that in all probability she never forgot the severe discipline to which she was then subjected, for certainly in her subsequent races she ran worse and worse, till at length she seemed to be incapable of winning in any company at all. Still a horse must be judged by his best, not by his worst, performance, and a winter's rest not unfrequently brings him back to his original form. Levant had wintered well and had grown into one of the finest fillies in training, and her behaviour at home in her gallops had caused the most sanguine expectations to be formed that she would show in the Oaks the same brilliant form she displayed last July at Newmarket. It was most unfortunate therefore that she should have gone wrong at the very last moment, after undergoing a capital preparation, for there was not another English representative with any pretensions to challenge the victorious French fillies; and through Majesty, who ran third in the One Thousand Guineas, Lord Rosebery had a fair idea of what chance Levant possessed against Camelia. Merry Duchess, a daughter of The Duke and Mirella, ran six times last season; but only accomplished one victory, carrying off the Newmarket Two-Year-Old Plate from a moderate field. At Chester she was twice beaten by Bella—then at the zenith of her brief and brilliant career—but managed to get in front of Levant. At Epsom she was beaten by Brigg Boy, Allumette finishing behind her; at Doncaster she was nowhere in the Bradgate Park Stakes; and in the New Nursery Stakes at the Newmarket Houghton Meeting she showed in equally bad form. The most careful examination of the *Racing Calendar* will fail to bring to light any performance of Liris, a daughter of King Victor and Scylla, which would justify the support accorded to her, from some unaccountable reason, on the Oaks day; and Catinka and Vittoria may be dismissed with a similar remark.

In the paddock almost the only competitors that attracted observation were Enguerrande, who was much admired; Levant, who was so obviously amiss that her chance was [illegible] hopeless; Filoselle, a French filly who has run prominently on the Continent this season; and La Seine, who looked by no means as well as on the One Thousand day. The favourite, Camelia, did not enter the paddock at all, and as the field on the whole did not deserve a very lengthened inspection, every one was gratified when the ceremony of the parade past the Stand and the preliminary canter were over, and the starter had them fairly under his charge. The flag fell to a much more even start than that for the Derby, and Allumette at once went to the front to make the running for her stable companion—a mission which she was only able to fulfil for about a quarter of a mile. Half way down the hill Camelia took the lead, and on entering the straight Enguerrande and Filoselle were her nearest attendants, all danger from the English division being over at this point. At the distance Enguerrande shook off Filoselle, and running with the greatest gameness reduced the lead of Camelia inch by inch, and just managed to catch the One Thousand winner in the last stride and make a dead-heat with her, Merry Duchess, four lengths off, beating Filoselle on sufferance for third place. The finish between Camelia and Enguerrande was very exciting, and the latter must be one of the gamest of the game to get where she did, for at the distance Camelia was a good length in front, and a length is a great deal to make up in the last two hundred yards of the Oaks course. Thus both the great races of the Epsom week fell to the foreigners; and English colts and fillies will have to play second fiddle in the three-year-old races this year, unless later in the season Levant should succeed in turning the tables

Cornelia. As long as Kisber keeps well there is little chance of his colours being lowered.

The general racing of the week was on the whole more interesting than usual, and attracted a larger share of attention. In the Craven Stakes Thunder almost met his match in Wisdom (the colt by Blinkhoolie out of Aline), who would have won if he had had the heart of a mouse. The fact was, however, that Mr. Vyner's grand old horse faltered towards the finish, if, indeed, he did not actually break down. Certainly he pulled up very lame, and we doubt whether we shall see him in public again. The match between Controversy and Chaplet was all one way, Chaplet never being able to get near Lord Rosebery's horse; and in consequence the hopes of the supporters of All Heart rose higher and higher, only to be utterly crushed on the morrow. The Egmont Plate produced an astonishing fine finish between Killiecrankie, Inglewood Ranger, and Bonny Blue Flag, the first-named coming in first by a head, while the other two ran a dead heat for second place, and Trappist, one of the best weight-carriers of the day, finished not more than a head behind the dead-heaters. Most curiously the heat of the weather caused the rider of Killiecrankie to lose just an ounce or two during the race—enough unfortunately to turn the scale against him in weighing in, and to cause the disqualification of his horse. The Woodcote Stakes brought out a field of ten, and introduced us to Chevron, a bay son of Rosicrucian and Cognisaunce (own sister to Achievement), who carried off this important race in a style worthy of his illustrious lineage. This victory came very opportunely a few days before the sale of the young Rosicrucians at Middle Park, and no doubt stimulated the anxiety of purchasers to bid for them. In the Paddock Stakes, on the third day of the meeting, Trappist made very short work of Tangible, who has probably seen his best day; and in the High Level Handicap the American aged horse Preakness improved on the form he has hitherto shown. They say that he still wants a great deal more work; but most horses at his age would be thinking of rest rather than of work. In the Epsom Cup another old horse from America, Mate, finished a bad third to Dalham and Wisdom; but the rest of the field, including Trappist and Controversy, were pulling up at the time, so that his position was only obtained on sufferance. We are told that Preakness will show to much greater advantage later in the season, over a long course—in the Goodwood Cup perhaps—but at present the experiment of running nine-year-old horses against English three and four-year-olds seems likely to be attended with scant success. Dalham's victory in the Epsom Cup was only secured by a head from Wisdom, who must be accounted an unlucky horse, having run well for a mile and a quarter in the Derby, as well as having fairly taken the measure of Thunder in the first race of the meeting, yet being unable to gain the coveted distinction of first place. He has good racing qualities, but has not the best of tempers or the stoutest of hearts, and thus the honours of victory were snatched from him at the last moment, when they seemed well within his grasp.

The Derby week was appropriately wound up with the annual sale of the Middle Park yearlings. Out of forty-nine lots, forty were disposed of at a very satisfactory average, and the young stock of Rosicrucian and of Victorious deservedly commanded high prices. Three of the Rosicrucians got into four figures, his sons from Lady of the Forest and Finesse fetching 1,300 guineas apiece, and his son from Little Heroine being knocked down for a round thousand. The stock of Rosicrucian show all the elegance and quality of their sire—one of the handsomest horses that ever trod the turf—and have proved themselves possessed of fine racing qualities. The stock of Victorious are also very good-looking, and sold well; while a high-bred daughter of Parmesan and Anderida fetched a high price. Altogether, the sale was a great success, and the second epoch of the existence of Middle Park as a breeding establishment bids fair to be as prosperous as the first.

We may remark that some little excitement was caused last week by a formal objection being raised against Kisber, the winner of the Derby, on the ground that the 16th Rule of Racing, which enacts that the certificate of the age, pedigree, and colour of any horse foaled out of the United Kingdom shall also include a description of the [illegible] which such horse is distinguished, had not been observed. The Stewards overruled the objection, and stigmatized it also as "frivolous," thereby, we imagine, intimating their opinion that the rule was never intended to be construed literally. It is a pity, then, that a vague and indefinite rule is allowed to remain in force; and it may be hoped that in the revised edition of the laws of racing this palpable defect, among many others, will be remedied. What are distinguishing marks, and how many of them are to be enumerated in the certificate of a foreign-bred horse, and how many are to be passed over as unworthy of notice? These questions deserve to be answered with some approach to accuracy, for it cannot be agreeable to a thoroughly practical racing-man, like the owner of the second in Kisber's Derby, after taking a course which the plain *bonâ fide* interpretation of the rules of racing would seem to justify, to be described as a frivolous objector. If rules are lax, those who sanctioned them, and who permit them to remain in force, are deserving of blame, not those who read them as they are written, and take the proper measures to have them applied.

REVIEWS.

MEMOIR OF LORD ALTHORP.*

SIR DENIS LE MARCHANT had many qualifications for the task of writing the Life of Lord Althorp, which he undertook at the request of his brother and successor, the fourth Lord Spencer. A life of official employment passed in intimate connexion with the principal members of the Whig party must have given Sir Denis Le Marchant an intimate knowledge of the political history of the time; and he was well acquainted with the subject of the present biography. Alone among the Whig leaders Lord Althorp was never alienated from Lord Brougham, who first brought Sir Denis Le Marchant into office. The Memoir, having been left unfinished, has been completed and arranged by Sir Henry Le Marchant, who acknowledges the value of suggestions which he has received from Lord Belper and from the late Lord Lyttelton. The work forms a valuable addition to the constantly accumulating mass of materials for the history of Lord Grey's Administration and of the Reform Bill; and it has the far higher merit of genuine biographical interest. Lord Althorp during his short public career exercised extraordinary influence, having done more than any of his colleagues to keep the Reform agitation within the bounds of law and of Parliamentary control. The first Reform Bill would have been with difficulty carried through the House of Commons if Lord Althorp had not, after a few weeks, taken the conduct of the measure out of the hands of Lord John Russell. During the two years' struggle he never lost his temper; and, while he commanded the unbounded confidence of his own followers, he provoked the smallest possible amount of hostility in the defeated party. His authority depended wholly on the combination of high moral qualities with plain common sense. Lord Althorp had not a spark of genius; he was a very bad speaker, and his range of knowledge and accomplishments was narrow; but he was clear-headed, straightforward, and intellectually as well as morally honest. His rank and fortune, and his thorough sympathy with the tastes and pursuits of English gentlemen, redeemed, in the estimation of Tory squires, the decided and sometimes extreme Liberalism of his opinions. His well-known aversion to office inclined the House of Commons to attach additional value to the continuance of his services. During one of the many Ministerial complications of the time Lord John Russell said, in answer to a charge of indirect contrivance, "I might believe that Althorp would intrigue to lose his place, but never that he would intrigue to keep it." Sagacious observers like Mr. Charles Greville were at first puzzled and almost scandalized by the success of a Ministerial leader who never took the trouble to disguise his blunders; but it was gradually found that he was generally in the right, even when he did little justice to his reasons. Sir Robert Peel complained that, when he had himself exposed in convincing language the defects of a statement by the Chancellor of the Exchequer, "Althorp gets up, and takes off his hat, and shakes his head, and, before he has said a word, the House is satisfied that there was nothing in the argument against him." Mr. Greville acutely remarks that the tolerance of which Lord Althorp was assured beforehand had the disadvantage of making him careless. The mistakes which another Minister must have elaborately explained away were condoned as soon as Lord Althorp set himself right with a good-humoured smile. It is true that he was entirely exempt from the imputation of levity. His temperament, though cheerful, was neither humorous nor gay, and his habits were laborious. All his contemporaries liked a character which all men could understand.

A political career which has secured to Lord Althorp a place in history extended only over four years. It is true that he had previously been six-and-twenty years in the House of Commons, and that at the beginning of that period he had been for thirteen months a Lord of the Treasury; but in those easy-going times he seldom took the trouble to come to London; and when he was compelled to make up a Board at the Treasury, he had relays of horses posted on the road, and rode down in the night that he might hunt with the Pytchley in the morning. After the downfall of the Coalition Ministry, Lord Althorp attached himself to the section of the Liberal party which, under the lead of Mr. Whitbread, held opinions in advance of the orthodox Whigs. It may be incidentally remarked that Sir Denis Le Marchant's characters of Mr. Whitbread and of some of his contemporaries add much to the value of the work. As he observes, with unquestionable truth, the Radical members of 1809 must not be confounded with those of our own time. "They belonged to the same class, were governed by the same social influences, and, with their common political principles, it was plain that, if true to themselves, they could have no separate interests." Some of the younger Radicals of the present day also belong to the same class with their more moderate allies and their political opponents; but they form a mere fraction of a numerous party which has nothing to do with the social influences which affect themselves. As the Opposition became more and more powerless in consequence of the successes of Wellington in Spain, Lord Althorp almost ceased to attend the House, devoting himself by preference to his duties as Master of the Pytchley Hunt, a function which had become almost hereditary in his family. He was a bold rider,

* *Memoir of John Charles, Viscount Althorp, Third Earl Spencer.* By the late Sir Denis Le Marchant, Bart. London: Bentley & Son. 1876.

though he had not a safe seat; and he kept the hounds with profuse liberality. The methodical taste which afterwards found vent in the study of financial statistics led him to keep a minute and accurate journal of every run; and "he kept an account of every shot he fired in the course of the year, whether he missed or killed, and made up the book periodically." Among other pursuits which were then popular, he took great interest in the prize-ring, and he was himself a respectable proficient with the boxing-gloves. After his accession to the peerage and retirement from office, he was sometimes disturbed by a whimsical scruple or doubt whether he was not neglecting a duty in not regularly attending prize-fights. It was at a late period that he concentrated his interests on the breeding of stock. In sheep he acknowledged that the late Duke of Richmond excelled him; but in shorthorns he had no superior. Although, after his succession to the family estates, he found it necessary to practise strict economy, he was content to lose 3,000*l.* a year on his model stock farm.

In 1814 Lord Althorp married at the age of thirty-two; and the death of his wife in her first confinement, after a happy life of only four years, saddened and matured his character. One effect of the loss was to produce or cultivate strong religious feelings; and he became more closely interested in politics as he cared less for his former amusements. "My two lines of reading," he said, soon after the death of Lady Althorp, "are divinity and political economy; the first to do myself good; the other to enable me to do good to others." In a fragment of autobiography, begun after his retirement from political life, he avows with remarkable simplicity the questionable proposition that "the only object I ought to have in view is to secure my eternal happiness." A more sophisticated intellect would have striven to disguise from itself the purely self-regarding motive which might be thought to defeat or neutralize itself. On Lord Althorp's own showing his study of political economy was more meritorious than his theological lucubrations; but good men are rarer than sound ethical reasoners, and Lord Althorp was a good man. After 1818 he became more regular in his attendance in the House of Commons, and he took an active part as a member of some important Committees. On the death of Lord Liverpool he at first strongly opposed the coalition of the Whigs with Canning, to whom he felt a strong aversion; but, apparently under the influence of Brougham, he was at last reconciled to the new Government. After the death of Canning, the selection of Lord Althorp by Huskisson, as Chairman of the Finance Committee, was the immediate cause of the fall of Lord Goderich's feeble Administration. For some time he offered no active opposition to the Duke of Wellington's Government; but he supported more than one motion in favour of retrenchment, and he had gradually and unconsciously become the most trusted member of his party. It was not before the middle of the Session of 1830 that he was chosen leader of the Whigs. He himself urged the claims of Brougham to the vacant post; but the Whigs insisted on their choice, and with the assent of Brougham himself Lord Althorp accepted the nomination. The unhesitating choice of the party between the two competitors was highly instructive. In knowledge, in eloquence, in the power of swaying the House of Commons, and in popularity out of doors, Brougham was incomparably superior. Lord Althorp had the advantage of being one of the Whig aristocracy; and he was universally trusted, while his brilliant rival was capricious, unsteady, and prone to intrigue. It is to the credit of both that they maintained their friendship and even their political alliance to the last. Sir Denis Le Marchant mentions for the first time a project of inducing Lord Spencer to form a Cabinet when Sir R. Peel's Government was supposed, in 1844, to be insecure. It seems that Lord Spencer was not indisposed to encourage the overture; but he foretold his failure, because he thought himself bound in honour to propose Lord Brougham as Chancellor. It may be inferred that he disapproved of Lord Melbourne's exclusion of Brougham from the Government of 1835. It is strange that the most conscientious of statesmen should have deliberately preferred personal claims to the public interest.

On the fall of the Duke of Wellington's Government Lord Althorp unwillingly became Chancellor of the Exchequer and Ministerial leader. Notwithstanding the claims of his party on his services, he would probably have declined office if Lord Grey had not positively refused to form a Ministry without him. The profound repugnance to official life which he felt by anticipation never abated or varied. He consistently declared that he had sacrificed the happiness of his life to public duty; and on the first opportunity he finally abandoned political life. Lord Grey had reason for the importance which he attached to Lord Althorp's aid. Among his own followers it would at the time have been impossible to find another leader who would have been acceptable to the House of Commons. Brougham, even if the party would have endured his appointment, could not have afforded to sacrifice his profession for a strictly political career. Lord John Russell and Mr. Stanley had not yet attained sufficient Parliamentary rank to entitle them to seats in the Cabinet. Sir James Graham was a comparatively new and doubtful recruit; and Lord Grey could not be expected, even if he had fully appreciated the ability of Lord Palmerston, to select as his confidential lieutenant a recent seceder from the Tory ranks. Sir Denis Le Marchant makes, without mentioning his authority, the novel and remarkable statement that Lord Palmerston proposed himself to Lord Grey as leader of the House of Commons. He could not refuse to acquiesce in the preference which had been given to Lord Althorp; and, fortunately for himself, though he had already been nearly twenty years in office, he could afford to wait. On Lord Althorp's retirement Lord Palmerston was not even thought of as his successor; and it was not until six-and-twenty years had elapsed from the formation of Lord Grey's Government that he assumed his proper place as Prime Minister and leader of the House of Commons. The Reform Bill could scarcely have been carried by a Minister who accepted it as an unwelcome, though necessary, measure. Lord Althorp thoroughly approved the principle of the Bill, and he would not unwillingly have rendered it still more democratic. The vicissitudes of the contest are fully recorded by Sir Denis Le Marchant, who was at the time principal Secretary to the Lord Chancellor; but there was little to add to many previous narratives, and especially to Mr. Greville's minute and accurate account of Lord Grey's negotiations with the waverers who followed Lord Harrowby and Lord Wharncliffe. As the biographer of Lord Althorp, Sir Denis Le Marchant properly records the wretched squabble which ended in the resignation of Lord Grey, and in Lord Althorp's retention of his office under Lord Melbourne. Brougham's restless love of intrigue, the awkward indiscretion of Mr. Littleton, the Irish Secretary, the vulgar and faithless cunning of O'Connell, and the excessive sensitiveness of Lord Grey, are perhaps more fully illustrated by the present biographer than by any previous writer. Lord Althorp himself for once appears to disadvantage as an honest bungler. Those who take the trouble to study the details will have no difficulty in understanding a disagreeable story. Lord Grey, on the demand of Lord Wellesley, then Lord-Lieutenant of Ireland, included in a Coercion Bill certain provisions against public meetings which were denounced as tyrannical by O'Connell. Lord Brougham privately entreated Lord Wellesley to facilitate the passage of the Bill by withdrawing his statement that the obnoxious clauses were necessary. Lord Wellesley, preferring the supposed convenience of the Government to the interests of peace and order, assented to the request, and Mr. Littleton communicated the secret to O'Connell under a pledge of confidence, which was of course immediately violated by the unscrupulous demagogue. In the meantime Lord Althorp and Mr. Littleton found that the Prime Minister was less willing than themselves to understand or accept the inconsistent statements of the Lord-Lieutenant. Lord Grey's family, if not himself, suspected that the whole intrigue had been devised by Brougham in the hope of supplanting his chief; but the more charitable construction of his conduct is probably just. A violent and passionate remonstrance addressed to Lord Althorp on the supposed dissolution of the Government shows that Brougham was taken by surprise at the result of his own indirect proceedings. Lord Althorp had acted indiscreetly, and he was compromised by Mr. Littleton's less excusable blunders; but it never occurred to any party in the transaction to doubt his uprightness of intention. It was at Lord Grey's urgent desire that he finally consented to retain the office of which he was finally relieved at his father's death three months afterwards.

A mere notice of well-known political transactions does injustice to Sir Denis Le Marchant's work. His biography sustains its interest and proves its accuracy by the entire consistency of Lord Althorp's character from the beginning to the end of his life. In his case the boy was father of the man. A letter to his father written at seven years old shows the same tastes which he retained in his maturer years, and illustrates his faculty of coming to the point in his statements:—

"Dear Papa,

"I went to Brington Hill this morning, and catched four rabbits, and there was a good many people; and I did not know who they were all. We threw off at ten o'clock—Tartar and Bowler and Punch and Turpin did very well, but Jenny's puppy did not do well, for she cried at the bushes—Fanny did very well too. I rode upon Castlebar and Ned Corns was behind. John Townshend and James walked by me, and I went a gallop, and had good sport. When you come back there is to be a race in which you are to run, and so shall John Townshend, and Jack Corns and Peter. I am to ride on Ginger, and you shall ride on Cowslip; I got three horses at the races at Northampton, and yours is a very good one. You have been a long time away, so no more.

"Jack Spencer, Viscount Althorp."

His sister, Lady Lyttelton, in a letter to her daughter, gives a touching account of his last moments. "He said that he deeply felt that his had been a happy life, and that he was now most happy; but that this did not diminish the joy with which he obeyed the awful summons, and accepted the call to heavenly peace." Probably the chief drawback to the happiness of his life, except the loss of his wife, had been the political success which made him eminent and useful.

BROOM'S PHILOSOPHY OF LAW.*

THERE is hardly anything more remarkable in the literature of English law than the want of good elementary books, unless it be the singular failure of almost all modern attempts to provide for it. The present work, notwithstanding its ambitious and ill-chosen title, whose relation to anything in the contents we have been unable to discover, appears to be in substance an attempt in this direction. Dr. Broom tells us that it "is meant for perusal not only by law students, but by the public," and "exhibits the

* *The Philosophy of Law; being Notes of Lectures delivered during Twenty-three Years* (1852–1875), *in the Inner Temple Hall.* Adapted for Students and the Public. By Herbert Broom, LL.D. London: Maxwell & Son. 1876.

elements of our existing law." A book that should really do this in a moderate compass, with any tolerable method, with competent accuracy, and with sufficient literary skill to make it interesting to readers willing to be interested, would undoubtedly be of the greatest value. But it is unhappily quite impossible to say that the book now before us answers any such description. In the first place, the elements which it purports to exhibit turn out to be the elements not of the law of England as a whole, but only of certain limited though important branches of it. Contract, Wrong, and Crime are the only general heads dealt with in these chapters, and it is hardly needful to state that these are very far from making up the whole body of the law. Why these particular heads have been chosen we are left to guess as best we may; the text gives no explanation. From the titlepage we gather that the book is in fact an outgrowth of several courses of lectures extending over a space of many years, and one can only presume that one or more distinct and independent courses were devoted to each of these distinct topics. Each of them is in itself a natural and proper topic for a course of lectures; nor is there any harm in afterwards bringing them all together in one volume. But authors and publishers are no less bound than dealers in more gross and material commodities to describe with reasonable correctness the wares they bring to market; and it appears to us, especially when we consider that the book is partly meant for laymen, who cannot be presumed to know by mere inspection how much of "the elements of our existing law" will not be found in it, that in this case there has been a certain laxity in the observance of that elementary duty.

Putting the question of nomenclature aside, however, let us consider these chapters on the merits of their actual contents. Every one of the subjects here dealt with is a large and abundant one, and demands a careful exercise of choice and method in order to make it clear, even in its most general features, to a reader coming to it for the first time. We may fairly assume that such a reader is here contemplated, but in our judgment he is not likely to be much enlightened; or, if he is, it will be by his own efforts in digesting and re-arranging in his mind the materials thus put before him. The method followed by Dr. Broom, if method it can be called, consists in starting a chapter with the statement of a few generalities of the barest kind, and then running off without further explanation into a long string of instances which might almost have been taken at random just as they were noted up in a commonplace book. The special subdivisions of the main topic are brought in anywhere and anyhow by way of digression, and as often as not are only to be found piecemeal in two or three different places. We begin with a chapter of Prelatory Observations on "The Province of Law." One is rather surprised at the outset by learning that the Common Law of England has been derived "from enactments of the Legislature" among other sources; but let that pass. Then we have paragraphs about the construction of statutes and the theory of judicial precedents, which have much to do with the determination and administration of the law, but to our poor apprehension very little with the definition of its province —which indeed is not a legal question at all. Then comes a somewhat confused statement of the distinction between civil and criminal law; then two or three instances of civil wrongs; then a sudden digression about fraud in its civil and criminal aspects—and so on for twenty pages. This, for example, is a singular paragraph to find in a general introductory discourse on "The Province of Law":—

> Subject to the condition that no riot be committed, a nuisance may sometimes be abated, *i.e.* removed and put a stop to, by the person whom it injuriously affects. The treasurer of a County Court has been held justified in breaking open the offices of the registrar of the Court, during the absence of that official, in order to get at the books kept by him, with a view to their being audited. Here no breach of the peace could have ensued from the act of violence in question. So if A. take goods out of the actual possession of B. against his will, B. may justify using force for retaking the goods, and so may set up a good ground of defence in an action of assault; and if goods are obtained under colour of a contract of sale, but really by trick and fraud, the semblance of a contract disappears—the property in the goods does not pass, and they may be recaptured.

As to the relevance of this in the place where it comes, we leave the reader to judge. As to the matter, we very much doubt whether the last proposition be true, and at all events it is not borne out by the cases cited in the notes, which are far from going to such an extent. Dr. Broom has certainly taken care to give plenty of references to recent authorities; but, although it is now understood that, other things being equal, recent authorities are the better, it is likewise understood that one should first be assured of their being in point. As to the manner and general utility, we confess that, when we have occasion for this kind of reading, we very much prefer Fisher's Digest.

After this we are abruptly taken to Contract; it does not appear why, but we have already waived that question. We very soon come to the familiar story of the old Common Law rule against the assignment of a *chose in action* having been devised by the wisdom of our ancestors to repress litigation. Now one must not be too hard on Dr. Broom about this, as he does no more than almost all the modern books have done in repeating without question an assertion first made by Coke. Still it is the kind of thing which a writer professing a philosophical interest in his subject might not unreasonably have paused to look into. When one does look into it, the result which comes out is that Coke's dictum is a mere rhetorical flourish (and, moreover, limited in its application by the context in which it occurs), and that, so far as one can make out by the help of the Year Books and of general analogies, the doctrine was in truth no politic invention, but, in this connexion at any rate, simply belonged to the ancient conception of contract as a strictly personal relation between the original parties. A little further on the terms *voidable* and *void* are introduced without explanation, so that a student might think them synonymous; whereas there is an important difference between them, which is, indeed, often lost sight of in the books, but for that very reason should be the more diligently and distinctly pointed out in elementary teaching. In like manner we presently read of a contract "implied by law *and* inferred by a jury," which is just what it cannot be; here, again, a distinction that ought to be made clear from the first is not merely omitted but obscured. Dr. Broom is of course not answerable for the unfortunate double meaning with which the term "implied contract" is used, standing sometimes for a real though not express agreement "inferred by a jury," sometimes for an obligation independent of agreement, the arising of which on a particular state of facts is a question of law; but one main use of such exposition as is here undertaken is to give timely warning and explanation to the learner on difficulties of this kind. The language here used is only fitted to perplex him. To make his confusion even worse, we find mixed up in this context one or two instances of legal presumptions touching the intention of the parties to certain kinds of contracts as to events on which the contract itself is silent, which is yet a third and different matter.

There is a chapter entitled "Mercantile Contracts" containing many things that have nothing to do with mercantile as distinguished from other contracts, and not one word on the really peculiar and characteristic features of the Law Merchant. There is something about agency, something about fraud, and something about illegality, but nothing whatever about negotiable instruments, nor about the rules governing public employments of a commercial kind, such as a carrier's, which from a still older time have been embodied in the Common Law as being "the custom of the realm." Moreover, it is said that "in regard to a mercantile contract the nicest good faith must be observed," which is an excellent moral precept as regards all contracts, but is not correct as a proposition of law. For instance, something far short of "the nicest good faith" is admitted in the contract of sale of goods, as appears by a remarkable case decided within the last few years. A special duty to communicate all material facts within the party's knowledge does exist in one or two special classes of contracts, but is distinctly treated as exceptional.

The following chapter, on "Written Instruments," is mixed up, like the last, with miscellaneous information. We are told here that a bond is the simplest of deeds. It has always appeared to us to be the most artificial and perplexed. The first specimen of it that a law student sees is usually the bond which he executes on his admission to one of the Inns of Court; and, as far as our experience goes, the effect of it to a novice is highly puzzling. The instrument may be described as a promise, stated in a curiously involved manner, to pay a sum of money if a specified event does not happen. The happening of this event, which may be the payment of money, the observance of the rules of a Society, or any other lawful act, is the only real object of the parties, and is in fact the thing contracted for. I want to promise A that I will ride to York; first, I profess myself bound to pay, say, 100*l.* to A, and then it is explained that, if I ride to York, I am to pay nothing. Such is the form of the simplest of deeds, which Dr. Broom's cursory statement almost assumes to be known by the light of nature. The absurdity of the whole thing is completed by the modern statutes which in many cases expressly forbid the Courts to enforce the instrument according to its terms.

Under the head of "Legal Principles applied to Contracts" the expounder proceeds to give a number of instances whose order and connexion we have failed to trace. There is a digression on the duties of Railway Companies to passengers, without so much as a hint at the existence of the Railway and Canal Traffic Act. The chapter on Torts is very simply constructed. A tort, we are told, is the infringement of a right; then follows an enumeration of various rights which may be infringed. It is perhaps a real question, however, whether a distinct genus of torts ought to stand at all in the arrangement of English law. The position of *delicts* in Roman law may be accounted for by the fact that most of the injuries to property or possession which with us come under the head of trespass were remedied in the Roman system, not by actions *ex delicto*, but by real or possessory actions. Delicts, therefore, correspond to a real division in procedure at all events. But the Common Law has not, if it ever had, any Real Actions in the Roman sense; even our old "real actions," all but the writ of right, were merely possessory; and the modern possessory actions are historically special variations of proceedings *ex delicto*. So that Tort, instead of being a genus co-ordinate with divers others, has really come to swallow up almost every part of our private civil law which does not come under the head of Contract. Practically the chief use of it is to lump together in a rough provisional way various topics which have really little in common except that for various reasons they have not been made the subject of monographs.

A good proportion of space is given, and so far rightly, to the somewhat difficult topic of Negligence. But Dr. Broom's language is sadly wanting in precision. First he says breach of duty may include negligence; then he speaks of "the distinction between breach of duty and negligence"; then he repeats that negligence is "one phase of breach of duty"; then he varies it again by saying that "the phrase 'breach of duty' may be identical with the term 'negligence.'" All this time he never explains the main

thing to be explained—namely, that negligence in a legal sense is a purely negative expression, meaning the omission of that amount of care which the law sees fit to require in the particular case, either as a positive duty or as the condition of asserting a right; and that the real question always is, What is the measure of the care which the law did in this case require? Further on, in the chapters dealing with the criminal law, the marvellously absurd Common Law definition of larceny, whereby a carrier was a thief if he opened a bale of the goods entrusted to him and took some of them, but not if he took the whole bale, is given, together with this consequence of it, as if it were the most natural thing in the world. After an interval of thirty pages we find the like treatment of "the curious results"—curious indeed in their unreasonableness—and "nice distinctions"—nice in Chaucer's as well as in the modern sense—which spring from the doctrine that there can be no larceny of things annexed to the freehold. These absurdities were no doubt sufficiently exposed about two centuries ago in a certain "Dialogue of the Common Laws of England," written by the founder of the English school of the philosophy of law; but Dr. Broom can hardly presume this to be so well known to his lay readers that further explanation is superfluous.

The motto on Dr. Broom's title-page—a motto more than once used by law reporters, and for their works a very fitting one—is *His utere mecum*. The pronoun refers, we presume, to the authorities made use of in the composition of these lectures. Lawyers and students will doubtless continue to use those authorities; but we conceive that they will be little assisted in so doing by such slight and inadequate guidance as is here offered to them.

THE ATONEMENT OF LEAM DUNDAS.*

THE novel has so often passed through experimental phases only to return, time after time, to the ordinary mechanical level of gossiping narrative, that it is perhaps idle to speculate on its future form; but just now it seems to be chiefly used for the illustration and discussion of social problems presented in a fanciful aspect. George Eliot puts the case of an ambitious girl whose first principle of conduct is not to be like other girls. Mr. Black also exhibits a dashing young lady in desperate conflict with the conventionalities of society, but subdued by love. Mr. Hardy takes another kind of problem; given an aspiring and clever woman, the daughter of a butler still in service, with brothers and sisters dependent on her for support, who finds her way as a guest to the table where her father waits, and is troubled with offers of marriage which add to the difficulties of her peculiar position, how would she be likely to act? and he treats it in his witty and poetical way. And in the work now before us, which has been appearing in instalments in the same magazine as Mr. Hardy's, Mrs. Linton also sets herself to the working out of an ideal position as illustrative of social perplexities. In each of these cases the philosophical aim is much the same, though the style of treatment varies. The authors of *Daniel Deronda* and *Madcap Violet* adhere pretty consistently to the limits of ordinary possibility, while the other two are disposed to give more license to the imagination. We must say for ourselves that we consider the various exercise of every kind of mind and talent in fiction to be so desirable that we are ready to accept any good story on its own theory, unless there is something positively objectionable about it. And, indeed, this is only fair. A close representation of the everyday incidents of life is very well in its way, especially when characterized by deep feeling and delicate art; but there is no reason for limiting the efforts of fiction to this kind of delineation; and we are therefore glad to see a free range of fancy and invention. Although we have just coupled the *Atonement of Leam Dundas* and *The Hand of Ethelberta* in the same general category, it would be a great mistake to suppose that they have, except their originality and romantic air, anything in common. Mrs. Linton looks at life from a point of view of her own, and certainly not with the genial complacency and whimsical humour of the other novelist. Her book produces on the reader as he goes through it very conflicting impressions, the balance of which he may at the close find some difficulty in striking, especially if he adopts the ordinary notion that a novel is intended solely as light reading and amusement. Those who take up the work before us with this expectation will certainly be very much disappointed; and indeed we should not be surprised if those who judge of a literary dish by the first spoonful were tempted to give it up in a state of mind at once exasperated and perplexed. In the first place, in order to enter into the spirit of the story, it is necessary to bear in mind that Mrs. Linton is not a sayer of smooth and soothing things. She has her own views of life, and on the whole finds it very jagged and unsatisfactory, except in so far as its systematic hypocrisy is redeemed by occasional impulses of superior sentiment and passion. How far this is a true or complete view of life it is unnecessary here to discuss. There are aspects of society which, as it seems to us, the writer leaves too much on one side, and the tone of bitterness and mutiny which breaks out occasionally in the course of the narrative has undoubtedly something morbid about it; nor can we say that she does not carry her conscientious and uncompromising desire not to stoop to mere giving of pleasure and amusement a little too far. We should be sorry to deter any one capable of appreciating such a work from reading it by saying that it is a very serious production; yet the writer's seriousness, her keen sense of the evils and waywardness of modern society, and of the duty of speaking out about them, must be taken into account in judging of her narrative. We ought to add, however, that, if it is serious, it is certainly not dull. Mrs. Linton has devised a series of incidents of a very striking and suggestive character which are perhaps not impossible, though they hang together in a way which strikes one as, in some respects, inconsistent; but, however that may be, she is entitled to have the conditions on which her story is based distinctly recognized and kept in mind.

The heroine, Leam Dundas, is the offspring of two very unlovely and repulsive beings. Her mother, Pepita, who exercises the deepest influence on her character, is presented to us as "a superbly beautiful Spanish woman, with the face of a sibyl, the temper of a fiend, the brutality of a savage, and ignorance to correspond." She went about in the morning in unsavoury garments, her long black hair tangled and uncombed, and her superb sibylline face innocent of soap and water and loaded with yesterday's powder and paint; and did not rub off the coating of white of egg which she substituted for ablution, do her hair, or put on a decent gown, till far into the afternoon. She was not only queer in these ways, but hated English society, and preferred to spend her time swinging in a hammock in the garden and puffing cigarettes and thumping a zambomba or Spanish drum, improvised from a bladder and an inverted flower-pot. When she did not agree with any observation which was made to her, she replied, "You do lie," or "You are as stupid as a pig." Another of her amusements was a box of dolls, which she shared with her little daughter. One of these was dressed like the Devil, and was called "El señor papa"—that is, Mr. Dundas, for whom, of all others, Mrs. Dundas had the keenest hatred and contempt. He had in his loose youth been captivated by her animal beauty, when he first picked her up in a small wayside tavern in the wilds of Andalusia; but she had married him only to suit her own purposes, and had observed that his admiration had fallen off after the first hot flush. When she was transplanted from Spain to a dull, damp English village, where sunshine was rare and fruit sour and scanty, where there were no festas, no bull-fights, no castanets, no flowers, no colours, no priests, no saints, she felt that she had been deluded and betrayed, and began simply to rage against her situation, and revenge herself on her husband. She was violent and paroxysmal in everything; hating her mate with sustained intensity, and perpetually insulting him in the most opprobrious way; loving her daughter, caressing her extravagantly, yet at times beating her savagely, and once even making her teeth meet in the child's lean brown arm. Her favourite lesson to Leam was that all Protestants were pigs, good only to be roasted by slow fires; and once, to express her feelings on the subject, she took the cat as representative of the parson, tied a pair of paper bands round its neck, and crying "Preach Birkett, preach; the one as good as the other," kept it hanging up till it died. Then she kicked it aside, saying, "I wish it had been the man-dog instead. A priest with a wife, pah! he should be burnt." Mr. Dundas, this fury's husband, is a weak, amorous fool, who sees he has made a mistake, returns Pepita's abuse in kind, and takes no interest in his daughter.

At the opening of the story, Leam, living between two open enemies, had chosen her side, and clung to her mother with a kind of religious fervour. She had been taught to dislike and despise her father, to think herself a true Spaniard, and to abominate English people and Protestants. She had no sense of religion except this, and a dim veneration of, and trust in, the saints and the Virgin Mary, and was densely ignorant both as to conduct and knowledge. She was absolutely destitute, we are told, of any fragment of moral sense besides her passionate fidelity to her vixen of a mother. "The words right and wrong were words having no meaning for her, and she knew no barrier, save material impossibility, between herself and her desires." She tried to coax the saints by prayer, but rated them soundly if they neglected her desires. This other state at fourteen:—"A mere bit of brute material, potentially active; a soul unborn; a heart untouched save by one affection; a spirit imprisoned; an intellect unawakened; a vitalized machine after the pattern of humanity, but as yet only a machine"; "volcanic forces for the present battened down, and with the surface smoothness unrent and undisturbed." She was shy and taciturn, meagre and undeveloped, a dark-eyed melancholy little statue, too proud to cry and too shy to thaw. Other children dreaded her, and she dreaded them, and shrank away. The event which first broke through the stagnation of her existence was her mother's sudden death in a fit of apoplexy, brought on by an outbreak of frantic jealousy at the suspected [illegible] of her husband to another woman. This was a mysterious [illegible] calling herself Mme. de Montfort, which in confidence [illegible] was raised to "Countess," who had suddenly appeared one night, with an infant girl, in the village of North Aston and settled there, having, as the reader is led to suppose, given the child a dose of opium to serve as a pretext for exciting the sympathy of the residents and explaining her abrupt stoppage on her journey. It comes out afterwards that she was a thoroughly disreputable adventuress; but her good looks and plausible manners conciliated her new friends, and were especially powerful in their effect on Mr. Dundas. She described herself as the daughter of an

* *The Atonement of Leam Dundas.* A Novel. By E. Lynn Linton, Author of "Patricia Kemball," "Lizzie Lorton," &c. 3 vols. London: Chatto & Windus. 1876.

American clergyman, married to a French nobleman, and afterwards living in London; and told such absurd and improbable stories that it is difficult to understand why her imposture was not detected. However, she marries Mr. Dundas within a year after he became a widower, and takes her place in North Aston society. This event appeared dreadful to Leam, who regarded the marriage as an atrocious injury to her mother, whom she supposed to be grieving in heaven. When she hears of the impending event, she flies out against her father for having made mamma miserable while she lived, and now making her miserable in another world. She tells him that if the saints forgot her mamma, she will not, and she will never acknowledge another; if another come she will kill her. But her father only laughs at her excitement. We can hardly, however, conceive of any one educated as a gentleman, however weak and wicked, suggesting to his own daughter that her mother was more likely to be in a place of torment than in heaven. Leam hid herself in the woods on the day of the wedding, and afterwards proclaimed open war against the new mistress of the house. The thought of her mamma was constantly in her mind; she feared the saints had deserted her, and that she had to look only to her own poor hands and bewildered brain to protect her mother's memory and revenge her wrongs. She heard a voice murmuring in her ear, "Little Leama, I am unhappy; sweetheart, do not let me be unhappy." When her new mamma and her father came home from their wedding trip, all this became more agonizing to her, and she resolved that the stranger must somehow be swept out of the place she had usurped. The girl had trusted to the saints to do it, but they had made no sign, and now she was thrown on her own resources. One day she had chanced, when with a playmate, the son of a retired doctor in the village, to be in the laboratory, and had heard from him of the operation of poisons. This had a strange fascination for Leam, and, watching her opportunity, she stole a little bottle of prussic acid. On the evening of Mr. and Mrs. Dundas's return, the bride was found lying dead in her bed-room, with a phial of cherry-water on the table near her. There were all sorts of surmises as to the cause of death; the jury attributed it to an over-dose of the cherry-water, but many people thought she had poisoned herself. The inquest was, as usual, a mere farce, and there was no *post-mortem* examination of the body. If there had been, it would have been found that it was something more potent than cherry-water which had been administered. This, in fact, was the use which Leam had made of the poison she had appropriated from Dr. Corfield's laboratory. She had gone into the bed-room which had previously been her mother's, to take a last look at it before it was desecrated by the new-comer; had noticed the phial on the table; and, as if by a flash of inspiration, saw that now her chance had come of revenging her mother, and poured the prussic acid into the bottle.

After this catastrophe, Mr. Dundas sent Leam to a boarding-school, shut up his house, and went abroad. Four years elapsed before they returned together to the old home. Leam had by this time gone through a process of civilization; she was no longer a little savage, but a well-bred, graceful young lady; grave, quiet, and laconic. She had also discovered the nature of the crime which she had committed as an act of devotion to her mother, and the gulf which had thus been created between her and the rest of the world. The memory of that dreadful deed overshadowed her life, and though remorse was not always present with her, it broke out at intervals in gusty storms. She was alone in the world, isolated from all around her, and with a terrible secret shut up in her heart. When the sense of sin was most burning, she felt as if she must at once make avowal of her hideous tale; then the instinct of self-preservation would come into play, and she would rush out for a long solitary ramble on the moor. The poor girl's fluctuations and sufferings under this terrible pressure are described with much force and pathos. Nothing can be more tender and delicate than the way in which the dawning of her pure and almost unconscious love for Edgar Harrowby—a worthless fellow, though Leam does not suspect it—and the dr[illegible]like happiness which suddenly comes over her when she [illegible]returned are brought out. It seems to her as if the dark passage in her history has now been blotted out, and that in the indulgence of a natural affection a new life has been opened up to [illegible]sense of "home and rest to one very tired and long lost." The vision, however, is only the fitful gleam that heralds the storm, the parting of the clouds before they close in darkness and make day night. We cannot attempt to follow this deep and touching study in detail, but must be content to say that it reveals a power of delineation, going below mere surface characteristics, of a very high kind.

It is in this part of the book undoubtedly that Mrs. Linton is seen at her best, and we could almost wish that she had allowed it to stand by itself as a proof of what she can do when she chooses to concentrate her mind upon a distinct subject, and to restrain the discursiveness which occasionally leads her astray. There is much in the early part of this novel which seems to us needlessly rough and disagreeable, and the main plot is also weakened by idle complications which only divert attention from what ought to be the leading feature of the story. Madame de Montfort is a very commonplace adventuress, and has an air of being introduced into the plot for a purpose which the writer afterwards abandons. Mr. Dundas's third marriage, with Josephine Harrowby, also helps the story very little, and the episode of old Gryce is not only absurd in itself, but quite superfluous. It is significant that in these padding parts of the work the style of the author is apt to sink into a looseness and slovenliness which contrast strangely with the compressed power and finish with which the central idea is worked out. The weird beauty and spiritual bewilderment of Leam are depicted with delicate grace and vividness, and the little glimpses of scenery—not thrust in to make up for want of incident, or elaborated under the delusion that a catalogue of colours is equivalent to a picture, but coming in naturally as a background—show the hand of a true artist. Perhaps the most serious fault of this work is the tendency to throw out what may be called nagging remarks on opinions, types of character, and ways of life which are distasteful to the writer. Thus there is in the present novel a continued insistance on the notion that the upper class are a set of hypocrites, who harden their hearts against the poor, and have no real charity or sympathy. In the description of the village of North Aston the "stately mansions of the local aristocracy on the slopes in favoured places" are contrasted with the ill-ventilated, ill-constructed, unhealthy cottages among the swamp and drainage of the bottom. This tone runs all through. The rector is represented as having a profound contempt for the poor, and no interest in his clerical duties beyond the fact that they yield him an income. His daughter is called a model English girl, "orthodox and lady-like," yet cold-hearted, intensely selfish, who, when she marries, will treat her "servants as serfs" whom she has "bought in soul as well as body, in mind as well as muscle," and will shirk the trouble of looking after her children. This strain of sneering at orthodoxy and respectability may no doubt be justified in certain cases; but its introduction as a sort of refrain in a novel conveys a one-sided and discoloured view of life, and is besides obviously a defect in art. The object of an author should be, not to irritate or offend his readers, but to conciliate them, and bring them into sympathy with his narrative. Still, with all its defects, *Leam Dundas* is a very remarkable and interesting book, with a true intellectual flavour and intensity which are very rare in current fiction.

TO THE VICTORIA FALLS OF THE ZAMBESI.*

A BOOK of travel does not altogether depend on its freshness to recommend it, and yet we do not see why it should be supposed to gain, like wine, by being "laid down" for a certain number of years. But it appears to be becoming a not unusual practice to publish travelling reminiscences after an inexplicable delay. More than one volume that we have lately noticed has supplied instances in point, and now we have Mr. Edward Mohr giving us a narrative of South African wanderings and sporting adventures which took place no less than seven years ago. A good deal has happened since then in some of the districts he passed through. The excitement of the diamond-digging attained its height; our colonists have had a fair share of chronic troubles with their aboriginal neighbours and the Dutch boers, and the dependency of Natal in particular has been in a political ferment. But, as Mr. Mohr only concerns himself incidentally with local politics or social changes, the fact that events of some historical importance have taken place since he visited the country does not seriously impair the interest of his travels. His objects were principally sporting, though partly scientific; he has written a pleasing book in a fresh and spirited style, and his translator has done him every justice. As might be surmised from his name, Mr. Mohr is a German; and as his countrymen have scattered themselves all over the world, he never found himself far from the German Fatherland, even in the wild borderland which divides the South African settlements from the savage interior, or among the bold miners and elephant-hunters who push their way into the wilderness. For himself, it was his intention to make the journey from Natal through the Orange Free State, the Transvaal Republic, and the ill-defined territories of the great Matabele tribe to the Victoria Falls on the Zambesi—an intention which he happily carried into effect, having been fortunate in securing the company of a compatriot, Herr Adolph Hübner, a mining engineer of some celebrity. Consequently he opened up no new country, and cannot be said to have made any actual contributions to our knowledge of African geography. Throughout the journey he came upon parties of white adventurers, who had gone out for the most part after ivory. But as he went amply provided with astronomical instruments, and was indefatigable in taking observations and determining localities, his labours are likely to prove useful to those who may follow him.

Nothing strikes us more in successive works on African travel than the steady way in which the interior is being opened up, although the progress of colonization may not go forward very rapidly. As the game recedes before the advance of the settlers and the multiplication of white trading adventurers, the difficulties diminish that used to loom so large. What was waste and wilderness in the last generation is now picketed by snug farmsteadings, whose inmates are ready to barter farm luxuries for tea and coffee, powder and shot. Trustworthy information as to the easiest routes is to be obtained far towards the interior, and the ponderous waggons, instead of pioneering their own way, jolt forward over rough-made tracks which marvellously facilitate their progress. For, as Mr. Mohr points out, in the African jungle as much as anywhere else, "ce n'est que le premier pas qui coûte." The passage of the first waggon involves the felling of trees and grubbing of scrub, with the occasional cutting away of sand-banks when some deep river-course has to be forded.

* *To the Victoria Falls of the Zambesi.* Translated from the German of Edward Mohr by N. D'Anvers. London: Sampson Low & Co. 1876.

But when once a waggon has gone by, others may follow comparatively easily; and accordingly, when the news gets about that a single white man has passed forward anywhere, there are sure always to be watchful countrymen of his who will not be far behind him. And nowadays the danger of trouble with the savages is very much less than it used to be. Should the stranger fall between hostile tribes in times of war, it is quite possible that he may suffer from the disturbed state of the country; but, if things are quiet, he has seldom anything more to fear than an irritating detention, with the idea of taxing him more heavily. The chiefs have become alive to their own interests; they fully realize the profits of the regular trade that opens to them a market for their skins, ivory, and ostrich feathers; and, besides, they have a wholesome dread of the retribution that may possibly follow any act of violence. Mr. Mohr relates how, on a former journey, he left his unprotected waggons to the care of the Matabele, while absent on a shooting expedition, although they were stocked with abundance of everything that is most precious in native eyes. And on this occasion he acknowledges the thoughtfulness of the Matabele chief when an unsparing war of succession was on the point of breaking out in the tribe. Peremptory orders were issued that all the white men should return to the frontier; and at first general indignation was felt. But the chief explained that his intention was to send them out of the way of harm, and the explanation was received as entirely satisfactory. It would appear, in fact, that now the chief inconveniences of travel south of the Zambesi are those natural obstructions which time can do little or nothing to remove—the unhealthiness of the country, the scarcity of water, and the poisonous tsetze fly. As to the first of these, it is Mr. Mohr's opinion that sickness may be generally avoided by proper precaution and a judicious selection of camping ground. As for water, although there are deserts where there is none of it to be found in the dry season, yet in the wooded country the permanent pools and springs are being steadily discovered as exploration proceeds. Again, although no remedy has as yet been discovered for the fatal bite of the tsetze, it has been proved that the fly is strictly confined within certain well-defined limits. In short, Mr. Mohr asserts that patience rather than courage is the indispensable quality for the African explorer; and although a man ought to have strong nerves to sleep tranquilly to a serenade of lions, or to dodge the mad rush of the wounded elephant or rhinoceros, yet we can easily believe that the assertion is true in the main. Imagine the wear and worry of having repeatedly to dig out your embedded wheels while pushing eagerly forward to the water that should be reached before nightfall; or, worse still, of being obliged to discharge the waggon of all its carefully packed freight in order to lighten it for the passage of some flooded ford that threatens to bring the march to a standstill.

Though there are still herds of antelope to be found in the immediate neighbourhood of D'Urban, the larger game has been driven back so far that it was not until the sportsmen were over the Limpopo that they had to take serious precautions against invasions of their night camp. But on the banks of that river lions are still plentiful, and as they held on their way to the northward they got into an excellent shooting country. Notwithstanding that elephant-hunting has become a regular trade, for many marches to the south of the Zambesi they were continually coming upon fresh elephant spoor. The troops of giraffes and herds of buffaloes were numerous; rhinoceroses, though generally of solitary habits, were common enough; while as to the manifold varieties of the deer and antelope tribes, in some districts there was literally no end to them. Although these are yearly slaughtered in vast numbers for their skins, the thinning has made no visible impression, and extermination seems as remote as ever. The exciting scenes described by Harris and Gordon Cumming far to the southward are repeated still, although much further in the interior. The horseman sights a troop of something or other, and starts in pursuit. As the game flies before him fresh herds are disturbed and join in the flight, till at last, in whirlwinds of dust, the plain is covered with a moving menagerie of gnoos, elands, quaggas, zebras, antelopes, &c., dominated by the tall necks of the cameleopards, who lead the way with their shambling gallop. There is seldom any want of volunteer beaters, for swarms of hungry natives are sure to crowd round the camp of the successful hunter. Yet, although native gluttony is equal to an incredible consumption of flesh, the indiscriminate slaughter sometimes exhausted their powers. "On a long halt in the wilderness the carcases of the wild animals destroyed accumulate on every side, and swarms of jackals and hyænas assembled about the camp at night, alarming the oxen and horses with their constant howling." Occasionally the presence of more formidable night prowlers than the jackals kept the travellers in constant anxiety, in spite of the blazing fires and the hastily improvised fortifications. Though lions and panthers can never suffer from hunger in districts so abundantly stocked with game, yet they would appear to have a weakness for a change of diet, and specially to have an inveterate craving for oxflesh. Once in particular Mr. Mohr had an anxious time of it, to say nothing of an exceedingly narrow escape, in an encampment on the banks of the Nata. The party had seen so many footprints of lions in the sands of the river, that they had entrenched themselves with unusual care. Mr. Mohr had lain down to sleep under his waggon, with a tame goat and a favourite bulldog established close behind his pillow. Awakened by a noise at his head, he sprang to his feet and seized his gun, when from a clump of bushes close by he heard the howls of his dog. He fired repeatedly in that direction, and shortly the poor animal crawled in, fearfully lacerated. Next morning, strange to say, they found the body of a huge panther, killed by a random shot. That incident over, he composed himself to sleep again, but only to be awakened a second time. Lions were roaring all around them; as new arrivals came up, they chimed in with the savage chorus; and all the precautions that usually prove effectual neither silenced them nor scared them away. In vain they piled on fresh fuel and kept up a discharge of fire-arms. "Nothing seemed to do any good. . . . This horrible suspense lasted about half an hour; then all was still again, and men and animals became calmer; but the natives kept watch all night, smoking and chattering by the fires."

Owing chiefly to the presence of the tsetze in the country near the Zambesi, Mr. Mohr was compelled to make out the last part of the journey on foot, leaving his waggons in the bush. Although in comparatively light marching order, he seems to have found the intervening forest all but impracticable; frequently he accomplished but a very few miles in the day, and repeatedly he had to deflect considerably from his course. It is true he carried with him, not only the indispensable articles for barter with the Zambesi natives, but also the instruments for taking those observations which were among the main objects of his expedition. On one occasion, when his native carriers had grown mutinous and were on the point of deserting him, a lucky incident kept them to their allegiance; for a rhinoceros that burst out of a thicket rolled over to his rifle, and the flesh proved an irresistible attraction. Of course the Victoria Falls have been repeatedly described before, but Mr. Mohr's enthusiasm was rewarded by seeing them to unusual advantage. There had been heavy rains in the country higher up, and the river was coming down in flood, but the weather was brilliant, and the lights were glorious. "The majestic river, a mile wide, comes down from the north-north-west, and flings its waters down 400 feet into a rocky ravine, varying in width from 240 to 300 feet, which runs across its bed. From the river above the falls rise many islands, all adorned with the richest tropical vegetation. The banks are covered with dense but not vast forests, in which occur whole groups of tall-stemmed palms, giving a thoroughly Southern character to the scenery." There are no habitations near; the continual moisture fosters the naturally luxuriant growth of the neighbouring woods; and the sense of savage loneliness is impressively brought home to one by the fresh spoor of the innumerable elephants and rhinoceroses who crowd to the place to enjoy their mud baths. Perhaps the strongest proof of the profound impression which the scenery made on Mr. Mohr is, that after having more than gratified his highly wrought-up expectations, he had little power of admiration left for the narrow gorge that is the sole outlet for all that vast breadth of water which is perpetually precipitating itself over the falls; yet just below them the whole volume of the river is compressed into a chasm of 270 feet wide, and the flood rushes down between precipitous rocks five or six hundred feet high and absolutely inaccessible. Even his stolid native attendants were moved to admiration by the spectacle. His measurement of the veils of spray that hung floating over the falls gave a height of 1,055 feet; and they had distinguished these vapoury cloud-masses the day before, from a distance of at least eight miles. Having accompanied Mr. Mohr to the great goal of his expedition, we may take leave of him there. We need only add, by way of practical information, that the cost of a journey which lasted twenty-six months was 1,500*l.*, inclusive of all hotel expenses and the passage-money from Germany and back again.

KENNEDY'S VIRGIL.*

ALTHOUGH in shape a somewhat unwieldy school-book, too cumbersome in method and arrangement to vie with Conington's three volumes, and yet too cramped and closely-printed to be an agreeable library companion, Dr. Kennedy's one-volume Virgil—the expectation of which dates back [illegible] as far as the commencement of the Bibliotheca Classica—will be welcomed by Latin scholars on the faith of its containing the responses of a lively and shrewd oracle to Virgilian questions [illegible]. Hereditarily familiar [illegible] the Mantuan poet through translations by his father and brother, and himself a Latin scholar of the highest distinction, Dr. Kennedy has naturally accumulated a large store of solid criticism on Virgil's works, and has not been content to acquiesce in the ordinary tradition of readings, explanations, and punctuational variations. He has now fulfilled the hope of many years, and put forth, in what he depreciatingly calls a school edition, a volume of some six hundred and fifty pages upon the text, interpretation, and literature of Virgil, in which, though, like the late Professor Conington, he does not profess to have collated MSS., he exhibits a thorough acquaintance with the best texts and commentaries, and an acumen which almost always enables him to arrive at a right judgment as to the poet's words and sense, often by weighing the conflicting views of others, not seldom by introducing some shrewd interpretation of his own. We could have wished, school exigencies apart, that the text and notes had not been dissociated; it would also have been more convenient if Dr. Kennedy's method of breaking up whole pages of interpretation into the several headings of (1) outline, (2) translation, (3) select vocabulary, (4) notes, (5) parallel passages, had

* *P. Vergilii Maronis, Bucolica, Georgica, Æneis; with Commentary and Appendix.* By Benjamin Hall Kennedy, D.D., Regius Professor of Greek in the University of Cambridge. London: Longmans & Co. 1876.

not superseded the old-fashioned plan by which a scholar despatches a passage in all its aspects by a slow and sure process. At the same time the real value of what is given under each of these heads soon comes to be discoverable by a little practice, and it is always competent to the learner to pass by the translation for the notes, though we warn him that, in so doing, he may overlook some excellent blank-verse renderings of difficult or striking passages. It is pleasant moreover to notice that in this work there is none of the acrimony which was displayed against a rival Scotch professor in the *Studia Sophoclea*, while not the less, where doctors disagree, Professor Kennedy will be found to assert and hold his own.

It is probably not to this work that readers will refer for an elaborate or comprehensive account of Virgil's life, writings, and poetic standing, though, considering the limited space allotted to these topics, there is no fault to find with what the author has done. He has wisely passed lightly by the minor and doubtful works of the poet, being apparently unimpressed by any except the Copa and Moretum. As one might expect, he takes the affirmative side on the question "Was Virgil a born poet?" though here he commits himself to no extravagant claims. "I venture," he says, "to call Virgil a true poet by nature; inferior in power to some famous poets, inferior probably to others of minor fame; but one who by fine feeling, exquisite skill, and intense study, reached a poetic perfection which has given him the place he holds in the world of literature." This is not asking so much as many might have claimed for the author of the Æneid, which great work, as the Professor elsewhere reminds us, is, after all, incomplete and unrevised. The nearest approach to originality in Dr. Kennedy's Life of Virgil is where he suggests a fancy supplement to the passage in the Sixth Book comparing the glories of Hellas and the renown of Rome, and conceives a finish to the lines (850-1)—

> Orabunt causas melius, cœlique meatus
> Describent radio et surgentia sidera dicent—

in a couplet affirming the superior excellence of Greek poetry, the spirit of which, he thinks, might be in this wise:—

> Accessu propiore petent Helicona tempia,
> Mortalesque regent divino carmine mentes.

But beyond question the great value of this edition of Virgil will be found in its clear insight into the niceties of grammar and syntax, and the fruits which it bears of long experience in the discernment of constructions. There may and will be two opinions as to endorsing all the terminology of the *Public Schools Latin Grammar*; but when Dr. Kennedy proceeds to unravel and disentangle a confused construction, it is hard to contend with him. Two puzzles in the very first Eclogue (vv. 54-5 and 68-70) are here so well handled as to furnish a good augury at the outset. In the former the editor justly prefers taking "vicino ab limite" as attributive to "sepes," "the hedge on your neighbour's boundary line"; and then all is plain, if "depasta" is seen to be a participle and "quæ semper" has "suasit" supplied from "suadebit." In the other passage, which has more real difficulty, the mind must divest itself of Claudian's sense of "aristas," *i.e.* summers, and regard "post" as an adverb, and "aristas" as the object of "mirabor." "Mea regna" will be limited in apposition to "pauperis tuguri culmen" in the previous verse, and then, if "videns" is taken to represent "cum videro," the sense will be as follows:—"Ah, shall I ever on beholding a long time hereafter my country's bounds and the turf-thatched roof of the poor hut, my *old* domain, after this, look in amazement at a few ears of corn?" In the Third Eclogue, v. 50, at

> Audiat hæc tantum—vel qui venit, ecce, Palæmon,
> Efficiam posthac ne quemquam voce lacessas,

the Professor points out that there should be only a comma after Palæmon, and that this fiftieth verse should be connected with the next, Menalcas having begun his sentence before seeing Palæmon coming up. To put it grammatically, "tantum" (which is *i.q.* "dummodo") with its verb "audiat" forms the protasis, and "efficiam" the apodosis. "Be but our umpire—ay, even Palæmon who is approaching—I'll effectually prevent you from challenging anybody to sing hereafter."

The Georgics furnish a good field for similar helpful criticism, and new light is thrown by Dr. Kennedy's editing upon passages the minutiæ of which had scarcely struck us before. In Georg. i. 150-1 he shows that the construction of "Mox et frumentis labor additus ut mala culmos esset robigo" is that of the substantival sentence in apposition; "*is* labor additus *est* ut," &c.; or in English, "Corn crops had toil and trouble attached to them in such sort that mildew devoured the stalks"; and in two other notable passages he brings out the force in a very striking manner by nice discrimination of the sense of particular words. The first is the well-known simile in G. i. 201-3:—

> Non aliter quam qui adverso vix flumine lembum
> Remigiis subigit, si brachia forte remisit,
> Atque illum in præceps prono rapit alveus amni.

Here he regards the comparison intended as not of *seed* and *man*, but of seed deteriorating under man's neglect, and a boat retrograding when man does not pull. He then ignores the supposed archaic sense of *straightway* in "atque," and gives it a co-ordinative force with the extra notion of *suddenness*. Then the Latin order will be, "Non aliter quam *fit* si forte (is) qui lembum vix subigit remigiis adverso flumine, brachia remisit, atque illum (lembum) alveus prono amni in præceps rapit"; or, in English, "As happens if by chance one who with difficulty rows a skiff up stream has slackened his stroke, and lo, the skiff is whirled headlong by the river down the current." He also satisfactorily elucidates the passage about the hurricane, in G. i. 318-21:—

> Sæpe ego, &c.
> Omnia ventorum concurrere prœlia vidi
> Quæ gravidam late segetem ab radicibus imis
> Sublimem expulsam eruerent, ita turbine nigro
> Ferret hiemps culmumque leves stipulasque volantes.

Here, with Professor Conington and most editors, "ita" stands for a particle of comparison, *i.e.* "So would winter carry," &c. But Dr. Kennedy demurs to thus weakening a powerful description by a simile without force or picturesqueness, and argues that it would be surplusage to use "culmus" and "stipula," just before used of the barley, to express other haulms and straw whirled up elsewhere at another time. "Ita," therefore, he takes with Wagner, Keightley, and others as a particle of transition (= ἔτι); "hiemps," as storm; and "ferret" as continuing the construction of "eruerent," *i.e.* "and then with black eddy the storm whirled up the light haulm and flying straws." It first tears up the barley by the roots, and carries it high into air, then with eddying current whirls it round and round in that situation. The picture is thus complete, and stands out, as one of our latest translators has it:—

> Up from the roots the pregnant corn is driven,
> Swept up on high and dashed across the heaven:
> Soaring away go reeds and sheaves and all,
> In buoyant circles riding the black squall.

Whilst we are on this passage we may remark that Dr. Kennedy does full justice in his notes to the "elaborate splendour" of the grand description of the storm and its ruler which follows in vv. 322-34.

In Georg. iii. 237-9, he declines to follow Professor Conington and others in punctuation. The lines run:—

> Fluctus ut in medio cœpit cum albescere ponto,
> Longius ex altoque sinum trahit; atque volutus
> Ad terras immane sonat per saxa, neque ipso
> Monte minor procumbit; at ima exæstuat unda;

and Conington would remove the comma from "ponto," and disconnect "ex alto" from "longius" by putting it between them. We quite believe that "Longius ex altoque" represents one notion, viz., "from further back," the wave being reinforced from the sea rising behind it. Dr. Kennedy regards the second "ut" as temporal, so that "ut volutus = ut volutus est," "as soon as it has rolled to land." "Medio ponto" is equivalent to "out at sea" as opposed to "on shore," in a sense which Dr. Kennedy at Ecl. viii. 58, "Omnia vel medium fiant mare," shows to have been unnoted by Facciolati, Freund, and most lexicographers. The sense of the passage, however, will stand thus:—"As when a wave out at sea begins to whiten, it draws a curving swell from the outer deep, and when it has rolled to shore sounds," &c.

In other places good service is rendered by nice and exact elucidation of the sense of words; as where, in Ecl. vi. 24, it is shown that "satis est potuisse videri" cannot mean "it is enough that I can have been visible" (which would require "videre"), but must be "it is enough to seem to have had the power." Again, where in G. ii. 416 "Jam canit effectos extremus vinitor antes" is explained not exactly in Conington's sense of "the last dresser singing the song of 'all rows finished,'" for the construction is that of "currere aquor," "The vine dresser," says Dr. Kennedy, "sings all the time he is working, and when he comes to the end of the rows he is still singing." Therefore he is singing over the finished rows. Once more, in G. iv. 484, "Atque Ixionii vento rota constitit orbis," we are fain to think that he has proved his case for explaining "vento" as *i.q.* "in a time of wind"; *i.e.* to heighten the miracle, Ixion's wheel stood still in a time of wind, or though the wind was blowing. The passage in G. i. 431 is a case in point.

If we pass on to glance at the Æneid, it will be seen that the editor shows no falling off in diligence or acumen as his work advances. In Æn. iii. 684-6 a well-known rock of stumbling to readers of Virgil is the passage:—

> Contra jussa monent Heleni, Scyllam atque Charybdim
> Inter, utramque viam leti discrimine parvo
> Ni teneant cursus: certum est dare lintea retro.

Professor Conington here takes *ni* in the sense of *ne*. Dr. Kennedy regards the passage as corrupt, but prefers to take the words as meaning, "The injunctions of Helenus warn (of peril) if they do not hold a mid course between Scylla and Charybdis, either passage a hair's breadth from death." Thus *ne* retains its natural sense. In an excursus on Book VI. Dr. Kennedy seems to have elucidated most convincingly the parallel constructions of Æn. iv. 683-5, "Date volnera lymphis abluam," &c., Æn. vi. 883-5, "Manibus date lilia plenis Purpureos spargam flores," &c. In each instance "abluam" and "legam" and "spargam," &c. are in immediate dependence as objects upon "date" in the sense of "sinite" (see *Publ. Sch. Gr.* § 197). One passage more we must notice, by way of showing how clearly the editor sets his author's pictures *in extenso* before the reader. We might indeed have quoted Æn. i. 159-68, "Est in secessu," &c. in Dr. Kennedy's blank verse, which omits no single feature from the famous Virgilian picture of the natural harbour; but this is only one of a number of neat pieces of translation which will speak for themselves. The explanation of the *coup d'œil* in the simile i. 393-7, "Aspice bis senos," &c., where the swans rallying from the eagle's swoop are made an augury of the recovery of the Trojan ships, is in prose, as follows:—

A flock of twelve swans have been scattered in the air by an eagle's swoop; they have reunited, and after several circuits in the sky with

whirring wings and song they are now descending to the earth in columnar order. The van is just alighting, while the ranks behind with sloping necks seem to be looking down on the spot chosen for occupation.

The peculiarity, it is added, is that while the picture is necessarily taken at a particular moment, the simile refers in part to moments past. We may remark that Mr. Morris in his new verse translation hits the sense as to the diverse attitude of the two sections of birds:—

And now seen choosing where to pitch, now on their choice to gaze.

Strangely enough he speaks of "twice seven" instead of "twice six" swans.

There are two or three passages, however, where we are disappointed of the help we looked for. In Georgic iii. 170,

Atque illis jam sæpe rotæ ducuntur inanes
Per terram, et summo vestigia pulvere signant—

is simply noticed as belonging to the injunction that young calves must be habituated to bear, first light, and then heavy weights. Conington translates, "By this time let them have an empty waggon often and often dragged at their heels, just printing the wheel rut on the surface dust." But a highly competent verse translator, Mr. Blackmore, surmises that "rotæ inanes" is used for "wheels unattached to any carriage," in contradistinction to "juncti orbes" in 174, and that "vestigia" means not the "wheel rut," but the footprints, light because the weight behind is light. Thus:—

Now let them often draw unbodied wheels
And scarcely mark the dust with flitting heels;
Soon must the beechen axle creak and strain,
And pole of bronze drag well-compacted wain.

We are disposed to think Mr. Blackmore right, and hence could wish that Dr. Kennedy had dwelt upon the passage. In another, Æn. ix. 486, "Nec te tua funera mater Produxi," all that he has vouchsafed is "Funera produxi," "carried out to burial," and we look in vain for a stray light in the appendix on Virgil's text. Professor Conington translates, "Nor have I, your mother, followed your corpse to the tomb," and Mr. Morris, "Not e'en may I, thy mother, streak thee, son, thy body dead," this last seemingly with commendable literality. Would Dr. Kennedy, with Ribbeck and Catrou, regard "tua funera" as epexegetical of "te," or in what sense is "funera produxi" "carried out to burial"? Hardly in Servius's sense of a private mourner, "funera," or "funerea." Upon "Haud numine nostro," in Æn. ii. 396, Dr. Kennedy seems to have fixed the meaning "With no deity succouring us," instead of "Under protection not our own," for reasons which might be taken to point the other way. But, on the whole, he deserves our best thanks for a valuable help to the interpretation of a poet whose favour is never likely to grow less; and he has been at pains to be as exact in matters of fact and common sense as in points of scholarship. It is amusing to find him, at Ecl. iii. 30, pointing out that Virgil must have been a bad farmer for making a cow have twins, "Binos alit ubere fetus,' though his slip arose from the too free copying of Theocritus, where the dam was a she-goat. But in the details of the Georgics Dr. Kennedy will be found as well posted up in agriculture and other technical matters as Martyn or Blackmore, and throughout his work there is much valuable matter in excursuses and appendices.

RECENT MUSICAL WORKS.*

THE *Dictionary of Musical Terms* which has just been brought out under the editorship of Messrs. Stainer and Barrett supplies a very urgent want in our scientific literature. The subject of music embraces sections of so many distinct departments of knowledge, such as physics, physiology, and æsthetics, together with the history of art and inventive industry, and has besides such numerous connexions with other subjects, as, for example, the drama and religious worship, that the student who would be thoroughly familiar with all its aspects needs to have some such work of reference as this always at hand. It seems to speak well for the growing taste and intelligence of Englishmen in relation to music that the publishers of this Dictionary have thought it worth while to bring out a work so thoroughly scientific in its aim. It is by no means an encyclopædia of music, constructed after the pattern of the great lexicon which is being published in Germany, and which is designed to take the place of particular treatises and historical works. It is an elegant and in no way cumbrous volume, which will attract the eyes of amateurs as well as of students, and which is eminently fitted to supply the amount of special knowledge that an inquiring amateur desires chiefly to secure. Thus, for example, while the articles on Counterpoint and Fugue will not take the place of text-books on these subjects with the professional student, they will serve exceedingly well to supply the general musical reader with a clear and succinct account of the nature and range of these studies.

As every student knows, the theory of music has been greatly enriched during the last fifteen or twenty years by the researches of numerous physicists and physiologists, among whom Helmholtz occupies the first place. The editors of the Dictionary have been fully alive to this progress, and the articles on the physical and physiological foundations of musical systems are all that could be wished. We may refer more especially to the brief but very full article on "Acoustics," by Mr. A. E. Donkin; to the one on "Temperament" by Mr. Bosanquet, which goes a long way towards making this exceedingly intricate subject intelligible to a careful lay reader; and to the fresh and graphic accounts of the ear, the larynx, and the hand (as concerned in pianoforte execution), supplied by Mr. Champneys. In the last-named paper, entitled "Fingering," the writer explains very fully the well-known defects of the third finger, and offers the startling suggestion that, by a simple surgical operation which would, it seems, be easy and not painful, though attended with a certain risk of inflammation, the "slips" which are given off by the extensor tendon of this finger, and which connect it with the corresponding tendons of the adjacent fingers, thus impeding its independent movements, might be divided so as to give increased facility of action to the hand. This expedient might no doubt be somewhat less objectionable than Schumann's mischievous experiments with his ring-finger, yet we hardly imagine that musicians will resort to it in large numbers. One may indeed well ask whether a rapidity and smoothness of digital movement such as may be reached by natural means—for example, in the case of Rubinstein—do not more than suffice for all the demands of the most acute and delicate ear. Mr. Champneys has further some ingenious observations on the greater amount of misery inflicted on the ear by sharp singing than by flat. He is inclined to think that this is due to the recognition of an unnecessary exertion in the first case. The singer "is using unnecessary muscular force, and we have a natural, though not purely rational, idea that, if he took less pains, exerted himself less, he would sing in better tune; we feel he is committing a 'presumptuous' musical sin." This psychological suggestion has rightfully perhaps no place in an article on the larynx, yet we do not feel disposed to quarrel with Mr. Champneys for giving it to us.

The more æsthetic or artistic aspects of music are dealt with for the most part historically, and in this way the discussion of these topics is freed from everything like capricious subjective opinion. When a question as to the end or value of art is unavoidable, the writers appear to treat it in a broad and impartial spirit. We would refer in illustration of this to the sensible and temperate criticisms of Wagner's innovations in operatic music (*sub voce* "opera"). We could have wished that the work had been a little richer in properly æsthetic ideas, such as one finds in abundance in any German handbook. Under the subject of "Form," for example, some reference might surely have been made to the proper place of form in all art as this is variously defined and interpreted by different schools of writers and artists.

The historical papers are an interesting feature of the volume, and, though necessarily condensed, furnish the reader with a good deal of curious and valuable information. We would mention among others the papers on "Opera," "Country Dance," and the excellent articles of Mr. W. Chappell on "Ballads," "Greek Music," and "Notation." Our present system of notation is said by the Sol-Faists to be needlessly cumbrous and complicated, yet a perusal of the article on this subject will show that this system has been very slowly developed out of the rudest and quaintest expedients by a large number of successive displacements and improvements. Another article largely historical in form, that on "Sonata," illustrates in a striking way the growth of the idea of structure in modern musical composition. The writer hardly brings out the relation of these melodic (monophonic) forms of composition to the contrapuntal (polyphonic) forms which they have in a large measure displaced. The most elaborate rules of imitation, inversion, &c., were carried out in the weaving of separate threads of notes into a complex strand, long before any skill was attained in varying and developing a single melody. It was not till the sense of melody had been revived and more highly cultivated by the growth of the opera at the commencement of the seventeenth century, that the idea of reaching a complex structure in a properly melodic style of music began to spring up, and finally to bear fruit in our classical sonatas and symphonies.

A word or two may be added respecting the general arrangement of subjects. The editors have evidently taken pains to make the Dictionary as complete as possible, so that no term which can by any legitimate process be shown to be musical shall be missing. This feature gives great practical value to the book; at the same time we are inclined to think that they have gone too far in this direction. The insertion of an article on Copyright may no doubt be justified in a general guide to musicians; but it is surely a little beneath the dignity of a scientific work to supply translations of simple and non-technical foreign words such as "début," "Daumen," "Theoretiker." In one or two cases also there is a slight confusion in the distribution of the subject-matter. Thus the principles of sonata form appear under both the heads "Sonata" and "Form." Again, there is a special article on mediæval musical instruments; but if one wants a list of Greek instruments, he must go through the whole Dictionary, collecting them one by one. We have noticed very few errors in this carefully prepared work. The uniform misspelling of the name of the composer Kuhnau as

---

* *A Dictionary of Musical Terms.* Edited by J. Stainer, M.A., Mus. Doc., Magd. Coll., Oxford, and W. A. Barrett, Mus. Bac., S. Mary Hall, Oxford. London: Novello, Ewer, & Co. 1876.

A Treatise on Musical Form and General Composition. By the Rev. Sir F. A. Gore Ouseley, Bart., M.A., Mus. Doc., Professor of Music in the University of Oxford. Clarendon Press. 1875.

The Third, or Transition, Period in Musical History. A Course of Lectures delivered at the Royal Institution of Great Britain. By John Hullah, Honorary Fellow of King's College, &c. London: Longmans & Co. 1876.

Kuhnau should be avoided in another edition. We can heartily recommend this Dictionary as a safe and ample guide to that increasing number of persons who wish to make a careful, though limited, study of musical history and theory.

Students of music have been amply supplied with text-books on the theory of Harmony and of Counterpoint, but they have hitherto had to dispense almost entirely with works on the form of musical composition. It is pretty certain, therefore, that the little treatise of Sir Gore Ouseley on this subject, published in the Clarendon Press Series, will be widely welcomed. The book is very well printed, and its whole appearance will be sure to recommend it. Moreover, it is clearly and pleasantly written, and, though making no pretension to profundity of view, generally enters with sufficient fulness into the subject it deals with. This subject is of far wider general interest than the more technical ones of harmony and fugue. It consists of the principles of structure of *melody* in its various forms and combinations. We all talk about melody, and have a dim conception perhaps that it must conform to certain laws of structure and possess a symmetrical arrangement of parts. But it requires special study to recognize all the subtle distinctions of form which mark off different vocal and instrumental melodies. In the work before us melodies are analysed into their constituent parts, periods, phrases, and strains, and their peculiarities of form are referred to differences in the combination of these elements. Numerous examples, drawn from well-known classical and popular works, are added in illustration of these principles. We are disposed to think that the author seeks too great a degree of absolute symmetry (which word he uses in the sense of perfect equality of parts) in some of the melodies analysed—for example, in that of Lord Mornington's well-known chant (p. 20). An arrangement of three bars, four bars, three bars, four bars, can hardly be called "a limping and anomalous structure," and the attempt to reduce it to an equal arrangement by regarding two consecutive phrases as overlapping in a common bar savours too much of the old-fashioned and decidedly unnatural modes of explaining musical combinations. The writer is careful to remind those students who might fondly imagine that melodies are to be composed by a simple process of measurement that "in the case of melody no amount of study can teach an unmusical man to invent a new tune." In other words, the principles of melodic form inform us of the general arrangements to which every good melody conforms; they cannot teach us the whole secret of any melody's beauty or charm.

After examining the various structure of melodies, the author proceeds to state the several modes in which different melodies may combine in whole musical compositions. Excluding the fugue form, which is generally discussed as a separate branch of composition, there are six well-marked forms of structure to be found in the works of the classical composers. These are (1) the Ancient Binary Form, (2) the Modern Binary Form, (3) the Ternary Form, (4) the Minuet Form, (5) the Rondo Form, (6) the Variations Form. One of the most important of these is the Modern Binary Form, called also the Sonata Form, which is illustrated in the leading divisions of all symphonies and sonatas. The author does not appear to be very clear as to the precise significance of these classical forms of musical structure. He sees, of course, that there are many compositions which cannot be brought under any of these heads, and "which yet possess a certain regularity of structure peculiar to themselves." He even goes so far as to state that "after all, regular forms (those here described) are absolutely arbitrary"; and yet, *mirabile dictu*, in the very same sentence he tells us that "experience and the practice of the best composers have demonstrated their superior excellence and value" (p. 59). If there is a superior excellence in these forms which has been recognized by the best composers, they can hardly be arbitrary. The slightest digression into the region of æsthetic principle might have sufficed to show the author wherein their superiority lies. But possibly this is asking too much of a mere elementary book of instruction for musical students, for which purpose Sir Gore Ouseley's little work is admirably fitted.

In Mr. Hullah's lectures on the Transition Period of Musical History, of which a second edition has just appeared, we have an expansion of a part of the subject handled in his earlier volume of lectures. The period dealt with (1600–1750) is of singular interest in the history of music, covering, as it does, at least two events of primary importance. The first of these is the rise of the opera, with the accompanying development of modern melodic music in place of the old learned or contrapuntal style of composition. The second event is the development of independent instrumental music and the first discovery of those forms of instrumental composition which the classical masters afterwards elaborated and made permanent. A third event falling within these limits which has a peculiar interest to Englishmen is the appearance of perhaps the greatest original English composer, Henry Purcell. Mr. Hullah carries us pleasantly through the several phases of this period of history. If there is not much original research—and the subject perhaps hardly admits of it after the excellent histories of Burney and Hawkins, not to speak of later German works—there is a freshness and vividness in the mode of presentation which gives an independent literary value to the work. Mr. Hullah has enriched his volume with numerous and lengthy illustrations, and the amateur pianist or vocalist may derive a renewed pleasure from the rendering of pieces which would otherwise be inaccessible. We find the treatment of the German music of this period least complete. The early developments of instrumental music are not sufficiently illustrated, no mention being made of Kuhnau, who, according to Brendel, was the composer of the first sonata in the modern sense of the term.

NICOLAI'S MARRIAGE.*

ONE is apt on seeing announced the sequel to a book that has been read with unusual pleasure to await its publication with a certain amount of dread, lest the vein of fancy which yielded good ore enough for one book should prove to have been worked out when a demand is made upon it for another. And in English works of fiction, the habit which Balzac affected of introducing the characters of one novel in a variety of others has of late become decidedly tiresome. In *Nicolai's Marriage*, however, the merits of *Nöddebo Parsonage* are, if not surpassed, fully equalled, and no one can object to making further acquaintance with Nicolai himself, the only one of the characters in *Nöddebo Parsonage* who plays a prominent part in the present volumes. The author's former work was marked by a picturesque, even poetical fancy, a pleasant faculty for exhibiting various shades of character in the natural course of the story without any appearance of effort, and a talent for telling incidents of simple light-hearted fun so as to make them neither laboured nor puerile. The book had also the merit, which in these days, when many novelists set themselves, without Balzac's power, to explore, like him, the darkest recesses of mean or villanous minds, it is singularly refreshing to find—that of dealing with the pleasanter aspects of human nature. It had nothing of what is ordinarily understood as incident, and yet, save for a few semi-religious passages which by their simplicity were guarded against any worse accusation than that of being tiresome, it was never dull. It dealt with the fortunes of three brothers of entirely different tastes and temperaments, each of whom the reader learnt to like in various degrees; and it is the youngest of these who is the hero of *Nicolai's Marriage*. He appeared as a young man of an impressionable character who was always falling in and out of love. He was further distinguished by a self-conceit which was somehow rather attractive than repulsive, and an innocent cunning which he employed in the most transparent way to gain the good opinion of people about him. He occasionally rebelled against the checks placed upon his dangerously high spirits by his more staid brothers, the "Old Man" and "Corpus Juris." He was left at the end of *Nöddebo Parsonage* having fallen desperately in love with his blue-eyed partner at a dance. "Well, I am married, and have my own establishment," he says at the beginning of the present novel, "but the blue-eyed daughter of the Justitsraad is not the fair one, as I once thought she would be, for in the course of a few months I discovered that she was a mistake, as so many others are. Nor did I engage myself upon the day of my examination as I had intended, for this good reason—that I never passed a theological examination." He devoted himself instead, having gained his brothers' consent, to art-studies, and about four years after this determination his brothers married and went off to new homes.

> I was left in sole possession of our old lodgings at the corner of Vestergade and Vestervold, and I was at liberty to move the furniture about the three rooms as much as I pleased, without any fear of remonstrance from Corpus Juris; I might also sing as loudly as I liked without being called to order by the Old Man's stern "Silence, Nicolai!" At first I was very well satisfied at being able unchecked to have my own way in these trifling matters. I arranged a bed-room as the dining-room, and the dining-room as my study, dragging about the sofas and tables until, at last, a message came from the people who lived in the flat below me, requesting to know if the Candidate would soon be finished with his moving. I sang so lustily at the open window that I verily believe I was heard all over the rampart.
>
> However, this exuberance of spirit did not last very long; the complete solitude soon began to oppress me. I missed the Old Man's friendly "Good morning" when I appeared at the breakfast table, and Corpus Juris's well-meant scolding on my return home in the afternoon. The rooms seemed so strangely empty when no one was there to growl at me, and to exclaim, "What have you done that for now, Nicolai?" or, "There you are, late again; we have been waiting three-quarters of an hour for you!" upon which generally followed a refreshing little shower of admonitions to be more careful in future. Now I looked round upon the four walls; they never said a word to me; I no longer came home too late, for there was no one waiting for me. It is true I might go to Corpus Juris, in the Kastanie Alley, and upset a cup of coffee, or, what was even worse, tear the newest Dagblad in pieces. Corpus Juris did not scold me as in former days; he treated me now as his guest, and merely remarked, "It is of no consequence—do not trouble yourself about it," but with a certain amount of formal civility, which deprived me of all pleasure in committing such excesses again.

Nicolai having spent many years in constantly falling in and out of love, always with the one great idea of betrothing himself before him, now makes up his mind that all such notions must be given up in the cause of art, and congratulates himself that "there are some young men who feel conscious of the heavy responsibility of duty, and who can and will show the thoughtless world that they are prepared, for the sake of an idea, to sacrifice the greatest and the best of blessings which this life can offer." This noble resolution does not last very long, however. He meets in one of the picture galleries an interesting middle-aged artist, with whom he presently makes acquaintance, and to whose house he goes. There, from a chance remark, he discovers that his

---

* *Nicolai's Marriage: a Picture of Danish Family Life.* By Henrik Scharling, Author of "Nöddebo Parsonage" and "The Rivals." From the Danish. 2 vols. London: Richard Bentley & Son. 1876.

new friend is married. "But you are a painter, an artist," he exclaims with innocent surprise:—

"Are painters and sculptors prohibited from marrying? What is the matter with you, my young friend? I hope mounting so many steps has not had the effect of making you giddy and setting your brain in a whirl."

I began to recover from my first surprise. My ideas on this subject were the fruit of years of mature reflection; there seemed to me to be something peculiarly beautiful in the thought that, for the sake of art, one should make a great and important sacrifice; indeed, I considered this to be a proof of true, unselfish love towards it, and I looked upon myself as a shining example of the same. I therefore felt hurt at my companion's flippant assertion that artists might marry as well as ordinary mortals, who merely exist for the paltry objects of the hour.

It then appears that the painter has not only a wife, but four daughters and a brother-in-law, called Morbro'er, an abbreviation of mother's brother, who for all practical purposes lives upon him. The result of Nicolai's first visit to the painter is that, when he returns home, his thoughts have taken a new turn. "It was a charming still spring night; the half-moon stood high in the heavens, and nodded cunningly down to me, as if it would say, 'You ought to marry, Nicolai! You really ought to marry!'"

Presently he falls in love with the painter's second daughter, Estrid, and for the first time finds that his love lasts. One evening, when the stars are out, the conversation between Nicolai and Estrid, who have become separated from the rest of the party, takes a critical turn:—

I gazed down upon Estrid: the stars were reflected in her clear eyes. I seized her small, white hand. She permitted it to rest in mine, and did not draw it back.

"Estrid!" I whispered, "even here, on earth—will you—" The words stuck in my throat, my thoughts had become jumbled up together—the stars, the sun, Estrid, Rembrandt, Raphael, all danced in wild confusion before my brain, without my being able to collect or arrange my ideas.

Still, underneath it all, I had a sort of dull conception that the moment was an extremely critical one; so with a supreme effort I gathered my strength together, as I stammered, "Will you—follow me—and be my wife?"

Estrid turned towards me; there was an indescribable expression of tenderness and love in her eyes; she leaned her head against my shoulder, and whispered scarcely audibly, "Yes."

In an instant I had recovered the power of speech.

"Oh, you sweet, precious girl!" I cried, seizing her head with both my hands, and kissing her frantically.

"Hush, there is some one coming!" she exclaimed, as she jumped up.

The proposal is well received by all the relations concerned, and Nicolai observes, "Well, here I was betrothed, and, according to my own theory, and that of all the poets I had read, I ought to be the happiest individual under the sun." He soon discovers, however, that the time of betrothal has its disadvantages. When he is at work over his books his attention is constantly distracted by the thought of Estrid, whom, after a struggle, he rushes off to see. But the moment he reaches her house he is seized with regret at having left his work, so that he is, "like the hero of a French tragedy, continually being placed upon a dangerous cross road between duty and love." Sometimes when he has abandoned his books to fly to Estrid she observes his restless and fatigued looks, which are really caused by remorse, and he replies to her anxious questions, "Oh, I am rather occupied at present." "Poor fellow!" she says, "I only hope you are not working too hard. You allow your studies, I fear, to absorb you too much." "Alas! the dear girl did not understand my misfortune was that my studies absorbed me far too little."

The appointment to a small post in one of the art museums, however, makes the marriage possible earlier than had been hoped, and Nicolai and Estrid set up in rooms at the top of a house commanding a view of green trees, with an old servant named Ane, of whom they both stand in great awe. It is hardly possible within our limits to convey any notion of the charm which the author has given to the story of Nicolai's and Estrid's married life. For a long time there is nothing in it to be told that might not happen any day to two pleasant young people under the same circumstances; but the narrator has the rare art of investing the most ordinary occurrences with touches of poetry or quaint humour, which raise them at once to interest. Thus several pages are amusingly taken up with an account of how the two go out for an evening walk in one of the public gardens, and find themselves first locked into the garden and afterwards locked out of their own house. Nicolai, when this last misfortune occurs, threatens to give Ane a "regular rowing" for not having sat up to let them in. "Estrid replied nothing to this; she full well knew the rowing would never take place; Ane's manners were too majestic for either of us to venture on such a thing." And, in fact, all that comes of the intended scolding is that Ane, when she hears of what has happened, says in a sharp tone, "If you will come home so late, you ought at least to remember to take the key with you." Ane, indeed, rules the young couple so severely that Nicolai's dignity as master of the house is much hurt, and yet he cannot find any tangible ground for complaint in her conduct. If Estrid orders the beef to be underdone, Ane replies, "Beef tastes best when thoroughly roasted," with an air which makes further discussion impossible. Again, whenever vegetables are ordered, she boils so many of the same kind at once that they have to be eaten every day in the week; and to all remonstrances answers that it is the most economical way. Nicolai comforts Estrid by telling her that they can give Ane notice to quit at Michaelmas, "so we determined to be patient, although both of us well knew that nothing would take place, for neither of us had the courage to send her away."

Ane's tyranny comes, however, at length to a crisis in a small country cottage which Nicolai takes for the summer, and the removal to which is attended by various incidents that owe their importance to the manner of their telling. Ane's temper is tried by having to share a kitchen with the woman of the house, and she bursts into an outbreak which is repressed by Nicolai, who speaks with a firmness and decision at which he is himself half frightened, and from that moment things go more smoothly. In this cottage the plot of the book begins to be unfolded, and in the management of this, although none of its incidents are new, the author has shown that he can artfully conceal a mystery, as well as tell a simple tale pleasantly. An old student friend of Nicolai's, who has become a sculptor, appears, and his appearance leads to various complications. Later on in the book, at a dinner given in honour of Estrid's birthday, Nicolai's brother Corpus Juris reappears, and one of the harmless wrangles which went on in *Nöddebo Parsonage* takes place between them. It begins by some one speaking of a portrait of Cort Adler's, and Corpus Juris, between whom and Nicolai the merits or demerits of Cort Adler are a standing ground of dispute, immediately exclaims, "Oh! that portrait is mere humbug and braggadocio, as everything is that comes from that quarter." "I beg your pardon," exclaimed Whitebear, amazed, and naturally supposing the words "from that quarter" referred to him. The battle between the two brothers, however, begins so quickly that there is no time for explanation, and it is only stopped by Corpus Juris proposing Estrid's health, and saying that "all know that brother Nicolai and I mean no harm; but we are both of us like lucifer matches, which ignite the moment they are struck together."

Those who cannot be satisfied with a novel unless it contains either extravagant scenes of passionate love-making, or keen dissections of unpleasant character, had better avoid *Nicolai's Marriage*; but to all who care for a bright, graceful story, told by a writer who likes to look at the happier side of life and gives to his characters a vivid reality, it can be safely recommended.

MINOR NOTICES.

THE late Rev. W. Harness, well known as an accomplished scholar and talker, some years ago printed for private circulation a selection of poems by Miss Catherine Fanshawe*, as a memorial of one who, "in her varied accomplishments, her acute perception of the beautiful, her playful fancy, her charming conversation, her gentle and retiring manners, her lively sympathy with the sorrows and joys of others, and, above all, her simple piety, was so cherished a member of a society not very extended, but intimately united by a common love of literature, and art, and science, which existed in London at the close of the last and opening of the present century, and which perhaps, taken for all in all, has never been surpassed." This volume Mr. Pickering now reproduces, in the hope that it may lead to a fuller collection of pieces by the same hand. It may be assumed that the personal characteristics so touchingly described by Mr. Harness gave a special value to Miss Fanshawe's verses among her friends, and perhaps readers of to-day, to whom these associations are strange, may not be equally impressed by them. There can be no doubt, however, that it was worth while to reprint them, not only on account of the quaint charm of their style and their genuine humour, but for the sake of the illustrations which they furnish of contemporary society. The first, an epistle to Earl Harcourt, on his wishing the name of Catherine to be spelt with a *k*, is perhaps rather too elaborate for such a subject; but the versification is of good quality, pointed, crisp, and animated. The next piece, a humorous warning to two young ladies, inspired with botanical enthusiasm, to avoid tasting any of their simples, is better; and so is the mock-heroic elegy by a beau of the last century on the abrogation of the birthnight ball and the subversion of the minuet. He contrasts

> The graceful bow, the curts'y low,
> The floating forms that undulating glide
> (Like anchored vessels on the swelling tide),
> That rise and sink, alternate, as they go,
> Now bent the knee, now lifted on the toe,
> The side-long step that works its even way,
> The slow *pas-grave*, and slower *balancé*,

with the clumsy antics of the modern style,

> Without a hoop, without a ruffle,
> One eternal jig and shuffle.

There is also a satirical sketch of the "Member for Odium" (Oldham)—that is, Cobbett—who is represented as moving for leave to bring in a Bill to abolish the sun and the moon, in a speech in which he complains very bitterly of the general maladministration of the univ[illegible] and shows [illegible]at the working of the elements urgently demands reform. A frag[illegible]nt in imitation of Wordsworth is very deceptive; but perhaps [illegible] most amusing piece is a representation of Ugo Foscolo's [illegible]yglot talk. He is urging that all living things are either slaves or tyrants from their birth:—

> *Les hommes, les femmes, et les petits enfans,*
> *Tutta la casa! tout ce qui est dedans!*
> Each prey on other—great fish eat the small;
> Beast, bird, the same—and mankind eat them all.

* *The Literary Remains of Catherine Maria Fanshawe.* With Notes by the late Rev. W. Harness. Pickering.

Some eat their little ones—three, four, five, six;
That animal—the mother of the Picts—
Je parle des pourceaux et de la femelle;
Now see, in English, comment cela s'appelle?
L'araignée soi—she who weaves *la nuit*,
Her cobweb on the *travée*, what she do?
She kill her husband on the wedding day.

He is coming to the conclusion, when, looking round, he finds his audience dispersed. The riddle on the letter *h*, which has been ascribed to Byron, is given here as Miss Faushawe's, beginning, "'Twas in heaven pronounced, and 'twas muttered in hell," instead of, as it is usually given, "'Twas whispered in heaven." It may be noted that this little book also contains a good story of a passage of arms between Byron and Mme. de Staël, in which Byron played his usual part of a social Manfred.

Among the revived arts of the day must be included, we suppose, the driving of four-in-hands, of which Captain Malet *, himself an old and experienced whip, gives us a gossiping historical account in his *Annals of the Road*, in the hope, apparently, of stirring up the spirit of modern coaching. There can be little doubt that as regards the vehicle and horses, the four-in-hands of to-day are much in advance of those of former years; but whether as much can be said for the drivers is another question. The high polish and delicate springs of the modern coach would have been out of place at a time when roads were often rough and broken, and when all sorts of accidents and strange adventures had to be faced; nor would the beautiful animals which may now be seen at a meet in the Park have been equal to the severe labour and fatigue to which their predecessors were subjected. Any one who turns to Captain Malet's book will get a vivid idea both from the text and the coloured prints which illustrate it of the perils to which mail-coaches used to be exposed. One of the dangers of the road was then the recklessness of drivers, especially amateurs, who vied with each other in rapid motion and feats of what was called "feather edging," that is, trying to go as near another vehicle as just to shave it, which often resulted in an accident. There is a story of a member of the old Richmond Driving Club who was celebrated for being "dangerous," and never could get a passenger to join him, till one night some one after dinner at Richmond climbed up to the box, not having observed whose coach it was. The driver was so much flattered that he started immediately; but the passenger, looking up, and recognizing his driver, never hesitated an instant, but jumped straight from the box into the middle of the road. The systematic organization of the mail service in 1784, chiefly due to the efforts of Mr. John Palmer, M.P., gave a great impetus to coaching, and made the whole country look up with patriotic pride and admiration to the noble array of coaches and horses. The excitement of a national victory was enhanced by the news being carried through the country by coaches decked with laurels, flowers, oak leaves, and ribbons—coachman and guard, passengers and horses alike, spreading the enthusiasm. Previously the mails were carried by post-boys, going at five miles an hour, but the coaches, beginning at six miles, soon increased their speed to eight and nine, and at length to ten miles an hour. One of the oldest coaching clubs was the Four Horse Club, which was started in 1808, and ceased to exist before 1826. The Richmond Driving Club began in 1838, but was soon given up. It was not till 1856 that the present Four-in-Hand Club was established, while the less exclusive Coaching Club dates from 1870. In 1862 the Brighton coach was taken off, and there was almost a total cessation of coaching. In 1866, however, a revival began, which has since been kept up with much spirit and enterprise. Four horses may be assumed to be as large a number as it is safe or convenient to handle from the box; but the writer of this book has seen the Norwich and Cromer coach with eight horses during a severe winter. It is perhaps because Captain Malet has written his work in India that he tells us very little about contemporary coaching in England. He deals almost exclusively with the past, and, in fact, his materials consist mainly of "Nimrod's" essays, and other articles of the same period. The general science of driving no doubt remains substantially unchanged; but a work of this kind [illegible] ought to contain some account of modern [illegible] construction of coaches and style of driving.

Thank[illegible]nce of publishers, literature is now largely de[illegible]ervice of lunatics. Here, for instance, is a solem[illegible] book of some four hundred and fifty pages, called *The [illegible]ums' Book*†, translated from the French of Allan Kardec, which is, it seems, the sequel to another work, by the same writer, called *The Spirits' Book*. The object of the present volume, of the original of which eighty-four thousand copies are alleged to have been sold, is to display "the theoretic teaching of spirits concerning all kinds of manifestations, the means of communication with the invisible world, the development of medianinity, and the difficulties and dangers of practical spiritism." It is intimated that this work is not addressed to materialists, and it will readily be understood that implicit faith in Spiritualism is necessary to begin with. The chief foe of Spiritualism, however, is, it appears, not so much its open enemies as a certain class of spirits who exercise a malignant ingenuity in humbugging pious devotees and making their faith ridiculous. "Innumerable contradictory theories," we learn, are put forth by ignorant and pretentious spirits; and "the cunning of deceptive spirits sometimes passes all imagination." "The art with which they erect their batteries and combine their attacks, would be a curious study if incessant pleasantries were their sole object; but these mystifications have very painful consequences for those who are not thoroughly on their guard." The writer adds that he could fill a volume with the most curious instances of spirit-hoaxings which have occurred within the circle of his own personal observation. In one case, a lying spirit dictated a feeble-minded letter in the name of Bossuet, and when challenged on the subject, confessed that he had been impelled by a desire to attract attention. He was then asked, "But did you not foresee that it would be judged spurious?" and replied, "Who can ever be sure what will happen? You might have been taken in." In fact, when we observe the many difficulties in the way of getting at the truth from spirits, such as their malice, ignorance, and wantonness; their doubts, when honest, as to how much they should let out; and last, not least, "the inadequacy of human language to express things pertaining to the incorporeal world," we do not wonder that people who have much to do with spirits get bewildered. We quite agree with the writer when he says, "It is, in fact, the readiness with which many persons accept whatever comes from the invisible world, under the apparent sanction of a great name, that encourages deceptive spirits." In other words, the folly of Spiritualists on earth is fearfully demoralizing the spirits whom they worship; and by and by, we fear, there will be hardly an honest spirit left. A chapter is devoted to the great question where the spirits get their clothes. The wearing of an old coat might, it is suggested, be accounted for as the result of "an action of the spirit's memory, and as forming, so to say, a part of his individuality"; but this, we are told, would not explain a snuff-box, stick, pipe, or so on, though we should have thought the explanation as good in one case as in the other. St. Louis, being consulted on the subject, shuffled a good deal, and at last, when pushed into a corner, said that the spirits could do anything they liked, but then they would not like to do anything that was "an infringement of the laws of natural order" which rather seems to cut the ground from table-turning, &c. Besides unprincipled spirits, there is another form of spiritual mischief which is called obsession. Obsession, we learn, exists when a malefient spirit imposes itself on a medium, and subjugates him more or less. There was a friend of the author's who was thus forced to kneel down and kiss the ground in public places, and who was therefore uncharitably supposed to be mad, but this the writer indignantly contradicts. A spirit, when examined on this point, said very frankly, "I have an itching to torment some one; a reasonable person would drive me away; I stick to this idiot because he has not the active virtue to withstand me.' On the whole, it would appear that spirits are, as the Scotch say, "kittle cattle" to have to do with, and show great discrimination in their choice of victims. Some specimens of flatulent verbiage are given as genuine messages from spirits.

With the help of the light thrown on spirits by the volume just noticed we can the more readily explain poor Mrs. Berry's delusions.* She was long an unbeliever, but she was one day convinced, by the repetition of familiar names and places, that she had been brought into the presence of one from whom she had parted in grief and sorrow; and since then her faith has remained unchanged. She has seen tables spinning about, heard bells ringing and banjos played, and has "repeatedly had her boot taken off, but never could induce the spirits to put it on again." Mrs. Berry after a time herself became a distinguished medium. At one of her *séances* "an eminent naturalist" received a blow on the head which drew blood, but he admitted that it was because "he was very curious to know what sort of hand was playing the guitar," an impertinence which was naturally resented by the spirits. In another case all the people in the room had their faces daubed like Red Indians. The finest sight of all, however, was Mr. Herne floating in the air, "Mrs. Guppy being struck on the head by his boots as he came down, and then rising again with Mrs. G. clutching hold of him, and rising also into the air." "Rather unfortunately, at this moment the door was unexpectedly opened, and Mr. Herne fell to the ground, injuring his shoulder, Mrs. Guppy alighting with considerable noise on the table, where, on the production of a light, she was found comfortably seated, though considerably alarmed." "A profoundly symbolical ceremony"—a glass of wine all round—"now took place under spirit direction." Mrs. Berry also furnishes us with some deep remarks by "an Egyptian spirit who lived contemporary with Semiramide" (*sic*), of which the following is a favourable example:—"I would not knock like death at the door, but I would pull the bell of immortality."

We have now a specimen of lunatic literature of another kind. The author of *Social Architecture* † is quite as infatuated in his way as Mrs. Berry or the author of the *Mediums' Book*. He calls himself an exile from France, but he is, it appears, a Styrian by birth, and was turned out of France in 1848 as a suspicious political character. He explains very clearly how he got into his present hopeless state of mind. Frequent visits, he tells us, to the reading-room of the British Museum "introduced him to the works of Plato, Sir Thomas More, Robert Owen, Stuart Mill, John Ruskin, Fitzjames Stephen, and others." He had already studied St. Simonism and Fourierism in France, and his education was completed by Karl

Marx in London. The result has been that the writer has brought to maturity a "plan for a comprehensive system of social regeneration," and we are bound to say that, whatever else it may be called, it is sufficiently comprehensive. There is hardly a custom or institution of modern civilized life which he would not abolish or reconstruct, and his system, if carried out, would certainly leave the w[illegible] great doubt as to where its head was and where its heels. [illegible]hort, *Social Chaos* would be a more appropriate title than *Social Architecture*. Capital is to be converted into common property, and trade suppressed, because it tends to keep the minds of the commercial classes in helpless stagnation. The writer denounces "the insipid occupation of persons devoting their intellectual energies" to common arithmetic, and also thinks that merchants and clerks under the present system "waste their intelligence in perusing endless price-lists every day, and in frequently raising or lowering the prices of their goods." This will be remedied under the new system by the "total omission of all accounts concerning profits and losses, good and bad debts, sales and purchases, bills, drafts, auctions, &c."; such limited labours of this kind as will be allowed being devolved on the older members of the community, so as to leave the young the free use of their limbs. The shopkeepers will also be protected against the "pitiless attacks and disastrous consequences of free competition," and the loss of time and temper which they at present incur in waiting on foolish and impertinent customers. "The insolence, whims, and caprices of customers, the frequent and unsuccessful attempts of purchase by undecided and hesitating purchasers, must be very galling to shopkeepers and shopmen," and lead to bad temper on both sides; and therefore must be put down by the State undertaking the duty of distribution of produce. "Private homes" are also to be put down, as conducive to conceit and oppression, and children and young people will thus be relieved from "the tyrannical and arbitrary treatment they often experience on the part of parents, brothers, sisters, governesses, tutors, servants, and relatives." The writer takes the saying that money is the root of all evil in its literal sense and promptly abolishes it. All kinds of private property are also to be thrown into the common stock. Under the arrangement which the author says he is prepared to devise, the main body of the population will be employed in agriculture, which will then be "rather of a recreative nature," labour in the fields being varied by healthy rambles in fine weather, and attention to domestic and other pursuits in wet or cold. Railways and carriages are to be much reduced, because it is much more wholesome for people to walk than to ride. The abolition of locks and locksmiths is to follow, as no doubt it logically does, the abolition of money and private property; but an exception is to be made in favour of locking your front doors for privacy. Our space prevents us from going through this extraordinary work in detail, but we must not omit to say that the writer is very indignant at what he calls the "conventional shyness of most people to speak about sexual relations and functions," and he certainly shows that he is himself entirely exempt from these prejudices by the language which he uses, and which we wonder any respectable publisher should print.

*Lord Byron Vindicated** is another of the crazy books which are published from time to time. "I have," says the author, "willingly lain (*sic*) down my life for the noble spirit whom I devotedly love. It is true I live to pen these lines, but the vitality, the strong principle of physical life has been lost, perhaps forever (*sic*) in this cause." It appears to have occurred to the writer that some people may wonder why a poem in vindication of Byron should be chiefly occupied with ancient Rome; and it is therefore explained that this has been done partly because "with the general subject of Rome the sympathies and interests of all educated societies must be forever blended"; and, further, because such a theme is needed to secure a perpetuity of fame. The volume is full of rhapsodical verses headed Rome, Greece, Julius Cæsar, Augustus, Napoleon, Love, Byron, and so on; but what it all means it is impossible to say.

Many attempts have been made in recent years to translate Heine's poems into English, but, as a rule, without much success. The truth is that Heine's vigorous simplicity, his use of homely, familiar language to express deep or pathetic ideas, cannot be satisfactorily rendered in any tongue but his own. Mr. Egan's translations of *Atta Troll* and other pieces† are, on the whole, easy and natural, but they are eked out by words, and even occasionally ideas, of which there is no trace in Heine. Take, for instance, such a passage as—

> Die schöne Maid, die putzet sich,
> Sie summt ein lied gar wunderlich:
> "Rinne, rinne, Wässerlein,
> Wasche mir das Linnen rein."

How imperfectly this is rendered by such lines as—

> The beauteous maid bestirs herself,
> She hums a song, the mystic elf;
> "Ripple, ripple, fountain bright,
> Wash me clean this linen white."

How stiff and stilted is "beauteous" compared with "schöne," "ripple" with "rinne," "fountain bright" with "wässerlein." In Heine there is nothing about "mystic elf," nor has he to drag out his line by adding "white" to "linen." Again, in another piece, how absurdly such a phrase as "tenderest effusions" represents "weiche Reime." In spite of these faults, however, Mr. Egan's translations have a certain spirit and animation which make them readable; and those who do not know German will at least get a notion of Heine's humour, if not of his style. Mr. George MacDonald has also, in his *Exotics*, tried his hand at Heine; and, though his language is more delicate and poetical than Mr. Egan's, Heine's magical use of homely little words completely baffles him. In the preface, in which he lays down the rules of translation, he is sound enough, insisting that the poet's "individual meanings" must be kept, and "his peculiar mode, the aroma of his style, preserved." But his practice of these rules is rather weak. The pieces lose their simplicity and directness, and what Heine expresses by a single word becomes a phrase. For example, "Durch alle Strassen herum," is stretched to "Through the streets with unsteady foot."

> Und starrte in die Höh',
> Und starrte nach deinem Fenster,

is clumsily expanded into

> And gazed, one glimpse to gain—
> Stood staring up at thy window.

The charm is also taken out of "Lieb Liebchen, leg's Händchen auf's Herze mein," when it is turned into

> The little hand lay on my bosom, dear:
> What knocking is that in the closet?—hear!
> There dwelleth a carpenter evil, and he
> Is hard at work on a coffin for me.

The "lieb Liebchen" is enfeebled; "bosom," as applied to a man, is a horrible Americanism; and a "carpenter evil" is a mere shirking of "ein Zimmermann schlimm und arg." Mr. MacDonald's volume also contains translations of Novalis's Spiritual Songs, Luther's Hymn-book, and other German and Italian poems; and in some of these he is more successful than with Heine. Luther's religious songs are interesting in themselves, and are also vigorously rendered. Mr. Hedley, in his *Masterpieces of German Poetry*, has taken pains to give, as near as possible, the measure of the originals, and has succeeded fairly well. He has caught the style and tone of Heine better than either of his rivals just noticed, but has given only one specimen. Indeed the selection of pieces for this work is not very judicious, some of them being very poor stuff. Mr. Hedley should have kept to the real masters, and given more of them.

The Royal Society for the Prevention of Cruelty to Animals has published a summary of the evidence collected by the Royal Commission on Vivisection*, and a statement of the position taken up by the Society on this question. It gives a good deal of information in a handy form.

Mr. Somers introduces his work on Trade-Unions† by a quotation from Mr. Bright, who lately suggested that "a book, not a small one, might be made up of the strange doings of Trade-Unions," adding that "monopoly is hard to teach," and that he feared "working-men will only learn through suffering, and may do mischief which cannot be afterwards repaired." Mr. Somers enforces a much-needed lesson by a digest of the evidence which has been collected in recent years as to the working and tendencies of Trade-Unions. His work is written in a very clear, earnest, and straightforward manner, giving authentic facts, and tracing out the natural and logical consequences of Trade-Union principles. He urges with much force the folly of treating such a question as "an undetermined and merely playful element in party politics," and points out that Trade-Unionism has in recent years been changing from a system of kindly mutual support and assistance into one of a [illegible]ely aggressive character which ought to be boldly faced. [illegible] that the financial difficulties of the Unions are due, [illegible] is the law, which has given them every assistance, [illegible] Unions themselves never having condescended [illegible]rs in a legal or consistent shape. At this mo[illegible]nce, they attempt to provide an insurance system by mean[illegible] which are continually diverted to purposes of agitation an[illegible]re. Mr. Somers hopes that in the future the Unions may have less of the character of fighting bodies, contending pell-mell, and often blindly, for indefinite and unattainable trade purposes, and will become "friendly societies of mutual help and of industrial and intellectual culture." Apart from Mr. Somers's own views, his book, as a logical and systematic digest of evidence, is a valuable contribution to the literature of an important question.

Mr. Frederick Clifford, the writer of the letters in the *Times* on the Agricultural Lock-out of 1874, has prepared a very clear and useful abstract of the Agricultural Holdings Act, explaining its details, and giving practical directions as to its working.

The fact that the *Churchwarden's Guide*§ has gone through nine

§ *The Churchwarden's Guide.* Ninth Edition. By W. G. Brooks, Barrister-at-Law. Knight & Son.

editions seems to show how much such a work is wanted by those who fill that anxious and perhaps too often ungrateful office. The present edition contains the substance of the most recent legislative and judicial decisions.

The essays on land tenure in various countries which were published under the auspices of the Cobden Club in 1870* have just been reprinted in a revised and cheaper form.

The third edition of the *Englishman's Illustrated Guide-Book* to the United States and Canada† contains, in addition to a general account of those countries, which is especially adapted to the use of British tourists and settlers, an appendix dealing with the Philadelphia Exhibition.

The Rev. J. Magens Mello has written a little handbook on the geology of Derbyshire‡—a peculiarly interesting district from that point of view—which, for those who have any scientific curiosity, should add to the pleasure of a tour.

Professor Bernstein has aimed, in the work on the Five Senses§ which he has contributed to the *International Scientific Series*, at hitting the mean between a mere popular sketch and an abstruse study.

Mr. Burnand has, no doubt, a certain sense of rollicking fun‖, but he is turning it to very poor account in a mechanical repetition of his old joke of "Happy Thoughts," which did very well for once, but won't do for ever.

Mr. Watson Lyall's Guide and Time-tables¶ for the use of sportsmen and tourists in Scotland has now become a necessary part of a traveller's outfit. It gives a great deal of information as to the rivers, lochs, moors, and deer-forests, in a compact and handy form.

M. Gustave Masson has edited two little text-books** for the Syndics of the Cambridge University Press—one containing eight chapters of Mme. de Staël's *Dix Années d'Exil*, with specimens of her own poetry and that of her contemporaries, and the other Collin d'Harleville's play *Le Vieux Célibataire*. Each contains useful notes and a biography.

Miss M. A. Baines has written some simple and unpretending verses descriptive of the Months†† as an accompaniment to a series of very delicate and beautiful etchings by Miss Wilhelmina Baines of the flowers, ferns, &c., belonging to the various seasons.

Mr. F. S. Turner, Secretary of the Anglo-Oriental Society for the Suppression of the Opium Trade‡‡, naturally discusses the subject with an obvious bias, but he has collected a good deal of interesting information, and his work is worth reading. He has of course no difficulty in demonstrating the evils which result from the consumption of opium as a narcotic, but the question is whether these would not be rather increased than diminished by the British Government giving up all control over the trade.

Mrs. Rattray, in a series of plain, familiar letters, apparently written to friends, gives a curious account of country life in Syria.§§ She and her husband, who had some kind of farming operations in hand, settled at Mualleka, in the valley of Cœlo-Syria, at the end of 1863, afterwards removing to Zahleh, which has the reputation of being the most turbulent and bigoted community in the Sultan's dominions, and then to Karak. They seem to have had rather a rough life, the natives being filthy in their ways, and food scarce and bad. Mrs. Rattray kept no servants, made the bread and butter, and did all the household work except washing. One day when her husband was absent in the fields along with the other able-bodied men and boys, a party of Kurds came demanding black-mail, but Mrs. Rattray, arming herself with a couple of loaded guns and a pistol, threatened to fire if the visitors attempted to lay hands on anything, so they rode off. As a rule, the peasantry do not venture to resist these marauders, who commit sad havoc. Mrs. Rattray seems to have mixed very freely with the people, and gives an interesting account of their peculiar habits. Her husband's farming did not turn out well; and in 1872, after they had lived for some time "in a hand-to-mouth fashion, without any money to fall back upon," his crops, which represented his whole income, were seized by the peasantry. Altogether, this is, from its unsophisticated candour, an amusing little book.

A considerable part of Sir Sibbald Scott's record of his visit to Jamaica‖‖ is devoted to the voyage out and home, and the rest of the narrative is also composed in a large degree of personal gossip. Sir Sibbald, in fact, does not seem to have gone into anything very deeply; but here and there he has some interesting jottings. On the whole, the condition of Jamaica seems to be improving. Tobacco is becoming a valuable staple, and the sugar estates are also reviving. A scheme is in operation for irrigating some 43,000 acres of waste land. The immigration of coolies has also been of advantage to the colony. There are now about 4,000 there, and, of 1,599 who in 1873 completed their term of service, only 420 chose to return to India. Those who left took back with them 3,855*l.* in Treasury bills, besides other valuables and specie. The fact that a military force not exceeding nine hundred men, and six hundred and eighty policemen, controls a population of upwards of half a million is a proof of the general contentment and tranquillity.
